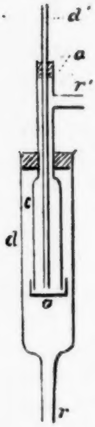
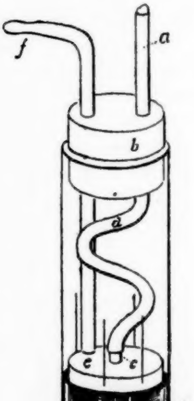
Vacuum Regulator for Distillations under Reduced Pressure. By JEAN HAUSSER (*Bull. Soc. Chim.*, 1899, [iii], **21**, 253—254).—The apparatus described is a simplification of that devised by Auger (this vol., ii, 474). The tube *d* is connected with the pump at *r*, and fitted with a bored stopper, through which a tube *c* is inserted; the latter is fitted at its lower end with a rubber membrane *o*, and is also connected with the pump by the side tube *r'*. The stopper *a* carries a tube *d'*, which is open to the air and can be made to slide up and down, so that it may be pressed against the membrane *o*. When the pump is working, a partial vacuum is produced on both sides of the membrane, and if the diminution of pressure exceeds a certain limit, depending on the elasticity of the membrane and the position of the tube *d′*, the former is pulled away from the latter and a certain quantity of air is admitted; the pressure in the apparatus is thereby increased and the membrane regains its original position; if the pressure is again diminished sufficiently the process is repeated, and thus the vibratory movement of the diaphragm prevents any considerable alteration of the pressure below a certain limit.



G. T. M.

Note.—Neither this apparatus nor Auger's is capable of preventing variations of pressure *above* the limit fixed upon at the commencement of the experiment; such variations may often arise through a falling off of the pump's efficiency. G. T. M.

Apparatus for Preventing the Backward Flow of Water during Exhaustion with a Water-pump. By Georges Chatanay (*J. Pharm.*, 1899, [vi], **9**, 524—527).—A small, cylindrical glass bottle about 12 cm. long and 3 cm. wide is interposed between the water-pump and the vessel to be exhausted. This bottle is closed with a cork, *b*, through which two glass tubes pass. The first, a straight tube, *a*, over 760 mm. long, is connected at its upper extremity to the vessel to be exhausted, and its lower end just passes through *b*, and is joined to one end of a piece of thin and narrow indiarubber tubing, *d*, the other end of which is joined to a small piece of glass tubing, *c*, which just passes through a cork, *e*, floating on mercury. It is essential that the length of the tube *c* beyond the lower face of the cork float *e* should not be more than about 1 mm. The second tube which passes through *b* has its upper end connected to the water-pump and the other just reaches to the top of the cork float. Four small rods which pass through the cork float in a vertical direction prevent it from being turned over by any sudden inrush of water. As the cork *e* floats on the mercury the end of the small tube *c* is always below the surface, and an influx of water into the apparatus leads only to a rise of mercury in the long tube *a*.



H. R. Le S.

Modification of Sprengel's Pyknometer. By A. Minozzi (*Gazzetta*, 1899, **29**, i, 406—407).—This pyknometer, intended for use with liquids which are volatile or hygroscopic, or which expand rapidly with rise of temperature, consists of a U-tube, one arm of which is a capillary tube drawn out to a point which can be closed by a glass cap, and the other a cylindrical bulb joined to a small stoppered upper chamber by means of a short capillary tube, on which a mark is scratched at the height to which the instrument is to be filled. If expansion occurs during an experiment, the liquid simply causes it to rise into the small chamber above the bulb. This modification is stated to be more convenient than that devised by Perkin (Trans., 1884, 443) for the same purpose. T. H. P.

Inorganic Chemistry.

New Explosive and Detonating Materials. By UGO ALVISI (*Gazzetta*, 1899, **29**, i, 399—405. Compare this vol., ii, 414).—To obtain the maximum effect from an ammonium perchlorate explosive fired by means of a mercury fulminate detonator, the latter must also contain ammonium perchlorate in quantity not greater than 20 per cent. Such mixed detonators are probably the most powerful used, and possess both great disruptive and great propulsive force.

T. H. P.

Use of Potassium Chlorate in Ammonium Nitrate Explosives. By HENRI LE CHATELIER (*Compt. rend.*, 1899, **128**, 1394—1395).—The addition of potassium chlorate to an ammonium nitrate explosive increases its sensibility to detonators; these two salts form isomorphous mixtures, and the addition is conveniently effected by the use of mixed crystals. Those mixed crystals which contain less than 4 parts of nitrate to 1 of chlorate have the same crystalline form as the latter salt, whilst those containing a greater proportion of nitrate crystallise in forms isomorphous with it. Mixed crystals of definite composition cannot be obtained by evaporating dilute solutions of their constituents to dryness; they are most conveniently produced by dissolving these salts in the mother liquors from previous crystallisations. G. T. M.

Action of Chromic Acid on Hydrogen. By CHARLES L. REESE (*Amer. Chem. J.*, 1899, **22**, 158—164).—Ludwig (Abstr., 1872, 590) has stated that when gypsum balls, saturated with aqueous chromic acid, are exposed in an atmosphere of hydrogen, the latter is oxidised; the author now confirms this statement, but points out that in no case is the whole of the hydrogen absorbed. Porous burnt clay balls behave in the same way as those of gypsum, but the absorption is much slower; hydrogen is also absorbed when agitated with chromic acid solution in sealed tubes containing platinised asbestos, although if platinum foil is substituted, no oxidation occurs.

Hydrogen was not oxidised by aqueous chromic acid, either alone or in presence of 1—15 per cent. by volume of concentrated sulphuric acid, at temperatures below 50°, and only very slowly below 100°. After exposure for 116 hours at 100°, 70 per cent. of the gas was oxidised. At 156°, 7 hours exposure led to the oxidation of 11 per cent. of the hydrogen, a large volume of oxygen being evolved owing to the decomposition of the chromic acid by heat; the oxidation, however, commences at temperatures below those at which oxygen is evolved by chromic acid, and thus does not seem to be dependent on the decomposition of the latter by heat.

Pure chromic acid in aqueous solution is not reduced by the hydrogen evolved on passing an electric current through the solution, but in presence of a trace of sulphuric acid or a sulphate, reduction occurs until a certain limit is reached, apparently dependent on the amount of sulphuric acid present. The behaviour of a solution of potassium dichromate under the influence of an electric current is the same as that of chromic acid.
W. A. D.

Combination of Carbon Bisulphide with Hydrogen, Nitrogen, [Argon and Carbon Monoxide]. By Marcellin P. E. Berthelot (*Compt. rend.*, 1899, **129**, 133—136).—When a mixture of gaseous carbon bisulphide (70 vols.) and hydrogen (100 vols.) is subjected to the action of the silent electric discharge at an E.M.F. of either 12·6 or 25 volts, both gases partially disappear in the ratio, by volume, $2CS_2 : 1{\cdot}01H_2$ and a yellow, resinous compound, $C_2H_2S_4$, is produced. This has an odour somewhat like that of mercaptan, is insoluble in ether, and but slightly soluble in carbon bisulphide. When a mixture of carbon bisulphide (69 vols.) and nitrogen (100 vols.) is similarly treated, the ratio between the volumes absorbed is $4CS_2 : N_2$ when the current working the coil has an E.M.F. of 12·6 volts, and $7CS_2 : N_2$ with a current of 25 volts; the discharge in the first case lasting for 6 hours, and in the second for 3 hours.

When a mixture of gaseous carbon bisulphide (70 vols.) and argon (100 vols.) is exposed to the silent electric discharge at an E.M.F. of 23·6 volts for 3 hours, the carbon bisulphide disappears together with 2 vols. of argon—the ratio being $34CS_2 : A$. After 6 hours in another experiment under similar conditions, 3 vols. of argon disappeared, the ratio being $24CS_2 : A$.

When a mixture of gaseous carbon bisulphide (68 vols.) and carbonic oxide (100 vols.) is subjected to the action of the silent electric discharge for 6 hours, the residual gas measures 3·5 vols. and consists of carbonic oxide free from carbonic anhydride. A yellow substance is formed which is a mixture of the two products obtained when the gases are separately acted on by the silent electric discharge.
H. R. Le S.

Combination of Nitrogen with Oxygen. By Marcellin P. E. Berthelot (*Compt. rend.*, 1899, **129**, 137—139).—A sample of argon containing nitrogen was purified by mixing it with an excess of oxygen and sparking the mixture over caustic potash. The ratio between the nitrogen and oxygen absorbed was 1·65 in one experiment and 1·84 in another. Now, if all the nitrogen were removed as nitric peroxide, this ratio should be 2, and the caustic potash solution should contain equal amounts of nitrite and nitrate, whereas it was found to contain an excess of the former. These facts are accounted for by supposing that the nitrogen and oxygen first combine to form nitric oxide; this oxide is then oxidised to nitrous anhydride; part of the nitrous anhydride is further oxidised to nitric peroxide, but some escapes oxidation and dissolves in the solution as such.

H. R. Le S.

[Iodine in Sea Water at Different Depths.] By Armand Gautier (*Compt. rend.*, 1899, **129**, 9—15. Compare this vol., ii, 477).—It has been shown previously that the whole of the iodine present in water taken from the surface of the Atlantic Ocean exists either in the form of soluble organic compounds or as part of the substance of infusoria, and it seemed probable that the absence of metallic iodides and iodates is due to the assimilation of these salts by living organisms inhabiting the upper layers of the ocean. To test the validity of this view, an examination was made of samples of water taken from the Mediterranean off Monaco (1) at 0·5 metre below the surface, (2) at a depth of 880 metres, (3) at a depth of 980 metres when the bottom was found. The results obtained are summarised in the following table:

	0·5 m.	880 m.	980 m.
Sp. gr. at 4°	1·03014	1·03104	1·03076
Solid residue (grams per litre)	43·40	44·78	43·41
Total halogens, calculated as sodium chloride (grams per litre)	34·92	35·99	35·68
Insoluble "organic" iodine (mgrms. per litre)	0·286	0·100	0·065
Soluble "organic" iodine (mgrms. per litre)	1·960	2·130	1·890
Iodine in inorganic combination (mgrms. per litre)	none	0·150	0·305
Total iodine	2·246	2·380	2·260

From these results, it appears that the total iodine, and also the iodine existing in the form of soluble organic compounds, are practically constant at all depths. On the other hand, the iodine existing in the form of metallic iodides and iodates decreases as the surface is approached, and ultimately disappears altogether. The variation of the iodine present in an insoluble form and forming part of the substance of organised bodies is, of course, in the converse direction, the smallest amount being detected at the greatest depth, at which but few living organisms are found. The lower values found for the sp. gr. and solid residue at a depth of 980 metres compared with those at 880 metres are attributed to the influx of fresh water from springs in the bed of the ocean.

N. L.

[Presence of Iodine in Algæ and Beggiatoa.] By Armand Gautier (*Compt. rend.*, 1899, **129**, 189—194).—Examination of fresh water algæ belonging to the orders *Cyanophyceæ*, *Chlorophyceæ*, *Floridæ*, and others shows that they contain from 0·25 to 2·40 milligrams of iodine per 100 grams of the dried material, a much lower proportion than that contained by salt water forms (compare Allary, Abstr., 1881, 320). *Beggiatoa* contain as much as 36 milligrams, but in lichens the quantity is much lower than in algæ. The bacillus of tetanus contains only a minute trace of iodine, if any, and that of diphtheria none. In the case of fungi, iodine varies in amount with the nature of the food supply, and may disappear altogether. C. H. B.

Recovery of Iodine from Waste Products. By F. D. CHATTAWAY and K. J. P. ORTON (*J. Soc. Chem. Ind.*, 1899, **18**, 560).—The material is heated on a water-bath with a sufficiency of nitrohydrochloric acid, the water, towards the last, being allowed to boil; the iodine is converted into monochloride, and no appreciable loss takes place. The iodine may be recovered from its monochloride in various ways, such as (1) by simple dilution with water, when the iodine will gradually separate in long crystals, or (2) the diluted liquid may be divided into two equal parts, the one is bleached by sulphurous acid or a sulphite, and, the other half now being added, all the iodine at once separates. If very pure iodine is required, the monochloride may be converted into nitrogen iodide, and the latter decomposed by Stas' method (compare Proc., 1899, **15**, 19, 21). L. DE K.

Action of Iodine on Sulphur. By LÉON PRUNIER (*J. Pharm.*, 1899, [vi], **9**, 421—424).—Iodine readily dissolves in sulphur at a temperature of 115—120°, and the resulting mass, when cold, is crystalline. The iodine is apparently uncombined, since it volatilises at the ordinary temperature, and is readily removed by a solution of sodium thiosulphate. On adding iodine (4 parts) to plastic sulphur (1 part) kept at a temperature of 200°, much heat is developed, and a product is obtained which is different from that just described, as, on treatment with sodium thiosulphate, the iodine is but very slowly removed.
H. R. LE S.

Action of Sodammonium and Potassammonium on Selenium. By C. HUGOT (*Compt. rend.*, 1899, **129**, 299—302. Compare Abstr., 1896, ii, 21; 1898, ii, 573; this vol., ii, 151).—A mixture of selenium with sodium or potassium is treated with liquid ammonia, and when the metal is in excess a white monoselenide, Na_2Se or K_2Se, is produced, which is quite insoluble in liquid ammonia. When selenium preponderates, the monoselenide dissolves in the ammonia to form a brown solution from which a brown, crystalline polyselenide separates if the solvent is evaporated off at $-25°$ and the residue cooled to $-55°$. These polyselenides, Na_2Se_4 and K_2Se_4, are decomposed by acids, yielding hydrogen selenide and selenium.

Contrary to the statement of Franklin and Krauss (this vol., ii, 208), the author finds that selenium is insoluble in anhydrous liquid ammonia. G. T. M.

Hydroxylamine. By E. WAGNER (*Chem. Centr.*, 1899, i, 244—245; from *J. Russ. Chem. Soc.*, 1898, **30**, 721—729).—Hydroxylamine is compared with hydrogen peroxide, and may be regarded as a derivative formed by replacing the OH by a NH_2 group. Hydrogen peroxide is obtained by reducing oxygen, whilst hydroxylamine or its alkylic derivatives are formed by the reduction of oxygen derivatives of nitrogen. Both compounds are unstable, the one decomposing into water and oxygen, and the other into ammonia and oxidation products. The alkylic derivatives of hydroxylamine act also as strong reducing agents, and in such reactions are, like hydrogen peroxide, themselves reduced. The close relationship of hydrazine to hydroxylamine is shown by the conversion of phenylazoimide into phenylhydroxylamine,  $PhN\Big<\begin{matrix}N\\ \|\\ N\end{matrix} \rightarrow$ $PhNH{\cdot}N{:}N{\cdot}OH \rightarrow PhNH{\cdot}OH + N_2$.

On the basis of the similarity of the NH_2 and OH groups, the following compounds are arranged in two series, the corresponding members of which are characterised by identical or similar behaviour, amidogen chloride, NH_2Cl, corresponding with hypochlorous acid, hydroxylamine with hydrogen peroxide, methylamine with methylic alcohol, hydrazine with hydroxylamine, nitramine with nitrous acid, &c. The oxidising and the reducing properties of the substituted hydroxylamines prepared by Bewad (*J. Russ. Chem. Soc.*, **20**, 125; **21**, 43) are also explained on the above theory. E. W. W.

Inorganic Hydroxylamine Compounds. By VOLKMAR KOHLSCHÜTTER and KARL A. HOFMANN (*Annalen*, 1899, **307**, 314—332. Compare Abstr., 1897, ii, 557; 1898, ii, 380).—*Hydroxylamine potassiouranate*, $UO_4(NH_3OH)(NH_3OK) + H_2O$, is prepared by dissolving uranyl nitrate (10 grams) and hydroxylamine hydrochloride (15 grams) in 100 c.c. of water, and adding a 10 per cent. solution of caustic potash until the yellow, flocculent precipitate at first formed is redissolved; reddish-yellow cubes separate slowly from the liquid, precipitation being hastened by adding alcohol. The substance disintegrates to a yellow powder when heated, and has an ammoniacal smell; it is sparingly soluble in water, and is oxidised slowly by Fehling's solution. Turmeric is coloured brown by dilute solutions. When the potassium compound is digested with water which has been saturated with carbonic anhydride, the colour changes to green and hydroxylamine uranate is produced.

Hydroxylamine sodiouranate, $UO_4(NH_3OH)(NH_3ONa) + H_2O$, forms minute, prismatic crystals. The mother liquor deposits the *salt* $UO_4(NH_3ONa)_2 + 6H_2O$, which separates in orange-red rosettes of prisms, and dissolves in its water of crystallisation when heated; it is readily soluble in water, and vigorously reduces Fehling's solution.

The *compound*, UO_5N, obtained by dehydrating hydroxylamine uranate at 125° until the weight is constant, is a brownish-black substance with metallic lustre; cold, dilute acids liberate a mixture of nitrogen and nitrous oxide, uranic acid remaining dissolved.

The *compound* $MoO_4H_2(NH_2OH)_3(NH_2OK)$, is prepared by mixing aqueous solutions of ammonium molybdate (5 grams), hydroxylamine hydrochloride (10 grams), and potassium carbonate, alcohol being then added to the yellow solution; it reduces Fehling's solution and ammoniacal silver nitrate, and decomposes when heated, forming a black powder and liberating ammonia. The substance dissolves readily in water, yielding a pale yellow, neutral solution; if carbonic anhydride is passed into this liquid, hydroxylaminomolybdic acid separates in the form of a yellowish-white, flocculent precipitate. In general behaviour, the molybdenum compound differs from the hydroxylamine uranates, and more closely resembles the vanadium derivatives already described (Abstr., 1898, ii, 381).

The *compound* $MoO_5N_3H_9$, obtained by mixing ammonium molybdate (10 grams) and hydroxylamine hydrochloride (7 grams) with 50 c.c. of 7 per cent. aqueous ammonia at 8°, dissolves with difficulty in water, and develops a bluish-green coloration when heated with dilute sulphuric acid.

Hydroxylamine orthophosphate, $PO_4H_3(NH_3O)_3$, may be obtained by adding alcohol to the filtrate from a mixture of hydroxylamine sulphate and secondary barium phosphate; it is also produced from hydroxylamine hydrochloride and ammonium metaphosphate.

Hydroxylamine arsenate, $AsO_4H_3(NH_3O)_3$, forms microscopic, rhombic prisms, yields an acid solution in hot water, and readily reduces Fehling's solution and ammoniacal silver nitrate.

M. O. F.

Action of Hydrogen Phosphide on Copper, Cuprous Oxide, and Ammoniacal Solutions of Copper Salts. By E. Rubénovitch (*Compt. rend.*, 1899, **128**, 1398—1401. Compare this vol., ii, 102).—Hydrogen phosphide reacts with precipitated copper when the temperature is raised to 180—200°: $2PH_3 + 6Cu = 2PCu_3 + 3H_2$; the reaction with cuprous oxide occurs at the ordinary temperature, and may be thus represented: $2PH_3 + 3Cu_2O = 2PCu_3 + 3H_2O$. Copper phosphide is a grey, amorphous substance melting at red heat; it is soluble in nitric acid and bromine water, has no action on potassium permanganate, but is attacked by hot concentrated sulphuric acid, hydrogen phosphide and sulphurous anhydride being evolved. When exposed to oxygen at the ordinary temperature, it is slowly oxidised; at 100°, the reaction is attended by vivid incandescence, phosphoric anhydride and metallic copper being produced.

In aqueous solutions, hydrogen phosphide (1 mol.) reacts with copper sulphate (2 mols.) to form the phosphide $P_2Cu_5 + H_2O$, and with copper acetate or formate ($2\frac{1}{2}$ mols.) to form the compound PCu_3O; it has no action on aqueous cupric chloride. In ammoniacal solutions from which air is excluded, the reaction with hydrogen phosphide is common to all copper salts, and in the case of the chloride may be represented thus: $6PH_3 + 12CuCl_2 + 6H_2O + 24NH_3 = 4PCu_3 + H_3PO_4 + H_3PO_2 + 24NH_4Cl$. In every case, 2 mols. of the salt react with 1 of the phosphide, and the copper phosphide produced is identical with that obtained from metallic copper or cuprous oxide. If oxygen be admitted after the precipitation of the copper phosphide, the latter will dissolve, and the amount of oxygen required for complete solution is equal to twice the volume of the hydrogen phosphide originally absorbed.

G. T. M.

Reducing Properties of Boron and Silicon. By André Duboin and Armand Gautier (*Compt. rend.*, 1899, **129**, 217—218).—When chlorine is passed over a red hot mixture of aluminium oxide and boron, obtained by the action of aluminium on boric anhydride, aluminium chloride and boric anhydride are the products; similar results are obtained with bromine and with iodine vapour mixed with hydrogen, whilst hydrogen sulphide yields boron sulphide. A mixture of aluminium oxide and silicon, obtained in a similar way, yields aluminium chloride, and not silicon chloride or silicochloroform, when heated to bright redness in a current of hydrogen chloride. When intimately mixed with aluminium oxide, boron or silicon therefore behave in the same way as carbon under the conditions described. C. H. B.

Preparation of Graphitoidal Silicon. By FREDERICK S. HYDE (*J. Amer. Chem. Soc.*, 1899, **21**, 663—665).—Finely powdered white sand is heated in a test-tube with magnesium powder, the brownish-black product is then powdered and fused in a Denver crucible with aluminium and cryolite. The product, consisting of an alloy of aluminium and silicon, is treated with warm hydrochloric acid, and the silicon obtained in black, glistening spangles. J. J. S.

Carbonic Anhydride on Mont Blanc. By MAURICE DE THIERRY (*Compt. rend.*, 1899, **129**, 315—316. Compare Abstr., 1897, ii, 253). —The results indicate that the amount of carbonic anhydride in the atmosphere varies only very slightly with changes of altitude; at altitudes of 1080 and 3050 metres, the amounts were respectively 26·2 and 26·9 litres per 100 cubic metres of air. G. T. M.

Argon and its Combinations. By MARCELLIN P. E. BERTHELOT (*Compt. rend.*, 1899, **129**, 71—84).—A record of experiments on the effect of the silent electric discharge on a mixture of argon with various organic compounds. The mixture was enclosed in an annular space formed by two concentric tubes, the distance between their surfaces being from 0·5 to 0·2 mm. The discharge was obtained from a Ruhmkorff coil, which was connected to a Leyden jar and fed by three or six accumulators (6·3 to 12·6 volts), the coil being so adjusted that its maximum spark was from 6 to 8 mm. long. The volume of argon varied from 5 to 10 c.c., and that of the organic compound, when a liquid, from 0·1 to 0·2 c.c.

Ethylene, glycollic ether, acetaldehyde, acetone, amylene, light petroleum, propionitrile, allylic thiocyanate, and amylamine were the members of the fatty series employed, and in no case was luminosity produced or any absorption of argon observed. Various decomposition products were formed; for example, methane, carbonic anhydride, and hydrogen were obtained in the experiment with glycollic ether, and in that with amylamine an odour of piperidine was noticed.

Benzene, toluene, cymene, terebenthene, anisoil, phenol, benzaldehyde, aniline, phenylic thiocyanate, and benzonitrile, as representative of the benzene series, gave results quite different from those obtained with members of the fatty series; a more or less intense green luminosity or glow was seen, accompanied by a decided absorption of argon. On spectroscopic examination, the characteristic lines of argon, mercury, carbon, and hydrogen were observed. The absorption of argon varied from 8 (for benzene) to 1 (for aniline) per cent. of the volume employed, and is attributed to the formation of a compound of argon, termed *phenylmercurargon*, possessing a low vapour tension, and depending for its production on the vapour tension of the organic compound which gives rise to it, and on certain complex conditions of stability and dissociation.

Absorption of argon was uncertain with furfuraldehyde and pyrroline, but amounted to 2—3 per cent. with thiophen and pyridine. The feeble, green luminosity produced in all four cases was most marked with furfuraldehyde and pyridine.

The action of argon on benzene and carbon bisulphide has also been studied more minutely (compare Abstr., 1895, i, 412; ii, 469, 498). With benzene, the luminosity and absorption appear at the same time, and the maximum absorption is about 8 per cent. of the volume of argon employed. When the temperature of the space through which the discharge takes place is too high, the phenylmercurargon compound is not obtained; also, if the volume of liquid benzene is equal to that of the argon, luminosity is not produced, even after 24 hours, possibly in consequence of the absorption of the phenylmercurargon compound by the hydrocarbon. The green luminosity immediately disappears when the electric discharge is stopped, although, if the experiment is made at twilight, a violet glow is seen for a fraction of a second, and then dies out, giving place to the permanent yellow tint of the polymerised derivative of benzene along the sides of the tube.

In the case of carbon bisulphide, it was found that, with an E.M.F. of 6·3 volts, 7 per cent. of argon was absorbed, and a fawn-coloured, solid compound was produced; with an E.M.F. of 12·6 volts, however, there was no absorption, even after 24 hours, and the product was black and carbonaceous. When a mixture of argon, hydrogen, and carbon bisulphide was subjected to the action of the silent discharge, the hydrogen disappeared in the course of 24 hours, and argon was absorbed to the extent of 10 per cent.; with a mixture of argon and equal volumes of carbon bisulphide and benzene, the amount of argon absorbed was 9 per cent.

The amounts of hydrogen, nitrogen, and argon absorbed by carbon bisulphide under the influence of the silent electric discharge were determined (see this vol., ii, 648). H. R. Le S.

Influence of Various Substances in Solution on the Crystalline Form of Sodium Chloride. By P. Orloff (*Zeit. Kryst. Min.*, 1899, **31**, 516; from *J. Russ. Chem. Soc.*, 1896, **28**, 715—774).—To determine the influence of the character of the solution on the form of crystals, numerous substances were mixed with aqueous solutions of sodium chloride, and the different forms—cube, octahedron, icositetrahedron—of the sodium chloride crystals obtained were noted. The presence of hydrochloric acid gives rise to elongated (acicular) cubes. The author considers that the influence on the form of the crystals is due to the alteration of the character of the solution by the formation of various hydrates and double salts.

Attempts to prepare $NaCl + 10H_2O$ were unsuccessful. L. J. S.

Basic Silver Copper Salts. By Paul Sabatier (*Compt. rend.*, 1899, **129**, 211—213).—The action of silver oxide on a solution of cupric nitrate yields the same compound, $3Cu(OH)_2,2AgNO_3$, as is formed by the action of cupric hydroxide on silver nitrate (Abstr., 1897, ii, 553). The rate of action of silver nitrate solution on cupric hydroxide varies with its concentration. A very concentrated solution acts rapidly on either the blue or the brown hydroxide, and forms pale blue, slender needles of a compound, $2Cu(OH)_2,2AgNO_3$.

Cupric hydroxide and silver chlorate, or silver oxide and cupric chlorate, yield the compound $2Cu(OH)_2,2AgClO_3$ in prismatic leaflets. With silver oxide and an excess of cupric chlorate, the compound $3Cu(OH)_2,Cu(ClO_3)_2$ is formed.

Cupric hydroxide and silver sulphate yield the compound $3Cu(OH)_2,Ag_2SO_4$ in short prisms, or the hydrated salt, $3Cu(OH)_2,Ag_2SO_4 + 3H_2O$, in long needles.

The double basic dithionate, $2Cu(OH)_2,Ag_2S_2O_6$, is a very bulky, flocculent, violet-blue product. C. H. B.

Agents for Removing Lime and Magnesia from Natural Waters for Industrial Purposes. By Martin L. Griffin (*J. Amer. Chem. Soc.*, 1899, **21**, 665—678. Compare this vol., ii, 476).—Comparative experiments have been made with sodium hydroxide, sodium aluminate, barium hydroxide, sodium phosphate, and sodium fluoride as reagents for removing lime and magnesia from natural waters. The results indicate that waters containing from 0·020 to 0·025 gram calcium oxide, and from 0·005 to 0·007 gram magnesium oxide cannot be appreciably purified, although frequently the amounts of these impurities can be reduced below these limits in the case of waters highly charged. The most effectual reagents for removing calcium carbonate are sodium hydroxide and sodium fluoride, and in certain cases sodium aluminate. Waters containing a large proportion of calcium sulphate and carbonate can also be successfully treated with the same reagents; barium hydroxide does not give such satisfactory results. The most useful reagent for removing magnesium salts is sodium hydroxide, then follows barium hydroxide. Sodium fluoride is of no use for removing magnesium salts, but is to be recommended when large quantities of calcium sulphate and chloride are present. Barium hydroxide is most serviceable in the treatment of acid mine waters.

J. J. S.

Arsenides of Strontium, Barium, and Lithium. By Paul Lebeau (*Compt. rend.*, 1899, **129**, 47—50).—The method of preparing calcium arsenide by reducing calcium arsenate with petroleum coke at the temperature of the electric furnace (this vol., ii, 288) has now been successfully applied to the production of the arsenides of strontium, barium, and lithium. *Strontium arsenide*, Sr_3As_2, is thus obtained as a crystalline mass which is transparent and reddish-brown in thin sections, has a sp. gr. 3·6 at 15°, and closely resembles the corresponding calcium compound in its reactions. It is attacked by fluorine at the ordinary temperature with incandescence and production of arsenious fluoride, and a similar reaction takes place with chlorine at 160°, with bromine at 200°, and with iodine vapour at higher temperatures. Vivid combustion also occurs when the arsenide is heated to dull redness in oxygen and in sulphur vapour. It is converted into strontium carbide when heated with carbon in the electric furnace. In contact with water, it is decomposed, with production of strontium hydroxide and hydrogen arsenide. Strontium arsenide reduces most metallic oxides and is violently attacked by oxidising agents. Barium arsenide, Ba_3As_2, has a sp. gr. 4·1 at 15°, and is somewhat darker in colour and more fusible than the arsenides of calcium and strontium; it also displays greater chemical activity. It burns at the ordinary temperature in fluorine, chlorine, or bromine, in oxygen at 300°, and in sulphur vapour below a dull red heat. *Lithium arsenide*, Li_3As, forms a dark brown, crystalline mass, which is transparent and reddish-brown in thin sections. It is attacked by fluorine, chlorine, bromine, or iodine at the ordinary temperature with incandescence, burns vividly when heated in oxygen at a temperature below redness, reacts violently with nitric acid, and reduces most metallic oxides at a low temperature. Attempts to prepare the arsenides of potassium and sodium were unsuccessful, these compounds being apparently unstable under the experimental conditions employed.

N. L.

Action of Magnesium on Solutions of its Salts. By Georges Lemoine (*Compt. rend.*, 1899, **129**, 291—294).—Hydrogen is evolved when magnesium is added to a solution of one of its salts. The evolution ceases when the metal becomes coated with a deposit of hydrated magnesium oxide, but recommences if, after filtering, more of the metal is added to the solution, the maximum quantity of hydrogen obtainable being about 42 per cent. of the total amount present in the water. In very dilute solutions, the action may continue for several months, but with greater concentrations it ceases after 2 or 3 days. The alteration in composition is very slight when solutions of the acetate or chloride are employed; with the sulphate, a partial precipitation occurs owing to the formation of basic salt. When excess of magnesium is added to an acid, hydrogen is rapidly evolved during the formation of the salt; this action is followed by a slower evolution of gas arising from the interaction of the salt and the metal. The phenomenon is probably due to hydrolytic dissociation of the salt into magnesium oxide and free acid; the latter acts on the metal, an oxy-salt being formed as an intermediate product; this decomposes into normal salt and oxide, the latter is precipitated, and the cycle of changes is repeated.

A similar behaviour with solutions of its salts is exhibited by aluminium, but not by zinc or cobalt. G. T .M.

Hydrates of Magnesium Chloride. By Alexis Bogorodsky (*Chem. Centr.*, 1899, i, 245—246; from *J. Russ. Chem. Soc.*, 1898, **30**, 735—740).—Van't Hoff and Meyerhoffer have shown from theoretical considerations that magnesium chloride should form the hydrates, $MgCl_2 + 8H_2O$ and $MgCl_2 + 12H_2O$, and hydrates of these compositions have now been prepared. When a solution of magnesium chloride in water (10 mols.) is cooled to 20°, both hydrates separate out, but on removing the mass from the vessel the dodecahydrate disappears and the *octohydrate* remains as a coarse, crystalline powder, which, when mixed with the original solution cooled to —10° or – 12°, forms thick, crystalline plates. As this hydrate decomposes at – 9·8°, it is probably an isomeride of Van't Hoff and Meyerhoffer's compound which decomposes at – 3·4°. The *dodecahydrate* is obtained in large crystals by adding a crystal of the hydrate to a solution of magnesium chloride in about 12·06 mols. of water. The crystals are lighter than the mother liquor, and, according to the author, this is the first time that increase in volume has been observed in the formation of a hydrate, The hydrate may also separate from solutions which contain smaller proportions of water than the hydrate itself. It melts without decomposing at $-16°$, and on becoming liquid absorbs a large amount of heat. It may be assumed therefore that hydrates which melt without visible decomposition may exist also as liquids between certain limits of temperature. E. W. W.

Electrolysis of Fused Zinc Chloride. By HERMANN S. SCHULTZE (*Zeit. anorg. Chem.*, 1899, **20**, 323—332).—When fused zinc chloride is electrolysed with carbon electrodes, chlorine is evolved at the anode and hydrogen at the cathode, whilst the electrolyte is rendered cloudy by the separation of a bluish-grey substance. After a time, the evolution of hydrogen stops, zinc is deposited instead, and the separation of the bluish-grey substance ceases. The author has observed the same phenomena when a piece of the purest zinc is introduced into fused zinc chloride: thus the cloudiness of the latter cannot be due to the carbon electrodes.

Zinc chloride obstinately retains traces of water, and this probably reacts with zinc according to the equation $Zn + H_2O = ZnO + H_2$; analysis confirms this, and shows that when the action continues the zinc oxide contains an excess of zinc beyond that required for ZnO, whence the darkening in colour. A specimen of zinc chloride which evolved hydrogen but from which zinc oxide did not separate was found to contain hydrochloric acid. According to the method of preparation, zinc chloride may contain water or hydrochloric acid, and of these only the former interferes with a smooth electrolysis of the fused salt.

J. C. P.

Orthoplumbates of the Alkaline Earths. III. A New, Higher Oxide of Lead. By GEORG KASSNER (*Arch. Pharm.*, 1899, **237**, 409—426).—Grützner and Höhnel's calcium metaplumbate (Abstr., 1896, ii, 248) has the composition which they assigned to it; at 300°, it loses only 3/4 of its water.

When calcium metaplumbate is heated for a considerable time at 250° in a current of pure dry air, its loss of weight is less than the weight of the water given off. This is due to absorption of oxygen; the residue, a reddish-brown powder, evolves oxygen when treated with water, but more rapidly when treated with dilute nitric acid; in the latter case, lead dioxide is left undissolved, and lead and calcium nitrates go into the solution; at 330°, the compound is also decomposed. Probably this residue contains a small amount of a compound,  $\mathrm{Ca}<\begin{array}{l}\mathrm{O{\cdot}PbO{\cdot}O}\\ \mathrm{O{\cdot}PbO{\cdot}O}\end{array}$, or *calcium perplumbate*, as it may be called. For the corresponding oxide,  $\mathrm{O}<\begin{array}{l}\mathrm{PbO{\cdot}O}\\ \mathrm{PbO{\cdot}O}\end{array}$, it is proposed to reserve the name *lead peroxide* or *superoxide*, which ought not to be given to the dioxide, PbO_2, as this has not the character of a true peroxide such as hydrogen peroxide. C. F. B.

Dissociation of Diammonio-mercuric Iodide. By MAURICE FRANÇOIS (*Compt. rend.*, 1899, **129**, 296—299).—Two phases may be distinguished in the dissociation of diammoniomercuric iodide, $HgI_2,2NH_3$; the first corresponds with the formation of an intermediate *compound*, $3HgI_2,4NH_3$, and the second with the decomposition of this into mercuric iodide and ammonia. The first phase is characterised by high and the second by low dissociation pressures; in both, the pressure is constant for a given temperature, and increases as the latter is raised. At 25°, the compounds $HgI_2,2NH_3$ and $3HgI_2,4NH_3$, like the ammonio-silver chlorides (Jarry, Abstr., 1897, ii, 259), have the same dissociation pressure in aqueous solution as in a vacuum. G. T. M.

Hydrates of Manganous Chloride. By P. Kuznetzoff (*Chem. Centr.*, 1899, i, 246; from *J. Russ. Chem. Soc.*, 1898, **30**, 741—748).—When the tetrahydrate of manganous chloride, $MnCl_2 + 4H_2O$, is slowly heated, it decomposes at 58°, forming a pink powder and a liquid, and at 120° it is not completely melted (compare Brandes, *Ann. Chim. Phys.*, 1881, [v], **22**, 563). The product formed at 58° may be cooled to 23° without change, but below this temperature the tetrahydrate is regenerated. The dihydrate, $MnCl_2 + 2H_2O$, prepared by heating the tetrahydrate in filter paper at 60—63° for 1/2—1 hour, is a pale pink substance, loses water at 70°, and when exposed to the air for two months is converted into the tetrahydrate.

When the crystals, obtained by cooling a solution of the composition $MnCl_2 + 11{\cdot}7H_2O$ to $-37°$ are added to another portion of the same solution at $-21°$, the hexahydrate, $MnCl_2 + 6H_2O$, separates after 48 hours as a light pink, crystalline powder containing crystals up to 5 cm. long. From a solution, $MnCl_2 + 10{\cdot}35H_2O$, the tetrahydrate, mixed with traces of the hexahydrate, separates, and a solution, $MnCl_2 + 9{\cdot}17H_2O$, yields only the tetrahydrate. On the other hand, a solution, $MnCl_2 + 12H_2O$, even when cooled to $-48°$, only yields the hexahydrate with difficulty. At $-2°$, the hexahydrate decomposes with the tetrahydrate.

From a comparison of the hydrates of manganous, ferrous, cobaltous, and nickelous chlorides, it is seen that the greater the atomic weight of the metal the greater is the stability of the hydrate. E. W. W.

Constitution of Inorganic Compounds. XVI. Complex Cobaltammonium Compounds. By Alfred Werner, F. Steinitzer, and K. Rücker (*Zeit. anorg. Chem.*, 1899, **21**, 96—115).—*Sulphatoimido-octamminedicobalt chloride*, $[NH{:}Co_2(OH_2)(NH_3)_8SO_4]Cl_2 + 2H_2O$.—When the nitrate of the hydrosulphatoimido-octammine series is rubbed with hydrochloric acid, the salt, $[NH{:}Co_2(NH_3)_8SO_4]Cl_3 + 2H_2O$, is obtained in lustrous, violet crystals which can be recrystallised from water. This salt, when heated for 6 hours at 110°, loses 1 mol. of hydrogen chloride, and is converted into the sulphatochloride, a small quantity of imido-octamminedicobalt sulphate being formed at the same time. A similar reaction takes place when the hydrosulphatonitrate is treated with concentrated ammonia and *sulphatoimido-octamminedicobalt nitrate*, $[NH{:}Co_2(OH_2)(NH_3)_8SO_4](NO_3)_2 + 2H_2O$, is obtained.

Nitratoimidohexammine salts.—The *nitrate*,

$$[NH{:}Co_2(OH_2)_3(NH_3)_6NO_3](NO_3)_3,$$

is obtained by adding fuming nitric acid to a warm aqueous solution of tetraquoimidohexamminedicobalt nitrate. When treated with hot hydrochloric acid, it is converted into the imidohexammine chloride; with cold hydrochloric acid it yields the *chloride*,

$$[NH:Co_2(OH_2)_3(NH_3)_6NO_3]Cl_3,$$

which crystallises in lustrous, reddish-yellow leaflets.

The authors have obtained two new series of compounds which contain the peroxide group, and they name them ozocobalt- and diozocobalt-salts. The *ozoimidohexamminedicobalt* salts are obtained in the conversion of crude melanochloride into nitrate after the separation of the imidotetraquohexammine salt, when the nitrate of the new series separates from the mother liquors in dark green crystals (Abstr., 1898, ii, 226). The *nitrate*,

$$[O_2NH:Co_2(OH_2)_2(NH_3)_6](NO_3)_3,$$

crystallises in dark green leaflets, and in aqueous solution yields, with hydrochloric acid, a sparingly soluble chloride, with hydrobromic acid the corresponding bromide, and with potassium cyanide a brown precipitate. Sulphurous acid converts it into a red compound which, when evaporated with hydrochloric acid, yields cobaltous salts and a small quantity of a sparingly soluble, green salt which is probably a dichlorotetrammine salt, whilst when treated with fuming nitric acid it yields a red salt which, when crystallised from hydrochloric acid, yields dichloraquotriamminecobalt chloride. The *chloride*,

$$O_2NH:Co_2(NH_3)_6Cl_3,HCl,$$

a heavy, black, crystalline powder, can be recrystallised from dilute hydrochloric acid and is acid, being in this respect similar to the imidohexammine chloride. The reactions of the nitrate of the new series with fuming nitric acid show that the six ammonia groups are symmetrically disposed with regard to the two cobalt atoms, thus, $(NH_3)_3Co{-}NH{-}Co(NH_3)_3$, and since the ozoimidohexammine salts bear the same ratio to the imidohexamminedicobalt salts as the anhydro-oxycobalt salts bear to the aquopentammine salts, the constitution of the ozoimidohexammine salts can be expressed by the formula

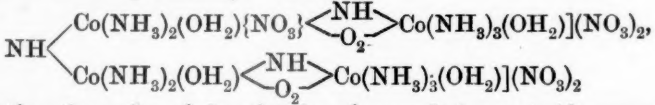
$$NO_3[(NH_3)_3(OH_2)Co{<}\begin{matrix}O_2\\NH\end{matrix}{>}Co(OH_2)(NH_3)_3](NO_3)_2.$$

Diozotri-imidodecamminetetracobalt compounds.—The *chloride*,

$$O_4(NH)_3Co_4(NH_3)_{10}Cl_8+2H_2O,$$

is obtained by dissolving oxycobaltammine nitrate (300 grams) in water (2 litres) at 50°, and, after filtration, diluting with an equal bulk of water, adding 4 litres of concentrated hydrochloric acid, and then passing a current of air through the solution for some hours. The black, crystalline precipitate of the crude chloride mixed with imidohexammine chloride, after washing with alcohol and ether, is converted into the nitrate and reconverted into the chloride. It is a black, crystalline powder sparingly soluble in cold water, more easily in warm water, is partially decomposed when heated with water at 60—70°, completely so when boiled, and gives brown, flocculent precipitates with platinic chloride and mercuric chloride. It is not decomposed by dilute acids or by concentrated hydrochloric acid. The *bromide* is a black, crystalline powder, similar to the chloride. The *nitrate*, obtained by treating the chloride dissolved in dilute nitric acid with silver nitrate, crystallises in beautiful, black, tetrahedral forms, and has the composition $O_4(NH)_3Co_4(NH_3)_{10}(OH_2)_4(NO_3)_5 + H_2O$. When treated with warm concentrated nitric acid, it yields cobaltous salts and a bright red salt which, when treated with hydrochloric acid, is converted into the dichloraquotriammine chloride. When treated with nitrous acid, it yields an imidohexammine salt, probably nitratotriaquoimidohexammine nitrate, and the mother liquors of this salt, when treated with hydrochloric acid, yield the dichlorotetrammine chloride and a dark coloured salt of unknown composition.

The diozocobalt salts have probably a constitution similar to the ozocobalt salts; a comparison of their composition shows that they are formed by the combination of 2 mols. of the ozo-salt with elimination of 1 mol. of ammonia and the addition of 1 mol. of water. In the diozo-series, 3 imido-groups are present, and, considering the decomposition products obtained from the diozo-salts by the action of sulphurous, nitric, and nitrous acids, it is most probable that their constitution is expressed by a formula,



$$\mathrm{NH}\left\langle\begin{array}{l}\mathrm{Co(NH_3)_2(OH_2)\{NO_3\}}\left\langle\begin{smallmatrix}\mathrm{NH}\\ \mathrm{O_2}\end{smallmatrix}\right\rangle\mathrm{Co(NH_3)_3(OH_2)](NO_3)_2},\\ \mathrm{Co(NH_3)_2(OH_2)}\left\langle\begin{smallmatrix}\mathrm{NH}\\ \mathrm{O_2}\end{smallmatrix}\right\rangle\mathrm{Co(NH_3)_3(OH_2)](NO_3)_2}\end{array}\right.$$

indicating the union of 2 molecules of ozo-salt by an imido-group.

Constitution of Inorganic Compounds. XVII. Oxalatodiethylenediamminecobalt Salts. By Alfred Werner and A. Vilmos

(*Zeit. anorg. Chem.*, 1899, **21**, 145—158).—*Oxalatodiethylenediamminecobalt chloride*, $[Co(C_2O_4)C_2H_4(NH_2)_2]Cl + 3H_2O$, obtained by heating dichlorodiethylenediamminecobalt chloride (praseo-salt), dissolved in a small quantity of water, with oxalic acid until the green solution changes to red, is precipitated from the cold solution by alcohol. It crystallises in thin, red leaflets or ruby-red, four-sided prisms, effloresces on exposure to the air, is fairly soluble in cold, easily so in hot water, and insoluble in alcohol. It is not decomposed when heated at 130°, or when treated with concentrated sulphuric acid, and gives no precipitate with calcium chloride. With sodium dithionate, it yields a precipitate of bright red leaflets; with potassium dichromate, orange-red, six-sided leaflets; with ammonium oxalate and potassium iodide, precipitates which distinguish it at once from the corresponding tetrammine salt. The *mercurichloride*, $Co(C_2O_4)(C_2H_8N_2)HgCl_3$, crystallises in red, lustrous leaflets insoluble in water; the *aurichloride* is a bright orange yellow, insoluble powder. The *base*, $[Co(C_2O_4)C_2H_8N_2]OH$, obtained in aqueous solution by the action of freshly-prepared silver oxide on a solution of the chloride, gives a cherry red solution, is strongly alkaline, absorbs carbonic anhydride from the air, precipitates metallic hydroxides from solutions of salts of zinc, copper, &c., and is very stable. The *bromide* crystallises in dark red leaflets; the *iodide*, which is obtained mixed with a dark violet, insoluble periodide, crystallises in red, lustrous leaflets and is sparingly soluble in water. The *thiocyanate* separates from hot water in dark red, lustrous crystals; the *nitrate* crystallises from solutions above 30° without water of crystallisation in dark red aggregates, but below 30°, with $2H_2O$, in aggregates of pale red needles, and is soluble in 400 parts of water at 0°; the *hydrogen sulphate* crystallises, with $1H_2O$, in aggregates of slender, red needles and has an acid reaction; the *sulphate*, with $4H_2O$, separates in large, brownish-red crystals, is very soluble in water, and effloresces on exposure to the air; the *oxalate*, with $2H_2O$, crystallises in rose-coloured needles, is neutral, and easily soluble in water.

Hydroxylamine Compound of Nickel Sulphate. By RUDOLF UHLENHUTH (*Annalen*, 1899, **307**, 332—334).—When purified hydroxylamine is added to a cold, saturated solution of nickel sulphate, the green colour gradually changes to azure blue, becoming finally transformed into deep red, resembling the colour of ferric thiocyanate; if a few drops of alcohol are then added, the compound, $NiSO_4 + 6NH_2 \cdot OH$, separates in red, quadratic crystals. The substance is decomposed by water, and reduces Fehling's solution.

M. O. F.

Action of Nitric Oxide on Chromous Salts. By GABRIEL CHESNEAU (*Compt. rend.*, 1899, **129**, 100—103).—When nitric oxide is passed into blue chromous chloride solution, protected from the air by a layer of petroleum (sp. gr. 0·87) 0·1—0·5 mm. in depth, heat is developed and the liquid becomes dark red, changing to a greenish-brown in from 1 to 2 hours at the ordinary temperature, and immediately if heated to 100°. No gas is evolved when the resulting solution is heated or placed in a vacuum. When a rapid current of the gas is passed into the solution, the amount absorbed is from 1·2 to 1·3 mols. NO for every 3 mols. $CrCl_2$, a proportion corresponding with that required for the formula $3CrCl_2,NO$; with a slow current of the gas, the absorption is less, being only 0·87 mol. NO for every 3 mols. $CrCl_2$. This difference is attributed to a secondary action between unchanged chromous salt and the newly formed compound, because the solution through which a rapid current of the gas has been passed, after exposure to the air to ensure the oxidation of any uncombined chromous chloride, precipitates cuprous oxide from Fehling's solution, but gives no ammonia by Schlœsing's method, whereas that prepared by passing a slow current of the gas gives no precipitate with Fehling's solution, but evolves ammonia on heating with an alkali. The reactions involved under the two conditions are represented respectively by the equations $2[(CrCl_2)_3NO] + 3H_2O = 3Cr_2Cl_4O + 2NH_3O$; $2[(CrCl_2)_3NO] + 2CrCl_2 + 3H_2O = 4Cr_2Cl_4O + 2NH_3$.

H. R. LE S.

Chromic Acetate. By ALBERT RECOURA (*Compt. rend.*, 1899, **129**, 158—161. Compare Abstr., 1897, ii, 172; this vol., ii, 226, 339).—Chromic acetate exists in four isomeric modifications. A solution of the normal salt is best prepared by the double decomposition of equivalent quantities of violet chromic sulphate and barium acetate. From the green solution so obtained, the author has isolated the salt $Cr(C_2H_3O_2)_3 + 5H_2O$. That this substance is a normal, and not a basic, salt is proved by the fact that it requires exactly 3 mols. of sodium hydroxide for the complete decomposition of 1 mol. of the acetate, chromic hydroxide being precipitated. Moreover, when a solution containing 1 mol. of the acetate is treated with an equivalent amount of dilute sulphuric acid, the heat evolved (12·17 Cals.) corresponds exactly with that required for the displacement of the whole of the acetic acid by sulphuric acid. The normal salt may also be obtained by dissolving freshly precipitated chromic hydroxide in the calculated amount of acetic acid.

The green solution of the normal salt gradually changes colour, and at the end of a few hours is pure violet in shade; this corresponds with the first phase of transformation. The violet colour then changes in tint during about a fortnight, the change corresponding with the second phase of transformation. The third phase requires about a year for its completion, and during this time the violet colour gradually changes to green. These colour changes correspond with the gradual conversion of the normal salt into three isomerides. In the liquid resulting from the first phase of transformation, only two of the acid radicles react with sodium hydroxide, that is, only two exist as electropositive ions, the third remaining combined with the chromium, whilst in the liquids resulting from the second and third phases only one exists in the ionic state. H. R. Le S.

Isomeric Modifications of Chromic Acetate. By Albert Recoura (*Compt. rend.*, 1899, **129**, 208—211. Compare preceding abstract).—Normal chromic acetate is best prepared by mixing freshly precipitated chromic hydroxide with the equivalent quantity of glacial acetic acid, the product being collected immediately by means of a pump, and dried on porous plates. It is a grey-lilac powder, which forms a yellowish-green solution identical with that obtained by the interaction of violet chromic sulphate and barium acetate, but changes very rapidly to one of the abnormal violet acetate.

The violet monacid acetate (*loc. cit.*) is obtained by allowing a solution of the violet acetate to evaporate over sulphuric acid in presence of acetic acid. It forms thin, brilliant, vitreous, violet lamellæ, of the composition $Cr(C_2H_3O_2)_3 + H_2O$, and when exposed to air slowly loses 1 mol. of acetic acid. When treated with sodium hydroxide, chromium is not precipitated, and the compound behaves like a monobasic acid. Thermochemical measurements show that the chromic radicle is not decomposed by sulphuric acid. The heat of neutralisation by sodium hydroxide is 13·25 Cals., which approximates to that of acetic acid, 13·40 Cals., and the difference is not due to errors of experiment, but shows that the third molecule of acetic acid is not dissociated from the rest of the compound in solution. This is confirmed by cryoscopic observations, the difference between the molecular reduction of the acetate and the product formed by neutralising it with sodium hydroxide being identical with the difference between the molecular reduction of acetic acid and sodium acetate respectively; the actual values of the molecular reductions also approximate somewhat closely. It follows that this abnormal chromic acetate is to be regarded as a complex monobasic acid, $Cr(C_2H_3O)_2,C_2H_4O_2 + 2H_2O$, containing the radicle $Cr(C_2H_3O)_2$, and the author calls it *chromomonacetic acid*.

C. H. B.

Isomeric Modifications of Chromic Acetate. By Albert Recoura (*Compt. rend.*, 1899, **129**, 288—291. Compare preceding abstracts).—When an aqueous solution of ordinary chromic acetate is left for several hours, its colour changes from green to violet, an isomeride being produced. This substance, *chromodiacetic acid*, $Cr(C_2H_3O_2),2C_2H_4O_2$, has not been isolated in the solid state, but its existence is inferred from the alterations in the properties of the solution. Alkalis no longer produce a precipitate, and 2 mols. of caustic soda are required to neutralise a solution originally containing 1 mol. of chromic acetate, the heats of neutralisation being 12·8 and 9·7 Cals. for the first and second molecules respectively. Cryoscopic observations also indicate that the solution contains the complex molecule, and not chromium acetate and free acetic acid.

The green isomeride, which is formed when a solution of chromic acetate is left for 12 months (*loc. cit.*), can be more rapidly obtained by heating to the boiling point a solution of chromic acetate (1 mol.) with acetic acid (3 mols.). The green solution, on evaporation over sulphuric and acetic acids, yields a green solid which has the composition $Cr(C_2H_3O_2)_3 + \frac{1}{2}H_2O$. This *green* chromomonacetic acid differs from its violet isomeride in containing half the amount of water; the heat of neutralisation by soda is 12·54 Cals. instead of 13·25, and different varieties of chromium hydroxide are precipitated when they are boiled with solutions of the caustic alkalis.

The paper concludes with a summary of the properties of the four isomeric forms of chromic acetate. G. T. M.

Metallic Thioantimonites. By Pouget (*Compt. rend.*, 1899, **129**, 103—104. Compare Abstr., 1897, ii, 499 and 500).—When a dilute solution of potassium thioantimonite is added to a solution of a salt of zinc, manganese, or lead, a voluminous precipitate of the trimetallic thioantimonite, $Zn_3Sb_2S_6$ (orange), $Mn_3Sb_2S_6$ (dirty rose), or $Pb_3Sb_2S_6$ (maroon) is produced. With a concentrated solution of potassium thioantimonite, the same compounds are formed, but if the potassium salt is in excess these precipitates are rapidly converted into crystalline compounds of the composition $ZnKSbS_3$ (white), $MnKSbS_3$ (rose), or $PbKSbS_3$ (maroon) respectively. These are easily decomposed by water, forming crystalline, trimetallic thioantimonites.

The compounds $Fe_3Sb_2S_6$, $Ni_3Sb_2S_6$, and $Co_3Sb_2S_6$, precipitated from solutions of salts of ferrous iron, nickel, and cobalt respectively, are very easily oxidised, and always contain potassium if prepared from concentrated solutions.

A dilute solution of potassium thioantimonite added to a solution of a copper salt gives a black precipitate of $Cu_3Sb_2S_6$, provided the copper is in excess; if, however, the potassium thioantimonite is in excess, the precipitate first formed is eventually reduced to Cu_3SbS_3. With concentrated solutions of potassium thioantimonite, the black precipitate rapidly changes to Cu_2KSbS_3, a yellow, crystalline compound, which is easily decomposed by water, forming the reddish-brown compound Cu_3SbS_3.

Potassium thioantimonite precipitates metallic mercury from a solution of a mercuric salt. H. R. Le S.

A Ruthenium Potassium Nitrite. By L. Brizard (*Compt. rend.*, 1899, **129**, 216—217).—When a dilute and slightly warm solution of the complex chloride, $Ru_2H_2(NO)Cl_3,3KCl,2HCl$, slightly acidified with hydrochloric acid, is mixed with successive small quantities of potassium nitrite until liberation of nitrogen oxides ceases, its colour changes from red to orange-yellow, and, after concentration, it deposits crystals of the complex nitrite, $Ru_2H_2(NO_2)_4,3KNO_2 + 4H_2O$. This salt is very soluble in water, but almost insoluble in a concentrated solution of potassium chloride. It becomes anhydrous at 100°, but does not begin to decompose much below 360°; at this temperature, however, decomposition is rapid. When heated with hydrochloric acid, it is rapidly reconverted into the double chloride from which it was formed.

C. H. B.

Purification of Iridium. By Émile Leidié (*Compt. rend.*, 1899, **129**, 214—215).—Iridium purified by fusion with lead is finely powdered, mixed with twice its weight of fused sodium chloride, and heated to incipient redness in a current of dry chlorine. The cooled product is treated with very dilute hydrochloric acid, and the filtered solution is heated to 50—60°, and mixed with successive small quantities of sodium nitrite until the evolution of nitrogen oxides ceases and the liquid becomes neutral to litmus. It is then carefully mixed with sufficient sodium carbonate to make it alkaline to litmus, and with a slight excess of sodium nitrite, boiled for a few minutes, cooled and filtered; iron and gold are thus eliminated. A slight excess of sodium hydroxide is then added, and the solution, after cooling, is saturated with chlorine, heated gently, and treated with a rapid current of chlorine to eliminate ruthenium and osmium in the form of peroxides. The residual liquid is repeatedly evaporated with hydrochloric acid to decompose nitrites, nitrates, and chlorates, and the residue dissolved in cold chlorine water and crystallised to remove sodium chloride. The final crystalline separations are a mixture of sodium ruthenio-chloride and sodium iridiochloride; these are carefully dried, heated in dry chlorine at 440°, cooled, and treated with cold chlorine water. Ruthenium chloride remains undissolved, whilst the iridium passes into solution, and can be precipitated in the form of ammonium iridiochloride. The successful separation of iridium and ruthenium depends on obtaining the double chlorides free from any excess of sodium chloride, and on drying very carefully both the chlorine and the mixture of double chlorides.

C. H. B.

Osmium. By Arthur Rosenheim and Edward A. Sasserath (*Zeit. anorg. Chem.*, 1899, **21**, 122—144).—*Sodium sulphonosmate*,

$$3Na_2O,OsO_3,4SO_2 + 5H_2O,$$

is obtained by passing sulphurous anhydride through a solution of perosmic acid in 20 per cent. sodium hydroxide until this is nearly neutral to litmus, and then neutralising with a solution of sodium hydrogen sulphite. It crystallises in bright brown needles, is easily soluble in water at 50°, yielding a reddish-brown solution, which soon decomposes with precipitation of a black oxide. When treated with sodium hydroxide, it yields a violet solution of sodium osmate; with barium chloride, a bright brown barium salt, and with silver nitrate, a yellowish-brown silver salt. The *potassium* salt, $7K_2O,4OsO_3,10SO_2 + 7H_2O$, obtained in a similar manner to the sodium salt, is more soluble in water than the latter, and can be recrystallised; decomposition takes place at 70°. It also crystallises with $3H_2O$ and without water. If a stronger solution of potassium hydroxide is employed, a salt of the composition $11K_2O,4OsO_3,14SO_2 + H_2O$ is obtained. Corresponding ammonium salts could not be prepared. Both the sodium and potassium salts are produced in almost theoretical quantities, and are very easily converted into other osmium salts. The sodium salt is also obtained by cautiously adding sodium hydrogen sulphite to a solution of sodium osmate, and since it yields sodium osmate when treated with sodium hydroxide and the corresponding barium and silver salts as described above, it probably has the constitution $(ONa)_2Os(SO_3Na)_4 + 5H_2O$. The potassium salt, which reacts in a similar manner, is probably derived from a salt of the composition $K_2Os_2O_7$.

Sodium osmium hexachloride, Na_6OsCl_{12}, obtained by gently heating sodium sulphonosmate in a current of hydrogen chloride, crystallises in lustrous leaflets, mixed with a small quantity of sodium hydrogen sulphite, cannot be recrystallised without decomposition, and when treated with potassium chloride is partially decomposed, forming the osmichloride, K_2OsCl_6. The corresponding potassium hexachloride is obtained by treating potassium sulphonosmate with hydrogen chloride.

Theoretical yields of the following compounds of quadrivalent osmium can be obtained from the sulphonosmates. Sodium osmichloride, $Na_2OsCl_6 + 2H_2O$, is formed by heating the sodium sulphonosmate in a current of hydrogen chloride, first at a gentle heat and finally at dull redness, and also by boiling it with excess of fuming hydrochloric acid (sp. gr. 1·19), then evaporating to dryness on the water-bath, extracting with absolute alcohol, and distilling the alcoholic solution under diminished pressure. The corresponding potassium and ammonium salts are described, those of the alkaline earths cannot be obtained by double decomposition from the sodium salt.

Sodium osmibromide, $Na_2OsBr_6 + 4H_2O$, obtained from the sulphonosmate by interaction with hydrogen bromide, crystallises in long, blackish-brown prisms having a metallic lustre. The *potassium* salt, a blackish-brown, crystalline powder having a copper-like lustre, crystallises from dilute solutions in large octahedra and is very sparingly soluble. The *ammonium* salt is a black, crystalline powder, soluble in water, and crystallises from dilute solutions in blackish-brown octahedra and tetrahedra. The *silver* salt is a flocculent, insoluble, indigo-blue precipitate.

Sodium sulphonosmate when treated with concentrated hydriodic acid, is completely decomposed with the formation of sulphurous anhydride, iodine, perosmic acid, and other products, and when gently heated in a current of dry hydrogen iodide, loses iodine and volatile osmium compounds, leaving a mixture of osmium tetriodide and iodine which can be separated mechanically. Complete decomposition also takes place with concentrated hydrofluoric acid, and a black precipitate of hydrated osmium dioxide, $OsO_2 + 4H_2O$, is obtained.

Sodium osmisulphites.—The *salt* $[Os(SO_3)_6]Na_8 + 8H_2O$ is obtained by boiling an aqueous solution of sodium osmichloride with concentrated sodium hydrogen sulphite for some time. It crystallises from dilute sodium hydrogen sulphite in microscopic, brownish-white prisms, is sparingly soluble in water, and decomposes with a bluish-green coloration, gives an intense blue precipitate when treated with alkali, and does not yield all its sulphurous acid when boiled with concentrated hydrochloric acid. It is also obtained with $3H_2O$ by leaving a mixture of sodium sulphonosmate and sodium hydrogen sulphite in a closed flask for some weeks. The *salt* $[Os(H_2O)(SO_3)_5]Na_6 + 4H_2O$, obtained by boiling sodium sulphonosmate with sodium hydrogen sulphite, is a white, crystalline powder. The *salt* $[OsCl(SO_3)_5]Na_7 + 6H_2O$, prepared by heating sodium osmichloride with a solution of sodium sulphite at 60°, is a bright violet, crystalline powder, which dissolves in boiling water with a reddish-violet coloration and then decomposes, yielding a violet precipitate. The chlorine in this compound cannot be precipitated quantitatively with silver nitrate. The *salt* $[OsO(SO_3)_4]Na_6 + 3H_2O$, obtained by the action of sodium sulphite on sodium sulphonosmate at 50°, is a deep violet, crystalline precipitate.

Potassium osmisulphites, $[Os(SO_3)_6]K_6H_2 + 2H_2O$, obtained by boiling a solution of potassium sulphonosmate with potassium hydrogen sulphite, crystallises in beautiful, white needles, is more easily soluble than the sodium salts, and can be recrystallised from water without decomposition. It is also obtained by boiling potassium osmitetrachloride with potassium hydrogen sulphite and by allowing a mixture of potassium sulphonosmate and potassium hydrogen sulphite to remain at the ordinary temperature. The *salt* $[Os(H_2O)(SO_3)_5]K_6 + 4H_2O$ is obtained, together with a small quantity of a salt containing chlorine, by adding potassium sulphite to a cold solution of potassium osmichloride; it crystallises in white needles. The chlorine compound forms long, yellow needles. The *salt* $[Os(H_2O)(SO_3)_{11}]K_{11}H_3 + 5H_2O$, obtained by the action of potassium hydrogen sulphite on potassium sulphonosmate in the cold or at a gentle heat, is a beautiful, white or pale rose compound, and can be recrystallised without decomposition.

E. C. R.

Mineralogical Chemistry.

Occurrence of Vanadium, Chromium, and Titanium in Peats. By CHARLES BASKERVILLE (*J. Amer. Chem. Soc.*, 1899, **21**, 706—707).—Small quantities of these three elements have been found in the ashes from three different samples of peat from Hyde Swamps, near the northern junction of Beaufort and Hyde Counties, North Carolina.

J. J. S.

Copper Glance pseudomorphous after Copper Pyrites from the Altai Mountains. By PAVEL V. VON JEREMÉEFF (*Zeit. Kryst. Min.*, 1899, **31**, 508; from *Bull. Acad. Sci. St. Pétersbourg*, 1897, [v], **6**, xxxvii—xxxix).—Quartz veins near the Georgieff gold washings on the rivers Berdj and Kamenka contain copper glance in lamellar masses, copper pyrites, hæmatite, chrysocolla and malachite. All these minerals have been derived from the copper pyrites, and all stages of passage from copper pyrites to copper glance can be seen. Analysis by J. A. Antipoff of the copper glance gave:

Cu.	S.	SiO_2.	Fe_2O_3.	CO_2.	Sb.	As.	CaO.	Total.
68·76	17·12	2·44	1·33	6·32	0·82	trace	1·03	97·82

L. J. S.

Cinnabar Ores in Servia. By J. Z. Raušar (*Zeit. Kryst. Min.*, 1899, **31**, 525; from *Zeit. chem. Industrie, Prag.*, 1896, 52—54).—Besides being found at the abandoned works of Avala, cinnabar occurs near Šabac as a crust on lead ores. The galena contains Pb, 55·51; Hg, 0·229; Ag, 0·01 per cent. L. J. S.

Thallium in Marcasite from Poland. By J. A. Antipoff (*Zeit. Kryst. Min.*, 1899, **31**, 515; from *J. Russ. Chem. Soc.*, 1896, **28**, 384—387).—Analysis gave:

Fe.	S.	As.	Tl.	SiO_2.	Zn.	Total.
47·831	44·772	0·783	0·311	2·840	trace	96·537

A second determination of the thallium gave 0·532. The difference (3·463 per cent.) is probably oxygen. This is the largest amount of thallium that has been noted in a pyrites-like mineral. The above analysis corrects that previously given (this vol., ii, 109).

L. J. S.

Cupro-goslarite, a New Variety of Zinc Sulphate. By Austin F. Rogers (*Kansas Univ. Quart.*, 1899, **8**, A, 105—106).—A translucent, greenish-blue incrustation on the walls of an abandoned zinc mine at Galena, Cherokee Co., Kansas, gave the following results on analysis. It has doubtless been formed by the oxidation of the blende and copper pyrites which occur in the mine. On exposure to the air, it loses some water and becomes white. Analysis gave:

ZnO.	CuO.	FeO.	H_2O.	SO_3.	Insol.	Total.
23·83	6·68	0·13	41·76	[27·02]	0·58	100·00

This amount of copper oxide corresponds with 12·48 per cent. of copper sulphate in the mineral. The percentage of water is calculated from the loss at 100°, on the assumption that six-sevenths of the water was expelled at that temperature. L. J. S.

Spinel and Forsterite from the Glenelg Limestone (Inverness-shire). By Charles Thomas Clough and William Pollard (*Quart. Journ. Geol. Soc.*, 1899, **55**, 372—380).—The limestone bands occurring in the gneisses and schists (probably of sedimentary origin) on the southern side of the Big Glen, or Glenmore, of Glenelg, contain a variety of minerals, including white diopside in large masses, a serpentinous mineral, phlogopite, graphite, tremolite, a dark hornblende, and quartz. The serpentine is sometimes seen to be derived from a colourless olivine, which is shown by analysis I to be forsterite. Lumps in the limestone consisting mainly of forsterite contain grains 2—5 mm. across of pale blue spinel (analysis II). Dark green octahedra of spinel and a violet spinel also occur.

	SiO_2.	Al_2O_3.	FeO.	CaO.	MnO.	MgO.	Loss on ignition.	Total.	Sp. gr.
I.	41·16	1·02	2·00	0·26	0·26	54·86	0·70	100·26	3·24
II.	1·20	69·80	2·03	—	—	27·30	—	100·33	3·57

The forsterite also contains traces of titanium oxide and fluorine. This association of minerals is the same as that in the metamorphic limestone of Passau in Bavaria (Abstr., 1897, ii, 413). L. J. S.

Ilmenite from Russia. By František Kovář (*Zeit. Kryst. Min.*, 1899, 31, 525; from *Rozpravy České Akad.* [*Memoirs Bohemian Acad.*], 1896, 5, Class II, No. XXXVII., 3 pp.).—The sand of a small lake in the granite district at Stepanowka, near Voronovica, Gov. Podolien, contains about a quarter per cent. of a black, granular mineral with metallic lustre and conchoidal fracture. Sp. gr. 4·543; only a few grains are attracted by the magnet. Analyses gave:

TiO_2.	FeO.	Fe_2O_3.	SiO_2.	Al_2O_3.	CaO.	MgO.	Total.
50·85	42·55	2·23	3·67	0·12	0·18	trace	99·60
51·20	43·04	2·06	2·98	0·20	0·14	trace	99·62

Deducting SiO_2, Al_2O_3, and CaO, these analyses give the formula $44FeTiO_3,Fe_2Ti_3O_9$. L. J. S.

Analyses of Bohemian Minerals. By Karl Preis (*Zeit. Kryst. Min.*, 1899, 31, 526; from *Sitz.-ber. k. böhm. Ges. d. Wiss.*, 1897, No. XIX., 5 pp.).—*Monazite* from Pisek gave:

P_2O_5.	SiO_2.	Ce_2O_3.	$(La,Di)_2O_3$.	Y_2O_3.	ThO_2.	Fe_2O_3.	CaO.	H_2O.	Insol.	Total.
27·57	1·46	31·05	26·64	4·02	5·85	1·32	0·41	0·42	1·96	100·70

There is no simple relation between the amounts of silica and thoria, so they are probably not present as thorite.

Phenakite from Ober-Neusattel gave: SiO_2, 54·27; BeO, 45·17; H_2O, 0·53 = 99·98.

Damourite, from the primitive limestone at Tabor, gave:

SiO_2.	Al_2O_3.	Fe_2O_3.	CaO.	K_2O.	Na_2O.	H_2O.	Total.
43·69	39·57	1·02	0·60	9·98	0·90	4·97	100·73

Delvauxite occurs at Trpin, near Beraun, in lenticular nodules with wrinkled surfaces, and, in the interior, of a brown colour. Analysis by E. Butta gave:

P_2O_5.	Fe_2O_3.	Al_2O_3.	CaO.	CO_2.	H_2O.	Insol.
18·45	38·74	2·71	9·63	1·38	26·22	3·95

Deducting calcium carbonate, this gives the formula

$Ca_3(PO_4)_2,3Fe_3(OH)_6PO_4,20H_2O$. L. J. S.

A New Cerium Mineral from the Caucasus. By G. Tschernik (*Zeit. Kryst. Min.*, 1899, 31, 513; from *J. Russ. Chem. Soc.*, 1896, 28, 345—359).—A pebble from Gov. Batum, South Caucasus, consists of an opaque, black mineral, with greasy lustre and white streak. It is very brittle, and has an uneven to splintery fracture. H = 5—6; sp. gr. 5·08. It encloses small crystals of copper pyrites. The mean of three closely agreeing analyses made on material from different parts of the pebble is:

SiO_2.	CeO.	LaO.	DiO.	YO.	ErO.	ZrO_2.	TiO_2.	ThO_2.
6·57	34·20	6·73	2·27	6·97	0·67	11·67	14·73	0·73
	UO.	CaO.	FeO.	CuO.	P_2O_5.	SO_3.	H_2O.	
	0·03	2·33	3·70	0·67	3·30	0·97	3·43	

A pebble of wolframite from the river Tschoroch, near the town Batum, gave:

WO_3.	MoO_3.	SnO_2.	Fe_2O_3.	MnO.	Total.	Sp. gr.
74·1	1·6	5·1	17·5	1·3	99·6	7·53

L. J. S.

Argon and Helium in Cerium Minerals from the Caucasus. By G. Tschernik (*Zeit. Kryst. Min.*, 1899, **31**, 514; from *J. Russ. Chem. Soc.*, 1897, **29**, 291—302).—Analysis of gas from the cerium mineral from the Caucasus (preceding abstract) gave: O, 4·8; H, 3·6; N + argon, 90·5 = 98·9.

Analysis of the ash of coal from Tkwibuli, near Kutais, gave approximately:

Helium.	CeO.	LaO.	DiO.	SiO_2.	Al_2O_3.	$CaSO_4$.
1·1	3·86	3·71	2·34	18·0	11·0	52·0

It also contains Fe, Mg, Mn, K, Na, Y. L. J. S.

Loranskite, a New Mineral. By Michail P. Melnikoff (*Zeit. Kryst. Min.*, 1899, **31**, 505; from separate publication, *St. Petersburg*).—Loranskite is a massive, black mineral from the quartz-veins at Imbilax, near Pitkäranta, Finland. It is brittle, and has a conchoidal fracture; strong sub-metallic lustre; H = 5; sp. gr. about 4·6. Streak, greenish-grey. On the edges it is translucent and greenish-yellow; optically isotropic. L. J. S.

Analysis of Loranskite. By Petr D. Nikolaéeff (*Zeit. Kryst. Min.*, 1899, **31**, 505; from *Verh. k. russ. min. Ges.*, 1897, [ii], **35**, Protokolle, 11—13. Compare preceding abstract).—A preliminary analysis gave:

Ta_2O_5.	Y earths.	CeO.	CaO.	Fe_2O_3.	ZrO_2.	Loss on ignition.	Total.	Sp. gr.
47·00	10·00	3·00	3·30	4·00	20·00	8·15	95·45	4·162

Also some sulphur, titanium and manganese. Rare earths showing an absorption spectrum are absent. The mineral is only slightly attacked by acids or by fusing with alkalis. It is completely decomposed by fusing with potassium fluoride. L. J. S.

Aluminium Phosphate from Moravia. By František Kovář (*Zeit. Kryst. Min.*, 1899, **31**, 525; from *Rozpravy České Akad.* [*Memoirs Bohemian Acad.*], 1896, **5**, class II, No. XV (II), 7 pp.).—On the walls of crevices in ochreous limonite from Gross-Tresny near Oels, are drusy spheres, with an internal radial structure of a light grey mineral. At first it is translucent, but on exposure to the air it becomes dull and opaque. Fresh pure material has sp. gr. 2·617; H = 4. Analyses gave:

Al_2O_3.	Fe_2O_3.	CaO.	MgO.	MnO.	P_2O_5.	H_2O.	Insol.	Total.
42·28	0·98	0·56	0·42	trace	29·01	26·86	0·25	100·36
42·17	1·04	0·49	0·30	trace	28·94	26·93	0·34	100·21

At 100°, there is a loss of 10·32, and at 200°, of 16·55 per cent. of water, the remainder being expelled only at a red heat. In composition, the mineral comes between peganite and fischerite, and agrees best with sphærite. L. J. S.

Analyses of Phosphates from New South Wales. By John C. H. Mingaye (*Rept. Australian Assoc.*, 1898, **7**, 332—333; and *Records Geol. Survey N.S. Wales*, 1899, **6**, 116—118).—Pyromorphite from Braidwood, near Little River, gave :

PbO.	Pb.	P_2O_5.	V_2O_5.	Cl.	Fe_2O_3.	CaO.	H_2O.	Insol.	Total.
69·40	6·57	15·22	trace	2·26	0·62	trace	0·86	4·67	99·60

Partial analyses are also given of apatite (Abstr., 1898, ii, 386), marsupial excrement, phosphatic deposits from Moruya Caves, and of gem gravels containing zircon and phosphates of the rare earths. L. J. S.

Phosphatic Deposits in the Jenolan Caves, N. S. Wales. By John C. H. Mingaye (*Rept. Australian Assoc.*, 1898, **7**, 327—331; and *Records Geol. Survey N.S. Wales*, 1899, **6**, 111—116).—The large and numerous Jenolan caves are in a thick bed of Siluro-Devonian limestone. The following analyses are given of materials from the caves :

I. Reddish marl, which partly fills portions of the caves ; it also contains MnO, trace, and organic matter, 0·24 per cent.

II and III. Light, porous, white substance, occurring as veins in the white and red marls ; it is soluble in dilute hydrochloric acid. Trace of chlorine in II.

IV and V. A deposit under a layer of gypsum on the floor of the cave. Contains also traces of chlorine, and, in IV, SO_3, 5·39 ; in V, SO_3, 28·67 per cent.

VI. Light, fluffy, fungoid substance on the walls ; it resembles very light wadding, and is easily blown about. Contains also $CaCO_3$, 76·03 ; $MgCO_3$, 6·12 ; $SrCO_3$, trace, and organic matter, 1·32 per cent.

VII. Same as VI. Contains also $CaCO_3$, 72·57 ; $MgCO_3$, 5·28 ; $SrCO_3$, trace, and organic matter, 1·14 per cent.

VIII. A nodular, grey substance.

	H_2O.	SiO_2.	Al_2O_3.	Fe_2O_3.	CaO.	MgO.	K_2O.	Na_2O.	P_2O_5.	CO_2.	Total.
I.	4·50	63·41	18·02	7·33	0·16	0·79	5·09	trace	0·08	—	99·62
II.	33·60	0·70	26·83	0·72	8·10	0·14	0·09	nil	30·04	0·15	100·37
III.	9·83	50·10	13·88	8·65	1·02	0·14	1·35	trace	15·38	0·12	100·47
IV.	16·82	37·82	0·64	trace	22·66	0·32	0·11	—	15·71	0·24	99·71
V.	22·59	2·78	0·10	nil	31·52	0·09	trace	—	14·50	0·10	100·35
VI.	1·88	13·22	1·46		—	—	—	—	0·28	—	100·31
VII.	1·48	17·26	1·94		—	—	—	—	trace	—	99·67
VIII.	10·31	54·13	15·13	7·46	nil	trace	1·69	0·87	10·63	—	100·22

Minervite also occurs in the caves (Abstr., 1898, ii, 386).

Nitre, as a white efflorescence from crevices, contains small quantities of lime, magnesia, chlorine and sulphuric acid.

Bat guano and bone breccias are not associated with these substances.

The phosphoric acid has doubtless been derived from bones, and in acting on the marls has given rise to potassium and aluminium phosphates (compare Abstr., 1896, ii, 185). L. J. S.

Garnet from the Urals. By V. VON WOROBIEFF (*Zeit. Kryst. Min.*, 1899, **31**, 504; from *Verh. k. russ. min. Ges.*, 1897, **35**, 19—42).—The optical characters of garnets from the Eugenie-Maximilianoff mines are described; they are in agreement with those described by Karnojitsky from the same locality (this vol., ii, 37). The yellow dodecahedral crystals show well-marked optical anomalies, and the optical orientation varies in zones of different colour. The author considers garnet to be pseudo-cubic, and the twin-lamellæ to be the result of paramorphic strains. Analyses of hessonite gave:

SiO_2.	TiO_2.	Fe_2O_3.	Al_2O_3.	CaO.	MgO.	Total.
39·3	0·4	6·3	17·9	35·5	1·3	100·7
39·5	0·2	6·2	17·6	34·5	1·8	99·8

L. J. S.

Garnet pseudomorphous after Idocrase from the Urals. By PAVEL V. VON JEREMÉEFF (*Zeit. Kryst. Min.*, 1899, **31**, 505; from *Verh. k. russ. min. Ges.*, 1897, [ii], **35**, Protokolle, 14—16).—Pebbles and fragments with parting planes, and pyramidal crystals with the forms of idocrase, are found in the gold washings on the Borsowka river, near Kyschtymsk; they consist of a microcrystalline aggregate of garnet. Analysis by P. Nikolaéeff gave:

SiO_2.	Al_2O_3.	Fe_2O_3.	CaO.	MgO.	Loss on ignition.	Total.
36·58	18·67	4·33	35·57	3·48	0·75	99·38

The idocrase has here been altered to pure garnet without being intermixed with clinochlore, diopside, &c. L. J. S.

Fibrous Forms of Silica from Moravian Serpentines. By JINDŘICH LADISLAV BARVÍŘ (*Zeit. Kryst. Min.*, 1899, **31**, 525; from *Sitz.-ber. k. böhm. Ges. d. Wiss.*, 1897, No. XIV, 8 pp.)—By their optical characters, quartzine, chalcedony, lutecite and lussatite are identified from the quartzose veins in Moravian serpentine. Lussatite from Ratkowic is white and fibrous, and occurs mixed with opal, from which it has probably been derived. Sp. gr. 2·015. Analysis gave: SiO_2, 90·64, loss on ignition, 2·62 per cent.; also MgO, FeO and Al_2O_3.

L. J. S.

Minerals from Moravia. By FRANTIŠEK KOVÁŘ (*Zeit. Kryst. Min.*, 1899, **31**, 523—525; from *Rozpravy České Akad.* [*Memoirs Bohemian Acad.*], 1896, **5**, Class II, No. XV (I), 18 pp.).—The minerals described are from the graphite mines of Gross-Tresny.

Stolpenite fills crevices in the limestone which carries the graphite. It is earthy and compact with a greasy lustre, and is brown on the surface, but siskin-green on a fresh fracture. It crumbles slowly in water. Sp. gr. 2·365. Analyses I and II. 7·95 per cent. of the water is only expelled at a red heat, hence the formula $H_4CaAl_4Si_9O_{27} + 15H_2O$.

Nontronite forms a sulphur-yellow incrustation on graphite. Sp. gr. 2·145. Analyses III and IV give the formula $Fe_2Si_3O_9 + 5H_2O$.

Kaolinite occurs with graphite in limonite, limestone and hæmatite. Analyses V—VII of white material; in VI and VII there are traces of CO_2, and in VII also P_2O_5.

	SiO_2.	TiO_2.	Al_2O_3.	Fe_2O_3.	CaO.	MgO.	$(K,Na)_2O$.	H_2O.	Total.
I.	48·50	—	18·90	0·42	5·12	0·13	—	27·40	100·47
II.	48·37	—	19·48		4·98	0·19	—	27·49	100·51
III.	41·78	—	35·30	0·86	0·92	0·40	—	20·68	99·94
IV.	41·65	—	36·24		1·01	0·37	—	20·74	100·01
V.	46·02	0·18	37·85	0·47	0·68	0·35	1·06	13·70	100·31
VI.	48·65	0·39	35·18	0·76	0·73	0·46	0·93	12·82	99·92
VII.	53·15	0·92	30·05	1·66	0·64	0·49	1·40	12·25	100·56

Pitticite occurs as stalactites in a shaft through limestone containing much mispickel. The stalactites attain a length of 10 cm., and consist of alternate shells of soft, yellow, and of hard, brown materials. Analyses VIII and IX give the formula

$$4FeAsO_4,Fe_2(OH)_4SO_4,6Fe(OH)_3,3H_2O.$$

Evansite occurs on limonite as a botryoidal coating of a white (analysis X), or of a yellowish colour (analysis XI). The analyses (traces of magnesia are also present) agree with those required for the usual formula $AlPO_4,2Al(OH)_3,6H_2O$.

	Al_2O_3.	Fe_2O_3.	CaO.	As_2O_5.	P_2O_5.	SO_3.	H_2O.	Insol.	Total.	Sp. gr.
VIII.	—	55·06	trace	26·13	—	4·64	14·29	0·12	100·24	2·475

Analcite from Baku, Caucasus. By **Konstantin D. Glinka** (*Zeit. Kryst. Min.*, 1899, **31**, 517; from *Travaux Soc. Nat. Varsovie, Compt. rend., section phys. et chim.*, 1895–1896, No. 3).—A rock fragment from the blue clay of a mud volcano near Baku consists of pyroxene, a brown, isotropic substance, quartz and magnetite, together with analcite, which occurs either as a constituent of the rock or in cavities with celadonite. The analcite crystals are colourless and transparent, and are bounded by perfect faces of the form {211}; sections parallel to (100) are birefringent. The results of the analysis agree with those required for the usual formula $Na_2O,Al_2O_3,4SiO_2,2H_2O$.

SiO_2.	Al_2O_3.	Na_2O.	H_2O.	Total.
55·19	22·84	13·44	8·60	100·07

L. J. S.

Jadeite and Széchenyiite from Burma. By **József A. Krenner** (*Zeit. Kryst. Min.*, 1899, **31**, 502—504; from *Scientific Results of Count Béla Széchenyi's Journey in Eastern Asia*, 1877—1880, *Budapest*, 1897, **3**, 285—291, Hungarian).—Most of the specimens were bought in the market at Bhamo; the jadeite is usually white or greenish-white, but also pale grass-green and leek-green, and sometimes with emerald-green spots. The surfaces of the pebbles and fragments have a weathered crust, 1—10 mm. thick, which is either brown and compact, or light tile-red, and non-coherent. In thin sections, the larger, colourless fibres (1 × 10 mm.) show the optical characters of a monoclinic pyroxene. The prism cleavage angle = 93° 5′; optically positive, $Bx_a \wedge c' = 33° 34'$, $2V = 71° 56'$, $\beta = 1{\cdot}654$ (Na). Analysis by J. Loczka gave the results under I, agreeing with those required for the formula $NaAl(SiO_3)_2$. The emerald-green spots contain a little iron and traces of chromium.

	SiO_2.	Al_2O_3.	Fe_2O_3.	FeO.	MgO.	CaO.	K_2O.	Na_2O.	H_2O.	Total.	Sp. gr.
I.	59·77	24·10	0·54	—	0·29	0·62	0·17	13·61	0·36	99·46	3·323
II.	55·02	4·53	1·04	3·28	20·36	8·00	1·52	6·71	0·51	100·97	3·033

Széchenyiite is the name given to a dark brownish-green, foliated mineral embedded in greenish jadeite; it resembles diallage in appearance, but is shown to have the characters of an amphibole. The fibres have a prism cleavage angle of 56° 8′, and an extinction angle on (010) of 16° 16′; the pleochroism is feeble. Splinters easily fuse and give a strong yellow coloration to the flame. Analysis by J. Loczka gave II, agreeing with $2Na_2O,10MgO,3CaO,Al_2O_3,16SiO_2$. In some of the jadeite specimens are light greenish-yellow or colourless fibres of amphibole. This occurrence of amphibole explains the presence of magnesia and lime shown in some analyses of jadeite.

Auerbachite, and the Rock in which it occurs. By Pavel V. von Jereméeff (*Zeit. Kryst. Min.*, 1899, **31**, 512; from *Bull. Acad. Sci. St. Pétersbourg*, 1897, **7**, 89—95).—An examination of auerbachite from near Mariupol, Gov. Ekaterinoslaff, shows that the mineral in its chemical, physical and geometric characters is identical with zircon. The excess of silica is due to the large numbers of enclosed ægirite needles. The crystals are sometimes altered to a white, porous material resembling porcelain.

The rock in which auerbachite occurs is shown not to be a quartz-schist, but to be a pure, schist-like aggregate of albite crystals with a few small ægirite crystals. Analysis gave:

SiO_2.	Al_2O_3.	Fe_2O_3.	CaO.	MgO,K_2O.	Na_2O.	Loss on ignition.	Total.
60·29	21·39	3·07	0·46	traces	12·30	0·67	98·18

L. J. S.

Microcline pseudomorphous after Adularia from the Altai Mountains. By Pavel V. von Jereméeff (*Zeit. Kryst. Min.*, 1899, **31**, 506; from *Verh. k. russ. min. Ges.*, 1897, [ii], **35**, Protokolle, 55—56).—The pseudo-crystals have bright, smooth faces, and are twinned according to the Manebach and Baveno laws; they consist of an aggregate of microcline individuals. Analysis by P. Nikolaéeff gave:

SiO_2.	Al_2O_3.	Fe_2O_3.	CaO,MgO.	K_2O.	Na_2O.	Loss on ignition.	Total.
63·41	18·60	0·57	traces	10·09	6·01	0·54	99·22

L. J. S.

Clay from Russia. By Wladimir Alexéeff (*Zeit. Kryst. Min.*, 1899, **31**, 509; from *Verh. k. russ. min. Ges.*, 1897, [ii], **35**, Protokolle, 63).—A clay from Kossoi Brod on the Chusovaya (Tschussowaja) river, Perm, is seen, under the microscope, to consist of irregular, transparent, and birefringent lamellæ. Analysis shows it to be near pyrophyllite. It contains 38·6 per cent. of quartz.

SiO_2.	Al_2O_3.	Fe_2O_3.	CaO.	MgO.	K_2O.	H_2O.	Total.
67·60	22·22	1·65	0·18	0·28	3·93	5·37	101·23

Rock Analyses. By EDMOND BONJEAN (*Bull. Soc. Chim.*, 1899, [iii], 21, 691—693).—Details of work already published (this vol., ii, 500). N. L.

Meteorite from Zavid. By CARL HÖDLMOSER (*Tsch. Min. Mitth.*, 1899, 18, 513—517).—The bulk analysis of the stone which fell at Zavid, in Bosnia, gave:

SiO_2.	Al_2O_3.	Fe.	FeO.	CaO.	MgO.	Na_2O.	K_2O.	H_2O.	S.	Total less O for S.
41·90	1·92	0·15	27·40	4·60	22·79	1·05	0·41	0·39	1·01	101·11

Also traces of cobalt, nickel and manganese. Sp. gr. 3·5241. The metallic iron was estimated from the amount of hydrogen liberated when the material was treated with acid; a description and figure are given of the apparatus used in the estimation. L. J. S.

Analysis of Meteoric Iron. By O. SJÖSTRÖM (*Mitth. naturwiss. Ver. f. Neu-Vorpommern u. Rügen*, 1899, **30**, 1—29).—The author gives the details of the methods of separation and estimation used by him in the analysis of meteoric irons. The methods are essentially the same as those outlined by Cohen (Abstr., 1893, ii, 20), and several of the author's analyses are given in recent papers by Cohen. L. J. S.

Meteoric Irons. By EMIL W. COHEN (*Ann. k.k. naturhist. Hofmus. Wien*, 1899, 13, 473—486).—A review of the literature and notes concerning the structure are given of various meteoric irons; the following new analyses by O. Sjöström are given:

Shingle Springs, El Dorado Co., California.—In the large proportion of nickel and in the bright etching spots, this resembles the Cape of Good Hope, Iquique, and Kokomo irons (this vol., ii, 307). Sp. gr. 7·8943. Analysis gave the results under I, corresponding with the following mineralogical composition: Nickel-iron, 97·65; nickel-iron phosphides, 2·21; troilite, 0·14.

Magura, Hungary.—The angular fragments left after dissolving the iron in very dilute hydrochloric acid gave, on analysis, the results under II. As in other irons, this material consists mainly of kamacite, with perhaps a little tænite.

	Fe.	Ni.	Co.	Cu.	Cr.	C.	P.	S.	Total.
I.	82·21	16·69	0·65	0·02	0·02	0·03	0·34	0·05	100·01
II.	92·54	6·40	0·73	—	—	0·00	0·09	—	99·76

Previous analyses (Abstr., 1893, ii, 20) of tænite (a nickel-iron) show the presence of small amounts of carbon. New determinations made on tænite from the Toluca and Glorieta Mt. irons gave 0·22 and 0·12 per cent. of carbon respectively. L. J. S.

Red Rain Dust. By THOMAS STEEL (*Rept. Australian Assoc.*, 1898, 7, 334—335).—On December 27th, 1896, there occurred over Melbourne and a considerable area of Victoria an unusually heavy fall of dust of a red colour, which was carried down by accompanying rain. Analysis of this dust (dried at 110°) gave:

Soluble SiO_2.	Fe_2O_3.	FeO.	Al_2O_3.	CaO.	SO_3.	Insol. and diff.	Loss on ignition.
0·75	4·68	0·50	15·16	1·36	0·62	[66·23]	10·70

The loss on ignition includes: H_2O, 6·08; N, 0·30, and organic matter. This composition agrees with that of an ordinary surface soil derived from volcanic rocks. Under the microscope, diatoms, lepidopterous scales, quartz, and garnet have been detected in the material. L. J. S.

Mineral Waters of Mont Dore. By F. Parmentier (*Compt. rend.*, 1899, **128**, 1408—1409).—Mineral waters from neighbouring springs generally contain the same constituents, but the water taken from borings in the neighbourhood of Mont Dore presents no points of similarity with samples obtained from other sources in the same district. It contains a comparatively large amount of sodium chloride and notable quantities of sodium arsenate, iron being entirely absent.
G. T. M.

Mineral Waters containing Fluorine. By F. Parmentier (*Compt. rend.*, 1899, **128**, 1409—1410).—In reply to Lepierre (this vol., ii, 602), the author states that his remarks on the occurrence of fluorides in mineral waters refer to the special case of water from Mont Dore and St. Honoré-les-Bains (compare this vol., ii, 501).
G. T. M.

Analysis of Waters from the Tougourt-Ouargla District of the Sahara Desert. By E. Lahache (*J. Pharm.*, 1899, [vi], **9**, 477—482).—Analyses of water from the following places in the Sahara:—Tougourt, Bled et Amax, El-Fetir, H. Messaoud, El-Hadjira, H. Dahane, H. Debiche et Strifigi, Donionidi, N'Gonça, Ouargla.
H. R. Le S.

Physiological Chemistry.

The Effect of Compression of one Lung on the Respiratory Gas Exchange. By Vaughan Harley (*J. Physiol.*, 1899, **25**, 33—48).—The experiments were made on dogs, morphine being administered to prevent muscular action. The compression of one lung (right or left) is followed by an increased rate of breathing as a rule, and always by an increase in the quantity of air breathed, of oxygen absorbed, and of carbonic anhydride eliminated; the respiratory quotient is, as a rule, not altered.

The cause of the increase in gas exchange is not due to the increased rate of breathing, for the latter did not always occur; nor is it due to an increase of body temperature, or to displacement of the heart. A possible explanation is, that carbonic anhydride is a secretion of the alveolar epithelium (Bohr), and that carbonic anhydride acts as a stimulant to its own secretion. W. D. H.

Pancreatic Diabetes. By Ivor Ll. Tuckett (*J. Physiol.*, 1899, **25**, 63—68).—Gaglio found that extirpation of the pancreas was not followed by glycosuria if the thoracic duct was ligatured. This, if true, proves that something enters the circulation by the thoracic lymph which normally is destroyed by the pancreas, and which, in the absence of the pancreas, causes glycosuria. But Lepine and Biedl maintain that ligature of the thoracic duct increases the glycosuria caused by excision of the pancreas. Ligature or fistula of the left thoracic duct in dogs is in itself a cause of glycosuria (Biedl). The present communication is a preliminary account of experiments which support the following supposition, and so reconcile the above opposing statements :—Glycosuria, which follows interference with the thoracic duct, is but a mild form of pancreatic diabetes, if we assume that the pancreas has an internal secretion (t) which enters the circulation constantly *viâ* the thoracic lymph ; and also that a toxic substance (t') capable of causing glycosuria, if not neutralised by t, is absorbed from the intestine during digestion *viâ* the lymph stream. It must also be assumed that the thoracic lymph contains a large quantity of t' during digestion, but none at other times, whereas only a small quantity of t is ever present in the thoracic lymph, but the blood always contains a relatively large quantity, as it is continually accumulating there.

If the thoracic lymph from a fasting animal is injected into the portal circulation of another animal, there is no hyperglycæmia or glycosuria ; but if the lymph injected be from a digesting animal, the hypothetical t' acts on the liver cells deleteriously and produces hyperglycæmia and glycosuria. If the lymph is injected into the general blood stream, the effect is less marked, namely, t' is then partially neutralised by t before it acts on the liver. If the venous return from the pancreas is impeded by air bubbles, the secretion of t is checked, and glycosuria is more marked. W. D. H.

The Behaviour of Benzoyl Peroxide and Calcium Peroxide in the Digestive Canal of Dogs and Men. By Marcellus Nencki and J. Zaleski (*Zeit. physiol. Chem.*, 1899, **27**, 487—506).—The administration of such drugs as calomel and castor oil was empirical previous to the discovery of the true nature of putrefaction. The absolute disinfection of the alimentary canal is not possible, or even advisable; the use of antiseptics is limited because of their harmful effects on the alimentary canal. After the discovery that pancreatic juice will decompose, not only fats, but also many salts of the aromatic series, into their components, the use of such substances as salol (which is resolved into salicylic acid and phenol) became possible. The present research relates to the use of oxygen, not in the free state, but by the decomposition of peroxides. The use of organic peroxides dates from the time of Brodie (1863). Benzoyl peroxide is undoubtedly decomposed in the intestine ; hippuric acid appears in the urine, although not in amount sufficient to account for half of the drug given. Experiments with artificial digestion confirmed this ; but the drug has little or no effect on the amount of ethereal hydrogen sulphates in the urine. Better results followed the use of calcium peroxide; it appears to be more readily decomposed; it has no harmful effects; in dogs, the ethereal hydrogen sulphates are lessened, and the indican completely disappears; its effect is transitory; in man, especially in the acid dyspepsia of children, it is beneficial. W. D. H.

Physiological Effects of 'Peptone' when Injected into the Circulation. By William H. Thompson (*J. Physiol.*, 1899, **25**, 1—21).—This is a continuation of results already published (this vol., ii, 604), and relates to the influence of the constituents of 'peptone' on the vessels of the spleen, liver, and limbs, all of which were investigated by the plethysmographic method. The vessels of the spleen share, to a moderate extent, the dilatation which produces the fall of blood pressure. Vaso-mobility, as tested by stimulation of the splanchnic nerves, is diminished, but to a less degree than in the intestinal, although in a greater degree than in the renal, district. The vessels of the liver are enormously dilated, the accumulation of blood there exceeding that in the intestines. The liver, in fact, probably plays the part of a safety receptacle to the heart. There is also a great depression of vaso-mobility. The effect on the limb-vessels is very slight, even less than on those of the kidneys.

Of the constituents of Witte's peptone, proto- and hetero-proteose are the most effective in producing these results. Deuteroproteose and purified peptone have comparatively little influence.

W. D. H.

The Effects on Blood and Urine of the Intravenous and Subcutaneous Injection of Various Carbohydrates. By Frederick W. Pavy (*J. Physiol.*, 1899, **24**, 479—517).—The sugar normally present in blood does not consist exclusively of dextrose, its reducing power compared with that of dextrose being 75 : 100. The small amount of sugar in normal urine has an even smaller reducing pover. The amount of sugar found in the blood collected immediately after the injection of large doses (in rabbits) is greater in the case of the saccharoses than in that of the hexoses. The highest figures (21—24 per 1000) occur after cane sugar; galactose and dextrose give respectively 11—12 and 14—15 per 1000. After small doses, the same disparity is not observable. The saccharoses comport themselves as unserviceable foreign matter and are speedily cast out into the urine. The results obtained with maltose are ambiguous; after intravenous injection, they correspond with those of lactose and cane sugar; after subcutaneous injection, the results correspond with those of the hexoses. The hexoses show a low degree of elimination; galactose escapes more freely than lævulose or dextrose, between which there is not much difference. Dextrose appears to undergo an alteration; after injecting a large quantity, it is found in both blood and urine; injected in less quantity, the reducing power of the sugar in the blood and still more of the sugar in the urine is far less than that of dextrose. In the case of galactose, and probably also in that of lævulose, there is no such change.

Glycogen injected intravenously causes a rise of sugar in the blood, and the elimination in the urine of a considerable amount of a product with low reducing power.

Considerable stress is laid on the generalisation that the sugars susceptible of application by the body are those which ferment with yeast; a sugar which yeast can appropriate is likewise susceptible of appropriation by living matter of another kind, not necessarily that of the liver exclusively, but by the protoplasmic matter of the body generally. W. D. H.

Elimination of Nitrogen and Phosphorus during Assimilation. By WILLIAM ŒCHSNER DE CONINCK (*Compt. rend.*, 1899, **129**, 223—224).—Observations made in 1892 and 1893 on infants fed on milk show that the ratio of phosphoric anhydride to nitrogen, N/P_2O_5, in the urine varies from 1/5·2 to 1/10·4, and the results are practically identical with those recently described by Keller.

C. H. B.

Further Proofs of the Origin of Uric Acid from Nuclein Compounds and Derivatives. By WILLIAM J. SMITH JEROME (*J. Physiol.*, 1899, **25**, 98—104).—Ingestion of pig's pancreas, herring's roe, or Liebig's extract increases the excretion of uric acid. The evidence of the origin of the latter from nucleins does not therefore depend on thymus feeding alone. Any disproportion between the excretion of uric acid after flesh diet and the amount of nucleins contained in muscle is probably to be explained by the presence in such diet of alloxuric bases, and especially of hypoxanthine, in sufficient quantity to account for the rise produced. The presence of these bases in flesh probably accounts for the early rise in uric acid after a meal, and will also account for the increase found when pepsin-hydrochloric (nuclein free) extracts of the thymus are taken. Fresh experiments are given showing a rise of uric acid after taking pure nucleins. There is, in fact, no evidence that uric acid can arise in man independently of a substance containing an alloxuric (purine) group. W. D. H.

Results of Administration of Indole. By EYVIN WANG (*Zeit. physiol. Chem.*, 1899, **27**, 557—574).—Indole was first recognised as the source of indican in the urine by Jaffé (*Centr. med. Wiss.*, 1872, 1, 2), and urinary indican was shown to be an ethereal sulphate by Baumann (*Zeit. physiol. Chem.*, 1877, **1**, 67). Estimation of indican now being possible by the author's method, the present research was undertaken to determine the quantitative relationship of indole given by the mouth, and the indigo of the urine, in dogs. The following results were obtained:—The indole of the alimentary canal is excreted by the urine within 24 hours; 1 gram of indole is sufficient to cause symptons of poisoning in a medium sized dog; this has been denied by some previous observers (Baumann and Brieger); the quantity of ethereal hydrogen sulphates excreted is smaller than that which would correspond with the amount of indole given; about half of this amount of indole is passed as indigo-forming substance; ethereal hydrogen sulphates other than potassium indoxyl sulphate are formed; the excretion of indigo and of ethereal hydrogen sulphates is not constant on a fixed diet in the normal condition; there is also no constant relationship between the indican and the ethereal hydrogen sulphates; cooking the food makes no difference. W. D. H.

Pentoses in the Urine. By Ernst Salkowski (*Zeit. physiol. Chem.*, 1899, **27**, 507—539).—The reactions examined for the detection of pentose in the urine were:—(1) The Tollens reaction with phloroglucinol and hydrochloric acid; (2) the Tollens reaction with orcinol and hydrochloric acid; (3) the test with aniline acetate paper; (4) the occurrence of furfuraldehyde after distillation with hydrochloric acid; and (5) the preparation of the osazone. Each test is described with full details and the precautions that are necessary. After the use of certain drugs such as menthol and chloral, these tests, especially the first, may be positive without the presence of pentose; glycuronic acid also may be a source of error. In the presence of dextrose, pentose can still be detected, after the removal of the sugar by fermentation. Three cases of pentosuria are described. The origin of pentose in the body is discussed, and the view that it originates from the nucleoproteids in the pancreas is dismissed. It is regarded as probable that it originates from hexoses. W. D. H.

Reducing Power of Urine. By Henri Hélier (*Compt. rend.*, 1899, **129**, 58—60).—The author determines the reducing power of urine by mixing 10 c.c. of the liquid with 10 c.c. of concentrated sulphuric acid and adding a solution of potassium permanganate (6·36 grams per litre) until a permanent rose tint is produced. An estimation of the urea is also made in order that the reducing power may be expressed with reference to urine of normal concentration containing 2 per cent. of urea. If n is the number of c.c. of potassium permanganate solution used and m the number of grams of urea per litre, then the reducing power $P = 20n/m$. Normally, P ranges from 12·5 to 15, but with pathological urine higher or lower values are found, according to the nature and intensity of the disease. N. L.

Toxicity of Normal Urine. By Wilmot P. Herringham (*J. Pathol. and Bacteriol.*, 1899, **6**, 158—179).—The experiments recorded were made on rabbits. Normal human urine is undoubtedly fatal when injected intravenously into these animals. The fatal dose varies very considerably, and is not the fixed quantity upon which Bouchard deduced his 'mathematical' theories on the subject. These theories are subjected to criticism, and when tested by experiment invariably fall to the ground. The difference between morning and evening urine, upon which Bouchard established his well-known theory of sleep and waking, does not exist. Bouchard apparently never made any chemical examination of urine, or at least never published any results. The symptoms that follow injection of the urine are contraction of the pupils, drowsiness, twitchings and convulsions, failure of respiration and heart. The analyses published show that the toxicity and amount of potassium salts vary together. This supports the view, which has already been advanced by numerous investigators, that the toxic agents are the potassium salts; they will account for all the symptoms except the contraction of the pupils. W. D. H.

Proteids of Muscle. By GEORGE N. STEWART and TORALD SOLLMAN (*J. Physiol.*, 1899, **24**, 427—459).—The method of fractional heat coagulation can be usefully employed in the separation and quantitative investigation of the muscle proteids. The two principal proteids of muscle are paramyosinogen, a typical globulin coagulating from 45—50°, and an atypical globulin, myosinogen coagulating at about 56 to 63°. Halliburton's myoglobulin is regarded as part of the myosinogen. Von Fürth's soluble myo-fibrin is regarded as part of the paramyosinogen. Both proteids pass readily, either in the muscle itself or in saline extracts, into an insoluble modification, myosin; myosinogen first passing readily into a modification similar to or identical with paramyosinogen. As a rule, paramyosinogen is more abundant in saline (5 per cent. magnesium sulphate) extracts than myosinogen; extracts of muscle made with water contain more myosinogen. No marked quantitative differences in the relative amount of the two proteids could be established in the muscles of different animals, in different muscles of the same animal, or in *rigor mortis*. The method of estimation is not capable of detecting minute differences.

The coagulation of the proteids is accompanied with increase of acidity; this confirms what Halliburton originally stated, and von Fürth denied.

Certain facts indicate that *rigor mortis* is associated with the precipitation of paramyosinogen and myosinogen; still the properties of the proteids in extracts do not afford a complete explanation of the production and resolution of rigor. W. D. H.

Effect of Removal of the Proteid on the Molecular Concentration and Electrical Conductivity of Muscle Extracts. By GEORGE N. STEWART (*J. Physiol.*, 1899, **24**, 460—463).—The results given show that the conductivity is increased after removal of the proteids; the globulins of muscle extracts (which probably would hold salt more firmly or in greater amount than albumins) depress the conductivity in a greater degree than the proteids of serum or hæmoglobin. No constant difference is as yet made out between the various proteids of muscle extracts. W. D. H.

Nature of the Action of Antitoxins. By LOUIS COBBETT (*J. Pathol. and Bacteriol.*, 1899, **6**, 193—219).—The experiments recorded were performed with the toxin and antitoxin of diphtheria. They follow very much on the lines of those previously published (this vol., ii, 234) by Martin and Cherry, and the results obtained confirm their view, namely, that the interaction of toxin and antitoxin is a chemical one; neutralisation takes place *in vitro*, provided time is allowed, and the intervention of the living cells of the body is not necessary, as Buchner maintains. W. D. H.

Presence in the Animal Organism of an Enzyme Capable of Reducing Nitrates. By E. ABELOUS and ERNEST GÉRARD (*Compt. rend.*, 1899, **129**, 56—58).—The filtered aqueous extracts of the liver, kidney, suprarenal capsules, lungs, testes, intestines, ovary and submaxillary gland, pancreas, spleen, striated muscle, and brain of the horse possess the property of reducing alkali nitrates to nitrites, the activity of the various organs decreasing in the order indicated. The reduction is in all probability due to the action of an enzyme, since it does not occur if the extracts have been previously heated at 100°, but is not affected by the presence of antiseptics. The activity of the enzyme varies with the temperature, being very feeble at 0°, attaining a maximum between 20° and 40°, and ceasing altogether at 72°. N. L.

Presence of a Soluble Reducing Enzyme in the Animal Organism. By E. Abelous and Ernest Gérard (*Compt. rend.*, 1899, **129**, 164—166).—An aqueous or glycerol extract of the kidney of the horse contains an enzyme which is capable of reducing nitrates to nitrites; if the extract is boiled, the ferment is destroyed, and the liquid no longer reduces nitrates. Antiseptics like chloroform, thymol, essence of cinnamon, and sodium fluoride do not destroy the reducing power of the extract, but mercuric chloride (1 in 2000) does. The amount of nitrite formed attains a maximum at a temperature of 40—45°, above this it gradually decreases and becomes *nil* at 71—72°. A mixture of 100 c.c. of the extract, 8 grams of potassium nitrate, and 1 c.c. of chloroform was placed in each of three flasks, the air in two of which was displaced by hydrogen and carbonic anhydride respectively. After standing for 24 hours at 42°, the flask, the air in which had been displaced by hydrogen, contained the greatest amount of nitrite, and the flask with the carbonic anhydride by far the least. The addition of sodium carbonate to the extract favours the formation of nitrite. The extract is inactive after filtration through unglazed porcelain.

The enzyme reduces, not only potassium nitrate, but also ammonium nitrate, it decolorises methylene-blue and seems to reduce butyric acid to butyraldehyde. H. R. Le S.

Physiological Action of the Alkaloids derived from Anhalonium Lewinii. By Walter E. Dixon (*J. Physiol.*, 1899, **25**, 69—86).—*Anhalonium Lewinii* is a small cactus, locally known as "mezcál." A drink prepared from it has remarkable physiological properties, and is used by certain tribes of Mexican Indians in their religious ceremonies. E. White has confirmed Heffter's results (Abstr., 1896, i, 267) with reference to the existence of the four alkaloids. Mezcaline, anhalonidine, anhalonine, and lophophorine are all crystalline except the last. The physiological action of each is practically the same. Experiments were made on dogs, cats, and men.

There is no action on the skin, an increased flow of saliva, occasionally vomiting, constipation (in man with small doses), and diarrhœa, with blood-stained stools (in animals with large doses). There is no effect on the blood; there is slowing of the heart and fall of blood-pressure; the effect on the heart is not neutralised by atropine; the vagus is paralysed, the return to normal blood pressure is usually quite sudden. There is no effect on the muscles. Respiration is affected only in toxic doses; it becomes quicker and shallower, and death occurs from failure of the respiratory centre. In animals, there is first increased reflex activity, then paralysis, which is central in origin. In man, there is a preliminary stage of excitement, followed by one of intoxication, which is very much like that caused by alcohol. There are also a number of interesting subjective sensations: a feeling of 'dual existence,' an increased sensitiveness to odours and to music; but the visual sensations are the most marked; there is a kaleidoscopic display of colours; these can be seen with either eye, and must be of central origin. The colouring of external objects is intensified. The urine contains the drugs, and there is some diuresis. Lophophorine is the most powerful of the alkaloids, but mezcaline is most effective in producing colour visions. W. D. H.

Mineral Composition of the New-born Child, and Bunge's Law. By Louis Hugounenq (*Compt. rend.*, 1899, **128**, 1419—1421. Compare this vol., ii, 503).—Bunge's law, which states that the epithelial cells of the mammary glands secrete, from the mineral salts of the plasma, the exact amounts of inorganic substances necessary for the development of the offspring, holds in the case of the cat, dog, and rabbit. Analyses of the mineral skeleton of the new-born child and of the ash of human milk however, show that these differ widely in composition, and hence the law is not applicable to the human species. It is probable that the law holds only for those mammals whose osseous tissues are largely developed during the period of lactation; this is not the case in man, and hence the mother's milk is a less important factor in the development of the human offspring than in that of other mammals. G. T. M.

Chemistry of Vegetable Physiology and Agriculture.

Amount of Ash and Cellulose Present in Posidonia Caulini. By Felix Chancel (*Bull. Soc. Chim.*, 1899, [iii], **21**, 740—742).—The seaweed, *Posidonia caulini*, after being washed with water, contains 10·9 per cent. of ash, calculated on the dry sample, consisting principally of salts of calcium and magnesium; the cellulose, estimated by digesting the dry plant alterately with bromine water and boiling dilute caustic soda, amounts to 39·5 per cent. Since the amount of cellulose remaining after boiling the seaweed with 50 per cent. aqueous caustic potash for 2½ hours under a pressure of 15 lbs. per square inch was 15·3 per cent., and wheat-straw under the same conditions yields 17·9 per cent., it appears probable that the weed, which is very plentiful on the southern coasts of France, can be utilised for paper-making.
W. A. D.

Amount of Pentosans in Vegetable and other Substances. By A. Menozzi (*Ricerche Lab. chim. agrar. R. Scuola Sup. Agric. Milan*, 1898, 247—249).—The following percentage amounts of pentosans were found in the dry matter of the different substances:—Mulberry leaves, 5·00 (average of five analyses); excrement of silkworms, 9·48; compressed yeast, 2·18; edible fungi (*Boletus edulis*), 1·93; *Penicillium glaucum*, none. Mulberry leaves and the excrement of silkworms contained 11·16 and 18·07 per cent. of cellulose respectively.

N. H. J. M.

Oxidising Enzyme from Hellebore. By PH. VADAM (*J. Pharm.*, 1899, [vi], **9**, 515—516).—The stem and fresh leaves of this plant contain an oxydase similar to those studied by Bourquelot and Bertrand, Lépinois, and others. Its ash contains iron, but the presence of manganese is not proved. H. R. LE S.

Secretion of Enzymes. By DIENERT (*Compt. rend.*, 1899, **129**, 63—64. Compare this vol., ii, 442).—If a yeast which ferments lactose is grown in different portions of a nitrogenous, nutritive medium containing (*a*) glucose, (*b*) galactose, and (*c*) lactose, and the yeasts subsequently separated, dried, and extracted with water, three solutions containing lactase are obtained, the relative activity of which, in hydrolysing lactose, are represented by the numbers 1, 5, and 6 respectively. The most active solution, however, hydrolyses not more than 6 per cent. of lactose. It thus appears that the acclimatisation of a lactose yeast to galactose is accompanied by an increased secretion of lactase. Similarly, the acclimatisation of bottom yeasts is found to be associated with the production of melibiase. N. L.

Decomposition of Glucosides by the Action of Moulds. By KONSTANTIN A. PURIEWITSCH (*Chem. Centr.*, 1899, i, 702—703; from *Ber. Deut. bot. Ges.*, **16**, 368—377).—*Aspergillus niger* decomposes salicin into glucose and saligenin, the former being absorbed by the mycelium, and when solutions of helicin, arbutin, coniferin, æsculin, phloridzin, or hesperidin are covered with the mycelium, these glucosides undergo the same decompositions as emulsin effects. The salicylaldehyde formed by the decomposition of helicin kills the mycelium. *Aspergillus glaucus* and *Penicillium glaucum* behave like *A. niger*, but whilst emulsin or the extract from any of these moulds decomposes amygdalin into glucose, benzaldehyde, and hydrocyanic acid, neither benzaldehyde nor hydrocyanic acid is formed by the action of the living mycelium and the amygdalin solution in this case does not reduce Fehling's solution. The amygdalin is assimilated by the mycelium, with formation of ammonia.

In all cases, the glucosides are decomposed into glucose, which is assimilated by the mould and benzene derivatives which are either assimilated or left in solution. This action is effected by means of emulsin, which diffuses from the mycelium. Apparently an enzyme which inverts the sugar is also present. The benzene derivative is only attacked when all the sugar has been used, and similarly in culture solutions containing glucosides and carbohydrates, the former are hydrolysed only when a certain amount of the latter has been appropriated by the mould. E. W. W.

Influence of Mineral Constituents of Water on the Composition of Worts and Yeast Ash. By FRANCIS E. LOTT (*Bied. Centr.*, 1899, **28**, 503—504; from *D. Bierbrauer*, 1898, *Beibl.* No 12).—Water containing calcium sulphate extracts less phosphates and resin, but as much nitrogen as soft water; the fermentability is diminished and the beer produced has a better taste and a lighter colour. Magnesium sulphate diminishes the amount of extract, but not the percentage of phosphates and nitrogen in the extract; when large amounts are present, the beer has a somewhat rough, hard taste. Sodium chloride causes a separation of phosphates and increases the amount of maltose. Calcium chloride increases the nitrogen in the worts, and diminishes the total maltose and the production of yeast. Nitrates cause diminished amounts of extract, impede fermentation, and readily produce beer of a darker colour. Sodium, potassium, and magnesium carbonates check the diastatic power, increase the amounts of proteids, dissolve the hop-resin, and so produce dark-coloured beer with a rough taste. Hydrogen calcium carbonate diminishes the yield of extract, separates phosphates, and dissolves the resin.

The mineral matters in water influence the composition of yeast, and if the effect is at first harmless, injury may be caused as time goes on; on the other hand, the yeast may become acclimatised and eventually be less affected by the mineral matter. Yeast from worts in soft water was found to contain most of the phosphoric acid (93·9 per cent. of the ash) as potassium salt, whilst the ash of Burton yeast contained considerable amounts of magnesium and calcium phosphates (21·0 and 13·6 per cent.) as well as the potassium salt (63·1 per cent.). N. H. J. M.

Experiments with Nitragin. By Hjalmar von Feilitzen (*Mitt. Ver. Förd. Moorkultur*, 1898, **16**, 323—324).—Nitragin experiments made in 1896 with grey peas growing on new peat-land showed an increase of about 55 per cent. of straw and 116 per cent. of corn under the influence of inoculation. More recent experiments are described in which grey peas and bastard clover were grown on three plots of 2 acres each, the nitragin being applied to the seed and to the soil respectively. As before, the soil was uncultivated peat-land. The following amounts of produce (in kilos.) were obtained:

	Not inoculated.	Seed inoculated.	Not inoculated.	Soil inoculated.
Grey peas (dried)...	270	1220	100	1340
Clover (green)	60	2130	0	1020

N. H. J. M.

Influence of Ether on Germination. By C. O. Townsend (*Expt. Stat. Record.*, 1899, **10**, 1048; from *Proc. Amer. Assoc.*, 1898, **48**, 409—410).—Seeds were soaked in pure water for 24 hours and then transferred to air-tight chambers containing respectively 1, 2·5, 5, and 10 c.c. of ether in 100 c.c. of water. One c.c. of ether slightly expedited germination, but somewhat retarded the subsequent growth. Ten c.c. of ether prevented germination, and in 2 weeks seemed to kill the seeds; when, however, the seeds were removed after 7—10 days, they germinated readily Similar results were obtained with spores on gelatin plates. N. H. J. M.

Behaviour of Calcium Oxalate during the Growth of Vegetable Organs. By Gregor Kraus (*Bied. Centr.*, 1899, **28**, 458—459; from *Flora*, 1897, **83**, 54—73, and *Bot. Centr.*, 1897, **69**, 384).—On growing roots of *Rumex obtusifolius* in pure quartz sand, with and without addition of chalk, it was found that, whilst in presence of chalk there was either no change or else a gain of calcium oxalate in the plants, there was a not inconsiderable loss of oxalate in the plants grown without lime; in some cases, the loss of oxalate diminished to the same extent as the other reserve substances. The oxalate had evidently been utilised to supply the lime necessary for the development of the growth above ground, and it is concluded that this occurs under normal conditions when lime becomes necessary.

In the case of the oxalate in the rind of bushes and trees, it was found that the amount diminished during the formation of buds.

The fact that, in *Cactaceæ*, the amount of oxalate is greatest in the older parts would seem to indicate that it is not used up, but inasmuch as the crystals are mostly in the living parenchyma, it seems possible that the oxalate might be available if required.

A number of experiments made with a variety of vegetable acids showed that the acids present in the cell-sap have the power of dissolving calcium oxalate. N. H. J. M.

Formation of Alcohol and Carbonic Anhydride, and Absorption of Oxygen in Plant Tissues. By Marcellin P. E. Berthelot (*Compt. rend.*, 1899, **128**, 1366—1370. Compare Abstr., 1895, ii, 124).—In order to demonstrate conclusively the existence of alcohol in the organs of the living plant, it is absolutely necessary to operate on tissues recently removed with as little mutilation as possible, otherwise appreciable quantities of this substance may be produced by subsequent fermentative changes.

Freshly-cut blades of wheat were introduced into a tared flask and heated to 94° after displacing the air by a current of hydrogen. The carbonic anhydride and alcohol were driven off, and the former estimated by potash absorption. The experiment was repeated with hazel leaves, and a large quantity of material was employed in order to ascertain the nature of the alcohol; in this case, the distillation was conducted in a current of steam, and from 10 kilos. of leaves, about 10 grams of alcohol were obtained, consisting chiefly of the ethylic derivative, together with appreciable quantities of its higher homologues, and a trace of some camphor-like substance; methylic alcohol was not detected.

These results indicate that the tissues of wheat and hazel grown under normal conditions contain small quantities of alcohol, this substance being produced by reactions similar to those which give rise to methylic alcohol in certain other plants. No simple relationship could be traced between the amounts of alcohol and carbonic anhydride; the evolution of gas continues for several hours, and is due to changes which do not involve the formation of alcohol, and the quantity increases when air is admitted during distillation. It follows from this that the variation in the ratio between the carbonic anhydride produced and oxygen absorbed ("respiratory coefficient") cannot depend on the formation of any one compound such as ethylic alcohol.

G. T. M.

Production of Alpine Characters in Plants by Extreme Variations of Temperature. By GASTON BONNIER (*Compt. rend.*, 1898, **127**, 307—312).—Experiments on the influence of temperature on growth in the case of plants (clover, wood sage, groundsel, vetch, oat, and barley) capable of growing either at high or low altitudes. The plants were cultivated (1) in enclosures cooled to 4—9°; (2) under the normal summer conditions prevailing at Fontainebleau, the temperature ranging from 15—30°, and occasionally from 10—35°; (3) under conditions alternating between those of series 1 at night and those of series 2 in the daytime, the variations of temperature (4—35°) being comparable with those of Alpine regions; (4) at a uniform temperature of 16°. After an interval of two months (June 3rd to August 1st), the plants of series 3 were found to differ greatly from the others, being more stunted with smaller leaves, and more rapid flowering than even those grown at 4—9°. Hygrometric conditions are shown not to influence growth to any marked degree, and hence variation in temperature is the most important factor in the dwarfing of the alpine flora.

G. T. M.

[Respiration] of Plants Rendered Alpine Artificially. By GASTON BONNIER (*Compt. rend.*, 1899, **128**, 1143—1146).—The experimental conditions recorded in the preceding abstract were maintained until all the specimens of *Teucrium scorodonia* under investigation had blossomed and fructified (Sept. 16th). The differences presented by the plants are discussed, the most striking changes being found in the leaves. The assimilative power per unit of surface of the leaf showed a great increase in the specimen grown under alpine conditions, and a study of the gaseous exchange between the leaves and the atmosphere indicated that the following amounts of oxygen per sq. cm. of leaf area were evolved during half an hour by plants grown under the conditions 1, 2, and 3, recorded in the preceding abstract.

Series.	1	2	3 (Alpine conditions).
Wood sage (*Teucrium scorodonia*)...	0·200	0·265	0·271
Clover (*Trifolium repens*)	0·061	0·05	0·067

G. T. M.

Modification of Plant Respiration resulting from Variations of Temperature. By WLADIMIR PALLADIN (*Compt. rend.*, 1899, **128**, 1410—1411).—Etiolated stems of *Vicia faba* were weighed out in three portions; the first was kept at a medium temperature (17—20°), the second cooled to 7—12°, and the third heated to 36—37°; after several days, the three were brought to the same temperature, namely, 18—22°, and the amount of carbonic anhydride evolved from 100 grams was determined in each case. The stems which had been cooled evolved 40 per cent., and those which had been heated 53 per cent. more carbonic anhydride than those which had remained at the medium temperature. These experiments support the conclusions arrived at by Bonnier (preceding abstracts) with respect to the increase in the assimilating power of the leaves of plants grown under alpine conditions. G. T. M.

Improvement in the Chemical Composition of the Maize Kernel. By Cyril George Hopkins (*Univ. Illinois Agric. Expt. Stat. Bul.*, **55**, 1899, 205—240).—Whilst the composition of an ear of maize is nearly uniform throughout, different ears of the same variety often vary considerably in composition. It was therefore thought possible that, by selecting grain of known composition, crops might be obtained with high percentage of proteids, carbohydrates, or fat as desired. The results of field experiments commenced in 1896 show that this change can be effected. Selected seed containing a high percentage of proteids produced a crop containing 11·10 per cent. of proteid, whilst seed containing less proteid produced a crop containing 10·55 per cent. Greater differences were subsequently obtained.

In a similar manner, crops were obtained containing 5·15 and 3·99 per cent. of fat respectively. In six experiments, differences of 0·67 to 1·45 per cent. of fat were produced.

The percentage of carbohydrates varying inversely with the combined percentages of proteid and fat, carbohydrates are increased whenever the combined percentage of proteid and fat is decreased.

The amount of proteid in the seed varies chiefly with the proportion of glutinous layer in the kernel, whilst the amount of fat varies uniformly with the proportion of germ. It is thus both possible and practicable to select seed by mechanical examination and without chemical analysis. N. H. J. M.

Cultivation of Potatoes and Mangolds at Grignon. By Pierre Paul Dehérain (*Ann. Agron.*, 1899, **25**, 336—350).—Potatoes:—Different varieties of potatoes were manured with 30,000 kilos. per hectare of farmyard manure in addition to the previous crop of vetches which had been ploughed in. There were two plots for each variety of potatoes, one of which had produced a large, the other a smaller, yield of vetches. The average increase of potatoes (tubers), taking all varieties, due to the green manure, was 1·07 ton to each ton of vetches; as the vetches contain about 1 per cent. of nitrogen to 0·3 per cent. in potatoes, the green manure was by no means exhausted.

After discussing the amounts of produce and starch furnished by the different varieties grown under equal conditions, attention is drawn to the great importance of obtaining a change of seed.

Mangolds:—Experiments were made in which two varieties of mangolds, very similar in composition, were grown after vetches ploughed in. In addition to the green manure, all the plots except one had farmyard manure (30,000 kilos. per hectare); four plots received in addition sodium nitrate (200 kilos.), three were inoculated with nitrifying soil and four received no further treatment. The plot which had only green manure gave a very fair yield of roots (31,000 kilos). The application of nitrifying soil gave rise, on one plot, to greatly increased production of roots, the yield (59,300 kilos.) being higher than that of the plot which had nitrate; on another plot, however, nitrifying soil was without effect.

The amount of nitrogen removed by the roots (the leaves were returned) was about 170 kilos. per hectare, whilst the amount applied to the soil was 322 kilos. (in the form of dung, green manure, and nitrate), leaving 150 kilos. in the soil as organic nitrogen. The average amount introduced on the plots as green manure was 159 kilos. per hectare.

N. H. J. M.

[Analyses of Rothamsted Soils.] By **Arthur Goss** and **Harry Snyder** (*U.S. Dept. Agric. Div. Chem.*, *Bul.* 51, 1898, 73—79).—Partial analyses were made by the U.S. Department of Agriculture, and at several Agricultural Experiment Stations, of samples of surface soil (9 inches deep) from the following plots: Broadbalk Field (wheat), plots 3 (unmanured since 1843), 10 A (ammonium salts; N = 86 lb.), 11 (ammonium salts and superphosphate), and 13 (ammonium salts, superphosphate, and potash). Hoosfield (barley), plots 1 A (ammonium salts; N = 43 lb.), 2 A (ammonium salts and superphosphate), 3 A (ammonium salts and sodium, potassium, and magnesium sulphates), and 4 A (ammonium salts and complete minerals). The results are given as percentages in dry soil.

The soluble organic matter and nitrogen were determined by extracting with 3 per cent. ammonia and 3 per cent. sodium hydroxide respectively. Owing to the difficulties of the method, the results varied considerably; the highest and lowest are given here.

	Broadbalk Plot 3.			Hoosfield Plot 2 A.		
	Total N.	Humus.	N in humus.	Total N.	Humus.	N in humus.
Highest	0·12	3·29	4·92	0·12	2·93	3·14
Lowest	0·09	1·47	1·00	0·10	1·82	1·10
Mean	0·102	2·16	2·93	0·110	2·33	2·41

The total phosphoric acid was determined by the Goss method and by digestion with nitric acid; the total potash by the (1) Smith, and (2) hydrofluoric acid methods. Soluble phosphoric acid and potash were also determined.

	P_2O_5.		K_2O.				
	Total.	Sol. in	Total.		Soluble in.		
	(Mean).	*N*/5HCl.	Smith	HF.	*N*/5AmCl.	*N*/5$CaCl_2$.	*N*/5HCl.
Broadbalk Plot 3 ...	0·119	0·0039	1·20	1·38	0·0118	0·0110	0·019
Hoosfield Plot 2 A...	0·172	0·0357	1·29	1·30	0·0188	0·0097	0·016

The following average results, obtained with soils which have had no phosphates for 53 years (Broadbalk 3 and 10 A; Hoos. 1 A and 3 A), and with soils which received 350 lbs. of surphosphate each year (Broadbalk 11 and 13; Hoos. 2 A and 4 A), show that the methods give results in accordance with known facts.

Without phosphates.		With phosphates.	
Total P_2O_5.	P_2O_5 sol. in *N*/5HCl.	Total P_2O_5.	P_2O_5 sol. in *N*/5HCl.
0·108	0·0035	0·183	0·0398

N. H. J. M.

Influence of various Plants on the Amount of Moisture in the Soil. By MAX MAERCKER (*Bied. Centr.*, 1899, **28**, 436—437; from *Landw. Jahrb.*, 1898, **27**, 170).—The amount of moisture in soil growing various crops was determined twice a week. At the commencement (May 21), the amounts of moisture were fairly uniform, except in the case of the oat plot, which was rather dryer than the others. During the first few weeks there was comparatively little change in the case of sugar-beet, potatoes, and peas, whilst the oats, and especially the wheat, took up large amounts of water. In July, the sugar beet began to take up more water, and the soil became almost as dry as that under wheat.

After the peas and the wheat were cut, it was found that the former left considerably more moisture in the soil than the latter, whilst sugar beet takes up as much moisture as any crop when the leaves are fully developed. N. H. J. M.

Changes in Butter Produced by Feeding with Fat. By GEORG BAUMERT and FR. FALKE (*Bied. Centr.*, 1899, **28**, 452—454; from *Zeits. Unters. Nahrungs u. Genussmittel*, 1898, Heft. 10, 665).—Two cows were fed during successive periods with different oils, in the form of emulsions, in addition to hay and rape-cake meal freed from fat. During the first and last periods, the oil was omitted. The results of analysis of the butter produced under the different conditions showed, not only that the oil in the food essentially altered the nature of the butter, but that the changes varied in accordance with the character of the oil. The determinations made were the Köttstorf, Reichert-Meissl, and the von Hübl iodine numbers.

The results are thus opposed to those of Soxhlet, which indicated that the fat in food does not pass into the milk, but that it replaces the fat already existing in the body, enabling a portion of the body-fat to migrate to the milk (compare Abstr., 1898, ii, 402). N. H. J. M.

Assimilability of Organic Nitrogen in Sterilised Media. By A. LYEBYEDYEV (*Expt. Stat. Record*, 1899, **10**, 723; from *Selsk. Khoz. Lyesov.*, **186**, 1897, No. 7, 159—169).—Barley was grown in sand manured with urea, hippuric acid, leucine, aspartic acid, and asparagine respectively, calcium carbonate being added to obtain neutrality. The sterilised cultivations produced very little growth, and seed was only produced in the pots manured with asparagine. In the case of similar pots inoculated with soil extract, the following amounts of dry produce (roots, straw, and grain) were obtained: hippuric acid; 1·05; urea, 0·778; leucine, 4·246; asparagine, 2·942; aspartic acid, 0·920 gram.

Calcium nitrate produced far more growth (over 10 grams) than any of the organic substances. N. H. J. M.

Sugar as an Agent in Nitrogen Fixation and an Aid to the Growth of Plants. By JOHN GOLDING (*J. Soc. Chem. Ind.*, 1899, **18**, 564—566).—Lucerne, beans, clover, and sainfoin were grown in pure sand, with mineral manure, both with and without addition of cane sugar (5 and 10 grams). The pots, previously sterilised, were inoculated with water containing a portion of a crushed nodule taken from a corresponding plant. The following amounts of green produce were obtained (grams).

	Lucerne.			Beans.
	Stems, &c.	Roots.	Total.	Entire plants.
Without sugar	25·0	16·3	41·3	53·5
With sugar	38·1	21·6	59·7	62·1

The distinct gain in produce under the influence of cane sugar is attributed to increased energy of the nitrogen-fixing bacteria.

N. H. J. M.

Composition of Starfish. By GEORGE WILTON FIELD (*Ann. Rep. Agric. Expt. Stat. Rhode Island,* **10**, 1898, ii, 150—165).—Analyses of starfish (*Asterias Fobesii*) obtained in Narragansett Bay, were made in order to ascertain its value as manure. The percentage results in (1) the live unrinsed starfish and (2) the dry matter of the rinsed starfish were:

	N.	Crude ash.	K_2O.	CaO.	P_2O_5.
(1)	1·80	20·34	0·23	9·62	0·20
(2)	5·20	58·84	0·66	27·82	0·57

N. H. J. M.

Action of Bremen Poudrette on Sandy Soil. By BRUNO TACKE (*Bied. Centr.*, 1899, **28**, 437—438; from *Mitt. Ver. Förd. Moorkultur*, 1897, **15**, No. 22, 369).—In order to ascertain the relative value of the nitrogen of poudrette as compared with that of sodium nitrate, winter rye and potatoes were grown in a cultivated, sandy soil, and manured with 21·07 kilograms of nitrogen per hectare in the two forms. Kainite and basic slag were also applied, and the soil, which contained a good deal of humus, had been previously marled. In a second experiment, 42·15 kilograms of nitrogen were employed

Taking the yield of produce obtained under the influence of nitrogen as 100, the yield of rye manured with poudrette was 58 with the smaller, and 56 with the larger quantity of manure. In the case of potatoes, the action of the smaller amount of nitrogen in the form of poudrette was 65, as compared with 100 for the nitrate. The results of the two experiments taken together show that the nitrogen of the poudrette was equivalent to about 60 per cent. of nitrogen in the form of nitrate, a somewhat higher result than that obtained by Maercker (*Mitt. deut. Landw. Ges.*, 1897, Stck. **17**, 218). N. H. J. M.

How much Basic Slag should be Applied to Meadows? By PAUL WAGNER (*Bied. Centr.*, 1899, **28**, 439—442; from *Deut. landw. Presse*, 1898, **25**, Nos. 1 and 2).—The opinion that 4 cwt. of basic slag per hectare is a sufficient application for the greatest amount of produce is based on an error in Wolff's tables, according to which hay contains 0·43 per cent. of phosphoric acid. Hay from good meadows may contain a considerably higher percentage of phosphoric acid.

According to the amount of phosphoric acid present in the soil, a meadow should receive the first year 12, 16, or 20 cwt. of basic slag, the amount being made up to 24 cwt. the second year. In subsequent years, 5 cwt. of basic slag (containing 16 per cent. of phosphoric acid) may be applied for every cwt. of hay obtained.

In the case of rich soil, containing, for example, 0·15 per cent. of phosphoric acid, a yearly application of 4 cwt. of basic slag would be sufficient for the best crops. N. H. J. M.

Manurial Experiments with Sugar Beet. By MAX MAERCKER (*Bied. Centr.*, 1899, **28**, 442—443; from *Landw. Jahrb.*, 1898, **27**, 32).—The object of the experiments was to ascertain whether a top-dressing of sodium nitrate has an injurious effect on the amount of sugar produced, and whether different varieties of roots are differently affected by the top-dressing.

The different varieties varied less in amount of roots than in leaf production. Generally, but not invariably, there was a relation between the amounts of leaf and of sugar; varieties which produced least leaf contained 2·72 per cent. less sugar than the varieties with the greatest amounts of leaf.

Omission of nitrogenous manure influenced the yield considerably; but the top-dressing of sodium nitrate had, in these experiments, no effect on the sugar production. Probably the particularly favourable season (1896) prevented any injurious action. N. H. J. M.

Manurial and Variety Experiments with Barley. By MAX MAERCKER (*Bied. Centr.*, 1899, **28**, 443—446; from *Landw. Jahrb.*, 1898, **27**, 94).—Although the soil of the field in which the experiments were made contained 0·25 per cent. of potash, the application of kainite increased the yield of grain 192·3 kilograms per hectare; the quality of the grain was also improved, the grain containing 64·3 per cent. of starch instead of 60·0 per cent.

Excess of nitrogenous manure is injurious, especially when there is a deficiency of mineral matter. Guano gave slightly less grain and straw than sodium nitrate, but the grain was of the best quality. In conjunction with guano, potash was without effect.

As regards the composition of barley, the results given for nitrogen in Wolff's tables are too high both for grain and for straw, and the results for potash in grain are somewhat low. Barley-straw was found to contain 1·65 per cent. of soda (Wolff gives 0·16 per cent.), probably owing to the prolonged use of manures rich in soda. N. H. J. M.

Determination of the Manure Requirements of Soils. By GEORG LIEBSCHER and EDLER (*Bied. Centr.*, 1899, **28**, 448—452; from *J. Landw.*, 1896, 84).—Pot experiments were made with oats, and both the produce and the soil analysed. The soil contained 0·6—0·7 per cent. of nitrogen, and the application of nitrogenous manure always increased the yield of produce, whilst without nitrogenous manure the produce was poor in nitrogen. Exclusive potash manuring diminished the percentage of nitrogen in the produce, and complete mineral manure had a still greater effect. Without nitrogenous manure, that is, with small amounts of produce, the percentage of phosphoric acid in the produce was comparatively high. Potash manuring increased in every case the amount of potash in the produce, whilst with a complete manure the percentage of potash was lowest. It is concluded that, under equal conditions of cultivation, including temperature and moisture, the analysis of the crops will give trustworthy evidence as to the wants of the soil, inasmuch as results are obtained in accordance with the results of manuring experiments. Von Seelhorst, however, thinks that this method would not have the same value in practice, since plants grown in the field often differ a good deal in composition from those obtained in pot cultures. N. H. J. M.

Employment of Ammoniacal Manures on Calcareous Soils. By Ercole Giustiniani (*Ann. Agron.*, 1899, **25**, 325—335).—Experiments were made to ascertain the effect of different amounts of chalk on ammonium salts in sterilised sand, and the influence of temperature and moisture on the loss of nitrogen as ammonia. Purified air was passed through the sand (200 grams) to which dilute ammonium sulphate had been added, and afterwards through titrated sulphuric acid in which the ammonia was subsequently determined. In the first experiment, there were four flasks with sand, (1) without and (2, 3, and 4) with 0·36, 10, and 40 per cent. of chalk respectively, a fifth flask containing chalk alone. The amounts of water and of nitrogen as ammonia were 5·0 and 0·054 per cent., and the temperature was 12—24°. In absence of chalk, there was no loss of ammonia, whilst with the smallest amount of chalk, there was a loss of 22·8 per cent. in 22 days, and the loss increased slightly with increased amounts of chalk. With chalk alone, the loss was greatest (26·7 per cent.). The same flasks were next subjected to a higher temperature (30—42°) for 18 days. The total loss (40 days) was almost the same in each case (94·3—95·7 per cent.).

A similar experiment, in which dry air was employed, showed that although 60 per cent. of the moisture in the sand was lost in 10 days, nearly all the ammonia was lost in presence of chalk, the proportion of chalk having no appreciable effect on the result.

On substituting basic slag (0·1, 1, and 3 per cent.) for chalk, it was found that the largest amount caused the loss of most of the ammonia in 24 hours. N. H. J. M.

Analytical Chemistry.

Correct Values of Empirically Divided Hydrometer Scales. By Paul Fuchs (*Zeit. anal. Chem.*, 1899, **38**, 333—341).—The author gives tables showing the true density (at a stated temperature in each case) corresponding with each degree of a number of hydrometers in use for technical purposes. These include the rational Baumé scale, the Beck and Cartier instruments, Fischer's and two other oil-hydrometers, the percentage salinometer, and a special instrument for the percentage of acetic acid in vinegar. As has frequently been pointed out, the instruments in actual use often deviate seriously both from the intended values and from one another. M. J. S.

Volumetric Estimation of Sulphur in Cast Iron, Steel, &c., by Arsenious Acid. By J. Thill (*Zeit. anal. Chem.*, 1899, **38**, 342—344).—The metal is dissolved in hydrochloric acid and the evolved gases passed through a mixture of 25 c.c. of *N*/10 arsenious acid and 50 c.c. of cold saturated sodium hydrogen carbonate solutions. The absorption apparatus of E. Franke, or that of Wiggert and von Reis, is recommended, because it is necessary to cool the vapours from the evolution flask. The acid must be added to the metal very slowly, and then kept just at the boiling point until all the metal is dissolved; the gases are then driven over into the absorption vessel by carbonic anhydride. The arsenite is then acidified, made up to 500 c.c., filtered, and 100 c.c. titrated with *N*/50 iodine solution after making alkaline with ammonium carbonate. Very good results are obtained.

M. J. S.

Estimation of Sulphur in Substances Rich in Iron. By C. Meineke (*Zeit. anal. Chem.*, 1899, **38**, 351—352).—The author has compared Lunge's process for the analysis of pyrites with that recommended by himself and by Heidenreich (this vol., ii, 517, 518), and obtained absolutely identical results. M. J. S.

Electrolytic Method for Estimating Nitrogen in Organic Substances. By C. C. L. G. Budde and C. V. Schou (*Zeit. anal. Chem.*, 1899, **38**, 344—348).—The substance is mixed with 4 c.c. of fuming and 8 c.c. of ordinary sulphuric acid, as in the Kjeldahl process, and the liquid is electrolysed. Rapid oxidation ensues, and the nitrogen is converted into ammonia. The apparatus used is a globular flask of 50 c.c. capacity, with a pocket holding 10 c.c. projecting downwards from the bottom. The electrodes, consisting of a cylindrical anode of platinum foil, with a stout platinum wire in its axis for the cathode, are passed to the bottom of the pocket, and the connecting wires, which are protected by glass tubes, are connected with an electric supply of 8 volts. Only a feeble current passes at first, but the current soon rises to about 10 ampères, and the liquid becomes hot. Sulphurous anhydride is given off, and sulphur is often deposited in the neck of the flask. In about 3/4 hour the liquid will, as a rule, have become colourless, although a small, black deposit often forms, and the cathode is covered with a black powder. About half of the sulphuric acid will have disappeared. Excess of soda is added and the ammonia distilled as usual. A great advantage of the process is that no reagent other than sulphuric acid is required, as this greatly facilitates the examination for inorganic constituents. The electrolysed solution may be diluted and treated with hydrogen sulphide before distilling off the ammonia. Most of the substances tried gave results agreeing more closely with theory than those obtained with the ordinary Kjeldahl process, but uric acid and ethylic cyanurate gave low numbers, and the method is altogether inapplicable to cyclic compounds containing more than one atom of nitrogen in the ring.

M. J. S.

Analysis of Nitrites. By E. Orloff (*Chem. Centr.*, 1899, i, 805; from *Techničeski Sbornik*, 1899, i, 29).—0·1 gram of the nitrite dissolved in 10 c.c. of a 10 per cent. solution of potassium iodide is carefully introduced into a Lunge's nitrometer. 25 c.c. of a solution of 1 gram of arsenious acid and 5 grams of sodium carbonate in 200 c.c. of water are then added; this must, however, be first neutralised by hydrochloric acid and freed from carbonic anhydride by boiling. Finally, 2—3 c.c. of strong hydrochloric acid are added. The brown liquid soon becomes colourless as the iodine is absorbed by the arsenious acid, and consequently the mercury remains clear. The volume of the nitric oxide is now read off and reduced to weight.

L. de K.

Estimation of Carbon and Hydrogen in Organic Substances containing Nitrogen. By Olin F. Tower (*J. Amer. Chem. Soc.*, 1899, **21**, 596—605).—The substance is burnt in a current of purified oxygen, the water being absorbed by calcium chloride, and the carbonic anhydride collected in two soda-lime tubes, a small U-tube containing glass wool moistened with sulphuric acid being placed between the two. When the combustion is finished, the oxygen is swept out by a current of purified air.

When dealing with nitrogenous matter, such as amido- or nitro-compounds, it has not been found necessary to use a spiral of metallic copper, except in the case of picric acid, which appears to yield some nitric peroxide. The soda-lime and the sulphuric acid were afterwards repeatedly tested for nitric compounds, but none were found; moreover, the carbon determinations were quite satisfactory.

L. de K.

Carbon Combustions in a Platinum Crucible. By Porter W. Shimer (*J. Amer. Chem. Soc.*, 1899, **21**, 557—558).—The amount of carbon in steel is estimated as follows:—The sample is treated with an acidified solution of copper potassium chloride, and the carbon collected on asbestos, or a little asbestos is added to the liquid, and then collected on a Gooch crucible. When washed and dried, the asbestos is put, carbon side downwards, into a platinum crucible, taking care that all the carbon is kept within a quarter of an inch of the bottom; if a Gooch crucible has been used, it is placed inside the platinum crucible without its cap. The crucible is then nearly filled with asbestos. The essential part of the apparatus is a water-cooled stopper for closing the crucible; it is made of sheet copper and fitted with a band made of pure black rubber. There is no danger of burning or softening the rubber, for it is cooled by the water passing through the stopper, and also by a wet wick wrapped a few times round the upper part of the crucible, the ends of the wick drawing water from a circular trough kept full by the overflow from the stopper.

The carbon is burnt in a current of purified air, the inlet and outlet tubes for which pass through the stopper, and a blast lamp is used as the source of heat. The products of combustion pass through a small tube containing copper oxide and heated by a single Bunsen burner, and then through a tube filled with glass beads moistened with water, to retain chlorine compounds; no advantage was found to arise from the use of silver sulphate. The gas is then dried over calcium chloride, and the carbonic anhydride is absorbed in a weighed Geissler potash apparatus.

The apparatus may also be used for other purposes, such as the estimation of carbonic anhydride and water in limestone by ignition.

L. de K.

Analysis of Silicon. By Hugo Bornträger (*Zeit. anal. Chem.*, 1899, **38**, 350—351).—About 10 grams of potash are dissolved in 100 c.c. of water in a large silver basin, and 0·5 gram of the finely-divided silicon is added while gently warming. The substance readily dissolves, leaving the alumina, ferric oxide, and ferro-silicon which are present as impurities. These are collected on a filter and washed until free from alkali. They are then dissolved in hydrochloric acid and the solution evaporated. After filtration from traces of silica, the ferric oxide and alumina are precipitated by ammonia and weighed together. The iron is then estimated by reduction and titration. Silicon is found by difference.

M. J. S.

Estimation of Potassium as Platinochloride. By Friedrich Bolm (*Zeit. anal. Chem.*, 1899, **38**, 348—350).—The platinochloride is collected on an unweighed filter (which has been previously washed with hot water and alcohol, and not dried), and is washed with 96 per cent. alcohol. After expelling the adhering alcohol in the oven, the precipitate is dissolved in boiling water and the solution evaporated in a glass or porcelain (not platinum) basin. The salt deposits in concentric rings on the wall of the basin, and can be dried to a constant weight in half an hour at 130°. It may then be reduced by Sonstadt's method (Trans., 1895, **67**, 984) by dissolving it in the basin in a little hot water, adding mercury, and stirring while keeping hot, until the solution is colourless.

M. J. S.

Estimation of Potassium and Sodium [in Rocks]. By Edmond Bonjean (*Bull. Soc. Chim.*, 1899, [iii], **21**, 691—693).—The process recommended differs from those commonly employed, chiefly in the fact that both sodium and potassium are estimated directly. The solution, from which silica, oxide of iron, alumina, and lime have been removed in the usual way, is evaporated to dryness, and the residue, after expulsion of ammonium salts by ignition, dissolved in water, and the magnesium precipitated as ammonium magnesium phosphate. The phosphoric acid in the filtrate is precipitated by 10 per cent. normal lead acetate solution, and the excess of the latter removed by means of hydrogen sulphide. The potassium is finally converted into potassium platinochloride, from which, after collection, the platinum is precipitated by metallic magnesium, whilst the sodium in the filtrate is weighed as sulphate, after removing excess of platinum by treatment with hydrogen sulphide.

N. L.

Volumetric Estimation of Zinc. By Pouget (*Compt. rend.*, 1899, **129**, 45—47).—The process described is based on Rollet and Campredon's method for the estimation of sulphur. The acid solution, mixed with sodium acetate, is treated with ammonia until a permanent precipitate is produced, and then excess of hydrogen sulphide solution is added. The liquid is boiled until hydrogen sulphide is completely expelled, then mixed with a known volume of standard iodine solution, left for a short time, and the excess of iodine titrated with sodium thiosulphate solution, using starch as indicator. In this process, the troublesome filtration and washing of the precipitated zinc sulphide are avoided; the results are accurate. N. L.

Kjeldahl's Process for Destroying Organic Matter Applied to the Detection of Metals in Foods, &c. By A. HALENKE (*Chem. Centr.*, 1899, **1**, 551; from *Zeit. Unters. Nahr.-Genussm.*, **2**, 128—132).—The following process is recommended for the detection of zinc and other volatile metals, with the exception of mercury, in articles of food: 50 grams of the substance, dried apples, for instance, are boiled with 175 c.c. of sulphuric acid and 1 gram of mercuric oxide for 8 hours in a 750 c.c. Kjeldahl flask; the residue occupying about 10 c.c. is dissolved in 250 c.c. of water, the mercury removed by hydrogen sulphide, and any zinc estimated in the filtrate. For the detection of zinc in flour, 25 grams of the sample are first charred by means of 30 c.c. of sulphuric acid; 3 successive portions of 10 c.c. of acid are then added at intervals of 10 minutes, and after heating for another half-hour, 65 c.c. more acid and 1 gram of mercuric oxide are added and the mixture boiled for five hours. If not sufficiently concentrated, the liquid is transferred to a platinum dish and boiled down to 20 c.c. The residue is then dissolved in water and treated as directed. The test analysis is satisfactory. L. DE K.

Titration of Iron in Hydrochloric Acid Solution. By WILLENZ (*Chem. Centr.*, 1899, **1**, 638—639; from *Ann. chim. anal. appl.*, **4**, 37—41).—The author recommends a process originated by Reinhard, but now almost forgotten (compare, however, Abstr., 1898, ii, 646). 60 grams of tin are dissolved in 250 c.c. of hydrochloric acid of sp. gr. 1·19 and then diluted to 500 c.c.; after filtering, 500 c.c. of acid of sp. gr. 1·12 are added and then 1 litre of water. A solution is also prepared containing 200 grams of crystallised manganous sulphate in a litre of water and mixed with 200 c.c. of sulphuric acid. To the boiling solution of the ferric salt the solution of the tin is gradually added until the yellow colour has completely vanished; large excess should be avoided. The source of heat is now removed and 60 c.c. of the manganese solution, 600 c.c. of cold water and 50 c.c. of a cold-saturated solution of mercuric chloride are added and the iron at once titrated with permanganate.

L. DE K.

Influence of Ammonium Salts on the Precipitation of Nickel by Ammonia. By ARTHUR MARSHALL (*Analyst*, 1899, **24**, 202—205).—Unless a large excess of ammonium salts or free ammonia are present, dilute ammoniacal solutions of nickel are apt to deposit a large quantity of the metal as a basic salt, particularly on warming; the presence of sufficient tartaric acid, however, prevents the precipitation.

In one experiment, about 60 per cent. of the nickel present was precipitated as a light green deposit having the composition

$$NiSO_4,8NiO,16H_2O.$$

Cobalt and zinc behave in a similar manner. L. DE K.

Separations of Metallic Sulphides by Means of Hydrogen Chloride. By J. Bird Moyer (*J. Amer. Chem. Soc.*, 1899, **21**, 642—645).—The sulphides of arsenic, antimony, or bismuth may be separated from lead sulphide by passing hydrogen chloride over the heated mixture; sulphide of arsenic may also be separated from sulphides of cadmium or silver in a similar manner. The non-volatile sulphides are converted more or less completely into chlorides during the process. J. J. S.

Analysis of Water. By George H. Bailey and J. H. Johnston (*J. Soc. Chem. Ind.*, 1899, **18**, 455—457).—*Use of phenolphthalein as an indicator.*—When determining the acidity in water by titrating with standard alkali, using phenolphthalein as indicator, the results may be vitiated by the presence of ammonium salts. If to a solution of ammonium chloride phenolphthalein and solution of sodium hydroxide are added, a considerable quantity of the latter may be added before the liquid turns red; on diluting, it is decolorised and then consumes another portion of alkali; the process is also considerably influenced by the temperature.

Collection and examination of samples of water.—The authors show the necessity of having the bottles completely filled and carefully stoppered; even then the analysis ought not to be delayed. Examples are given where the free ammonia, originally large, had completely disappeared in a fortnight, and the albuminoid ammonia had also much diminished. This is due to oxidation by the oxygen dissolved in the water, as proved by the proportional increase in the nitrites and nitrates.

Acidity of boiler waters and steam.—Acid waters act seriously on the boiler, but not until the acidity (calculated as hydrogen chloride) reaches nearly 1 per cent. will there be any danger of acid escaping with the steam and injuring the steam valves. Acid may be liberated in the boiling water by decomposition of certain neutral salts, such as magnesium chloride. L. de K.

Use of Hyposulphite for Titration, especially for the Estimation of Oxygen in Water and Sewage Effluents. By B. William Gerland (*J. Soc. Chem. Ind.*, 1899, **18**, 340—342).—The author gives further instructions as to the estimation of dissolved oxygen in waters, the method employed being substantially the same as the one described in a former paper (*J. Soc. Chem. Ind.*, 1896, **15**, 16). Ordinary coal gas is still employed to displace the air in the apparatus after being freed from oxygen by passing it through an iron pipe filled with copper filings and heated to redness. As regards the indigo used in the process, it is of importance to use a preparation which, when treated with solution of hyposulphite (hydrosulphite), shall change to a yellow, and not to a brown, colour; such indigo may be prepared as follows: indigo is treated with hydrochloric acid, washed, digested with weak caustic soda or ammonia, washed, dried, and crystallised from boiling nitrobenzene. The crystals are washed with benzene, dried, warmed with hydrochloric acid, roughly washed and digested for some hours with hydrogen peroxide or ammonium persulphate in acid solution. After filtering, the product is first washed with water, then with weak ammonia, and when dry exhausted with strong alcohol. After drying at 110°, it may be regarded as pure indigotin, which is then dissolved with the usual precautions in strong sulphuric acid. L. DE K.

Distinctions between Mercuric Cyanide and Oxycyanide. By VON PIEVERLING (*Chem. Centr.*, 1899, i, 504; from *Pharm. Centr. Halle*, **39**, 615—616).—Mercuric cyanide forms well-defined crystals, is more readily soluble in water than the oxycyanide, and is neutral to test-paper, whilst the oxycyanide forms a yellowish, crystalline powder having an alkaline reaction. The oxycyanide is precipitated by ammonia or tannin, and also by disodium hydrogen phosphate or potassium chromate in the presence of ammonia; these precipitates are rapidly reduced by stannous chloride. If a solution of mercuric cyanide (1 : 20) is mixed with a solution of potassium iodide (1 : 3), crystals of silvery lustre are gradually formed, which dissolve in ammonia and more water to a colourless liquid. A solution of the oxycyanide (1 : 20), when similarly treated, turns yellow and becomes turbid and orange-red on adding ammonia. On standing, a reddish-brown precipitate is formed, which is soluble in potassium iodide; this solution also deposits silvery crystals. L. DE K.

Distinction between Mercuric Cyanide and Oxycyanide. By WILLY WOBBE (*Chem. Centr.*, 1899, i, 504—505; from *Pharm. Centr. Halle*, **39**, 934—935).—The author criticises von Pieverling's paper (preceding abstract) and states that the tests fail with dilute (1 per cent.) solutions. The following tests are proposed: the oxycyanide forms a micro-crystalline, faint yellowish, and faintly alkaline powder. Its 5 per cent. solution is precipitated by tannin and reduced by stannous chloride, whilst ammonia yields a precipitate soluble in excess. Disodium hydrogen phosphate or potassium chromate gives a precipitate soluble in ammonia. A 5 per cent. solution of potassium iodide, added drop by drop, gives a yellow coloration, turning red on adding ammonia; after a while, a reddish-brown precipitate forms, which is soluble in potassium iodide. Hydrogen sulphide or ammonium sulphide precipitates mercuric sulphide. L. DE K.

Mercuric Oxycyanide. By VON PIEVERLING (*Chem. Centr.*, 1899, i, 505; from *Pharm. Centr. Halle*, **40**, 22—23).—The author, in reply to Wobbe (preceding abstract), states that the commercial oxycyanides vary much in composition and rarely agree with the formula $HgO,HgCy_2$; this explains the varying surgical value of these preparations. The author agrees that, to make his tests work well, strong solutions should be employed.

A proper article should conform to the following test: 3 c.c. of its 5 per cent. solution should give a deep yellow colour on adding 3 drops of a 50 per cent. solution of potassium iodide. L. DE K.

Estimation of Alcohol and Ether in the Presence of Light Petroleum. By HENRY DROOP RICHMOND (*Analyst*, 1899, **24**, 201—202).—*Estimation of alcohol.*—20 c.c. of the mixture are shaken with 25 c.c. of water, saturated with ether, and the volume of the ethereal layer (A) is noted. The aqueous layer is drawn off and the liquid is again shaken with 25 c.c. of etherised water; the volume (B) of the ethereal layer is then again noted. Then 2A – B gives the volume of ether and light petroleum and $(20 + B - 2A) \times 5$ equals the percentage by volume of alcohol in the original mixture.

Estimation of light petroleum.—A mixture is prepared of 20 c.c. of 90 per cent. sulphuric acid and 20 c.c. of glacial acetic acid. When cold, 10 c.c. of the sample is introduced into a burette and the acid is gradually added, the mixture being well shaken after each addition. The ether and alcohol are completely dissolved and the volume of light petroleum is then read off. Two satisfactory test-analyses are given. L. DE K.

Chemistry and Analysis of Wine. By MAXIMILIAN RIPPER (*Chem. Centr.*, 1899, i, 548—549; from *Zeit. Landw. Vers.-Wes. Öst.*, 2, 12—23).—The author calls attention to the importance of the ethereal salts in wine. Claret, for instance, is medicinally preferable to white wines, notwithstanding that it contains more tannin, on account of its larger percentage of volatile ethereal salts. The author divides the ethereal salts into two classes, volatile and non-volatile. Those which are volatile are divided into compounds which distil unaltered and others which suffer decomposition; a quantitative separation of these two groups is as yet impossible. The chief constituent of the first group is ethylic acetate, whilst small quantities of ethylic butyrate and ethylic succinate are also present; in practice, these may be expressed as acetate. The author contradicts the statement that the volatile ethereal salts of wine are only saponified by hot alkalis, as it was found that, with a reasonable excess of potassium hydroxide dissolved in proof-spirit, saponification was complete within an hour. Allowance must, of course, be made for the volatile acid accompanying the ethers when estimating their amount by the saponification process.

The detection and separation of the non-volatile ethereal salts in wine is beset with difficulties, and the author has only isolated ethylic tartrate and glycerylic tartrate. L. DE K.

Analysis of Wines. By MAX BARTH (*Chem. Centr.*, 1899, i, 550; from *Zeit. Unters. Nahr.-Genussm.*, 2, 106—118).—The product obtained by fermenting pressed out grapes often mixed with stalks consists of an inferior wine with a large extract in which tannin predominates. To identify such a wine or to detect its presence in other wines, a new colorimetic method for the estimation of tannin has been devised.

A standard solution is prepared containing in 100 c.c. 0·2 gram of acetic acid, 6 grams of alcohol and 0·05 gram of pure tannin. Of this, 10 c.c. is mixed in a Desaga's tannin tube with 1 c.c. of a 20 per cent. solution of sodium acetate and 5 drops of a 10 per cent. solution of ferric chloride. A black liquid is obtained, quite opaque on the top and only just transparent when viewed through the elongated bottom part of the tube. More dilute solutions for comparison cannot be prepared from this, as oak bark tannin gives on dilution quite different tones to œnotannin; the solution actually used for comparison is therefore prepared as follows: An alcoholic extract is made of fresh, undried grape stones, which is then diluted with water containing 0·2 per cent. of acetic acid until the coloration obtained on adding ferric chloride is the same as that given by the standard solution. This solution can be diluted to any desired extent for purposes of comparison.

The sample to be tested must be quite clear and its acidity is rendered exactly 0·2 per cent. by volume, either by partially neutralising or else by carefully adding acetic acid. If it should contain more tannin than the standard solution, it must be suitably diluted with water containing 0·2 per cent. of acetic acid. The ferric chloride should be put into the two tubes at as nearly as possible the same moment. L. DE K.

A New Principle for the Testing of Sugared ("Gallisierter") Wines. By MÖSLINGER (*Chem. Centr.*, 1899, 1, 549—550; from *Zeit. Unters. Nahr.-Genussm.*, 2, 93—106).—The author states that sugared wines invariably show a less amount of residual acidity than true wines. This residual acidity is found by subtracting from the total acidity the acidity due to the volatile acids calculated as tartaric acid, and also the free and half-combined tartaric acid; the figure obtained is not less than 0·28 per cent. in genuine wines.

As it is possible to defeat this test by adding citric acid, the author has devised a simple method for the detection of that acid. 50 c.c. of the sample are evaporated to a thin syrup and then mixed slowly with 70—80 c.c. of 95 per cent. alcohol. (Free tartaric acid must first be removed by adding a calculated quantity of potassium hydroxide and so converting it into potassium hydrogen tartrate.) The filtrate is freed from alcohol by evaporating to 10 c.c.; 5 c.c. of this is then mixed with 0·5 c.c. of acetic acid and a strong solution of lead acetate is added; if citric acid is present, a precipitate is obtained which disappears on heating. The hot liquid, if turbid, is filtered, and any citrate precipitate will then reappear on cooling. L. DE K.

New Method for the Analysis of Commercial Phenols. By SAMUEL B. SCHRYVER (*J. Soc. Chem. Ind.*, 1899, **18**, 553—556).—The process is based on the fact that phenol and its homologues (1 mol.), when acting on sodamide, liberate ammonia (1 mol.). About ½ gram of finely-powdered sodamide is washed a few times by decantation with small quantities of benzene, and then introduced into a 200 c.c. distilling flask fitted with a separating funnel and with an inverted condenser in connection with an apparatus for absorbing ammonia, and this in turn with an aspirator. About 60 c.c. of benzene are introduced into the flask, and this is boiled on the water-bath for 10 minutes, a slow current of dry air, free from carbonic anhydride, being drawn through in order to free the apparatus and contents from ammonia. 20 c.c. of *N* sulphuric acid are then placed in the absorption apparatus, and the solution of the phenol in pure benzene (freed from any moisture by prolonged contact with fused sodium acetate) then introduced into the distilling flask and the boiling continued; the ammonia evolved is absorbed by the standard sulphuric acid, the excess of which is then titrated with sodium carbonate, using methyl-orange as indicator.

The method may be successfully employed for the estimation of phenols in essential oils, such as guaiacol in wood tar, thymol in oil of thyme, and eugenol in oil of cloves. If the total weight of two phenols is known, their respective amounts may be approximately calculated from the amount of ammonia evolved.

Water in phenols may be estimated by making two experiments, one before, and one after drying; the difference in ammonia represents moisture. L. DE K.

Volumetric Estimation of Glucose. By LÉON GARNIER (*J. Pharm.*, 1899, [vi], **9**, 326—330. Compare this vol., ii, 529).—This process is a modification of the Haen-Lehmann method, and is carried out as follows:—50 c.c. of Fehling's solution (10 c.c. = 0·05 gram glucose) are placed in a porcelain dish, diluted with an equal volume of water, and heated to boiling, and to this is added a volume of the glucose solution insufficient for the complete reduction of the Fehling's solution. The liquid is boiled for 2 minutes and poured into a 250 c.c. flask, which is filled to the graduation mark with boiling distilled water. The whole is rapidly cooled, accurately diluted to 250 c.c., and thoroughly mixed, the flask then corked and left for 2—6 hours until the liquid is quite clear.

The excess of Fehling's solution is determined thus:—To 25 c.c. of the clear solution contained in a stoppered flask are added 1 c.c. of dilute sulphuric acid (1 : 3) and 10 c.c. of iodine solution, prepared by dissolving 1 gram of iodine and 1·5 grams of potassium iodide in 200 c.c. of water. The flask is corked and left for ten minutes, a little starch paste is added, and then thiosulphate solution (1 c.c. = 1 c.c. iodine solution) in slight excess; the blue colour is brought back by the careful addition of iodine solution. The strength of the iodine solution is determined by titrating 5 c.c. of the Fehling's solution in the manner just described. From the data so obtained, the volume of Fehling's solution reduced by the glucose is readily calculated. H. R. LE S.

Estimation of Methylated Pentoses. By EMIL VOTOČEK (*Chem. Centr.*, 1899, i, 642; from *Zeit. Zuck.-Ind. Bohm.*, **23**, 229—241. Compare Abstr., 1897, i, 405).—The compound, such as rhamnose, is distilled with hydrochloric acid of 12 per cent. strength, the liquid in the distilling flask being constantly replenished with acid, until 400 c.c. have been collected in the receiver; strong hydrochloric acid is then added to make up to 500 c.c., the liquid being now supposed to contain 12 per cent. of hydrogen chloride. Two hundred c.c. of the liquid are mixed with about three times as much pure, powdered phloroglucinol as is actually required, and after some time the precipitate, consisting of methylfurfuraldehyde-phloroglucide, is collected, washed until the red colour has changed to yellow, dried at 110° in a current of hydrogen, and weighed. The compound may contain an admixture of furfuraldehyde-phloroglucide, but the joint amount of methylfurfuraldehyde and furfuraldehyde may be calculated with reasonable accuracy by multiplying the weight obtained by 1·024. To estimate methylfurfuraldehyde and furfuraldehyde in the presence of each other, Schiff's reaction may be utilised. One hundred c.c. of the distillate are neutralised with soda, acetic acid is added until its amount reaches 5 per cent., and an alcoholic solution of xylidine is added, which gives a red coloration with the furfuraldehyde. After remaining for half an hour in the dark, the liquid is tested in a Krüss colorimeter, using as the liquid for comparison a 0·01 per cent. solution of furfuraldehyde in 5 per cent. acetic acid mixed with xylidine solution. If much methylfurfuraldehyde is present, the yellow colour of the methylfurfurylidenexylidine interferes with the red colour, so that in such a case the test should be made in gas-light. The process is not trustworthy if only relatively small quantities of methylfurfuraldehyde are present, as it is then no longer admissible to estimate this by difference; a direct colorimetric test for this substance has yet to be found.

The presence of methylfurfuraldehyde in the acid distillate of the seeds of beet shows these to contain methylpentoses. L. DE K.

Influence of Temperature on the Specific Rotation of Sucrose, and a Method of Correcting Readings of Compensating Polariscopes therefor. By HARVEY W. WILEY (*J. Amer. Chem. Soc.*, 1899, 21, 568—596).—The author has made a lengthy investigation as to the influence of temperature on the specific rotatory power of sucrose and has tabulated the results.

It is now proved beyond doubt that the rotatory power of sucrose at 17·5° is 66·547, whilst at 4° it is 66·657, and at 40°, 66·299. It therefore increases when the temperature falls and decreases as the temperature rises, but the mean rate of increase is not the same at every temperature, as it appears to be greater from 15° to 17·5°, from 20° to 25°, and from 30° to 35° than at other points at which the observations were made. L. DE K.

Estimation of Pentosans and its Application to Food Analysis. By OTTO HEHNER and WILLIAM P. SKERTCHLY (*Analyst*, 1899, 24, 178—183).—An important factor in the analysis of such articles as cocoa, pepper, mustard, coffee, &c., is the amount of husk. This may be determined by the well-known acid-alkali method, but the authors have found that much better results are obtained by estimating the amount of pentosans and calculating the husk from these constituents.

Black pepper, for instance, gave about twice as much crude fibre as white pepper, but it yielded three times the amount of pentosans. Pressed cocoa contains 6—7 per cent. of crude fibre, and cocoa-shell powder about 12 per cent., but whilst the former contains only 2 per cent. of pentosans, the shells contain 8—9 per cent. Pure mustard flour contains but little pentosan, whilst mustard husk contains a large quantity. There is also a decided difference in the amount of pentosan yielded by coffee and chicory.

The results are fully explained and tabulated. The analytical process used is the one recommended by Tollens and Krüger (Abstr., 1897, ii, 353) coupled with Councler's method for the estimation of furfuraldehyde (Abstr., 1895, ii, 144). L. DE K.

Estimation of Starch in Sausage Meat. By HENRICH WELLER (*Zeit. anal. Chem.*, 1899, **38**, 375; from *Forsch. Lebensmittel*, &c., **3**, 430; *Zeit. Unters. Nahr.-Genussm.*, 1, 167).—Use is made of the solubility of starch in zinc chloride and the optical activity of the solution. 40 grams of the finely divided material are mixed with 100 c.c. of water, 0·3 gram of zinc chloride, and 0·5 gram of hydrochloric acid of sp. gr. 1·19, and heated for half an hour in boiling water. After cooling, it is made up to 200 c.c. with water, and the turbid liquid strained. Of this, 50 c.c. are mixed with 0·3 gram of zinc chloride and 0·5 gram of hydrochloric acid and heated to boiling; after cooling, it is made up to 100 c.c. with cold saturated mercuric chloride solution, by which means the optically active proteids are precipitated. The clear filtrate is then polarised in a 200 mm. tube. The different starches exhibit different rotations, 1° Ventzke corresponding with 0·37732 gram of potato starch (in 40 grams of substance), 0·40966 gram of wheat starch, or 0·48284 gram of rye starch. The variety of starch must therefore be ascertained by microscopic examination. The method does not serve for sausage meat containing liver, in consequence of the presence of glycogen and other optically active substances. M. J. S.

Detection of Maize Starch in Wheat-Flour. By KARL BAUMANN (*Chem. Centr.*, 1899, 1, 547; from *Zeit. Unters. Nahr.-Genussm.*, **2**, 27—29).—The author finds that chloral rapidly gelatinises both maize and wheat starches, and cannot therefore be successfully used for distinguishing between them. A more suitable reagent is a solution of potassium hydroxide of 1·8 per cent. strength. 0·1 gram of the suspected flour is treated in a test tube with 10 c.c. of the alkali for 2 minutes, and the alkali is then nearly neutralised by adding 4—5 drops of 25 per cent. hydrochloric acid. The wheat starch is completely gelatinised by this treatment, whilst the maize starch remains intact and may be readily recognised microscopically. Rye-flour gelatinises even more quickly than wheat-flour.

L. DE K.

Examination of Commercial Flour. By HENRY KRAEMER (*J. Amer. Chem. Soc.*, 1899, **21**, 650—663).—Details are given of micro-chemical methods for the detection of maize in wheaten flour.

Detection of Formaldehyde by Means of Phloroglucinol. By LUDWIG VANINO (*Chem. Centr.*, 1899, i, 710; from *Pharm. Centr. Halle*, **40**, 101—102).—The author (compare Abstr., 1898, **2**, 545) recommends Jorissen's phloroglucinol test for the detection of formaldehyde in milk. 8—10 c.c. of the sample are mixed with 1—2 c.c. of a 0·1 per cent. solution of phloroglucinol and a few drops of aqueous soda. A reddish coloration is noticed even when the milk contains but 4 parts of formaldehyde per million. The reaction is most pronounced with liquids containing 0·5 per cent., but if larger quantities of formaldehyde are present, the test becomes less distinct, and with more than 3 per cent. fails altogether. L. DE K.

Detection of Formaldehyde in Food Stuffs. By FERDINAND JEAN (*Chem. Centr.*, 1899, 1, 641; from *Ann. chim. anal. appl.*, 4, 41—42).—The substance to be tested is rubbed to a thin paste with water containing about one per cent. of sulphuric acid. When dealing with milk, 100 c.c. of the sample are mixed with 4 drops of sulphuric acid, heated in a 300 c.c. flask to 80° for a few minutes, and, after adding excess of dry powdered sodium sulphate, 50 c.c. are distilled. The distillate is then tested for formaldehyde. It turns red on adding a solution of magenta previously decolorised by sulphurous acid; with aqueous solution of aniline, a milky turbidity is obtained, and with Nessler's reagent a yellowish- afterwards brownish-red, precipitate is formed. Phenylhydrazine hydrochloride gives a white turbidity, and an alkaline solution of sodium nitroprusside a blue colour; these tests distinguish it from acetaldehyde which gives a reddish colour.

To make perfectly sure, the following test should be applied:—The distillate is mixed with 3 drops of sulphuric acid and ten drops of dimethylaniline and heated for 1—2 hours in a sealed tube at 40° with frequent shaking; the contents are then put into a porcelain dish, made alkaline with soda, and boiled to expel the dimethylaniline. A slight excess of acetic acid is added and then a trace of lead dioxide, when an intense blue colour will develop should formaldehyde have been present. By this process any formaldehyde which has entered into combination with proteids is also liberated. L. DE K.

Estimation of Organic Acids in Urine. By LEO STEINDLER (*Chem. Centr.*, 1899, i, 643; from *Österr. Chem. Zeit.*, 2, 70).—The sample of urine is first titrated with standard acid, using methyl-orange as indicator; this shows the point when the first traces of organic acid are being liberated. The titration is now repeated, using as indicator a solution of dimethylamidoazobenzene, which will turn red the moment the organic acids are completely liberated; the difference between the two titrations is due to organic acids, which may be conveniently expressed in terms of hydrochloric acid. The author believes that the process involves no serious sources of error.

L. DE K.

Quantitative Separation of Isovaleric and Acetic Acids. By ALFRED C. CHAPMAN (*Analyst*, 1899, 24, 114—116).—The mixed acids are carefully neutralised with sodium hydroxide, the water is distilled off under reduced pressure, and the residue dried for a short time at 100°; it is then powdered and boiled with acetone, which must contain exactly 0·5 per cent. of water, when the sodium isovalerate alone dissolves; the liquid is filtered hot, and the residue is washed with hot acetone. After distilling off the solvent, the sodium isovalerate is treated with sulphuric acid to convert it into sodium sulphate, which is then weighed; the undissolved sodium acetate is also converted into sulphate, and from the amounts of sulphate obtained the quantities of the respective acids are calculated.

L. DE K.

Wine-Vinegar. By K. Farnsteiner (*Chem. Centr.*, 1899, i, 710—711; from *Zeit. Unters. Nahr.-Genussm.*, **2**, 198—209).—Three samples of wine were mixed with one-fifth of their bulk of wine-vinegar and allowed to undergo acetous fermentation. Of each three analyses were made, one at the beginning of the experiment, one some three weeks later, and another after four months. The results, which have been tabulated, show a large decrease in alcohol and also a loss in solid matter. The amount of total fixed acidity has decreased, but as the tartaric acid remains unchanged, the loss must have been caused by the disappearance of malic acid. A volatile substance having strong reducing properties, although seemingly not an aldehyde, has been detected in four years old wine-vinegars, but not in commercial samples. L. de K.

Detection and Separation of some Unsaturated Fatty Acids. By K. Farnsteiner (*Chem. Centr.*, 1899, i, 545—547; from *Zeit. Unters. Nahr.-Genussm.*, **2**, 1—27).—*Conversion of oleic acid into elaidic acid by nitrous acid, and separation of elaidic acid from other unsaturated acids.*—Oleic acid may be separated from elaidic acid by treating the mixed lead salts with ether, in which the elaidate is insoluble; or the mixture may be treated with hot benzene, when the elaidate will separate in crystals on cooling. The best way to convert oleic acid into elaidic acid is to act on 1 gram of the acid at 10—20° with 20—25 c.c. of nitric oxide in an apparatus from which the air has been removed; an equal volume of oxygen is then introduced, and the flask is well shaken. The elaidic acid, which, however, contains about 14—18 per cent. of oleic acid, is then obtained as a bluish- or greenish-white substance which may be reduced to powder, and melts at 43°.

Estimation of oleic acid.—Dried barium oleate is practically insoluble in benzene; if 5 per cent. of 95 per cent. alcohol is added, it dissolves on boiling, but practically all deposits on cooling. The barium salts may be obtained directly by heating the fats for 15 minutes with a solution of barium hydroxide in a mixture of equal volumes of benzene and methylic alcohol.

A table is given showing the amount of saturated acids, unsaturated acids, and oleic acid in olive oil, ground-nut oil, lard, and cocoa butter.

Detection and estimation of linoleic acid.—By brominating liquid fatty acids Hazura has obtained the compounds $C_{18}H_{32}O_2Br_4$ and $C_{18}H_{30}O_2Br_6$. On reduction, the first yields linoleic acid, and the second linolenic acid. A process of estimating the tetrabrominated compound is based on its sparing solubility in light petroleum. When both occur together, they are dissolved in 50 times their weight of benzene, an equal volume of absolute alcohol is added, and the solution is titrated hot with standard alcoholic potash, with phenolphthalein as indicator. On cooling, potassium hexabromolinolenate is deposited, whilst potassium tetrabromolinoleate remains in solution.

L. de K.

Estimation of Oxalic Acid in Urine. By Ernst Salkowski (*Zeit. anal. Chem.*, 1899, **38**, 394; from *Centr. med. Wiss.*, 1899, 257).—Advantage is taken of the solubility of oxalic acid and almost complete insolubility of phosphoric acid in ether. Half a litre of urine is evaporated to one-third, mixed with 20 c.c. of hydrochloric acid of sp. gr. 1·12, and thrice extracted by shaking with 200—250 c.c. of ether containing 5—10 per cent. of alcohol. The ethereal extract is filtered through a dry filter, distilled, and after addition of water concentrated to about 20 c.c., the solution made feebly alkaline with ammonia, mixed with 1—2 c.c. of calcium chloride, and acidified with acetic acid. The precipitate of calcium oxalate is weighed in the usual manner. With a mixed diet, human urine contains 0·128 gram of oxalic acid per 100 grams of nitrogen. M. J. S.

Solubility of Calcium Tartrate. By HENRIK ENELL (*Zeit. anal. Chem.*, 1899, **38**, 368—369; from *Nordisk. farm. tid.* 1896).—At 15°, 1 part of calcium tartrate dissolves in 2630 parts of water, 3850 parts of glacial acetic acid, 296—303 parts of 25 per cent. acetic acid, 2280 to 5242 parts of concentrated potassium hydrogen tartrate solution, or 350—385 parts of 3 per cent. acetic acid saturated with potassium hydrogen tartrate. Potassium hydrogen tartrate containing calcium may be readily purified by washing with dilute acetic acid (compare Abstr., 1897, ii, 608). M. J. S.

Estimation of Uric Acid. By E. MALLET (*Zeit. anal. Chem.*, 1899, **38**, 396—397; from *Ann. chim. anal. appl.*, **4**, 82).—The uric acid is precipitated as copper salt by mixing 100 c.c. of urine with 10 c.c. of a 16 per cent. solution of sodium carbonate and taking 82 c.c. of the filtrate for the precipitation of the copper salt. The latter, after washing until free from alkali, is dissolved in 500 c.c. of water containing 5 c.c. of sulphuric acid, and titrated with *N*/10 permanganate. The number of c.c. of permanganate expresses directly the number of centigrams of uric acid per litre of urine. M. J. S.

Preparation of Homogentisic Acid and its Detection in Urine. By KARL H. HUPPERT (*Zeit. anal. Chem.*, 1899, **38**, 395—396; from *Deut. Arch. klin. Med.*, **64**).—The urine, concentrated to one-sixth, is shaken with $1\frac{1}{2}$—2 vols. of ether; the residue from the ethereal extract is dissolved in water, and the boiling solution precipitated by a copious addition of lead acetate, the dark coloured precipitate being immediately removed by filtration. The crystals, which will have deposited from the filtrate by the following day, are collected, washed well with water, and treated with hydrogen sulphide in boiling water. The solution is freed from hydrogen sulphide by heating to 55—60° in a vacuum, and the precipitation with lead acetate, &c., repeated until a white lead salt is obtained. The acid solution obtained from this deposits crystals when concentrated in a vacuum over sulphuric acid. A further quantity may be obtained from the mother liquor of the first crop of crude lead salt by treating with hydrogen sulphide, concentrating the filtrate, triturating with solid lead acetate, and washing the paste on a suction filter, first with a saturated lead acetate solution, and then with water. This precipitate is then purified as before.

On moistening the solid acid with potash solution and allowing access of air, the crystals become surrounded with a dark green border which persists as long as any of the substance remains undissolved, and passes then into brown. If the crystals are completely immersed in the liquid, the brown coloration is obtained at once. A solution of the crystals in methylic alcohol treated with sodium methoxide exhibits a blue colour in thin layers (compare Abstr., 1897, ii, 576; 1891, 1129; 1892, 925). M. J. S.

Composition of Milk and Milk Products. By HENRY DROOP RICHMOND (*Analyst*, 1899, **24**, 197—201. Compare Abstr., 1897, ii, 511).—The paper deals with a large number (over 29,000) of samples of milk analysed in the laboratory of the Aylesbury Dairy Co. in 1898.

The standards for milk again prove to be fair, as most of the samples were much above the requirements in every constituent; a few gave non-fatty solids so low that, judging by these only, they might have been condemned as containing 5—6 per cent. of water, but it was ascertained that the deficiency was mainly in milk-sugar, the more important constituents—fat, proteids, and ash—being present in normal quantity. No sample which falls a little below the accepted standard should be condemned unless the proteids and ash are also rather low. Vieth's ratio for sugar, proteids, and ash of 13 : 9 : 2 was again practically confirmed.

An analysis of cream shows the great variation in the composition of this article, but it seems that the non-fatty solids contain the usual proportion of milk sugar, which fact upsets Storch's evidence for the presence of a new proteid in milk (Abstr., 1897, ii, 420).

Analyses of butter are communicated, showing that the refractive index at 35° varies from 46—47°; a butter prepared in the Channel Islands gave, however, the figure 43·8°.

Interesting analyses are given of so-called "putrid slime," which is in reality a product from milk deposited on the sides of the drum of a separator: *Solids* (of one of the three samples examined), 29·2; *fat*, 1·3; *milk solids*, calculated, 7·2; other *non-fatty solids*, 17·5; *ash*, 3·2, including 1·28 P_2O_5. This substance, although also containing any dirt present in the milk, is no doubt largely composed of Storch's mucoid. Its average quantity in milk amounts to about 0·032 per cent. L. DE K.

Milk Analysis. By LEONARD DE KONINGH (*Analyst*, 1899, **24**, 142—146).—*Analysis of sour milk.*—If this is not too much decomposed, the sp. gr. may be taken with a milk-hydrometer, the sample being previously liquefied by adding 5 c.c. (or more) of a solution of sodium hydroxide of sp. gr. 1·03 to 95 c.c. of the sample. If the sp. gr. of the mixture should differ much from 1·030, a correction should be made by deducting from the gravity found (excess over 1000) 1·5, and dividing the difference by 0·95. As, however, milk loses in gravity by addition of alkali, the author suggests the addition of 0·8 to the gravity obtained. The alkaline milk may be used for the estimation of the fat in the Leffmann-Beam apparatus, allowance being made for the slight dilution.

Detection of cane sugar.—As the ordinary non-fatty solids process may fail where cane-sugar has been added to mask the adulteration, it is suggested that all samples should be tested for cane sugar by a slightly modified form of Cotton's molybdic acid process; 10 c.c. of the milk are mixed with 2 c.c. of a cold saturated solution of pure ammonium molybdate and 8 c.c. of dilute hydrochloric acid (1 : 8), and the mixture heated for 5 minutes at 80°. A blue coloration is developed if the sample contains 5 per cent. or more of added sugar solution of sp. gr. 1·0308. If the milk is very stale, the test is less satisfactory.

Detection of boric acid.—100 c.c. of the sample are heated to boiling in a large beaker covered with a light dish containing cold water; the flame is at once removed and 8 c.c. of dilute nitric acid (1 part of fuming acid diluted to 50 parts) added; the coagulum which forms will occupy about 8 c.c. When cold, the liquid is filtered through muslin, 80 c.c. are collected, and 0·8 gram of dry sodium carbonate added; the whole may now be rapidly evaporated and burnt in a large platinum dish, and the portion soluble in water then tested for boric acid by any recognised process. L. DE K.

Possible Source of Error in Modifications of the Leffmann-Beam Method for the Estimation of Fat in Milk. By HENRY DROOP RICHMOND and F. R. O'SHAUGHNESSY (*Analyst*, 1899, **24**, 146—148).—In the original process devised by Leffmann and Beam, the milk was mixed with a solution consisting of equal volumes of amylic alcohol and hydrochloric acid, and finally with sulphuric acid. In a modification of this process devised by Gerber the use of hydrochloric acid is omitted. From the results of a series of experiments the authors conclude that Gerber's method, when carefully practised, generally gives good results, but may at times lead to error, particularly in hot weather. They also show the advisability of first adding the sulphuric acid, next the milk, and then the amylic alcohol. If the acid and amylic alcohol are added first, a mixture is obtained which, when diluted with milk, throws up an amylic compound, by which the layer of fat may become sensibly increased in volume.

L. DE K.

Estimation of Fat in Milk, using Light Petroleum as a Solvent. By HENRY DROOP RICHMOND and C. H. ROSIER (*Analyst*, 1899, **24**, 172—174).—The authors prefer using light petroleum instead of ether in milk analyses, as it is insoluble in aqueous liquids. To properly extract the fat, the operation should be conducted as follows: 9 c.c. of 91 per cent. sulphuric acid are measured into a tube holding 50 c.c. and constricted just above the point to which 20 c.c. reaches; 10 grams of milk are introduced without mixing it with the acid, and 0·9 c.c. of amylic alcohol is then added, and the whole well shaken. When cooled to 25°, 20 c.c. of light petroleum are added, and the mixture is again thoroughly shaken two or three times. When separation is complete, the petroleum is blown off into a tube containing 20 c.c. of water, with which it is shaken to remove traces of acid; the acid liquid is washed with a little more light petroleum, which is added to the main bulk. The fat solution is finally blown off into a tared flask, and the light petroleum, which should boil below 80°, is then distilled off and the residual fat dried and weighed. L. DE K.

Apparatus for Estimating Total Solids and Fat in Milk. By S. SONN (*Zeit. anal. Chem.*, 1899, **38**, 353).—An aluminium boat with a cover is charged with about 2 grams of cotton-wool freed from fat, and is then dried and weighed. Twenty c.c. of the milk are dropped upon the wool, the boat is reweighed and dried in an oven until constant in weight. It is then slipped into a cylindrical metal (nickel-plated) cylinder, closed at the bottom, and furnished with an internal self-starting syphon, the bend of which is a little higher than the upper end of the boat. This cylinder fits loosely into a glass tube, narrowed at its lower end for passing through the cork of the flask in which the fat solution is to be received, and is fitted with a condenser. The extraction proceeds in the same manner as with a Soxhlet extractor, and when it is complete the boat is redried and the amount of fat ascertained from the loss of weight. M. J. S.

Physical and Chemical Constants of Butter-Fat. By C. A. BROWNE (*J. Amer. Chem. Soc.*, 1899, **21**, 612—633).—The results of a large number of analyses of genuine butter fats are given. The figures include the sp. gr. at 40° (water at 15·5°), the melting point, the acid number, the saponification number, the ether number, the iodine number, the Reichert and Reichert-Meissl numbers, the insoluble acids per cent., the acetyl number, the glycerol, the total and soluble fatty acids, the sp. gr. of the insoluble acids at 20° (water at 20°), the melting point of the insoluble acids, the saponification number of the insoluble acids, the mean molecular weight of the insoluble acids, the sp. gr. of the soluble acids at 20° (water at 20°), the saponification number of the soluble acids, and the mean molecular weight of the soluble acids.

Full particulars as to the methods of determining these constants are given. The results show the great variation in composition of butter-fats, chiefly due to the quality of the cattle food, and many a genuine butter might be condemned as containing margarine; if, however, prepared from the mixed milk of a large herd of cows, there is less danger of this happening.

The author points out the importance of not heating the butter above 50° when preparing the butter-fat for analysis. L. DE K.

Butter and its Adulterations. By C. B. COCHRAN (*Chem. Centr.*, 1899, i, 709—710; from *J. Franklin Inst.*, 1898, **147**, 85—97).—The author states (compare Abstr., 1898, ii, 198) that in eastern Pennsylvania about 5 per cent. of cotton seed oil (sold under the name of "cream ripener") is added during the churning to increase the yield of butter or rather to make this hold more water. This fraud may be readily detected by the Bechi test. Another fraud now frequently practised consists in melting stale, unsaleable butter and then rechurning the clarified fat with the fresh milk or buttermilk, the resulting product being sold as fresh butter. If otherwise unadulterated, this sophistication may be detected chemically by the high percentage of free acidity and physically by Valenta's acetic acid test as the critical point or turbidity temperature is lowered from 60° to about 50°; also when applying Jean's modification of this test, the amount of acetic acid required will be raised in the proportion of 7 to 10. The fraud may also be detected microscopically, using polarised light. Fresh butter is amorphous, and the field is dark and even. Butter which has been melted is more or less crystalline, and presents an uneven, spotted field. L. DE K.

Cryoscopic Examination of Butter and Margarine. By POURET (*Bull. Soc. Chim.*, 1899, [iii], **21**, 738—740).—By the cryoscopic method, using benzene as solvent, the author has determined the molecular weight of various samples of the fat of pure butter and finds that it lies between the limits 631 and 662, whilst that of margarine is practically constant between 840 and 860. A determination of the molecular weight of a sample of butter-fat thus renders it possible to ascertain rapidly whether margarine is present as an adulterant, since 15 per cent. of the latter increases the molecular weight by 30—35 units, an amount greater than the extreme variation observed by the author amongst pure butters. The presence of "vegetaline," the fat obtained from cocoa-nut oil, which is often used to adulterate butter, cannot, however, be detected by this method, as the cocoa-fat has a molecular weight lying within the limits of the values obtained for pure butter-fat. W. A. D.

Paraffin as an Adulterant of Oleomargarine. By JOSEPH F. GEISLER (*J. Amer. Chem. Soc.*, 1899, **21**, 605—608).—Solid paraffin frequently occurs in margarines; it is added, not to cheapen the article, but to improve its appearance.

Any quantity above 2 or 3 per cent. may be detected as follows: 2·5 grams of the sample are saponified with 20 c.c. of alcohol containing 1 gram of potassium hydroxide, and an equal volume of water is then added; the paraffin will collect on the surface, and may then be further identified. Large quantities will betray their presence by the abnormally low sp. gr. of the sample at 100° F., and by its not giving a clear liquid on saponification.

The fraud may also be detected with the aid of the microscope; two photomicrographs are given in illustration. The author states that no proofs have as yet been brought forward to show that paraffin, even when diluted with butter-fat, is harmless to the system.

L. DE K.

Iodine Absorption of Commercial Tallow. By ALFRED SMETHAM (*J. Soc. Chem. Ind.*, 1899, **18**, 330—331).—The author shares the views of many authorities that the iodine absorption figure offers the most trustworthy method of ascertaining the value of tallow and similar fats for candle or soap making. In using Hübl's test, it is important to use absolute alcohol and to keep the solutions of the iodine and the mercuric chloride separate. As a good deal depends on the length of time of action, the author now allows the iodine to act on the fats for 18 hours.

A table is given showing the iodine absorption figure of a large number of tallows of different kind and origin. L. DE K.

Saponification Value of Fish-Oils. By WILHELM FAHRION (*Chem. Centr.*, 1899, i, 645—646; from *Chem. Rev. Fett. Harz.-Ind.*, **6**, 25—29).—The saponification number of fish oils is not constant. Sardine oil, for instance, gives numbers varying from 185—199, and stickleback oil from 178—210. The saponification may be effected by boiling with alcoholic potash, or in the cold by dissolving in light petroleum and adding alcoholic soda; in this case, it is important to dissolve the soda in absolute alcohol.

Oils with a high iodine number, excepting haddock oil, give too high and irregular results, as they are decomposed by excess of alkali into fatty acids with a lower molecular weight; there is, however, no such danger when the author's method for taking the inner saponification number is used (Abstr., 1898, ii, 654).

Fatty acids may be prevented from undue oxidation, caused by long heating at 100°, by evaporating their solutions in light petroleum to dryness in several platinum dishes and drying the residue for half an hour on the water-bath; in presence of any water, the residue should first be moistened with a little absolute alcohol. L. DE K.

The Iodine Number of Linseed Oil. By J. J. A. WIJS (*Chem., Centr.*, 1899, i, 646; from *Chem. Rev. Fett. Harz.-Ind.*, **6**, 29—31). —The author has determined the iodine number of a large number of linseed oils of undoubted purity and freshness by means of his new process with iodine chloride and acetic acid (Abstr., 1898, ii, 412).

The results of other authors are confirmed as to the quality of the oil varying with the source of the seed. Oil pressed from Dutch seed showed an iodine number of 193—201; from East Indian seed, 182—187; from La Plata seed, 174—182; from North American seed, 177—188; from Baltic provinces, 192—200; from Central Russia, 188—189; from Black Sea districts, 176—182; from Danube districts, 182.

The iodine number increases with the sp. gr. of the sample, which is determined commercially by the aid of Fischer's instrument.

L. DE K.

Maize Oil (Corn Oil). By LEONARD ARCHBUTT (*J. Soc. Chem. Ind.*, 1899, **18**, 346—347).—The author has tested an authentic sample of maize oil with the following results: Sp. gr., 0·9243 at 15·5°; absolute viscosity, 0·789 at 15·5°; Maumené test using acid containing 97 per cent. of hydrogen sulphate, 81·6°; saponification value, 18·97; iodine absorption figure, 122·7; unsaponifiable matter, 1·69 per cent., and free acid calculated as oleic acid, 2·4 per cent.

From these figures, and also from practical drying tests, it may be concluded that maize oil is a semi-drying oil, rather more strongly drying than cotton seed oil, and that it must be considered unfit for lubricating purposes. L. DE K.

Composition of the Fatty Oil of Cedar Seeds. By D. KRYLOFF (*Chem. Centr.*, 1899, i, 592; from *J. Russ. Chem. Soc.*, 1898, **30**, 924—926).—A sample of commercial Siberian cedar seed oil, solidified at 20°, had a sp. gr. 0·9326 at 0°/0°, iodine number 149·5—150·5, Reichert-Meissl number 2·0, Hehner number 93·33, saponification coefficient 191·8, and acid coefficient 1·09. The elaidin test showed the presence of a small quantity of olein. The crystalline acids precipitated from the oil, when purified, melted at 63°, and had the composition of palmitic acid; the filtrate, when treated with potassium permanganate by Saytzeff's method (*J. Russ. Chem. Soc.*, **17**, 419), yields the tetrahydroxystearic acid melting at 165° obtained from linseed oil by Reformatsky, and a substance which melts at 140° and is probably dihydroxystearic acid. Cedar seed oil is therefore very similar to linseed, hempseed, and other fatty oils, resembling the first particularly in respect to its content of unsaturated acids. Its content of linoleic acid is about the same as that of the drying oils.

E. W. W.

Cacao Butter. By JULIUS LEWKOWITSCH (*J. Soc. Chem. Ind.* 1899, **18**, 556—558).—The Reichert-Meissl value of cacao butter has been recorded as 3·52, but the author states that it varies from 0·20 to 0·83. The adulteration with large quantities of cocoa-nut oil or palm-nut oil may therefore be detected by the large increase of volatile soluble fatty acids.

Filsinger has stated that when two grams of cacao butter are dissolved in 6 c.c. of a mixture of 4 parts of ether and 1 part of alcohol, the solution remains clear when cooled to 0°, whilst the presence of as little as 5 per cent. of tallow causes crystallisation. The author states that this test is apt to mislead, as some undoubtedly genuine samples deposited crystals at 9°, and some even at 12°. When the adulteration with tallow has been practised to the extent of more than 10 per cent., the tallow crystals may be readily recognised by the microscope, as they appear like curved tufts somewhat of the shape of an "*f*," the ends of the *f* resembling horse-tails, whereas cacao butter crystals have the appearance of densely-packed clusters of needles radiating in all directions from a common centre. Unfortunately, when less than 10 per cent. of tallow is present, the tallow crystals lose much of their characteristic appearance.

A better proof of the adulteration with tallow or similar fats is the presence of cholesterol, which is readily isolated and recognised microscopically.

The author also states that although cacao butter does not readily turn rancid if properly kept, it will turn quite as rancid as any other fat under very unfavourable conditions, and it then acquires a nauseous taste and smell.

L. DE K.

Testing of Oil and Spirit of Mustard. By JOHANNES GADAMER (*Arch. Pharm.*, 1899, **237**, 372—378).—The method previously described (this vol., ii, 455, where *for* 4·5 *read* 4·65), does not always give trustworthy results. It is assumed that the allylthiocarbimide is first converted into allylthiocarbamide, $CS{:}NC_3H_5 + NH_3 = NH_2{\cdot}CS{\cdot}NHC_3H_5$, from which the silver nitrate then abstracts hydrogen sulphide with formation of silver sulphide and allycyanamide, $NH_2{\cdot}CS{\cdot}NHC_3H_5 + 2AgNO_3 + 2NH_3 = Ag_2S + CN{\cdot}NHC_3H_5$; $2AgNO_3$ is thus removed from solution for each mol. of thiocarbimide originally present. It is quite possible that some of the compound $NH_2{\cdot}CS{\cdot}NHC_3H_5,AgNO_3$ (Abstr., 1896, i, 140) may be deposited, and only slowly undergo further decomposition; if so, only $1AgNO_3$ would be removed per mol. of the thiocarbamide as regards a portion of the latter, and this would affect the result of the titration. Now it is conceivable that this source of error might be avoided by using a larger excess of silver nitrate, when the compound $NH_2 \cdot CS \cdot NHC_3H_5,2AgNO_3$ (*loc. cit.*) might be deposited instead, and as this requires $2AgNO_3$ per mol. of the thiocarbimide, the titration would not be affected; as a matter of fact, it was found that a larger excess of silver nitrate is beneficial, and the method is to be modified as follows: Of the spirit of mustard, 5 c.c. (=4·2 grams) are allowed to remain with 50 c.c. of $N/10$ silver nitrate solution and 10 c.c. of officinal ammonia solution (German pharmacopœia) for 24 hours in a well stoppered, graduated flask of 100 c.c. capacity, the flask being shaken frequently. After dilution to the mark, 50 c.c. of the clear filtrate, mixed with 6 c.c. of officinal nitric acid and 1 c.c. of ferric ammonium sulphate solution, must require not more than 17·15 and not less than 16·6 c.c. (?16·5) of $N/10$ ammonium thiocyanate solution to produce a red coloration. This corresponds with 92·5—100 per cent. of $CS{:}NC_3H_5$ in the oil.

Experiments with oils from different sources are quoted, and the conclusion is drawn from them that the percentage of sulphur assigned by Grützner (this vol., ii, 530) to the pure natural oil is too low; it is, perhaps, admissible to replace the number 17·15 by 17·2 c.c., in order to allow a somewhat wider margin. C. F. B.

Volumetric Estimation of Aniline. By MAURICE FRANÇOIS (*J. Pharm.*, 1899, [vi], **9**, 521—524).—The principle of the method depends on the fact that, if bromine water is added to an aniline solution which contains a little sulphate of indigo as indicator, the bromine does not act on the indigo until all the aniline has been converted into tribromaniline. The bromine water (5 grams bromine in 1000 c.c. water) is standardised by means of an aqueous solution of aniline hydrochloride, which contains 1·392 grams of the pure salt in 1000 c.c. (1 c.c. = 0·001 aniline). The bromine water, if exposed to the air, is continually losing bromine; it is therefore essential (1) to use a burette of such capacity that it contains enough bromine water for both the standardisation and estimation without refilling; (2) to close the end of the burette with a plug of cotton wool; (3) to find approximately the number of c.c. of bromine water required, and then, in the final titration, to add nearly the whole at once, in order to avoid the slight loss of bromine which occurs when drops of the solution fall through the air. The method may be applied to solutions containing aniline or its hydrochloride, the presence of ammonium chloride does not vitiate the result, and, finally, if the solution to be titrated contains mineral substances which would react with the bromine, the aniline may be liberated by potash and distilled in steam. The degree of dilution of the aniline solution does not influence the result.

H. R. LE S.

Volumetric Estimation of Alkaloids. By ELIÉ FALIÈRES (*Compt. rend.*, 1899, **129**, 110—111).—The estimation of alkaloids by titration with an acid is in many cases unsatisfactory, because the colour change of the indicator is not sharply defined, and also is more or less masked when, as is often the case, the alkaloidal solutions are coloured. To obviate these and other difficulties which are experienced when ordinary indicators are used, the author employs an ammoniacal solution of copper as indicator; the point of neutralisation is then made evident, not by a colour change, but by the precipitation of copper oxide, which is most readily seen. The copper solution is prepared by dissolving 10 grams of copper sulphate in about 500 c.c. of water, adding ammonia until the precipitate first formed is nearly all dissolved, filtering, and diluting to a litre. This solution is titrated by means of decinormal sulphuric acid. For an estimation, 0·1 gram of the alkaloid is dissolved in 20 c.c. of decinormal sulphuric acid, the flask placed on a black surface, and the ammoniacal copper solution added until there is a persistent turbidity in the liquid. The volume of copper solution used corresponds with the amount of sulphuric acid uncombined with the alkaloid, and, therefore, the amount of acid combined with the alkaloid is readily calculated. In estimating the total alkaloids in cinchona bark by this method, the colouring matter need not be removed before titration. H. R. Le S.

A New Method for the Estimation of Morphine in Opium. By Harry M. Gordin and Albert B. Prescott (*Arch. Pharm.*, 1899, **237**, 380—384).—The method described previously (this vol., i, 90) has been modified in so far that the maceration of the drug with the ammoniacal mixture is continued for 5—6 instead of 3 hours, and the evaporation of the liquid is effected at the ordinary temperature in a good draught. Further, the morphine is extracted by percolation with a mixture of chloroform and absolute alcohol (5 : 1 by volume) instead of with acetone, and the evaporation of the solvent is again effected in a good draught; an excellent percolator for this purpose is obtained by cutting off the upper 3/5 of a 50 c.c. burette, and using the lower part with a plug of cotton-wool placed above the stopcock.

An alkalimetric estimation may also be employed, either alone or combined with the iodometric one. In this case, 3 grams of the drug are treated just as in the other method up to the evaporation of the chloroform–alcohol mixture. The residue of morphine is then ground with 50 c.c. of *N*/20 sulphuric acid, and rinsed with water into a tall, narrow measuring cylinder, the whole diluted to 90 c.c., shaken, and allowed to settle for a time, after which 75 c.c. are filtered into a beaker and mixed with 30 or 35 c.c. of *N*/20 caustic potash, the excess of the latter being titrated finally with *N*/20 acid; the number of c.c. of acid neutralised by the morphine, multiplied by 0·568, gives the percentage of morphine in the opium. The indicator used is filter paper, dyed a pale yellow with neutral methyl-orange solution, and it is dipped for about 10 seconds in the liquid; the acid and alkali must be standardised under conditions similar to those of the estimation. If it is desired to control the result by an iodometric estimation, the titrated liquid is mixed with 3—4 grams of calcium hydroxide, diluted to 250 c.c., and shaken vigorously and frequently during an hour; 50 c.c. are then filtered into a 100 c.c. graduated flask, acidified, treated with excess of *N*/10 iodine solution, and titrated with thiosulphate, just as described in the previous paper; the weight of iodine used, multiplied by 150, gives the percentage of morphine.

In a sample of opium 17·66—17·90 per cent. of morphine were found by the alkalimetric and 17·49—17·50 by the iodometric method, but by the gravimetric method only 14 per cent. were found.

C. F. B.

Separation of Brucine from Strychnine. By Willem Stoeder (*Chem. Centr.*, 1899, i, 506; from *Ned. Tydschr. Pharm.*, 11, 1—5).—The separation of brucine from strychnine by means of potassium ferrocyanide in a sulphuric acid solution is untrustworthy. Good results are obtained by Keller's method (Abstr., 1894, ii, 491). The crude alkaloids, weighing about 0·3 gram, are dissolved in 10 c.c. of 10 per cent. sulphuric acid, 1·5 c.c. of 50 per cent. nitric acid is added, and the mixture left for 1½ hours. The brucine is thus converted into dinitrobrucine, and the strychnine may be recovered by agitating the liquid with chloroform, after rendering alkaline with ammonia.

L. de K.

A New Test for Cocaine. By George L. Schaefer (*J. Amer. Chem. Soc.*, 1899, 21, 634—635).—The following test is suggested for detecting the presence of the other coca alkaloids in cocaine, and is preferable to McLagan's permanganate test.

0·05 gram of the commercial cocaine hydrochloride is dissolved in 20 c.c. of water, mixed first with 5 c.c. of a 3 per cent. solution of chromic acid, and then with 5 c.c. of a 10 per cent. solution of hydrochloric acid, and the solution cooled to 15°. If the sample is pure, a clear solution will result, but if more than traces of the other coca alkaloids are present, the solution becomes cloudy at once, or in a few minutes.

L. de K.

Reactions of Indole Bases and of Proteids. By Julius Gnezda (*Compt. rend.*, 1899, 128, 1584—1587).—On fusing oxalic acid with a trace of indole, a sublimate and residual mass of a splendid purple colour are obtained, and on dissolving in water, a coloured solution is formed which is only slightly changed by the addition of potash; 2′-methylindole, scatole, and 1′-methylindolecarboxylic acid behave similarly, whilst 2′-phenylindole gives a greenish-yellow sublimate, changing to black. Phthalic, isophthalic, or terephthalic acid, when fused with indole, 2′-methylindole, scatole, or 1′-methylindolecarboxylic acid, yields a faintly violet sublimate; 2′-phenylindole is coloured green and violet by phthalic and terephthalic acids respectively, but gives no colour with isophthalic acid. Malonic, succinic, and glutaric acids give slightly red products with indole, 2′-methylindole, scatole, and 1′-methylindolecarboxylic acid, the intensity of the coloration diminishing as the number of CH_2-groups increases.

On adding albumin, peptones, or gelatin to fused oxalic acid, a pinkish sublimate is obtained; green colorations are formed with glycocholic, taurocholic, and cholic acids, and with bilirubin, whilst with other substances of animal origin such as leucine, tyrosine, the xanthine bases, urea, neurine, glycocine, sugars, &c., indefinite brownish-yellow products are formed. Alloxanthin gives a characteristic red colour with fused oxalic acid.

Proteids give faint orange colorations with malonic, succinic, glutaric, and the phthalic acids, and the latter give slightly yellow masses with cholic acid.

Scatole, 1′-methylindolecarboxylic acid, and an alcoholic solution of indole, give orange colorations with hydrofluoric acid, whilst 2′-phenylindole is turned slightly yellow, and 2′-methylindole violet; hot hydrofluosilicic acid acts similarly. A very persistent red colour is obtained on heating hydrofluosilicic acid with a concentrated solution of peptone, gelatin, or albumin; the albumin must be heated until peptonisation is complete.

When albumin (white of egg) is subjected to prolonged treatment with concentrated hydrochloric acid, the products formed give characteristic indole reactions. T. H. P.

Detection of Albumin in Urine. By Gabriel Guérin (*J. Pharm.*, 1899, [vi], 9, 576).—A 10 per cent. aqueous solution of di-iodoparaphenolsulphonic acid (sozoiodol) is a very delicate reagent for the detection of albumin in urine. 10—15 drops of the reagent when added to 8 or 10 c.c. of the filtered urine produce a whitish, flocculent precipitate or a milky turbidity if albumin is present. Albumoses, peptones, and most alkaloids are also precipitated by it, but their precipitates readily dissolve on heating, whereas that produced by albumin is completely insoluble. Alkaline urates and uric acid are not precipitated by this reagent. H. R. Le S.

Estimation of Albumoses and Peptones. By Jean Effront (*Bull. Soc. Chim.*, 1899, [iii], 21, 680—683).—The method of analysis is based on the author's observations on the influence of acidity on the solubility of proteoses in alcohol (this vol., i, 835). 50 c.c. of a 5 per cent. solution of the crude peptone are neutralised with $N/10$ sodium hydroxide, left for 2 hours, and the precipitate of syntonin washed with water and alcohol, dried at 100°, and weighed. Another 50 c.c. of the 5 per cent. solution are neutralised with normal caustic soda, diluted with water to 55 c.c., and filtered after some time; 44 c.c. of the filtrate, corresponding with 40 c.c. of the original solution, are mixed with 8 c.c. of normal hydrochloric acid and 250 c.c. of 95 per cent. alcohol, the clear alcoholic solution is neutralised by adding 8 c.c. of normal soda, and the precipitated albumoses are finally collected and dried at 100°. The peptone, together with mineral matter, is obtained by evaporating the filtrate. The application of this process to the products of the peptic digestion of fibrin at various stages shows that it yields accurate and consistent results; it is also very expeditious. N. L.

General and Physical Chemistry.

Refractive Indices and Densities of Normal and Semi-normal Aqueous Solutions of Hydrogen Chloride and the Chlorides of the Alkalis. By Sir John Conroy (*Proc. Roy. Soc.*, 1899, **64**, 308—318).—A number of refractive indices have been determined by the hollow prism method, special care being taken to keep the temperature of the prism at 18°; this was effected by a water jacket which was in contact with the prism above, below, and, as far as possible, on the faces.

The refractive indices and densities of normal and semi-normal solutions of the chlorides of hydrogen, lithium, sodium, potassium, and rubidium increase, as a rule, with the molecular weight; solutions of potassium chloride are exceptional, for their indices are less than those of the corresponding sodium chloride solutions. It is shown that whilst a litre of a normal solution of hydrogen, lithium, or sodium chloride contains nearly the same weight of water, a litre of a normal solution of potassium chloride contains about 10 grams less water than a litre of normal sodium chloride solution. Thus the water in a normal potassium chloride solution may be regarded as less dense than in a normal sodium chloride solution. Allowing for this decrease of density, the difference between the refractive indices of water thus calculated and the observed refractive indices of the solutions increases regularly with the molecular weight, potassium chloride no longer being an exception. The increase, however, has no apparent relation to the increase of molecular weight.

The change of the refractive index with temperature has been determined for the above solutions between 10° and 20°. J. C. P.

Simple Method of Reversing the Sodium Spectrum. By H. Kreusler (*Chem. Zeit.*, 1899, **23**, 37).—When a sodium chloride bead is held in the flame, a small dark "aureole" is observed just above the glowing bead, and as this aureole consists of dense sodium chloride vapour at a relatively low temperature, it may readily be employed for absorption. A piece of platinum wire is bent in such a way as to form two double loops, the lower parts of which hold beads of sodium chloride, whilst the upper and larger parts serve to increase the space occupied by the sodium chloride vapour. The whole is held with the beads hanging downwards in the flame of a spirit lamp, placed between an Auer's burner and the spectroscope, and is so arranged that the beads cover one another in the field of vision. In the upper half of the spectrum, the sodium lines are observed as extremely bright, in the lower half as dark lines. J. J. S.

Spectrum of the Corona. By Sir Norman Lockyer (*Proc. Roy. Soc.*, 1899, **64**, 168—170).—According to Nasini, the spectrum of the gases collected at the solfatara of Pozzuoli probably contains the characteristic green line of the corona. This and one of the other chief lines of the spectrum of the corona appear to coincide with enhanced lines of iron. It is doubtful, however, whether this coincidence is real, because the other lines in the corona are not coincident with enhanced iron lines. Careful examination of eclipse photographs obtained in 1893, 1896, and 1898 shows, in fact, that the coincidence is only approximate, and that the lines in question probably belong to some undiscovered gas or gases. J. C. P.

Chemical Classification of the Stars. By SIR NORMAN LOCKYER (*Proc. Roy. Soc.*, 1899, **65**, 186—191).—Comparison of stellar spectra with those of numerous elements at different temperatures (compare Abstr., 1898, ii, 2) has led to a classification of stars according to their temperature, the order of temperature being deduced from the character of their spectra. The hottest stars have the simplest chemistry, and in a series of stars from the highest temperatures to the lowest, the chemical forms indicated by the spectra become gradually more complex. On the idea that in this increasing complexity of stellar chemical forms an inorganic evolution may be traced similar to the organic evolution shown by successive geological strata, stars have been divided into a number of genera, the form of terminology being analogous to that adopted in geological classification. The simplest types are supplied by the proto-hydrogen and cleveite-gas stars, proto-hydrogen being that form of hydrogen which gives enhanced lines (*loc. cit.*); as the temperature falls, the stars are of the order proto-metallic or metallic, and the lowest temperature stars have fluted spectra. J. C. P.

Presence of Oxygen in the Atmospheres of certain Fixed Stars. By DAVID GILL (*Proc. Roy. Soc.*, 1899, **65**, 196—206).—The spectra of β Crucis, β and ϵ Canis Majoris and probably β Centauri are all practically identical, and contain, in addition to the hydrogen and helium lines, the stronger oxygen lines, a probable magnesium line, a probable carbon line, and three unknown strong lines.
J. C. P.

Specific Rotatory Power and Position Isomerism. By PHILLIPE A. GUYE and A. BABEL (*Chem. Centr.*, 1899, i, 466; from *Arch. Sci. phys. nat. Genève*, [iv], **7**, 23—42).—The specific rotatory powers of substituted derivatives of amylic benzoate and of aniline have been determined, and the influence of the substituent studied. The amylic benzoate derivatives are liquid, and were examined in the pure state; the aniline derivatives were examined in solution. The amylic alcohol used in the preparations had $[\alpha]_D - 4{\cdot}4°$ to $-4{\cdot}5°$.

Amylic orthonitrobenzoate, b. p. 238° under 69 mm. pressure, sp. gr. 1·135 at 17°, n_D 1·5132, $[\alpha]_D - 0{\cdot}61°$ at 17°, $+0{\cdot}90°$ at 75°; *metanitrobenzoate*, b. p. 223—225° under 52 mm. pressure, sp. gr. 1·144 at 19°, n_D 1·5187, $[\alpha]_D + 5{\cdot}85°$ at 19°, $+4{\cdot}28°$ at 75°; *paranitrobenzoate*, b. p. 250—252° under 80 mm. pressure, sp. gr. 1·140 at 17°, n_D 1·5203, $[\alpha]_D + 6{\cdot}93°$ at 17°, $+4{\cdot}82°$ at 75°; *orthobromobenzoate*, b. p. 285—287° under 730 mm. pressure, sp. gr. 1·279 at 16°, n_D 1·5243, $[\alpha]_D + 1{\cdot}88°$ at 16°, $+1{\cdot}43$ at 75°; *metabromobenzoate*, b. p. 286—289° under 737 mm. pressure, sp. gr. 1·285 at 17°, n_D 1·5243, $[\alpha]_D + 2{\cdot}70°$ at 16°, $+1{\cdot}99°$ at 75°; *parabromobenzoate*, b. p. 287—290° under 724·3 mm. pressure, sp.

gr. 1·288 at 16°, n_D 1·5282, $[\alpha]_D + 3·18°$ at 16°, $+2·35°$ at 75°; *orthamidobenzoate*, b. p. 192—194° under 41 mm. pressure, sp. gr. 1·047 at 17°, n_D 1·5364, $[\alpha]_D$ 5·98° at 17°, $+4·99°$ at 75°; *metamidobenzoate*, b. p. 184—187° under 35 mm. pressure, sp. gr. 1·051 at 18°, n_D 1·5351, $[\alpha]_D + 4·95°$ at 18°, $+4·30°$ at 75°; *paramidobenzoate*, m. p. 27—30°, b. p. 215° under 35 mm. pressure, sp. gr. 1·050 at 75°, n_D 1·5369 at 75°, $[\alpha]_D + 4·19°$ at 75°; *metatoluate*, b. p. 266—268° under 725 mm. pressure, sp. gr. 0·976 at 20°, n_D 1·4929, $[\alpha]_D + 5·05°$ at 20°.

The following derivatives of aniline and toluidine were examined in 5 per cent. pyridine solution. *Tartaryl anilide*, m. p. 250°, with decomposition, $[\alpha]_D + 259°$; *orthotoluidide*, m. p. 200°, with decomposition, $[\alpha]_D + 239°$; *metatoluidide*, m. p. 182°, with decomposition, $[\alpha]_D + 233°$; *paratoluidide*, m. p. 230°, with decomposition, $[\alpha]_D + 239°$.

The rotatory powers of the following derivatives of valeric acid were determined in 10 per cent. alcoholic solution. The valeric acid used in their preparation had $[\alpha]_D + 11·12°$ at 15°. *Valeryl anilide*, m. p. 95—96°, $[\alpha]_D + 10·5°$; *orthotoluidide*, m. p. 68—70°, $[\alpha]_D + 9·3°$; *metatoluidide*, m. p. 60—61°, no appreciable rotation; *paratoluidide*, m. p. 69—71°, $[\alpha]_D + 19·1°$.

The following malic acid derivatives were examined in 5 per cent. pyridine solution. *Malyl anilide*, m. p. 198°, $[\alpha]_D - 101·1°$; *orthotoluidide*, m. p. 179°, $[\alpha]_D - 61·8°$; *metatoluidide*, m. p. 153°, $[\alpha]_D - 75·9°$; *paratoluidide*, m. p. 206°, $[\alpha]_D - 92·5°$.

In all cases except that of amylic orthonitrobenzoate, the rotatory power falls with rising temperature. The molecular refractions of the compounds investigated are a little higher than the values calculated with the help of Conrady's coefficient. The molecular volumes of the amylic benzoate derivatives are all higher than the values calculated according to I. Traube. J. C. P.

Specific Rotatory Power and Position Isomerism. By Phillipe A. Guye and A. Babel (*Chem. Centr.*, 1899, i, 812, from *Arch. Sci. phys. nat. Genève*, [iv], **7**, 109. Compare preceding abstract). A review of the determinations of the rotation of amylic salts derivatives of tartaric, malic, valeric, and methyladipic acids, menthol, and *d*-carvoxime leads to the following conclusions. If the influence on rotation of mono- and di-derivatives of benzene is compared, the following order is obtained: ortho-compound—phenyl group—meta-compound—para-compound. Following this order, the rotation may steadily increase, decrease, or pass through a maximum or minimum, and these results accord with those obtained by Frankland and Wharton (Trans., 1899, **75**, 337). L. M. J.

Relations between Optical Isomerism and Triboluminescence. By Amerigo Andreocci (*Gazzetta*, 1899, **29**, i, 516—519).—From the results of an examination of santonin derivatives the author draws the following conclusions. 1. Two optical isomerides which are antipodes show the same behaviour as regards triboluminescence. 2. Crystals of racemic forms do not exhibit triboluminescence even though they may be derived from triboluminescent forms. 3. Optically active isomerides which are not antipodes do not behave similarly with respect to triboluminescence. 4. Optically active double forms, resulting from two non-antipodal components, may be triboluminescent.

With these compounds, the triboluminescence diminishes as the crystals are reduced more and more to a fine state of division and also those substances which are strongly triboluminescent possess to a marked degree the properties of superfusion and supersaturation and pass very slowly from the amorphous to the crystalline condition.

T. H. P.

The Latent Photographic Image. By R. Ed. Liesegang (*Chem. Zeit.*, 1899, **23**, 4—5).—Support is given to the view that, on exposure to light, part of the silver bromide becomes transformed into bromine and a lower bromide (argentous bromide, Ag_2Br). On development, this lower bromide becomes completely reduced to metallic silver, and, in order to account for the very large amount of silver thus formed compared with the minute quantities of argentous bromide which can be present on the exposed plate, the following hypothesis is advanced. The silver formed during development from the argentous bromide, is in a "nascent state" and immediately reacts with the argentic bromide, yielding a further quantity of the lower bromide, which, in the presence of the developer, again yields nascent silver. The reaction can thus proceed until the argentic bromide under the exposed parts becomes more or less completely reduced to metallic silver. J. J. S.

Hydrogen Peroxide as the Active Agent in producing Pictures on a Photographic Plate in the Dark. By William J. Russell (*Proc. Roy. Soc.*, 1899, **64**, 409—419).—Hydrogen peroxide acts on a photographic plate in the dark in exactly the same way as certain metals and organic compounds. A photographic plate laid on a dish containing pure water is not affected until a trace of hydrogen peroxide is added, when the plate rapidly darkens. The interposition of substances which are opaque to the action of the metals and terpenes prevents also any action by hydrogen peroxide, whilst the same substances are transparent to the action in both cases. The metals that act most strongly on a photographic plate are those which decompose water most readily; thus the formation of hydrogen peroxide can be accounted for, and even demonstrated, by laying a moistened piece of Wurster's tetramethylparaphenylenediamine paper on the bright metal surface. Practically the terpenes are the only organic compounds which act on a photographic plate, and the oxidation of this class of compounds gives rise to hydrogen peroxide. The ordinary essential and vegetable oils are all more or less active, whilst the mineral oils and compounds like benzene, naphthalene and methylic alcohol produce no effect.

A weak solution of hydrogen peroxide acts on a photographic plate even though gelatin, celluloid, gutta-percha tissue, indiarubber, tracing paper, goldbeater's skin, &c., be interposed, the time required for the action increasing rapidly with the thickness of the intervening layer; the action at first is almost *nil*, and only gradually reaches its maximum effect. When a sheet of the thinnest gelatin was placed over a weak hydrogen peroxide solution, and a plate was laid on the gelatin, successive exposures of twenty minutes each produced photographic impressions of gradually increasing intensity. The hydrogen peroxide requires time to travel through the intervening inactive substance, and the latter may in this way become active and of itself produce an impression on a photographic plate.

The transmission of the action through an inactive substance is greatly assisted by moisture; much less time was required for the production of a picture when the intervening inactive substance was damp. Alcohol also was found to accelerate the transmission of the action.

Several liquids, such as alcohol, ethylic acetate, and chloroform, produced no effect on a photographic plate even after a week's exposure, but when they had been in contact with polished zinc foil, they became active and produced a picture after a short exposure. It was found, however, that the zinc effected this change only when the liquids in question contained a trace of moisture. Perfectly dry specimens remained inactive even after a week's contact with zinc.

The observations show that hydrogen peroxide is the active agent in all the phenomena dealt with. J. C. P.

Electromotive Force of some Concentration Batteries and of a Copper-Zinc Battery with Organic Solvents. By ROBERTO SALVADORI (*Gazzetta*, 1899, **29**, i, 498—500).—A cell consisting of a copper and a zinc plate immersed in a solution of hydrogen chloride or trichloracetic acid in benzene or ether gives no E.M.F., although the zinc is strongly attacked and much hydrogen evolved. The following table gives the E.M.F. obtained on using other solvents :

	Hydrogen chloride.		Trichloracetic acid.	
Solvent.	Concentration.	E.M.F.	Concentration in grams per 100 of solution.	E.M.F.
Water	—	—	6·65	0·830
	N/20	0·838	1·50	0·765
Methylic alcohol	*N*/10	0·633	6·31	0·811
	N/20	0·608	1·12	0·877
Ethylic alcohol	*N*/10	0·537	4·29	0·771
	N/20	0·605	1·07	0·735
Acetone	*N*/10	0·409	5·90	5·573
	N/20	0·410	0·95	0·495 to 0·529*

A table is also given of the E.M.F. of cells containing two zinc rods immersed in different solutions of potassium chloride, the solvents for the latter being water and methylic or ethylic alcohol. In general, the E.M.F. obtained in this way are very small, the largest being with equally concentrated aqueous and ethylic alcoholic solutions of potassium chloride. T. H. P.

Practical Utility of Semi-permeable Membranes. By B. MORITZ (*Chem. Zeit.*, 1899, **23**, 400—401).—Notwithstanding their importance in physico-chemical investigations, semi-permeable membranes have found but little application in practical work. In many cases, however, the author considers they might be usefully employed, and, as examples, suggests the separation, at least qualitatively, of many organic compounds, and the concentration of solutions of unstable compounds. They might also be employed for the determinations of the value of glues and other compounds, which alter on exposure to air, as such alteration would, in all probability, be accompanied by changes in the osmotic pressure. L. M. J.

* One minute after immersing the electrodes.

Electrolytic Potential. By A. Schükareff (*Zeit. physikal. Chem.*, 1899, **29**, 726—729).—The consideration of the electrolytic properties of solutions may be simplified by the idea of an 'electrolytic potential' which may be defined as the work required to alter the conductivity by unity. On the assumption that the change of electrolytic potential is proportional to the change of chemical potential, the author deduces the equation, $\lambda^2/v = \text{constant}$, for the effect of dilution on conductivity, a result which is valid for very weak electrolytes.
L. M. J.

Electrical Conductivity and Luminosity of Flames containing Vaporised Salts. By Arthur Smithells, H. M. Dawson, and Harold A. Wilson (*Proc. Roy. Soc.*, 1898, **64**, 142—148).—According to Arrhenius, the conduction of an electric current in flames containing vaporised salts is electrolytic in character; the authors' experiments confirm this view, although the electrolytic conduction is different in some respects from that in aqueous solution; Ohm's law, for example, is obeyed only within certain limits.

The conductivity of a vaporised salt increases very rapidly with the temperature. The conductivities of different salts vary with the electropositive constituent, and for various salts of the same metal equivalent solutions sprayed into the flame give equal conductivities, provided the concentration be not too great. The conductivity of the haloid salts as a group is distinct from that of the oxy-salts; the conductivities of the latter are approximately equal, and approach those of the hydroxides. The conductivity of acids is small compared with that of the alkali salts. The introduction of chloroform vapour into a coloured flame and the consequent decolorisation of the flame does not lead to any appreciable decrease of conductivity, so that the colour of a flame produced by a vaporised salt cannot be due, like the conductivity, to the ionisation of the salt; it must be attributed to a chemical process in which the metal is set free, probably to a process of reduction by the flame gases.

The view of Arrhenius that vaporised salts are hydrolysed by the water vapour in the flame, and that the hydroxide then furnishes the ions, is not borne out by experiments made with a cyanogen instead of a coal-gas flame; the presence of water does not seem necessary for the formation of ions. J. C. P.

Electrical Conductivity of Flames containing Salt Vapours. By Harold A. Wilson (*Proc. Roy. Soc.*, 1899, **65**, 120—123. Compare preceding abstract).—When two platinum gauze electrodes are placed in a flame into which a salt solution is sprayed, the current attains a nearly constant value as the E.M.F. increases, provided both electrodes are hot. The current is much greater when the negative electrode is hot and the positive electrode cool, than when the negative electrode is cool and the positive one hot; the fall of potential near a cool electrode is nearly equal to the total fall of potential, especially if that electrode be the negative one.

Nearly all the ionisation of the salt vapour takes place at the surface of the electrodes, and the contact of fresh vapour with the electrodes, especially the negative one, produces a marked increase of current.

The relative velocities of ions in the flame were estimated from the potential fall required to urge the ions against the upward current of gases. In this way, it was found that the positive ions Li, Na, K, Rb, and Cs have nearly the same velocity, whilst the negative ions of various salts of these metals have a velocity about seventeen times as great. The fact that the ionisation of the salts takes place only at the surface of the electrodes, combined with the greater velocity of the negative ions, accounts naturally for the phenomena of unipolar conduction. J. C. P.

Electrolytic Precipitation of Metals on Electrodes of Platinum Gauze. By Clemens Winkler (*Ber.*, 1899, **32**, 2192—2194).—A piece of platinum gauze (weighing 10 grams per sq. cm., containing 250 meshes to the sq. cm., and made of wire 0·12 mm. thick), 10·5 cm. long and 5·5 cm. wide, has its long edges turned over a little, to give it additional strength, a lead of stout platinum wire riveted to it in the centre, and is then bent into a cylinder 5 cm. high and 3·5 cm. in diameter, a slit being left to admit the anode wire. This is used instead of the ordinary cathode of platinum foil; the precipitated metals adhere to it much more firmly than to foil, and the precipitation can be effected with a much greater current-density, and therefore in much less time (as little as one-fourth of the time with a cathode of platinum foil); by its means also, copper may be precipitated, without any tendency to fall off, from a solution acidified with sulphuric acid.

A cathode of brass wire gauze has already been employed by Paweck (*Österreich. Zeit. Berg.-Hüttenwesen*, **46**, 570). C. F. B.

Dissolution of an Iron Anode in a Solution of Sodium Acetate and Acetic Acid. By Georges Arth (*Bull. Soc. Chim.*, 1899, [iii], **21**, 766—768).—When an aqueous solution containing 5 per cent. of sodium acetate and 5 per cent. of acetic acid is electrolysed between a pure iron anode and a platinum cathode, using a feeble current at a low voltage, the iron dissolves as ferrous acetate in an amount corresponding with that required by Faraday's law. At higher voltages, and under certain conditions, which have not yet been accurately determined, the metal assumes an almost "passive" condition, and only a small quantity of ferric acetate is formed. In other experiments, the theoretical amount of iron was dissolved as ferric acetate, a small quantity of ferrous salt being also produced. The work of Wohlwill on univalent and tervalent gold ions is referred to in connection with these results (*Zeit. Elektrochem.*, 1897, **4**, 379, 402, 421). N. L.

[Note by Abstractor.—The similar behaviour of chromium has been noticed by W. Hittorf (compare Abstr., 1898, ii, 363; also *Zeit. Elektrochem.*, 1899, **6**, 6—10).]

Dissociation Equilibrium of Strong Electrolytes. By Hans Euler (*Zeit. physikal. Chem.*, 1899, **29**, 603—612).—Noyes considers the departures from Ostwald's dilution law in the case of strong electrolytes to be due to the fact that determinations of dissociation by the conductivity method are untrustworthy (Abstr., 1893, ii, 1143), whilst Arrhenius regards these as correct, but the mass-action law as inapplicable to such cases. Jahn has pointed out that the dissociation determinations assume the constancy of the ion-velocities at all dilutions (Abstr., 1899, ii, 6); but the author considers that this cannot be the cause of the discrepancies, which frequently occur for dilutions higher than $N/5$, above which the viscosity and the ion-friction are practically constant. Storch has given a general form of dilution law in which the exponent (which in Ostwald's law equals 2, and in Rudolphi's law is 1·5) varies for different salts (Abstr., 1896, ii, 288), and the author has determined this exponent for a large number of salt solutions, for which it varies from 1·4 to 1·7. The values change but slightly with temperature, a small decrease with rise of temperature being observed, so that the discrepancies are not due to polymerisation of the solvent, and the author does not consider the electrostatic attraction of the ions to be a possible cause. The most probable cause is finally considered to be an alteration of the dissociative power of the solvent, consequent on the presence of the dissolved salt (compare Abstr., 1899, ii, 492). L. M. J.

Alteration of Free Energy in Melted Halogen Compounds of some Metals. By Oskar H. Weber (*Zeit. anorg. Chem.*, 1899, **21**, 305—360).—This work, which necessitates the determination of the E.M.F. of cells with molten salts, is essentially similar to that of Czepinski (this vol., ii, 267), but the determinations have been carried to higher temperatures and with improved apparatus. The E.M.F. of the chain $Pb \mid PbCl_2 \mid Cl$ was determined between 502° and 956°, the latter being the boiling point of the salt. It was found that the temperature coefficient was practically constant from the melting point (506°) to about 900°, so that between these limits the alteration of total energy, that is, the heat development, is practically constant (*loc. cit.*), and, further, that the heat capacity of the compound is equal to the sum of the heat capacities of the components. By subtraction of the external work, the heat development is obtained which should be directly comparable with that determined directly, the differences are very slight and do not reach 0·5 per cent. From the heat produced above and below the melting point, the value 5·607 Cal. is obtained for the latent heat of fusion of lead chloride, a number in accord with Rudberg's direct determination, 5·806 Cal. Czepinski found that above 650° a very rapid fall of E.M.F. occurs, and this is due to the backward diffusion of the lead and chlorine; in the author's experiments, this does not occur until about 900°, owing to the improved form of the electrolytic tube. With lead bromide, analogous results were obtained, but the agreement with thermochemical determinations is not so satisfactory. The melting and boiling points were found to be 490° and 918° respectively, and the latent heat of fusion 5·1 Cal. (direct determinations = 4·5 Cal.). Similar chains, with silver chloride and silver bromide, were examined; in the latter case, two sets of values were obtained, abnormal results being found for two or three readings, but as the E.M.F. again became normal, this appeared to be due to the action of the molten salt on the porcelain. The latent heat of fusion of silver chloride was calculated to be about 4·4 Cal. The chain with cadmium chloride is interesting, as at the higher temperatures both cadmium and chlorine are gaseous; the melting and boiling points of the salt were found to be about 568° and 964° respectively, and the boiling point of cadmium about 780°. The value for the latent heat of fusion of the salt is 10·5 Cal., a number which is apparently high; the latent heat of vaporisation of cadmium is 26 Cal., and this is probably very nearly correct. Cadmium bromide was examined to 860°, and the latent heat of fusion found to be 5·0 Cal. The following are the values of the E.M.F.'s found for these chains: $Pb \mid PbCl_2 \mid Cl$, $1{\cdot}2818 - 0{\cdot}0_3584\,(t - 506)$; $Pb \mid PbBr_2 \mid Br$, $1{\cdot}0571 - 0{\cdot}0_3500\,(t - 490)$; $Ag \mid AgCl \mid Cl$, $0{\cdot}8848 - 0{\cdot}0_3270\,(t - 650)$; $Cd \mid CdCl_2 \mid Cl_2$, $1{\cdot}3680 - 0{\cdot}0_3580\,(t - 590)$, $Cd \mid CdBr_2 \mid Br$, $1{\cdot}1319 - 0{\cdot}0_3486\,(t - 610)$, the cadmium values being only for temperatures below 780°. Chains of the Daniell type were also examined with lead and silver electrodes at temperatures from 500° to 1000°; the values agree fairly with those calculated from the previous chains, and indicate for both metals a greater dissociation in the chloride than in the bromide.

L. M. J.

Ratio of the Specific Heats in some Gaseous Saturated Hydrocarbons. By A. Daniel and Paul Pierron (*Bull. Soc. Chim.*, 1899, [iii], **21**, 801).—Determinations by Kundt's method of the ratio of the two specific heats for ethane (1·225), propane (1·153), and isobutane (1·108) gave the values indicated. In the case of ethane, Clément and Desormes' method was also employed, the value 1·213 being obtained.

N. L.

Specific Heats of Gases and Mechanical Equivalent of Heat. By Anatole Leduc (*Ann. Chim. Phys.*, 1899, [vii], **17**, 484—510).—A thermodynamical paper not suitable for abstraction.

G. T. M.

Acoustical Method for the Determination of the Melting Point of Fats and Waxes. By Edwin Dowzard (*Chem. News*, 1899, **79**, 150—151).—The author employs two platinum wires connected with a battery and an electric bell; the wires are coated with the fat or wax, then immersed together in mercury, which is gradually heated; when the fat melts, the circuit closes, the bell then rings, and the temperature is read.

D. A. L.

Melting Points of Mixtures of Optical Isomerides. By M. Centnerszwer (*Zeit. physikal. Chem.*, 1899, **29**, 715—725).—The melting point curves for various mixtures were first determined in the case of two indifferent compounds, and found to consist of two portions with a minimum. The curves of two active optical isomerides are completely symmetrical with two minima and a maximum at the melting point of the inactive compound, which may, however, be either higher or lower than that of the active components. The addition of either active component to the inactive compound, or the reverse, causes a depression of the melting point, but apparent exceptions occur in the cases of dimethylic tartrate and tartaric acid. The first of these is probably due to the minima being too near the axis of coordinates, and the second to homogeneous crystallisation (compare Küster, Abstr., 1892, 396). In general, the results are in complete accord with the statements of Roozeboom (this vol., ii, 355). L. M. J.

Vapour Pressure Measurements. By ULRICH DÜHRING (*Zeit. physikal. Chem.*, 1899, **29**, 730—731).—A reply to observations made by Kahlbaum in his paper on this subject (Abstr., 1898, ii, 556).
L. M. J.

Direct Determination of Heats of Combination of Halogen Compounds: Aluminium Bromide. By NICOLAI N. BÉKÉTOFF (*Chem. Centr.*, 1899, i, 1062; from *Bull. Acad. St. Pétersbourg*, [v], **10**, 79—81).—The heat of combination of aluminium and bromine to form Al_2Br_6, has been directly determined, and found to be 41,000 cal. per atom of bromine. Thomsen and Berthelot's indirect determinations gave 40,000 and 42,000 cal. respectively. E. W. W.

Thermochemical Measurements. By MARCELLIN P. E. BERTHELOT (*Compt. rend.*, 1899, **129**, 320—321).—The results are summarised in the following table:

	Heat of combustion.			Heat of formation from elements.	Heat of dissolution at about 25°.
	1 gram. cal.	1 mol. at const. v. Cal.	1 mol. at const. p. Cal.	Cal.	Cal.
Cholic acid	7985	3401·7	3406·1	306·35	—
Amygdalin	5139·6	2348·7	2349·2	468·5	—
Conicine	10027·7	1273·5	1275·5	65·4	+5·1
Ethylenediamine......	—	—	—	8·8	+7·45
Ethylenediamine hydrate	—	—	—	80·6	+4·68
Ethylenediamine dihydrochloride ...	—	—	—	124·5	+6·65

The formation of cholic acid from cholesterol by oxidation would correspond with a considerable development of heat. The hydrolysis of amygdalin is accompanied by very little thermal disturbance.

The heat of neutralisation of conicine by hydrochloric acid is 11·4 Cal. The heat of dissolution of conicine hydrochloride obtained from Kahlbaum was −0·87 Cal., whilst the same compound prepared from Merck's conicine gave −1·49 Cal. Probably they were salts of isomeric conicines. The heat of formation of conicine hydrochloride is lower than that of ammonium chloride, but higher than that of aniline hydrochloride. The difference between the heats of formation of conicine and piperidine (40·9 Cal.) is much higher than would be the case if they were normal homologues (17 Cal.).

The heat of hydration of ethylenediamine is +2·77 Cal., and does not differ greatly from the heat of combination of liquid ammonia and water, +3·11 Cal. Its heat of neutralisation is +12·4 for the first equivalent and +10·8 for the second. The heat of formation of the solid dihydrochloride from the liquid base and the gaseous acid is +70·9 Cal. In the activity of its basic function, ethylenediamine hydrate is comparable with ammonium and potassium hydroxides. C. H. B.

Thermochemistry of Salicylaldehyde, Parahydroxybenzaldehyde, and Salicylhydramide. By MARCEL DELÉPINE and PAUL RIVALS (*Compt. rend.*, 1899, **129**, 520—523).—The authors have redetermined the thermochemical constants of salicylic acid and some of its derivatives, there being discrepancies between the recorded results of different observers.

Salicylic acid.—Molecular heat of combustion at const. vol. and const. pressure, 728·2 Cal., the mean of this and Stohmann's values being 728·3 Cal. Heat of formation from elements +138·8 Cal.; from solid phenol and carbonic anhydride +7·7 Cal., which differs from Berthelot and Werner's direct determination (+6·3 Cal.).

Salicylaldehyde.—Heat of combustion, 1 gram, +6527·4 cal.; molecular heat of combustion, 796·34 Cal. at const. vol., and 796·6 Cal. at const. pressure; heat of formation from elements, +70·5 Cal.; heat of oxidation to salicylic acid, +68·3 Cal.

Parahydroxybenzaldehyde.—The corresponding values are 6500·6 cal., 793·07 Cal., 793·3 Cal., +73·8 Cal. and +67·4 Cal.

In both cases, the heat of oxidation approximates to that of benzaldehyde, anisaldehyde, and cinnamaldehyde.

Salicylhydramide, contrary to the statements of previous observers, always melts at 167°, by whatever method it may be prepared, and, contrary to the statement of Ettling, is rapidly decomposed by acids and alkalis at the ordinary temperature. Heat of combustion (1 gram), 7305·6 cal.; molecular heat of combustion, 2527·73 Cal. at const. vol., and 2528·9 Cal. at const. pressure; heat of formation from elements, +72·4 Cal., and from ammonia and salicylaldehyde $2 \times 12·95$ Cal. The action of potassium hydroxide on the hydramide takes place in two stages, the first development of heat, 3·1 Cal., corresponding with the saturation of the third phenolic function of the hydramide. This indicates that two of the phenolic functions have been saturated by the nitrogen, which becomes quinquevalent, and this in its turn explains why salicylhydramide is yellow and not white, like most hydramides.

Parahydroxybenzaldehyde does not yield a corresponding hydramide. C. H. B.

Heat of Neutralisation and Electrolytic Dissociation. By WILHELM VAUBEL (*Chem. Zeit.*, 1899, **23**, 764—765).—The author attempts to explain the constant value of 137—138 *k* [*k* = 100 cal.] for the heat of neutralisation of strong bases and acids. His method of calculation of the molecular association (Abstr., 1898, ii, 593) indicates that in liquid water the molecule consists of 6 simple molecules and the heat of association is 726 *k*. The solution of base and acid and the subsequent neutralisation are then represented, thus: (i) $MOH + 6(H_2O) = M,H_2O + OH,5H_2O$; (ii) $A,H + 6(H_2O) = A,5H_2O + H,H_2O$; (iii) $OH,5H_2O + H,H_2O = (H_2O)_6 = \frac{1}{6}(H_2O)_6$; the heat development for this latter equation is calculated to be 142·4 *k*, a number not far removed from the experimental values. The author considers that the electric charges of the hydroxyl and hydrogen ions must pass over to the metallic and acid ion during neutralisation, and that this explains the higher E.M.F. necessary for the decomposition of the salt. He further attempts to show that his thermal values also explain the value of 0·59 volt which Glaser found for the decomposition potential of the hydroxyl ions (this vol., ii, 79). L. M. J.

Thermal Effects of the Dilution of certain Salts. By FRANCIS P. DUNNINGTON and T. HOGGARD (*Amer. Chem. J.*, 1899, **22**, 207—211).—The authors give a table showing the thermal effect of adding successive gram-molecules of water to nearly saturated solutions of ammonium acetate, lithium chloride, sodium bromide, magnesium nitrate, and calcium, magnesium and strontium chlorides; in all these cases, heat is developed on dilution, and it appears that by far the greater part of the thermal change occurs during the addition of the first few molecules of water. In the case of solutions of ammonium and sodium nitrates, ammonium, sodium and potassium chlorides, and potassium bromide and iodide, the same is true, but the dilution is endothermic; a solution of calcium nitrate, however, on dilution, at first gives out heat, but subsequently absorbs it. W. A. D.

Cryoscopic Measurements. By A. PONSOT (*Bull. Soc. Chim.*, 1899, [iii], **21**, 764—765).—A former paper by the author (this vol., ii, 546) requires sundry corrections, which do not, however, invalidate the conclusions arrived at therein. N. L.

Cryoscopic Depression in, and Latent Heat of Fusion of, Naphthylamine and Diphenylamine. By JOHN MASON STILLMANN and R. E. SWAIN (*Zeit. physikal. Chem.*, 1899, **29**, 705—710).—The molecular cryoscopic depressions for solutions in diphenylamine and in naphthylamine do not agree with those calculated by the van't Hoff expression $0·0199\ T^2/w$. The authors have therefore redetermined the cryoscopic depressions and the latent heats of fusion, as well as incidentally the specific heats of solid and liquid, in the case of pure specimens of the two compounds, a form of calorimeter designed by Waterman being employed. The cryoscopic determinations agreed completely with those of Eijkman, and the other values were diphenylamine, m. p. 54·0°, latent heat of fusion, 23·97; naphthylamine, m. p. 50·1°, latent heat of fusion, 25·59. The cryoscopic constants calculated from these numbers are 81·2 for naphthylamine and 88·8 for diphenylamine, agreeing well with the experimentally determined values 78 and 88 (Abstr., 1889, 666). L. M. J.

Method for Vapour Density Determination. By LUDWIG WILHELM WINKLER (*Chem. Zeit.*, 1899, **23**, 627).—The method is similar to that of Dumas; the apparatus consists of a thin-walled glass bulb of about 100 c.c. capacity, drawn out to a long, narrow neck which can be closed by a ground stopper. The bath is a modified

V. Meyer constant temperature bath, and the glass bulb does not come in contact with the boiling liquid. The bulb, full of air, is heated for 10 minutes in the bath, the stopper (slightly greased) inserted, and the whole weighed when cold; the operation is then repeated with the gas or vapour whose density is required. J. J. S.

Change of Volume at the Transition Point of Boracite. By Wilhelm Meyerhoffer (*Zeit. physikal. Chem.*, 1899, **29**, 661—664).—At a temperature of from 260° to 270°, boracite undergoes a transition from the rhombic to the regular system, and the author, employing the dilatometric method, shows that this transition occurs at 266° and is accompanied by a decrease in volume. L. M. J.

Application of Molecular Volumes. By Anatole Leduc (*Ann. Chim. Phys.*, 1899, [vii], **17**, 173—196).—The paper contains several tables showing the differences between the specific volumes of isopentane, ether, carbon bisulphide, and water vapours obtained by direct experiment and those calculated by the author from critical constants. The experimental data bearing on the dissociation of chlorine, nitric peroxide, and acetic acid vapour, are also discussed (compare Abstr., 1898, ii, 471, and this vol., ii, 354).

The atomic weight of hydrogen obtained by the author's calculations is 1·0076 ($O = 16$) and agrees closely with the value deduced from Sacerdote and Berthelot's experiments (this vol., ii, 404). G. T. M.

Dissociation of Nitric Peroxide. By A. Pochettino (*Real. Accad. dei Lincei,* 1899, **8**, 183—188).—A series of 29 measurements was made of the wave-length of sound in nitric peroxide at temperatures ranging between 4·2° and 150°, Kundt's formula being employed in calculating the results. The density of the gas at each temperature was taken from the tables of Natanson and of Troost and Deville, intermediate values being obtained by means of Gibbs' formula for the density of a dissociated gas. From the numbers thus found, the corresponding values k of the ratio of the specific heats have been calculated; the values of k have also been deduced from the law of mixtures, the gas being taken as a mixture of N_2O_4 and NO_2 in proportions given by its density. k is found to increase regularly with the temperature from 1·17 to 1·30, these values corresponding respectively with the hexatomic molecule N_2O_4 and the triatomic molecule NO_2; the agreement between the two sets of values is satisfactory. T. H. P.

Theory of Diffusion. By Emil Bose (*Zeit. physikal. Chem.*, 1899, **29**, 658—660).—From the equation for the diffusion of a non-electrolyte, that for the diffusion of a completely dissociated compound as deduced by Nernst, and the equilibrium equation $kc = (A - c)^2$, the author deduces expressions available for the diffusion of partially dissociated electrolytes, for which, however, no experimental support is offered although they are capable of such verification. L. M. J.

Diffusion of Ions into Gases. By John S. Townsend (*Proc. Roy. Soc.*, 1899, **65**, 192—196).—A gas which has been ionised by the action of Röntgen rays gradually loses its conductivity if left to itself;

the ions partly recombine and partly give up their charges to the walls of the containing vessel. If a stream of an ionised gas be passed through a metal tube of small bore, the loss of conductivity due to recombination of the ions will be negligible compared with that due to the absorption of the ionic charges by the metal tube. This latter will depend on the diffusion of the ions, and a mathematical discussion shows how the coefficient of diffusion may be calculated from the reduction of conductivity. With the help of the values obtained, it is shown that the ionic charges produced by Röntgen rays in air, oxygen, carbonic anhydride, and hydrogen are all the same and equal to the charge on a hydrogen ion in a liquid electrolyte. The number of molecules in 1 c.c. of a gas is estimated as 2×10^{-19}, and the weight of a molecule of hydrogen is calculated to be $4{\cdot}5 \times 10^{-24}$ grams. J. C. P.

A Hydrate Theory of Solution. By **Flavian Flawitzky** (*Chem. Centr.*, 1898, i, 651—653; from *J. Russ. Chem. Soc.*, **29**, 565—583).—A mathematical discussion leads the author to the conclusion that the same law applies to electrolytes as to non-electrolytes. Two types of solutions are distinguished: (1) normal solutions, in which the existence of normal hydrates can be demonstrated; (2) abnormal solutions, which give no indication of the formation of normal hydrates. The difference in the two cases depends only on the relative stability of the hydrates.

The extent of hydration in solution is directly proportional to the molecular weight; the same holds for cryohydrates, and the author therefore believes that the latter have an important influence on the properties of aqueous solutions. J. C. P.

Laws of Solutions. By **Wladimir A. Kistiakowski** (*Chem. Centr.*, 1899, i, 89—91; from *J. Russ. Chem. Soc.*, 1898, **30**, 576—585).—Apparatus is described in which osmotic pressure in gases may be observed and determined, the method depending on the fact that many membranes, &c., are permeable to some gases but not to others. Argon is found to diffuse through caoutchouc 100 times as rapidly as carbonic anhydride, and by means of a caoutchouc membrane separating air and ether vapour a rise in pressure of 15 cm. of mercury was observed. The laws of osmotic pressure are calculated from the basis of the law that in a system in equilibrium a small disturbance is not associated with any energy change, hence if a gas be in equilibrium with a solution $pdv - qdv_1 = 0$, where p is the partial pressure of the gas, q its osmotic pressure, and dv and dv_1 the respective volumes in the gaseous state and in the solution, and hence, since dv/dv_1 is constant $qv_1 = RT$. The author also shows that in the calculation of the cryoscopic depression a term involving the heat of dilution is necessary, the expression obtained being $T - T_1 = T/Q(RT/1000V_1 + Z)$ where Z is the heat liberated when 1 gram of the solvent is withdrawn from the quantity of solution which contains 1 gram-molecule of the solute. Comparison with the depression obtained in hydrogen chloride solutions shows that when this correction is applied the calculated values agree well with determinations for cryoscopic depressions as high as 28·8°. L. M. J.

Solid Solutions and Isomorphous Mixtures of Saturated and Non-saturated Open-chain Compounds. I. and II. By Giuseppe Bruni and F. Gorni (*Real. Accad. dei Lincei*, 1899, [v], 8, 454—463, and 570—579. Compare Abstr., 1898, ii, 562).—In ethylenic bromide solution, ethylenic chlorobromide has the molecular weight 343—359, the normal value being 143·5, and in the same solvent, ethylenic cyanide gives the values 98—135, the number corresponding with the formula being 80.

Dissolved in dimethylic succinate, dimethylic maleate shows normal, and dimethylic fumarate abnormal, cryoscopic behaviour; in the latter case, the molecular weights found are 797 to 914 instead of 144. As regards crystalline form and configuration, fumaric and succinic acids are closely related, whilst maleic acid has no such similarity with succinic acid.

Using butyric acid as solvent, the cryoscopic behaviour of crotonic acid, is abnormal and that of isocrotonic acid normal. Since crotonic acid melts at a higher temperature than the corresponding saturated acid and further is more stable than the iso-acid, the fumaroid formula must be assigned to it and to isocrotonic acid the corresponding maleoid formula.

In phenylpropionic acid solution, cinnamic acid raises the point of solidification, whilst allocinnamic acid gives the normal depression. Cinnamic acid has therefore a fumaroid molecular configuration, allocinnamic acid being the corresponding maleoid form.

Cryoscopic determinations of the molecular weight of elaidic acid in stearic acid solution give the value 303—315 instead of the normal number 282; also, stearic acid dissolved in elaidic acid has the molecular weight 348—370, whilst the formula corresponds with the number 284. These abnormal values show that stearic acid and elaidic acid form solid solutions, and to the latter must be attributed a fumaroid configuration, the isomeric oleic acid being the corresponding maleoid compound (Garelli and Montanari, Abstr., 1895, ii, 205). These conclusions are borne out by the greater stability towards reagents, and the higher melting point, of elaidic acid.

Muthmann (Abstr., 1898, i, 614) has shown that if the CH_2-group of potassium or ammonium methanedisulphonate be replaced by NH, the imidosulphonates thus obtained are isomorphous with the corresponding methanedisulphonates. This equivalence of CH_2 and NH does not obtain in the case of some other compounds. Thus diphenylamine shows normal cryoscopic behaviour in diphenylmethane solution. But benzylideneaniline and stilbene both have abnormal molecular weights in azobenzene solution; the isomorphism of stilbene and azobenzene thus indicated is confirmed by crystallographic measurement. Both crystallise in the monoclinic system. For azobenzene, [$a:b:c = 2\cdot10756:1:1\cdot33123$ and $\beta = 65° 34'$], whilst for stilbene, [$a:b:c = 2\cdot17015:1:1\cdot40033$ and $\beta = 65° 54'$]. Hydrazobenzene, benzylaniline, and dibenzyl all show abnormal cryoscopic behaviour in azobenzene. Dibenzyl is also crystallographically completely isomorphous with azobenzene and stilbene, and the last raises the melting point of dibenzyl.

The following conclusions are drawn. 1. The groupings -CH=CH- of a fumaroid compound and $-CH_2-CH_2-$ are isomorphotropic with -N=N-. 2. By substituting -N=CH- for one of the preceding groupings, the compounds retain morphotropic relations and are capable of forming solid solutions. 3. The substitution of -NH-NH- removes all similarity of configuration and hence also the capacity of forming solid solutions. 4. The effect of substituting the grouping $-CH_2-NH-$ is not well defined.

Cryoscopic Behaviour of Substances with Constitutions similar to that of the Solvent. IV. By FELICE GARELLI and F. CALZOLARI (*Real. Accad. dei Lincei*, 1899, [v], **8**, 579—590; *Gazzetta*, **29**, ii, 258—284. Compare preceding abstract).—When dissolved in thymol, menthol forms solid solutions with it, the molecular weight obtained being 168—177, instead of 156.

The freezing points of mixtures of dibenzyl and stilbene show very considerable differences from the values calculated by means of Küster's law for isomorphous mixtures, the largest difference being 17·36° for a mixture containing 40·66 per cent. of dibenzyl.

In dibenzyl solution, hydrazobenzene gives normal depression of freezing point, whilst azobenzene, benzylideneaniline, and benzylaniline behave abnormally.

Of the two theoretically possible stilbenes, that known must be regarded as the fumaroid modification.

Dibenzyl, stilbene, azobenzene, and benzylideneaniline all behave abnormally in benzylaniline solution, as does triphenylamine in triphenylmethane solution. T. H. P.

Cryohydric Phenomena in Solutions of Enantiomorphous Isomerides. By GIUSEPPE BRUNI (*Real. Accad. dei Lincei*, 1899, [v], **8**, 332—335).—The method employed by Roozeboom (this vol., ii, 276) for distinguishing between racemic compounds, inactive conglomerates, and pseudo-racemic mixtures by means either of the melting point curve or of the solubility curve of the solid, has a complete analogue in the method suggested by the author, who makes use of the curve of saturation in the case of binary mixtures, and of the cryohydric curve in the case of ternary mixtures. By this means are avoided the disadvantages of Roozeboom's method, which requires relatively large quantities of material, is not applicable to substances decomposing before melting, and, if the solubility curve be employed, involves experimental difficulties. T. H. P.

Recognition of Racemic Compounds. By H. W. BAKHUIS ROOZEBOOM (*Ber.*, 1899, **32**, 2172—2177. Compare this vol., ii, 276 and 401; also following abstract).—The author considers that Ladenburg's statements (Trans., 1899, **75**, 465; this vol., ii, 551) are less complete than his own (*loc. cit.*), and, as regards some of them, not accurately formulated. He also points out that Ladenburg, in applying to liquid externally compensated compounds the method used in the case of solids, has paid no attention to the phase rule, and hence his conclusions are invalid; in fact, determinations of solubility are not suitable for determining whether a liquid is a racemic compound or an inactive conglomerate. J. J. S.

Recognition of Racemic Compounds. By FREDERIC STANLEY KIPPING and WILLIAM J. POPE (*Ber.*, 1899, **32**, 2225—2227. Compare Trans., 1899, **75**, 36, and preceding abstract).—It is pointed out that Ladenburg's modified method (Trans., 1899, **75**, 465) is essentially different from his original one (*Ber.*, 1894, **27**, 3065) and that it is now in accordance with the results described by the authors (*loc. cit.*). The conclusions arrived at by Ladenburg with respect to the racemic nature of liquids such as *i*-pipecoline are invalid, as he has completely neglected the application of the phase rule. J. J. S.

New Method for the Resolution of Racemic Compounds into the Active Constituents. By WILHELM MARCKWALD and ALEX. MCKENZIE (*Ber.*, 1899, **32**, 2130—2136).—*r*-Mandelic acid has been etherified by the aid of an optically active alcohol, namely, *l*-menthol, and the results indicate that *l*-mandelic acid is not quite so readily etherified as the *d*-acid. The method, however, does not lend itself, at any rate in this case, to the complete resolution of the racemic acid, since after 50 grams of the acid and alcohol had been heated at 155° for 1 hour, only about 0·72 gram of the *l*-acid could be isolated. The menthylic mandelate formed in the reaction, when fractionally hydrolysed, gave first an acid having a slightly positive rotation (but the actual isolation of the *d*-acid was not attempted), and finally an acid with a negative rotation. Although the method is not so efficient as other methods for the resolution of racemic acids, the authors conclude that it may be of practical use for the resolution of racemic alcohols by the aid of an optically active acid. J. J. S.

Hylotropic-isomeric Forms. By KARL SCHAUM (*Annalen*, 1899, **308**, 18—40. Compare Abstr., 1898, ii, 211 and 372).—The cases of sulphur, tin, hexachloroketodihydrobenzene, nitrosobenzene, and menthol are discussed by the author. M. O. F.

Gaseous Reactions in Chemical Kinetics. V. Gradual Combination of Oxyhydrogen Gas. By MAX BODENSTEIN (*Zeit. physikal. Chem.*, 1899, **29**, 665—699).—The present paper deals with the non-explosive combination of hydrogen and oxygen when the mixture is passed through porcelain tubes raised to the desired temperature by means of a lead-bath. From the total volume of gas passed through, and the total time, the time during which the gas was exposed to the high temperature is found, and by varying these values various determinations of the velocity constant were made at temperatures of 482°, 509°, 560°, and 572°. The values at each temperature, as calculated for a trimolecular equation, are constant, and equal values were obtained on varying the initial proportions of the two gases; the action hence proceeds according to the equation $2H_2 + O_2 = 2H_2O$. The actual values of the constant vary with the form of the tube employed, and the author finds that the ratio of the constants for two tubes is approximately equal to the ratio of the quotients surface/volume, and hence concludes that the action proceeds almost entirely on the surface of the vessel and not throughout the entire mass, that is, it is a catalytic action. At temperatures which vary from 660° to 700° for different tubes, the steady union becomes explosive, and as the explosion temperature is approached, the velocity constant, previously in accord with that given by equation $\log k = A/T + B \log T + c$, increases enormously above the calculated values. The author considers this to be due to the imperfect conduction of heat, so that the heat generated by the union raises the temperature of the gas above that of the surroundings, and the explosion temperature is hence highest for vessels of greatest comparative surface. The results of the author are not in accord with those previously obtained by Hélier (this vol., ii, 85). L. M. J.

Velocity of Explosion of Acetylene. By Marcellin P. E. Berthelot and Henri Le Chatelier (*Compt. rend.*, 1899, **129**, 427—434. Compare Abstr., 1897, ii, 91).—The velocity of explosion of pure (98 per cent.) acetylene was studied at pressures varying from 5 to 36 kilograms per square centimetre, the gas being enclosed in glass tubes 1 metre in length and having an internal diameter of 2—6 millimetres. One end of the glass tube was closed, and the other end connected with an iron vessel in which the explosion was started by firing electrically a detonator of fulminate or chlorate mixture weighing 0·01—0·04 gram. Larger amounts are to be avoided, since they give rise to violent undulatory movements which are not strictly due to the detonation itself. In some cases, the influence of any irregular initial disturbance was obviated by introducing an iron tube, 1·5 metres in length, between the glass tube and the iron vessel. The phenomena observed in the glass tube were registered on a photographic plate which was made to drop in a frame at the moment of firing, so that the image of the flame traversing the tube was recorded in the form of a curve, the inclination of the tangent at any point of the latter being a measure of the velocity at which the explosion is being propagated at the corresponding part of the tube. The results of a number of experiments show that, contrary to what is observed with mixtures of acetylene and oxygen, the velocity of explosion of pure acetylene increases continuously with the propagation of the flame along the tube, which is generally ruptured before a uniform velocity can be attained. The fracture, or rather pulverisation, of the tube takes place, as a rule, when about half its length has been traversed, and is propagated backwards with a velocity comparable with that of the explosion. In the greater number of cases, the curve obtained assumes almost immediately an asymptotic form, indicating that the velocity, after a certain point, increases but slowly until, at the moment of rupture, a large and abrupt increase is noticed. In a considerable number of experiments, however, a more continuous and rapid increase was observed. These different results are independent of the pressure and appear to be connected with differences in the manner in which the explosion is initiated. According to the most uniform and regular determinations, the velocity of explosion increases with the pressure from 1000 metres per second at 5 kilograms per square centimetre to about 1600 metres at 30 kilograms.

The theoretical signification of the results obtained is finally discussed, and it is pointed out that a fundamental distinction exists between waves, such as those of sound, which are propagated from a single, unrenewed impulse and those occurring in an explosive mixture or an endothermic gas in which a continually increasing amount of energy is set free. The explosive properties of acetylene may be expected to differ from those of combustible gaseous mixtures, since the products of its decomposition, gaseous hydrogen and solid carbon, have very different physical properties. Moreover, in the combustion of hydrogen and gaseous hydrocarbons with oxygen, the carbonic anhydride and water formed, which are partially dissociated at the temperature of explosion, undergo association as the temperature falls and thus modify the violence of the initial shock, whereas acetylene is abruptly resolved into free carbon and hydrogen. N. L.

Velocity Constants in the Formation of Simple Ethers. By W. Sagrebin (*Chem. Centr.*, 1899, i, 1059—1060; from *J. Russ. Chem. Soc.*, 1899, **31**, 19—27).—The velocity constants were determined at 100° for the reaction between alcohols and ethereal salts of benzenesulphonic acid with the production of the ether and acid. Excess of the alcohol was employed as a solvent, and on this account the reaction is of the first order. The values for the constant compared with that for methylic alcohol are as follows: methylic alcohol, 100; ethylic alcohol, 48·9; propylic alcohol, 35·2; isobutylic alcohol, 21·4; *i*-isoamylic alcohol, 23·6; octylic alcohol, 16·2; allylic alcohol, 28·1; benzylic alcohol, 14·98. The order, which shows the influence of constitution, is the same as that obtained by Menschutkin for the rate of etherification of alcohols and the velocity of reaction of amines with allylic bromide, although differences occur in the actual numbers, explicable by the use of different solvents (Abstr., 1890, 1366; 1898, i, 119). Values for isopropylic alcohol, 16·1, and phenylmethylcarbinol, 4·5, were also obtained, but with trimethylcarbinol and dimethylethylcarbinol, constant values for the velocity constant were not observed. L. M. J.

Function of the Medium in Chemical Change. By Julius W. Brühl (*Ber.*, 1899, **32**, 2326—2331.) [Compare Lowry, Trans., 1899, **75**, 215—228].—The velocity of isodynamic change has been studied by means of the refractive and dispersive powers in the case of the enolic and ketonic forms of Claisen's ethylic mesityloxidoxalate (Abstr., 1896, i, 561), dissolved in different media; the refractive powers of the two isomerides are very different, and the dispersive powers differ by 400 per cent.

No isomeric change takes place on dissolving the enolic form, or on diluting the solution, the small changes in the optical constants being due to physical and not to chemical causes. Of the solvents used, chloroform produced the least acceleration, and in this solvent the formation of the ketonic form is hardly perceptible after 2½ months; benzene, *α*-bromonaphthalene, and carbon bisulphide act somewhat more rapidly, but the greater part of the enolic form is unchanged after 3 months; methylic and ethylic alcohol, on the other hand, cause a marked change in a few days, and in 2 or 3 months nearly the whole of the enolic is converted into the ketonic form, the reaction being complete and not proceeding to a state of equilibrium. The isomeric change is regarded as due to the ionic dissociation of the enolic form, followed by a reassociation of the ions in the ketonic form, and it is pointed out that the isomeric change takes place most rapidly in those media which have the greatest dissociating and dielectric power; these media are also usually characterised by great heat of vaporisation, heat of fusion, and specific heat.

[Dissociation of Molecular Chlorine by Water.] By ALEXANDER A. JAKOWKIN (*Zeit. physikal. Chem.*, 1899, **29**, 613—657).—The author has previously shown that in a solution of chlorine in water equilibrium is finally attained when $Cl_2 + Aq \rightleftarrows \overset{-}{Cl} + \overset{+}{H} + HClO + Aq$ (Abstr., 1897, ii, 246), and has now further investigated this equilibrium. As hypochlorous acid is a very weak electrolyte, the conductivity of chlorine solutions is almost entirely due to the hydrogen chloride, and the concentration of the latter can therefore be determined from conductivity experiments. By subtraction of double the quantity of chlorine so found from the total chlorine, the concentration of undissociated molecules is obtained, and it is found that when the concentration is so calculated, the partition ratio of chlorine between carbon tetrachloride and water is constant for all concentrations, so that the quantity of undissociated chlorine in water may be calculated from that in carbon tetrachloride in equilibrium with the solution. The gas is also shown to be present in both solvents in the form of simple molecules. The hydrolysis in water at various concentrations was then determined and the values of the equilibrium constant were found to remain constant when calculated for the trimolecular equation $k.c = (A - c)^3$. If chlorine ions be added, the dissociation of molecular chlorine must decrease, and, by addition of chlorides, this was found to be the case, the equilibrium constant for $kc = (A - c)^2(A - c + b)$ being equal to that previously obtained. In strong solutions, apparent variations occur consequent on the alteration of the partition ratio. Undissociated chlorides should produce no effect, but it was found that mercuric chloride causes a slight increase of dissociation which is explicable by the union of the salt with some hydrogen chloride (Le Blanc and Noyes, Abstr., 1891, 388). The effect of hydrogen ions, which should be equal to that of chlorine ions, was found to be in entire accord with theory, the acids employed being dilute sulphuric, nitric, acetic, and the three chloracetic acids. Boric acid, which is practically undissociated, has no effect except in strong solutions. Hydrochloric acid yields both hydrogen and chlorine ions and its effect is therefore considerably greater than that of other acids, the dissociation being in this case given by $kc = (A - c)(A - c + b)^2$. In solutions of hydrochloric acid, therefore, of moderate strength, the dissociation of the chlorine is very slight; for high concentrations, however, the results are complicated, owing to the formation of the trichloride HCl_3. The agreement of all the determinations with those calculated by the trimolecular equation is well seen by comparison of the experimental values with the theoretical curves, and conclusively proves the dissociation. The latter may also be calculated entirely from conductivity observations, and the results so obtained agree completely with the former determinations. The equilibrium constant increases with rise of temperature, so that the hydrolysis is accompanied by heat absorption, which decreases from about 7 Cal. at ordinary temperature to zero at from 75° to 95°, and the heat of solution of undissociated chlorine may also be calculated. The results are in accord with the determinations of Thomsen, and with the values for the hydrolysis calculated from the heats of formation of hydrochloric and hypochlorous acids.

L. M. J.

Equilibrium between Hydrocyanic and other Acids in Combination with Alkalis. By MARCELLIN P. E. BERTHELOT (*Ann. Chim. Phys.*, 1899, [vii], **17**, 453—457).—Potassium cyanide is completely decomposed by hydrochloric acid; when solutions containing each of these reagents are mixed at 15°, the heat developed is 10·7 Cal.; the same value is obtained for nitric acid, whilst 10·3 Cal. are developed in the case of acetic acid; these figures coincide with the theoretical values.

When solutions containing phenol (1 mol. in 20 litres) and potassium cyanide (1 mol. in 2 litres) are mixed together, 5·2 Cal. are developed. The hydrocyanic acid appropriates 3/5ths of the base, although its heat of neutralisation in solution is less than one-third that of phenol, but since the heats of formation of solid potassium cyanide and potassium phenoxide from solid generators are $(20·2 - S)$ and 12·4 Cal. respectively, where S (representing the heat of fusion of solid HCN) is not greater than 4 Cal., it follows that hydrocyanic acid is in reality a stronger acid than phenol. The following data are obtained with hydrogen sulphide (1 mol. in 20 litres):

H_2S dil. + 2KCN dil. = 4·7 Cal.
Na_2S „ + 2HCN „ = 3·2 „
Na_2S „ + HCN „ = 3·1 „
NaHS dil. + HCN dil. = 0·0 Cal.
Na_2S „ + KCN „ = 0·0 „

These results indicate that excess of hydrogen sulphide completely displaces hydrogen cyanide from solutions of its alkali salts.

Analogous conditions of equilibrium exist between carbonic and hydrocyanic acids; those obtaining with the latter compound and boric acid are indicated by the following data:

$$\begin{array}{llll} B_2O_3 \text{ dil. (1 mol. in 4 litres)} & + \text{HCN (1 mol. in 2 litres)} & = 0·0 & \text{Cal.} \\ 2\left\{\begin{array}{l} 2B_2O_3 \quad \text{dil.} \\ 2B_2O_3,K_2O \quad „ \end{array}\right. & \begin{array}{l} +2\text{KCN dil.} \\ +2\text{HCN} \quad „ \end{array} & \begin{array}{l} =14·6 \\ =-3·7 \end{array} & \begin{array}{l} „ \\ „ \end{array} \\ 3\left\{\begin{array}{l} 2B_2O_3 \quad „ \\ 2B_2O_3,K_2O \quad „ \end{array}\right. & \begin{array}{l} +4\text{KCN} \quad „ \\ +4\text{HCN} \quad „ \end{array} & \begin{array}{l} =16·8 \\ =11·6 \end{array} & \begin{array}{l} „ \\ „ \end{array} \end{array}$$

The alkali is shared between the two acids; in experiment 2, which corresponds with the monobasic borate, the hydrocyanic acid takes 1/6th of the base; in experiment 3 (dibasic borate), it takes 4/9ths.

G. T. M.

Dissociation of Ammonio-metallic Salts. By R. Jarry (*Ann. Chim. Phys.*, 1899, [vii], 17, 327—388).—The paper contains descriptions of apparatus employed in preparing ammonio-silver salts and in studying their dissociation.

When a concentrated ammoniacal solution of silver chloride is allowed to evaporate over quicklime, the ammonio-silver chloride, $2AgCl,3NH_3$, separates in colourless, birefractive prisms not affected by light; when the solution is placed over anhydrous calcium chloride, ammonia is removed, and the compound, $CaCl_2,NH_3$, is produced, this has a lower dissociation pressure than the ammonio-silver salt, and accordingly the latter dissociates, yielding crystalline silver chloride. The ammonio-silver chloride, $AgCl,3NH_3$, crystallises in long, colourless, birefractive needles when a solution of silver chloride in liquid ammonia is evaporated at −40° to −20°; the substance is not affected by light. Silver chloride is only slightly soluble in liquid ammonia, and a convenient apparatus is described which obviates the use of large quantities of the solvent in preparing the ammonio-silver chloride crystals. Silver iodide, unlike the chloride or iodide (compare Abstr., 1897, ii, 259, and 1898, ii, 515), is extremely soluble in liquid ammonia, and on allowing the solution to evaporate at −40° to −10°, white, birefractive, lamellar crystals of the ammonio-silver iodide, AgI,NH_3, are obtained; this substance dissociates at 4° under atmospheric pressure, forming a second ammonio-iodide, $2AgI,NH_3$. The dissociation pressures of the two compounds are as follows:

AgI,NH_3.

t	−23°	−13°	0°	6·2°	10·5°	15°	20·5°
p	145	80 [?]	585	820	1055	1380	2020 mm.

$2AgI,NH_3$.

t	0°	19°	37°	39°	52·5°	65°	80°	100°
p	3	12	57	63	155	270	485	1145 mm.

The latter compound is obtained in the crystalline form by the spontaneous evaporation of a solution of silver chloride in concentrated aqueous ammonia; it separates in small, white crystals which become dark violet on exposure to light; during the crystallisation, the pressure of the dissolved ammonia in the liquid surrounding the crystals must be greater than the dissociation pressure of the substance, otherwise the latter dissociates, yielding silver iodide.

Methylammonio-silver bromide, $AgBr,NH_2Me$, is quite analogous to the corresponding chloride (compare Abstr., 1897, i, 455), and is prepared in a similar manner. Its dissociation pressures are as follows:

$AgBr,NH_2Me$.

t	0°	19·5°	20·5°	45·2°	55°
p	11	52	58	290	514 mm.

The following table indicates the solubility of silver bromide in 10 c.c. of aqueous methylamine of different concentrations at 11·5°:

NH_2Me. Grams.	AgBr. Mgrm.	NH_2Me. Grams.	AgBr. Mgrm.	NH_2Me. Grams.	AgBr. Mgrm.	NH_2Me. Grams.	AgBr. Mgrm.
4·844	289	3·562	73	1·797	28	1·317	12
4·311	127	3·258	55	1·513	16	1·101	7

The curve representing these results shows a break corresponding with a solution saturated under the dissociation pressure of $AgBr,NH_2Me$.

The methylammonio-silver iodide, AgI,NH_2Me, obtained like its analogues, forms white, birefractive crystals not affected by light; its dissociation pressures are as follows:

t	0°	15°	25·5°	29·5°	34°	38°	40°	45°	47°	51°	56°	60°
p	35	142	300	403	550	713	803	1130	1210	1360	1575	1745 mm.

At 39°, under atmospheric pressure, this substance is wholly converted into another methylammonio-iodide, $2AgI,NH_2Me$, which gives the following dissociation pressures:

t	0°	19°	34°	47·5°	65°
p	11	34	60	116	228 mm.

These two compounds are very insoluble in aqueous solutions of methylamine, and on this account the latter iodide could not be obtained crystalline.

The dissociation curve of the compound, AgI,NH_2Me, is discontinuous at the point corresponding with the temperature 43° and the pressure 1070 mm.; at this temperature, the substance is seen to melt; the lower portion of the curve therefore represents the dissociation of the solid, and the upper portion that of the liquid, ammonio-iodide.

G. T. M.

Equilibrium in the System, Water–Phenol–Aniline. By FRANS A. H. SCHREINEMAKERS (*Zeit. physikal. Chem.*, 1899, **29**, 577—602).—The equilibrium relations had been previously studied for the system, water–alcohol–succinonitrile (Abstr., 1898, ii, 564), in which two of the pairs form two liquid phases between certain temperature limits. The present system is in this respect similar, but it yields a different form of equilibrium field, and the binodal curves for various temperatures are given, as well as the prismatic representation. The critical mixture temperature of the water–phenol system is 68°, and replacement of phenol by aniline causes a regular increase of this temperature to 167° for the water–aniline system. Curves are also constructed to show the effect of addition of aniline to a mixture of water and phenol in constant ratio, and in this case the critical temperature first rises and then again falls. The addition of salt raises, but that of alcohol lowers, the critical mixture temperature of phenol and water. If one constituent be added to a mixture of the other two, the composition of the homogeneous phase varies for varying ratios of the binary mixture, and curves are given to show the two correlated compositions. The theoretical considerations are postponed.

L. M. J.

False Equilibrium. By PIERRE DUHEM (*Zeit. physikal. Chem.*, 1899, **29**, 711—714).—The author replies to Bodenstein's criticisms (this vol., ii, 639) of the work of Pelabon, and considers that the observations of the former respecting the limits of temperature of formation and false equilibrium of hydrogen sulphide are incorrect. The discrepancies between the results of Bodenstein and of Pelabon are regarded as due to the fact that the former has overlooked the absorption of hydrogen sulphide by liquid sulphur, and on this account the use of indefinite quantities of sulphur militates greatly against the value of his researches. L. M. J.

Fixed Points of Transformation. By HENRI LE CHATELIER (*Compt. rend.*, 1899, **129**, 497—499).—Reversible transformations, such as fusion, allotropic changes, &c., are usually considered to take place under fixed external conditions, but the author does not consider that this is necessarily an absolute law. The equilibrium conditions in a heterogeneous system are $\epsilon - T\eta + Pv - M_1m_1 - \cdots - M_nm_n = 0$, where ϵ, η, v, m, M, are respectively the energy, entropy, volume, mass, and potential, this equation holding for each phase. If, however, changes of magnitude of the particles lead to changes in energy, &c., which may be the case if the particles are very small (for example, the vapour tension of small drops of water), then the above expression may be greater or less than zero. In the former case, the system would be stable, as the subdivided parts would reunite; in the second case, the subdivision could proceed spontaneously, ultimately yielding a homogeneous mixture, and the author does not consider there is any *à priori* reason why this should not occur. Crystalline liquids are, perhaps, cases of the progressive fusion of crystals, but experimental realisation of changes of state at variable tensions is probably difficult.

L. M. J.

"Genesis of Dalton's Atomic Theory." By GEORG W. A. KAHLBAUM (*Zeit. physikal. Chem.*, 1899, **29**, 700—704).—The author replies to certain criticisms of Debus on the German translation, by the author, of the above work of Roscoe and Harden.

L. M. J.

The Place of the New Constituents of the Atmosphere in the Periodic System. By JAMES LEWIS HOWE (*Chem. News*, 1899, **80**, 74—76).—Helium, neon, and argon are considered to be the first three elements of the eighth group in Mendeléef's table of the periodic system. Neon hence follows fluorine, and is the transitional element between the halogen and sodium, whilst argon is a transitional element between chlorine and potassium. Helium is thus in the same horizontal series as hydrogen, but the corresponding element of the halogen series is unknown. Other similar elements could be placed in this group, inasmuch as it is a group containing triads, for example, iron, cobalt, nickel, &c.; and the elements metargon, krypton, xenon may perhaps be placed in it. The author considers the position of elements with no chemical affinity as transition elements from the negative halogens to the positive alkali metals to be probable and natural, and the dissimilarity in properties of these elements and the others of the group, iron, platinum, &c., does not, in his opinion, militate against these views, as dissimilarity from the type elements occurs in other groups. L. M. J.

Inorganic Chemistry.

Solidification of Hydrogen. By JAMES DEWAR (*Compt. rend.*, 1899, **129**, 451—454; *Ann. Chim. Phys.*, 1899, [vii], **18**, 145—149; *Chem. News.*, 1899, **80**, 132—133).—In earlier experiments, liquid hydrogen was allowed to evaporate under 10 mm. pressure, and gave no sign of solidification. Whilst experimenting with some electric resistance thermometers, the wires being immersed in liquid hydrogen, and a small quantity of air entering through leakages and becoming frozen, it was observed that when the pressure was reduced below 60 mm. the whole of the liquid suddenly solidified into a white, froth-like mass like frozen foam. The solid evaporated completely under the low pressure, and melted when the pressure was allowed to rise to 55 mm.; it therefore could not be regarded as frozen air containing liquid hydrogen, and the fact that solidification did not occur in the earlier experiments is attributed to undercooling. This was confirmed by evaporating liquid hydrogen under 30—40 mm. pressure in a special apparatus; it became completely solid, but melted if the pressure was allowed to rise to 55 mm. The sp. gr. of the solid could not be determined, but the maximum sp. gr. of the liquid is 0·086 as compared with 0·07 at its boiling point.

Measurements with constant volume hydrogen thermometers showed that the temperature of the solid under 35 mm. pressure is 16° absolute. The boiling point under 760 mm. pressure is 21° absolute. Calculating from these data, a vapour tension of liquid hydrogen of 55 mm. would correspond with a temperature of 16·7° absolute, hence the melting point of hydrogen must be about 16° or 17° absolute. It may be noted that the critical temperature of hydrogen being 30° to 32° absolute, the melting point is about half the critical temperature. The melting point of nitrogen is also about half its critical temperature. The lowest temperature that can be obtained by evaporation of solid hydrogen under low pressure is 14—15° absolute. C. H. B.

Application of Liquid Hydrogen to the Production of High Vacua, together with their Spectroscopic Examination. By JAMES DEWAR (*Proc. Roy. Soc.*, 1899, **64**, 231—238).—By an extrapolation of the vapour pressure curves of oxygen and nitrogen down to the temperature of boiling hydrogen, the vapour pressure of air at that temperature may be estimated as less than one-millionth of an atmosphere. Vacuum tubes of ordinary shape, suited for the spectroscopic examination of gases, had attached to them a temporary tube, which was immersed for over a minute in liquid hydrogen; the solidification of the air in the interior produced a very high vacuum, as was proved by the extreme difficulty of passing a spark through the tubes.

The process brings about a concentration in the vacuum tubes of the more volatile constituents of the air, and spectroscopic examination of a number of tubes prepared in the above way revealed the presence of neon and helium in a volume of air less than 50 c.c. A number of tubes which had no electrodes showed a carbonic oxide spectrum, due to impurities coming from the glass. Only some tubes showed the hydrogen spectrum, so that the question of the presence of free hydrogen in the air requires further investigation. J. C. P.

Solubility of Bromine in Water. By Ludwig Wilhelm Winkler (*Chem. Zeit.*, 1899, **23**, 687).—Pure bromine and water were shaken for an hour at a constant temperature, a portion of the clear solution was then removed by a capillary pipette and added to a concentrated solution of potassium iodide, the liberated iodine being estimated by the aid of sodium thiosulphate.

The mean results obtained were

Temp.	0°	10·34°	19·96°	30·17°	40·03°	49·85°
Parts of water dissolve 1 part of bromine ...	24	26·74	27·94	29·10	29·02	28·39

Much less bromine is soluble in ice cold water in the presence of bromine hydrate.

Temp.	0°	5·12°
Parts of water dissolve 1 part of bromine	42·39	26·26

The solubility of bromine vapour in water has also been estimated. Bromine water was shaken in a partially filled vessel, the amount of bromine vapour evolved, and also the amount of bromine left in solution were then determined, and, after calculating the pressure of the bromine vapour, its absorption coefficient was calculated.

Temp.	Pressure.	Absorption coefficient.
0°	56—13	60·53
9·94	89—16	35·22
20·46	138—9	20·87
30·38	179—12	13·65
40·31	229—26	9·22
50·25	274—53	6·50
60·04	314—46	4·84
69·98	154—54	3·82
80·22	396—74	2·94

The absorption coefficient obeys the law previously enunciated (Abstr., 1892, 556). Since only so much liquid bromine is dissolved in water as corresponds with the absorption coefficient of bromine vapour and the tension of liquid bromine, it is merely necessary to determine the first two data for a given temperature and then the tension (p) of liquid bromine for that temperature may be calculated by means of the equation $p = b \cdot 760 / \beta . v . 0\cdot0071426$ where b = weight of liquid bromine dissolved by 1 gram of water, β = absorption coefficient of bromine vapour, v = specific volume of water at the given temperature, and 0·0071426 gram is the weight of 1 c.c. of bromine vapour at 0° and 760 mm.

It follows that liquid bromine, as such, is not soluble in water, and that only the vapour dissolves. J. J. S.

Electrolytic Method of preparing Alkali Chlorates, Bromates, and Iodates. By Erich Müller (*Chem. Centr.*, 1899, i, 1061; from *Zeit. Elektrochem.*, **5**, 469—473).—The conversion of potassium hypochlorite into chlorate is accelerated by the addition of potassium chromate, and the current yield is increased from 32·8 to 69·6 per cent. or more. Similarly, alkali bromides and iodides are almost quantitatively oxidised into bromates and iodates respectively in the presence of potassium chromate. Platinum is the most suitable metal for the anode; the use of graphite causing impurities in the salts, and platinum, iron, nickel, or copper may be used as cathodes, but not lead or zinc. In order to avoid the formation of perchlorates, the temperature of the chloride solution should not sink below 25° nor rise above 50°, but perbromates and periodates are not formed from bromides and iodides respectively, even when the solutions are well cooled. The current density may vary within wide limits. Manganese salts have no influence on the formation of chlorates, &c.

E. W. W.

Iodic and Periodic Acids. By Arthur Rosenheim and Otto Liebknecht (*Annalen,* 1899, **308**, 40—67).—The authors' experiments lead them to the following conclusions. (1.) Free iodic acid is dibasic, having the composition $H_2I_2O_6$. (2.) The hydrogen iodates have the composition RHI_2O_6. (3.) The complex iodomolybdates (compare Chrétien, Abstr., 1896, ii, 651) are acid salts of the composition RIO_3MoO_3, analogous to the hydrogen iodates. (4.) When hydrogen iodates or complex iodates are neutralised, the anion is split, and normal iodates (salts of a hypothetical, monobasic iodic acid) are formed. (5.) Periodic acid is pentabasic. (6.) Powerful bases convert periodic acid into stable, monometallic salts, normal salts of a monobasic, meta-periodic acid.

Ammonio-silver iodate, $AgIO_3,2NH_3$, prepared by allowing a solution of silver iodate in concentrated ammonia to evaporate spontaneously over solid potash in a bell-jar, crystallises in long, highly lustrous needles, and becomes greyish-violet when exposed to daylight.

Disilver hydrogen periodate, $Ag_2H_3IO_6$, first described by Magnus and Ammermüller (*Ann. Phys. Chem.*, 1833, [i], **28**, 514), is prepared by suspending the sodium salt, $Na_2H_3IO_6$, in water, adding just enough nitric acid to dissolve it, and treating the solution with neutral silver nitrate at 20°. When the operation is carried out at 100°, the black *salt,* Ag_3IO_5, is produced, but if the disilver periodate is first isolated and then treated with boiling water, the pale yellow colour changes to reddish-brown, and finally black, whilst the liquid becomes acid; by constantly replacing the water until this no longer shows an acid reaction, the *salt,* Ag_5IO_6, is obtained as a black, crystalline powder, and this compound is also produced when disilver hydrogen periodate is treated with ammonia. A boiling solution of the disilver periodate in dilute nitric acid dissolves freshly precipitated silver oxide, forming the black salt, Ag_3IO_5.

The following silver periodates are known at the present time: $AgIO_4$, $Ag_2H_3IO_6$ (and its anhydrides, Ag_2HIO_5 and $Ag_4I_2O_9$), Ag_3IO_5, and Ag_5IO_6; Lautsch's tetrabasic salt, $(Ag_2O)_4I_2O_7$, is not an individual substance.

Pentasodium hexatungstoperiodate, $5Na_2O,I_2O_7,12WO_3+16H_2O$, prepared by boiling a solution of hydrogen disodium periodate with sodium carbonate (1½ mols.) and tungstic acid in slight excess, is the tungsten analogue of Blomstrand's molybdo-salt (Abstr., 1892, ii, 122); it crystallises in microscopic needles, and the aqueous solution gives rise to the corresponding *potassium* salt, with $8H_2O$, *strontium* salt, with $28H_2O$, and *barium* salt, with $12H_2O$.

Trisodium monotungstoperiodate, $3Na_2O,I_2O_7,2WO_3 + 4H_2O$, prepared by adding the disodium periodate (15 grams) in small quantities to a boiling solution of sodium paratungstate (20 grams), forms a white, amorphous mass. The *diammonium sodium* salt, $2(NH_4)_2O,Na_2O,I_2O_7,2WO_3 + 16H_2O$, obtained when ammonia is added to a concentrated solution of sodium hexatungstoperiodate until the precipitate at first formed no longer disappears on stirring, is a crystalline substance. M. O. F.

Action of Hydrogen Chloride on Sulphates, Selenates, Tellurates, and Phosphates. By Raymond W. Tunnell and Edgar F. Smith (*J. Amer. Chem. Soc.*, 1899, **21**, 929—932).—Although selenic and telluric acids are readily expelled from their salts by the action of hydrogen chloride, the method cannot be employed for the separation of sulphates from selenates or tellurates, as a certain amount of sulphuric acid is also replaced, but even at a dull red heat the whole of the sulphuric acid is not removed (compare Heusgen, *Ber.*, 1876, **9**, 1671). At the ordinary temperature, a reaction takes place, the sulphate increasing in weight, probably owing to the formation of a double salt, such as K_2SO_4,HCl. The expulsion of the sulphuric acid takes place more readily in the presence of a selenate or tellurate, and the authors consider it a case of mass action.

Selenic or telluric acid may be completely removed from a mixture of phosphate with selenate or tellurate without the loss of any phosphoric acid. J. J. S.

Character of the Impurity found in Nitrogen Gas derived from Urea. By Lord Rayleigh (*Proc. Roy. Soc.*, 1898, **64**, 95—100).—Nitrogen prepared from carbamide by the action of sodium hypochlorite or hypobromite contains an impurity heavier than nitrogen, the excess amounting to 1—2 per cent. of the weight of pure nitrogen (compare *Phil. Trans.*, A, 1895, 188). When the generating vessel and its charge of hypochlorite were heated previous to the introduction of urea, the weight of impurity was increased. The gas evolved was passed over cold copper turnings, solid caustic potash, and phosphoric anhydride, and only traces of carbonic anhydride or oxygen could be found in the collected gas. With the idea that the impurity was nitrous oxide, the author determined the refractivity of the gas by a method of which details are given, and found that the proportion of impurity indicated in this way was nearly the same as that deduced from the weight. The view that the impurity is nitrous oxide agrees with the observation that it is much more soluble in water than nitrogen. Explosion of the gas with hydrogen gave a contraction rather in excess of the nitrous oxide supposed to be present. It is probable that nitrous oxide is formed by the action of hypobromite on carbamide, as well as in the preparation of nitrogen from chlorine and ammonia. J. C. P.

Densities of 'Atmospheric Nitrogen,' Pure Nitrogen, and Argon. By WILLIAM RAMSAY (*Proc. Roy. Soc.*, 1899, **64**, 181—183). —The density of 'atmospheric nitrogen,' calculated from the densities of the constituents taken in the proportion in which they occur, agrees well with the value found by experiment, whether the figures of Leduc and Schlœsing or those of Lord Rayleigh and Kellas are taken as the basis of calculation. J. C. P.

Free Hydrazine. By CORNELIS A. LOBRY DE BRUYN (*Rec. Trav. Chim.*, 1899, **18**, 297—298. Compare Abstr., 1897, ii, 22).—A preliminary communication relating to the action of sodium, phosphorus, phosgene, sulphurous and carbonic anhydrides, and nitrous oxide on free hydrazine. G. T. M.

Manufacture of Nitrite. By A. DARBON (*Chem. Zeit.*, 1899, **23**, 173—174).—The author describes the method for the manufacture of sodium nitrite by the action of metallic lead on fused sodium nitrate. It is essential that the lead shall be as free as possible from other metals, especially antimony. After fusion, the mass is poured into water, exactly neutralised with nitric or sulphuric acid, in order to precipitate any lead oxide in solution, filtered, and evaporated. Pure nitrite has a neutral, and not, as usually stated, an alkaline reaction. The best method for estimating the nitrite is by the aid of standard potassium permanganate in the presence of dilute sulphuric acid ; in this estimation, only a few c.c. of the acid should be added until the titration is nearly completed, when a larger quantity may be added without any loss of nitrous acid. The pink colour should remain permanent for 15 minutes. J. J. S.

Thioxyarsenic Acids. By LEROY W. McCAY (*Ber.*, 1899, **32**, 2471—2476. Compare Abstr., 1898, ii, 139).—Arsenates cannot be detected by magnesia mixture in the solutions obtained by dissolving arsenic pentasulphide in caustic alkalis or ammonia. The reaction is somewhat complicated, the chief products being thioarsenates and monothioxyarsenates; these salts are always accompanied by small quantities of dithioxyarsenates. The solution of pentasulphide in caustic soda, on digestion with strontium chloride, yields a precipitate consisting of strontium monothioxyarsenate and strontium sodium monothioxyarsenate. *Sodium monothioxyarsenate*, $Na_3AsSO_3 + 12H_2O$, is obtained in long needles by boiling this mixture with sodium carbonate, filtering, and adding alcohol to the filtrate.

Barium dithioxyarsenate is precipitated by adding barium chloride to the filtrate from the strontium monothioxyarsenates; on boiling with sodium carbonate, it yields *sodium dithioxyarsenate*, $Na_3AsS_2O_2 + 10H_2O$, which separates from solution on the addition of alcohol.

Thioarsenates and monothioxyarsenates are also obtained by dissolving arsenic pentasulphide in calcium, strontium, and barium hydroxides.

When hydrogen sulphide is passed into a 1 per cent. solution of arsenic acid, a mixture of arsenic tri- and penta-sulphides and sulphur is precipitated, whilst monothioxyarsenic acid remains in solution ; the latter is freed from unchanged arsenic acid by the addition of magnesia ; the solution, after filtration, contains magnesium monothioxyarsenate; this is converted successively into the potassium, barium, and sodium salts, and by this method 6 grams of crystallised sodium monothioxyarsenate are obtained from 10 grams of arsenic acid. When hydrogen sulphide is passed into a solution of sodium arsenate acidified with mineral acids, a small quantity of dithioxyarsenic acid is produced. G. T. M.

Products of Combustion of Boiler Fuel. By Wilhelm Thörner (*Chem. Zeit.*, 1899, **23**, 331—333).—When coal containing sulphur or pyrites is employed as fuel, sulphuric acid, in addition to sulphurous anhydride, is present in the products of combustion. The whole of this acid does not make its escape; part is deposited on the boiler walls, &c., and it is essential that these should be cleaned regularly. The corroding action of the acid is greater when moisture is present. The formation of the acid may be largely diminished, if not completely avoided, by mixing the coal with lime or by using briquettes made of an intimate mixture of coal with a little lime.

J. J. S.

Action of Chlorine on a Mixture of Silicon, Silica, and Alumina. By Émile Vigouroux (*Compt. rend.*, 1899, **129**, 334—335).—Silicon tetrachloride is readily obtained by the action of chlorine at about a red heat on the mixture of silicon, silica, and alumina obtained by reducing silica with aluminium, and treating the product first with hydrochloric acid and afterwards with aqua regia. The proportion of silicon in this product depends on the relative proportions of silica and aluminium, and on the care taken to cool the reduced mass rapidly and out of contact with air; a mixture of 2 parts of silica and 1 part of aluminium gives good results.

C. H. B.

Preparation, and some of the Properties, of Pure Argon. By William Ramsay and Morris W. Travers (*Proc. Roy. Soc.*, 1899, **64**, 183—192).—'Atmospheric nitrogen' was passed twice over heated magnesium and red-hot copper oxide, the process yielding a gas rich in argon. This gas was then passed (1) through a tube containing a mixture of magnesium powder and lime, heated to a dull red heat in a combustion furnace, (2) over red-hot copper oxide. The whole of the crude argon thus obtained was liquefied in a bulb surrounded by liquid air boiling under a low pressure. When the colourless, mobile, liquid argon is distilled, the first portion to boil off is rich in neon and contains helium, whilst the least volatile portion is metargon. The middle portion is argon, and by a repetition of the process pure argon is obtained.

The density of the gas so purified is 19·957, a value not differing greatly from that previously found, namely, 19·94. The refractivity of pure argon is 0·9665, whilst that of the crude gas was found to be 0·961. Neon and helium have both a low refractivity, and the removal of these gases accounts for the greater refractivity of pure argon. Even at the temperature of boiling oxygen, argon shows no polymerisation, for the ratio pv/T has practically the same value at that as at higher temperatures. J. C. P.

Basic and Ammoniacal Metallic Halogen Salts. By Eugène Tassilly (*Ann. Chim. Phys.*, 1899, [vii], **17**, 38—125).—The results of work already published (compare Abstr., 1894, ii, 92; 1895, ii, 45, 304, 342, and 500; 1896, ii, 350, 360, and 465; 1897, ii, 451; and 1898, ii, 117). G. T. M.

Metallic Sulphides. By A. Mourlot (*Ann. Chim. Phys.*, 1899, [vii], **17**, 510—574).—An account of work already published (compare Abstr., 1896, ii, 25, 304, 603; 1897, ii, 372; 1898, ii, 376; this vol., ii, 27 and 97). G. T. M.

Metallic Thiophosphates. By Lucien Ferrand (*Ann. Chim. Phys.*, 1899, [vii], **17**, 388—432).—An account of work already published (compare Abstr., 1895, ii, 389; 1896, ii, 418 and 473). G. T. M.

Action of Sodammonium and Potassammonium on Tellurium and on Sulphur. By C. Hugot (*Compt. rend.*, 1899, **129**, 388—390).—The following compounds have been prepared by the action of sodammonium and potassammonium on tellurium and on sulphur, the method of preparation being the same as that used for obtaining the corresponding selenium compounds (this vol., ii, 650).

With excess of alkali metal, the monotellurides Na_2Te, and K_2Te, and the monosulphides, Na_2S, and K_2S, are obtained as white, amorphous substances, soluble in water, insoluble in liquefied ammonia; they do not absorb ammonia gas. With excess of tellurium or sulphur, the polytellurides or polysulphides Na_2Te_3, K_2Te_3, Na_2S_5, K_2S_5 are formed as crystalline compounds which are soluble in water and in liquefied ammonia and absorb ammonia gas. The tellurium used in the preparation of the above compounds was obtained from commercial tellurium, and was purified according to the methods of Metzner and Ditte (Abstr., 1898, ii, 572). H. R. Le S.

Dehydration of Sodium Phosphate Crystals. By T. C. Whitlock and C. E. Barfield (*Amer. Chem. J.*, 1899, **22**, 214—215).—The water of crystallisation of disodium hydrogen phosphate is removed by heating for 1 hour at 180°, whilst the water of constitution begins to be lost at 230°, and is completely removed in 1 hour at 300°. W. A. D.

Persulphates of Rubidium, Cæsium, and Thallium. By Arnott R. Foster and Edgar F. Smith (*J. Amer. Chem. Soc.*, 1899, **21**, 934—936).—*Cæsium* and *rubidium persulphates*, $Cs_2S_2O_8$ and $Rb_2S_2O_8$, are obtained as white precipitates when solutions consisting of two-thirds of sulphuric acid of sp. gr. 1·35 and one-third of a saturated solution of the metallic sulphate are electrolysed in a Nernst "divided cell," surrounded by a freezing mixture. 100 parts of water dissolve 3·32—3·49 parts of rubidium persulphate at 22·5°, and 8·71—8·98 parts of cæsium persulphate at 23°.

A white precipitate was also obtained when thallium sulphate solution was electrolysed in a similar manner, but it could not be analysed on account of its instability. J. J. S.

New Explosive and Detonating Materials. By Ugo Alvisi (*Gazzetta*, 1899, **29**, ii, 64—81. Compare this vol., ii, 414).—From the results of a large number of tests of explosives and detonators, it is seen that the addition of ammonium perchlorate to a mercury fulminate detonator gives a greater effect with a dynamite only when the latter also contains ammonium perchlorate, and in this case the best detonating mixture consists of equal parts of ammonium perchlorate and mercury fulminate. For dynamite without perchlorate, the greatest effect is obtained with a detonator containing 17—20 per cent. of the perchlorate and 80—83 per cent. of the fulminate.

T. H. P.

Ammonio-silver Nitrate. By Marcellin Berthelot and Marcel Delépine (*Compt. rend.*, 1899, **129**, 326—330).—The reaction $AgNO_3$ diss. $+ 2NH_3$ diss. $= AgNO_3,2NH_3$ diss. develops $+13·35$ Cal. and the addition of either ammonia or silver nitrate produces no appreciable thermal disturbance, which shows that the compound is not dissociated in solution. The action of nitric acid on the ammoniacal silver nitrate solution develops $+12·25$ Cal., and this gives for the heat of combination $+13·15$ Cal. The author considers that silver oxide is first liberated and then converted into ammonio-silver oxide, $(NH_3Ag)_2O$, which immediately acts on the ammonium of the ammonium nitrate, forming a complex base, $NH_3(NH_3Ag)$, which exists in the ammonio-silver salts already known. The corresponding oxide in the solid state is identical with fulminating silver.

The dissolution of silver oxide in dilute ammonia develops $+10·45$ Cal., which is the heat of formation of the dissolved oxide, and is confirmed by indirect methods. Its heat of neutralisation by dilute nitric acid is $+13·62$ Cal., and therefore the energy of its basic function is comparable with that of potassium and sodium hydroxides. Ammonio-silver nitrate is readily obtained in crystals, as described by previous observers, and its heat of dissolution at $-15°$ is $-8·96$ Cal. (4 litres) and $-8·58$ Cal. (2 litres). Its heat of formation from its elements is $+78·45$ Cal., and from solid silver nitrate and gaseous ammonia, $+34$ Cal. Its resolution into gaseous water, silver, and nitrogen develops $+87·15$ Cal., which explains its explosive properties.

C. H. B.

Solubility of Lime in Water and Saccharine Liquids. By Julius Weisberg (*Bull. Soc. Chim.*, 1899, [iii], **21**, 773—776).—Determinations of the solubility of lime in water at 15° and at 20° gave results in close agreement with those of Herzfeld. The results of a number of experiments on the solubility of lime in sugar solutions of different strengths at 15° and at 16—17° are given in tabular form and compared with those obtained by Berthelot, Péligot, Petit, and Schatten. Péligot's tables, although most generally used, are considered to be the least accurate, and the solubilities given by previous experimenters are in each case lower than the values obtained by the author. The solubility increases with the amount of sugar present, but the weight of lime dissolved per 100 grams of sugar is greater in weak than in strong sugar solution. Anhydrous calcium oxide is more soluble in sugar solutions than calcium hydroxide, a result previously obtained by Herzfeld, Loiseau, and by the author, and now again confirmed. N. L.

Calcium Carbide as a Reducing Agent in Analysis in the Dry Way. By N. Tarugi (*Gazzetta*, 1899, **29** i, 509—512).—When cupric oxide is heated to a bright red heat (1408°) with five times its weight of calcium carbide, it is completely reduced to metallic copper. By carefully washing with water the mixture of excess of carbide and alloy formed, metallic leaves containing 5—8 per cent. of calcium are obtained; this alloy is unstable and renders water alkaline and turbid. If the washing is continued until the water effects no further change, the percentage of calcium in the alloy is reduced to 1·27—1·5, the substance thus obtained having a sp. gr. 8·329 and remaining unchanged in the air. Salts of copper act similarly to the oxide.

In salts of lead, calcium carbide effects reduction at about 400°, the alloy formed containing about 8 per cent. of calcium; this substance is more readily decomposed by water than the copper compound, and when freshly prepared has a lustrous surface which in the air rapidly gives place to a whitish efflorescence. With lead chromate, besides the alloy of lead and calcium, free chromium is also obtained. All salts of gold, silver, platinum, tin, bismuth, antimony, cadmium, zinc, nickel, and cobalt, on heating with calcium carbide, give calcium alloys readily decomposable by water. Mercury and arsenic salts deposit free mercury and arsenic.

The author recommends the use of calcium carbide in analysis in place of potassium cyanide or formate or the action of the reducing flame. T. H. P.

Electro-deposition of Brass. By T. J. Baker and T. J. Baker, junr. (*Chem. News*, 1899, **80**, 37).—Quantitative electrolytic experiments were made with solutions of copper and zinc cyanides, alone and mixed, the hydrogen evolved being measured and the metal deposited weighed, both from these solutions and from a copper sulphate cell in series with the cyanide solution. The electrochemical equivalent of copper which is deposited from its cyanide solution, whether alone or with zinc, as brass, is always that of the metal in its cuprous state. D. A. L.

Precipitation of Copper by Zinc. By John C. Shengle and Edgar F. Smith (*J. Amer. Chem. Soc.*, 1899, **21**, 932—933).—Although the precipitation of copper by zinc is recommended as a method for the quantitative estimation of copper and gives good results, experiments made by the authors prove conclusively that small amounts of zinc (1—3 per cent.) are always present in the precipitated copper and that the good results are due largely to a balancing of errors. Similarly, silver and copper deposited by the aid of cadmium always contains small quantities of the latter metal. J. J. S.

Action of Hydrogen Phosphide on Copper Oxide, Hydroxide, and Carbonate. By E. Rubénovitch (*Compt. rend.*, 1899, **129**, 336—338).—Cupric oxide, prepared by heating the nitrate, is readily attacked by hydrogen phosphide, at first slowly, and afterwards more rapidly, with considerable development of heat, copper phosphide, P_2Cu_5, phosphoric acid, and water being formed. Cupric hydroxide is attacked by hydrogen phosphide with great energy, and the proportion of phosphoric acid formed varies considerably, but if the reaction is moderated, it tends to proceed in the same manner as with the oxide.

The basic carbonate, $2[CuCO_3,Cu(OH)_2] + H_2O$, is attacked by hydrogen phosphide with considerable development of heat, the reaction being $5PH_3 + 5[CuCO_3,Cu(OH)_2] = 2P_2Cu_5 + H_3PO_4 + 5CO_2 + 11H_2O$.

The phosphide P_2Cu_5 is obtained by passing a mixture of hydrogen phosphide and carbonic anhydride over cupric carbonate, and the phosphide PCu_3 is obtained by treating cuprous oxide in the same way.
C. H. B.

Cupric Hypophosphite and its Decomposition by Precipitated Palladium. By Rodolphe Engel (*Compt. rend.*, 1899, **129**, 518—520).—Cupric hypophosphite is obtained by mixing cupric sulphate and barium hypophosphite solutions and adding alcohol. It forms a brilliant, white precipitate of the composition $Cu(H_2PO_2)_2$, and is somewhat stable both in the solid state and in solution. The solid explodes suddenly at about 90°; a dilute solution can be boiled without decomposing. Precipitated palladium decomposes cupric hypophosphite solutions in accordance with the following equation: $Cu(H_2PO_2)_2 + 2H_2O = Cu + 2H_3PO_3 + H_2$, and copper hydride is not formed. If, however, an aqueous solution of the salt is boiled, brown cuprous hydride is first precipitated and rapidly splits up into hydrogen and copper. In the first phase of the reaction, hypophosphorous acid is formed, but is slowly oxidised by the copper at about 100°, whereas with palladium this oxidation takes place at the ordinary temperature.

Hypophosphorous acid and palladium completely reduce bismuth and antimony salts at the ordinary temperature, but in the case of lead and stannous salts the precipitation of the metal interferes with the activity of the palladium.
C. H. B.

Mercury Derivatives of Nitrogen Compounds. By Leone Pesci (*Zeit. anorg. Chem.*, 1899, **21**, 361—376).—The author points out that the evidence brought forward by Hofmann and Marburg (this vol., i, 486) in support of the formulæ $NH_2{\cdot}HgCl$ and $Hg(NH_3)_2Cl_2$ for the infusible and fusible white precipitates obtained from mercuric chloride and ammonia in the presence of a large proportion of ammonium chloride, is unsatisfactory for the following reasons. The decomposition of these salts by a boiling 20 per cent. solution of potassium hydroxide, whereby all the nitrogen is eliminated in the form of ammonia, is no evidence as to their constitution, for mercuriammonium chloride, when treated in this manner, also parts with all its nitrogen. If, however, the infusible precipitate is treated with reagents which decompose ammonium salts but do not decompose mercuriammonium chloride, such as a 2 per cent. solution of potassium hydroxide or a solution of sodium carbonate, one-half only of the nitrogen is eliminated in the form of ammonia, and the theoretical quantity of mercuriammonium chloride is obtained. This reaction is in accordance with the formula Hg_2NCl,NH_4Cl. The fusible precipitate, when treated in the same manner, yields three-fourths of its nitrogen in the form of ammonia, together with the quantity of mercuriammonium chloride theoretically required for the formula $Hg_2NCl,3NH_4Cl$.

The author maintains that the mercuriammonium salts are all represented by the type Hg_2NX, and are derived from the hydroxide $Hg_2N\cdot OH$, which readily yields complex compounds when treated with ammonium salts. Millon's base is therefore represented by the formula $Hg_2N\cdot OH,2H_2O$. The salts obtained from this compound by Hofmann and Marburg by the action of hydrochloric, nitric, and hydrobromic acids were probably not pure. E. C. R.

Action of Potassium Iodide on Mercurous Iodide. By Maurice François (*J. Pharm.*, 1899, [vi], **10**, 16—18. Compare Abstr., 1896, i, 22; ii, 248, 301; and 1897, ii 492).—A solution of potassium iodide decomposes mercurous iodide into mercuric iodide and mercury. If mercury is allowed to remain in contact with a solution of potassium iodide saturated with mercuric iodide, the reverse action takes place, mercurous iodide being formed. In both cases, the action is limited, and for a temperature of 20° equilibrium is established between the reacting substances, when the liquid contains 11·9 per cent. of mercuric iodide. H. R. Le S.

Photographic Researches on Phosphorescent Spectra: Victorium, a new Element associated with Yttrium. By Sir William Crookes (*Proc. Roy. Soc.*, 1899, **65**, 237—243).—The method of separating victoria from earths of the cerium group and from yttria is described in detail. Long-continued fractionations (*a*) by fusion and partial decomposition of the nitrates, (*b*) by crystallisation of the oxalates, and (*c*) by precipitation with potassium sulphate, were had recourse to in succession, and the course of the fractionation is shown by a diagram.

Victoria is an earth of a pale brown colour, easily soluble in acids, and less basic than yttria. Assuming the oxide to have the formula Vc_2O_3, the atomic weight is about 117. The best material for phosphorescing in a vacuous tube is, not the earth itself, but the anhydrous sulphate; the photographed phosphorescent spectrum contains a pair of strong lines at about λ3120 and 3117, and other fainter lines at 3219, 3064, 3060. J. C. P.

Porcelain from Egypt. By Henri Le Chatelier (*Compt. rend.*, 1899, **129**, 387—388).—An analysis of a sample of Egyptian porcelain which came from Saggarah (Memphis) gave the following results: Na_2O, 5·8; CuO, 1·7; CaO, 2·1; Al_2O_3, 1·4; Fe_2O_3, 0·4; SiO_2, 88·6 per cent. The above composition is totally different from that of Chinese porcelain, and as the sample was undoubtedly of Egyptian origin, the author believes that the ancient Egyptians did manufacture real porcelain. A porcelain identical to the above may be produced by fusing a mixture of 40 parts blue glass, 50 parts fine sand, and 5 parts white clay. H. R. Le S.

Egyptian Pottery. By HENRI LE CHATELIER (*Compt. rend.*, 1899, **129**, 477—480).—The statuettes found in Egyptian tombs were regarded by Salvétat as carved out of a natural grit, the glaze being a sodium calcium silicate containing copper. The author finds, however, that statuettes from several different localities consist mainly of fine grains of quartzose sand, mixed with a small quantity of clay, which serves as a cement. The glaze is a mixture of grains of sand with a glass of the composition 4 SiO_2, 0·33 CuO, 0·67 Na_2O. C. H. B.

Chemical Equilibrium between Manganous Hydroxide and Ammonium Salts. By W. HERZ (*Zeit. anorg. Chem.*, 1899, **21**, 243—249).—The statement that manganous salts are not precipitated by ammonia in the presence of ammonium salts is not quite correct. A mixture of equal volumes of normal solutions of manganous sulphate and ammonium chloride in an atmosphere of hydrogen gives a cloudiness on the addition of about one and a-half times the quantity of $N/10$ ammonia solution; the further addition of ammonia does not appreciably increase the precipitate, which is deposited after the mixture has remained for some hours. The author has examined the reaction which takes place when manganous hydroxide is treated with solutions of ammonium chloride, nitrate and sulphate in an atmosphere of hydrogen, as expressed by the equation $Mn(OH)_2 + 2NH_4Cl \rightleftharpoons MnCl_2 + 2HN_4OH$. The reaction does not follow the laws of mass reaction, and the results do not agree with those obtained by Lovén for magnesium salts (Abstr., 1896, ii, 413). The abnormal results are probably due to the combination of the manganese and ammonia to form complex cations. E. C. R.

Decomposition of Monomanganous Phosphate by Water at 0° and at 100°. By GEORGES VIARD (*Compt. rend.*, 1899, **129**, 412—414. Compare this vol., ii, 26).—Monomanganous phosphate, $MnH_4(PO_4)_2 + 2H_2O$, dissolves in 100 times its weight of water at 0° without appreciable decomposition, but as the weight (P) of the salt which is added to the water increases, more and more of the dibasic phosphate, $Mn_2H_2(PO_4)_2 + 6H_2O$, is precipitated, and the ratio (R) of the total phosphoric acid remaining in solution to the combined phosphoric acid increases from 1·06 to 1·19 as P increases from 10 to 100. When heated with water at 100°, the precipitate consists solely of Erlenmeyer and Heinrich's ditrimanganous phosphate, $Mn_2H_2(PO_4)_2 + Mn_3(PO_4)_2 + 4H_2O$, but in this case the ratio R increases rapidly until a maximum value of 1·88 is reached, when $P = 20$, and then slowly decreases until, when $P = 150$, it becomes sensibly constant and equal to about 1·5. N. L.

Destructive Action of Water containing Free Carbonic Anhydride on Iron. By OTTO KRÖHNKE (*Chem. Centr.*, 1899, i, 907—908; from *Gesundheit*, **14**, 72—75).—The water of St. Johann a/Saar, which is of only 2° hardness and contains 38 milligrams of free carbonic anhydride per litre with only traces of carbonates, was found to attack iron conduit pipes, forming a rust of the following composition: Fe_2O_3, 72·76 per cent.; Fe, 13·95; H_2O, 8·69; CO_2, 2·9; $CaSO_4$, 0·78; Cl, traces; soluble in hydrochloric acid, 0·5. This action, which must be due to the free carbonic anhydride present, is decreased by the addition of calcium salts for the presence of a certain quantity of calcium hydrogen carbonate causes the formation of a layer of calcium carbonate which protects the iron from further corrosion. Neither the rust nor the water after its passage through the pipes contained sulphides or iron sulphate, hence Rosenblum's theory of the process according to which free hydrogen is assumed to reduce the calcium sulphate to sulphide, which is then decomposed by the carbonic anhydride with liberation of hydrogen sulphide, is not confirmed.

E. W. W.

Action of Sulphurous Acid on Metallic Sulphates, especially on Ferric Sulphate. By UBALDO ANTONY and E. MANASSE (*Gazzetta*, 1899, **29**, i, 483—488).—Manganese, nickel, cobalt, and ferrous sulphates are not affected when sulphurous anhydride is passed through their aqueous solutions. In the case of ferric sulphate, however, the action is similar to that on ruthenium sulphate (Antony and Lucchesi, this vol., ii, 299), ferrous dithionate being formed. Using a 2 per cent. solution of ferric sulphate at 0°, equilibrium is reached when 80 per cent. of the total sulphate has been converted into dithionate; this percentage diminishes as the temperature rises until, at 95°, no conversion takes place.

T. H. P.

A new Hydrate of Ferrous Potassium Sulphate, and the Relative Solubilities of the various Hydrates of this Salt. By FRIEDRICH W. KÜSTER and A. THIEL (*Zeit. anorg. Chem.*, 1899, **21**, 116—121).—When molecular quantities of ferrous sulphate and potassium sulphate in mixed solution are allowed to crystallise between 35° and 85°, a pale green salt of the composition $K_2SO_4.FeSO_4 + 4H_2O$ separates. The colourless hydrate, $K_2SO_4,FeSO_4 + 2H_2O$, crystallises as the stable form above 90°, but if allowed to cool in contact with the mother liquor, is transformed into the tetrahydrated salt.

The relative stability of the three hydrates, with six, four, and two molecules of water, is shown by a comparison of their solubilities at various temperatures. Nearly saturated solutions of each were shaken up with a further quantity of the same hydrate, and the amount in solution was determined at intervals by titration of a portion with permanganate. At temperatures where the hydrate under examination is stable, the volume of permanganate used reaches a maximum and remains permanently constant.

If the hydrate is unstable at the temperature of the experiment, the volume of permanganate used reaches a maximum, and then gradually alters until the value is reached corresponding with the stable hydrate. The temperature of transformation for the pair of hydrates with six and four molecules of water is about 30°, for the pair with four and two molecules about 87°, and for the pair with six and two molecules about 54°.

J. C. P.

Atomic Weight of Cobalt. By THEODOR WILLIAM RICHARDS and GREGORY PAUL BAXTER (*Zeit. anorg. Chem.*, 1899, **21**, 250—272. Compare Abstr., 1898, ii, 377).—The authors have determined the weight of cobalt obtained from a known weight of cobalt bromide by reducing it in a current of hydrogen. The apparatus employed and the method of conducting the analysis are the same as those previously employed for the determination of the atomic weight of nickel (this vol., ii, 488). The cobalt bromide (similarly to the nickel bromide) contains a small quantity of sodium bromide, and this is estimated by extracting the reduced cobalt with water and precipitating with silver. The metallic cobalt resembles nickel in being slightly attacked and dissolved by water, but the solution is quickly oxidised in the air and all the cobalt precipitated as cobalt hydroxide, so that, after separating this by filtration, the weight of the impurities can be obtained by evaporating the solution to dryness and weighing. The authors' experiments prove that the cobalt bromide is completely reduced, and that the impurities are entirely extracted from the reduced metal by water. The complete analysis of the cobalt bromide gave 26·923 per cent. Co, 72·981 per cent. Br combined with the cobalt, 0·070 per cent. Br in the impurities, and 0·033 per cent. Na = 100·007. The mean of twelve determinations gave as the atomic weight of cobalt, Co = 58·995, the extreme values being 59·021 and 58·955 [O = 16]. The results do not agree so closely as those obtained for nickel, and the authors are engaged in a further determination of the atomic weight by a different method. E. C. R.

Chromylamide. By JULIUS OHLY (*Chem. News*, 1899, **80**, 134).—By treatment with dry ammonia, potassium chlorochromate yields potassium amidochromate, $KO\cdot CrO_2\cdot NH_2$, and this, when dissolved in water, mixed with concentrated ammonia, covered with a layer of ether and treated with chlorine, yields a light brown solution which deposits yellowish-brown, dull, metallic leaflets of *chromylamide*, $CrO_2(NH_2)_2$. It evolves ammonia when rubbed with soda-lime, is soluble in water, and its solution gives amide reactions with silver nitrate and lead acetate. D. A. L.

Tungsten Chlorobromides. By ED. DEFACQZ (*Compt. rend.*, 1899, **129**, 515—518).—When liquid hydrogen bromide is allowed to act on tungsten hexachloride at the ordinary temperature, it yields the chlorobromide WCl_3Br_3, whilst at 60—70° the compound $WCl_6,3WBr_6$ is obtained. The latter forms small, olive-green crystals which melt at 232° and dissolve in many organic solvents. It is very unstable, alters rapidly when exposed to air, is immediately decomposed by water, and by steam at 200°, and is readily attacked by hydrogen, oxygen, chlorine, sulphur, phosphorus, halogen hydracids, hydrogen sulphide, nitric and sulphuric acids, alkalis, oxidising mixtures, and potassium hydrogen sulphate. The compound WCl_3Br_3 is very similar in appearance and properties. C. H. B.

Chloriodides [and Bromiodides] of Tin. By C. LENORMAND (*J. Pharm.*, 1899, [vi], **10**, 114—117. Compare this vol., ii, 33).—When the compound $SnCl_2I_2$ is fractionally distilled in air, the liquid which passes over at 280° solidifies to a mass of orange-red crystals of the composition $SnClI_3$. When the fraction 126—180° is redistilled in a vacuum, the distillate consists of stannic chloride, and the residue of the chloriodide, $SnCl_3I$ or $SnCl_2I_2$, according to the proportion of liquid which has passed over. When the compound $SnCl_2I_2$ is distilled in a vacuum, the distillate consists of stannic chloride, and the residue of stannic iodide.

Iodine is without action on stannous bromide at the ordinary temperature, but at 100° an energetic action takes place, and the compound $SnBr_2I_2$ is formed. This crystallises in hexagonal plates, melts at 50°, boils at 225°, and has a sp. gr. 3·631 at 15°. It is only slightly soluble in cold, but readily in warm, water, and at 80° its aqueous solution is decomposed into hydrated oxide of tin, and hydrogen bromide and iodide. When distilled in air, the bromiodide $SnBr_3I$ passes over between 230° and 250°, and $SnBr_2I_2$ between 250° and 275°, the residue consisting of the compound $SnBrI_3$. Distilled in a vacuum, it boils at 130° and partially distils, the temperature gradually rises to 180°, where it remains stationary, and the compound $SnBr_3I$ passes over whilst the residue in the flask has the composition $SnBrI_3$.

H. R. Le S.

Electro-deposition of Vanadium. By Sherard Cowper-Coles (*Chem. News*, 1899, **79**, 147—148).—Vanadium can be obtained as a brilliant, metallic deposit by a current of 18 to 20 ampères per square foot and an E.M.F. at the terminals of the electrolysing cell of 1·88, using a solution of the following composition and working at 82·5°: 1·75 parts of vanadic anhydride dissolved in 2 parts of caustic soda and 160 parts of water and then treated with 32 parts of hydrochloric acid.

D. A. L.

Influence of Oxidising Substances on the Solubility of Gold in Alkali Cyanides. By Emilio Noelting and G. Forel (*Chem. Centr.*, 1899, i, 823—824; from *Bull. Soc. ind. Mulhouse*, 1899, 28—43).—The solubility of gold in solutions of alkali cyanides is considerably increased by the addition of α-nitroso-β-naphthol, α-nitroso-α-naphthol, β-nitroso-α-naphthol, the nitroso-salt,

$$C_{10}H_4O(SO_3Na)_2\!:\!NOH\ [NOH:O:(SO_3Na)_2]=1:2:3:6],$$

nitrosophenol, dinitrosoresorcinol, and nitrobenzene, and to a less extent by orthonitrophenol, potassium ferricyanide, ammonium persulphate, quinonedichlorimide, picric acid, sodium isopurpurate, and oil of turpentine. The solubility is not affected by the presence of potassium nitrite or ammonium vanadate, but it is decreased by ether, chloranil, quinone, β-naphthaquinone, phenanthraquinone, and magenta, whilst methylene-blue and Ponceau-2R render gold insoluble.

The coefficients of solubility under given conditions of temperature, time, concentration of the solution, quantities of cyanide employed, &c., are given in tables in the original paper.

E. W. W.

Electro-deposition of Palladium. By Sherard Cowper-Coles (*Chem. News*, 1899, **79**, 280).—For the deposition of palladium in a bright form, a 0·62 per cent. solution of palladium ammonium chloride, in a 1 per cent. solution of the same salt [? of ammonium chloride] is employed. The solution is maintained at a temperature of about 24°, the current used per square foot being about 0·12 ampère, and the E.M.F. at the terminals of the bath 4 to 5 volts.

D. A. L.

Ruthenium and its Compounds. II. Potassium Ruthenichloride. By Ubaldo Antony and Adolfo Lucchesi (*Gazzetta*, 1899, **29**, ii, 82—84. Compare this vol., ii, 558).—Potassium ruthenichloride is obtained in a pure state by the following method. A mixture of 6 parts of potassium hydroxide and 1 part of powdered ruthenium is heated to fusion in a silver basin, and potassium chlorate added in small quantities with stirring until the ruthenium is completely dissolved. After heating at a high temperature until all evolution of gas ceases, the excess of chlorate being then decomposed, the cold mass, which is of an orange-red colour, is dissolved in cold water, and very dilute hydrochloric acid added until the solution gives a decided acid reaction. When allowed to evaporate at the ordinary temperature in a vacuum over quicklime, this liquid gradually deposits the ruthenichloride which is purified by repeated crystallisation. Thus prepared, potassium ruthenichloride, K_2RuCl_6, is a reddish-brown powder composed of very minute crystals; in cold water, it is very slightly soluble, but in presence of potassium chloride quite insoluble, and in hot water it dissolves readily with partial decomposition.

T. H. P.

Mineralogical Chemistry.

Albertite-like Asphalt from Indian Territory, U.S.A. By Joseph A. Taff (*Amer. J. Sci.*, 1899, [iv], **8**, 219—224).—The material described occurs as strings and veins, up to 25 feet thick, in greenish shales at several localities in the McAlister Quadrangle, Choctaw Nation, Indian Territory. It is jet-black, and in the upper parts of the veins is very friable with an uneven fracture, whilst at greater depths it has a smooth, conchoidal fracture. When heated, it softens and decomposes without fusing, but the distillation products differ from those of coal. It is soluble to the extent of over 35 per cent. in carbon bisulphide, and is almost insoluble in turpentine; it thus differs from coal, which is insoluble in carbon bisulphide, and from albertite, which is largely soluble in turpentine. Analyses, I by W. F. Hillebrand, and II by W. C. Day, were made on different samples of material.

Composition of Natural Thio-salts. By Constantin Guillemain (*Inaug. Diss., Breslau*, 1898, 47 pp. Compare *Jahrb. f. Min.*, 1899, ii, Ref. 190—195).—The results are given of 37 analyses made on various mineral thio-salts; in most cases, only massive material was used, and in only one instance was the material determined crystallographically. In the method of analysis, the material was first decomposed by nitric acid.

Emplectite, acicular crystals in quartz from Tannenbaum, Saxony; after deducting more than 50 per cent. of quartz, the mean (I) of two analyses agrees with Cu_2S,Bi_2S_3.

Aikinite (patrinite), acicular crystals in quartz from Beresovsk, Urals; after deducting about 75 per cent. of quartz, the mean (II) of two analyses agrees with $PbCuBiS_3$.

		Bi.	Cu.	Pb.	S.	Total.
Emplectite...	I.	61·95	18·80	—	19·16	99·91
Aikinite......	II.	36·22	11·01	35·58	16·58	99·39

Zinckenite, from Wolfsberg, Harz; anal. III, on a drusy mass of crystals; IV, on massive material. Formula, PbS,Sb_2S_3.

Dufrenoysite, from the Binnenthal, Switzerland; V, on crystal fragments from the surface; VI, the underlying material. Formula, $2PbS,As_2S_3$.

Jamesonite, VII, feather ore (a soft, felty mass of fine fibres and needles) from Wolfsberg, Harz; VIII, feather ore from Bräunsdorf, Saxony; IX, minute crystals in cavities of massive material (anal. X) from Arnsberg, Westphalia [compare heteromorphite, this vol., ii, 431]; XI, massive, from Wolfsberg; XII, feather ore from Wolfsberg. Analyses VII—X give the formula $2PbS,Sb_2S_3$; the other two, and previous analyses not agreeing with this formula, are assumed to contain admixed stibnite.

Boulangerite, XIII, compact, finely granular material from Ober-Lahr on the Rhine; XIV, ditto, from Betzdorf on the Sieg; XV, ditto, from San Antonio, California; XVI and XVII, Websky's "epiboulangerite," containing admixed galena, from Altenberg, Silesia. Of these, XIII and XV give the formula $3PbS,Sb_2S_3$; previous analyses not agreeing with this formula are supposed to contain admixed stibnite, jamesonite, pyrites, &c. (compare Abstr., 1898, ii, 29).

Geocronite, XVIII, massive, from Sala, Sweden; mean of two analyses giving the formula $5PbS,(Sb,As)_2S_3$.

Bournonite, XIX, mean of two analyses on crystal fragments from Liskeard, Cornwall; XX, mean of two analyses on material from Wolfsberg, Harz; Formula, $PbCuSbS_3$.

Jordanite, anal. XXI, bright crystals with twin lamellæ, from the Binnenthal, Switzerland; sp. gr. 5·48; formula, $4PbS,As_2S_3$. XXII is the mean of three analyses made on dull, black material from the Binnenthal; it is much fractured, and is coated with a white crust of arsenious acid; it is probably altered jordanite; formula, $Pb_6As_2S_{10}$.

Enargite, XXIII, mean of four analyses on massive material intergrown with pyrites, from San Juan Co., Colorado; XXIV and XXV, each the mean of two analyses on massive material intergrown with pyrites, from Morococha, Peru; formula, $Cu_7As_2S_9$.

Cerium in Bismutite from Argentina. By GUILLERMO BODENBENDER (*Zeit. prakt. Geol.*, 1899, 322—323).—Bismutite occurs in a vein in gneiss at La Toma, Sierra de San Luis; it is grey and compact, or forms a granular, crystalline aggregate with fibrous fracture and silky lustre. Embedded in it are quartz, mica, and grains of columbite, and it is sometimes coated with bismuth ochre. Analysis gave:

Bi_2O_3.	CO_2.	H_2O.	CaO.	MnO.	FeO.	Ce_2O_3.	Total.
80·7	8·7	1·9	6·7	0·8	0·3	0·54	99·6

L. J. S.

Formation of Corundum in Magmas. By JULIUS H. PRATT (*Amer. J. Sci.*, 1899, [iv], 8, 227—231).—The author has previously noted the occurrence of chromite, corundum and spinel in the peridotites (dunite, &c.) of North Carolina (Abstr., 1898, ii, 603; this vol., ii, 494). Morozewicz's recent experiments (this vol., ii, 762) were made on magmas containing alkalis and alkaline earths, but his earlier experiments (Abstr., 1895, ii, 275) showed that alumina readily dissolves in a magma having the composition of a basic magnesian rock, and that it separates out again as corundum and spinel. The conditions for the separation of corundum from such magmas are summarised as follows.

In a magnesium silicate magma containing no excess of magnesia, all the alumina separates out as corundum; but when there is an excess of magnesia, this unites with a portion of the alumina to form spinel, and the remainder of the alumina separates as corundum. When chromic oxide is present, any small amounts of alumina and excess of magnesia in the magma may enter into the composition of the chromite (mitchellite, this vol., ii, 495). In a peridotite magma containing, besides alumina, oxides of the alkalis and alkaline earths, a portion of the alumina is used to unite with these oxides and silica to form felspar. L. J. S.

Emery from Virginia. By W. W. Miller, jun. (*Amer. Chem. J.*, 1899, **22**, 212—213).—Analysis of emery from near Whittle's, Pittsylvania Co., gave

Al_2O_3.	Fe_2O_3.	FeO.	SiO_2.	TiO_2.	Na_2O.	Total.
56·74	15·50	20·77	0·68	1·86	3·95	99·50

It forms a black, crystalline mass, magnetic; polar; sp. gr. 4·205; H on edges 8; infusible, and does not lose in weight on ignition. Omitting the silica, titanic oxide, and soda, the composition corresponds with a mixture of 22·48 per cent. of magnetite, 33·34 per cent. of hercynite, and 37·16 per cent. of corundum. The erosive power is not sufficient to give it value as emery. W. A. D.

The so-called Valleriite. By Jakob Petrén (*Jahrb. f. Min.*, 1899, ii, Ref., 17—18; from *Geol. För. Förh.*, 1898, **20**, 183—192).—Valleriite was the name given by Blomstrand in 1870 to a mineral substance from Nya Kopparberg, Sweden, which, according to his analyses, had the composition $2CuS,Fe_2S_3 + 2MgO,Fe_2O_3 + 4H_2O$. A chemical and microscopical examination of the material shows it to be a mixture of covellite, pyrrhotite and spinel, together with hydrotalcite, chalybite, and limonite as secondary products. The covellite (CuS) separated from the mixture has the composition, Cu, 62·35; S, 34·83; Fe, 2·37 = 99·55 per cent. The separated spinel has the following composition:

Al_2O_3.	Fe_2O_3.	FeO.	MgO.	Total.
67·75	2·88	0·86	27·04	98·53

L. J. S.

Formation of Oceanic Salt Deposits, particularly of the Stassfurt Beds. XII. Hydrate of Magnesium Sulphate, $MgSO_4 + \frac{5}{4}H_2O$. By Jacobus H. van't Hoff and H. M. Dawson (*Chem. Centr.*, 1899, i, 1137—1138; from *Sitzungsber. Akad. Wiss. Berlin*, 1899, 340—343).—When a solution of magnesium sulphate containing magnesium chloride is concentrated at 65°, the dihydrate, $MgSO_4 + 2H_2O$, separates in cauliflower-like bundles of slender needles which soon change to more transparent and crystalline masses of the composition $MgSO_4 + \frac{5}{4}H_2O$. Experiments with the dilatometer showed that the same *hydrate*, $MgSO_4 + \frac{5}{4}H_2O$, may be obtained by adding a crystal of it to a solution of magnesium sulphate containing magnesium chloride which has deposited all its tetrahydrate at 25°. This hydrate also separates spontaneously when the solution is very slowly concentrated. E. W. W.

Minerals of Sarrabus, Sardinia. By G. B. Traverso (*Jahrb. f. Min.*, 1899, ii, Ref., 218—221; from *Sarrabus e suoi minerali*, Alba, Piedmont, 1898).—Descriptions are given of the numerous mineral species occurring in the mineral veins of Sarrabus; analyses are given of the following:

Embolite contains 61·1 AgCl and 29·4 AgBr. Native silver gave the results under I; also traces of lead and zinc. Massive argentite gave II.

Ullmannite gave analysis III, by Mascazzini; also impurities 9·736 per cent.

	Ag.	Cu.	As.	Sb.	S.	Hg.	Ni.	Co.	AgCl.
I.	91·07	0·26	0·12	0·07	0·28	0·03	trace	—	0·87
II.	83·0	1·2	—	0·9	12·0	trace	0·4		—
III.	0·1	—	0·78	52·51	13·37	—	24·0	—	—

Partial analyses are also given of impure arsenic and antimony compounds of nickel and cobalt. L. J. S.

Occurrence of Iodine in Cuprite and in Malachite. By Wilhelm Autenrieth (*Chem. Zeit.*, 1899, **23**, 626. Compare Abstr., 1897, ii, 561).—A number of specimens of cuprite and malachite from New South Wales have been found to contain small quantities of iodine, the amount varying from 0·006—0·15 per cent. It is thought probable that the iodine is present in cuprite in the form of cuprous iodide (marshite) and in malachite as a basic cupric iodide, OH·CuI.
J. J. S.

Occurrence of Iodine in Cuprite and in Malachite. By Carl Ochsenius (*Chem. Zeit.*, 1899, **23**, 669. Compare preceding abstract).—The author draws attention to the conversion of sulphide ores into halogenised ores in the Andes of both North and South America. In Chili, chlorides occur in the upper, iodides in the lower, and bromides in the intermediate layers. J. J. S.

Iodine in Copper Ores from New South Wales. By Arthur Dieseldorff (*Zeit. prakt. Geol.*, 1899, 321—322).—Copper ores—cuprite, malachite and chrysocolla—from several localities, Cobar, Broken Hill, &c.—were found to contain small amounts of iodine, from 0·01 to 0·14 per cent., together with a little silver. The occurrence of iodyrite (AgI) and marshite (CuI) at Broken Hill suggests that the iodine is present as iodides of silver and copper.
L. J. S.

Formation of Manganosite and Periclase By Hjalmar Sjögren (*Jahrb. f. Min.*, 1899, ii, Ref., 15—16; from *Geol. För. Förh.*, 1898, **20**, 25—32. Compare Abstr., 1897, ii, 324).—Manganosite (MnO) and periclase (MgO) occur under the same conditions as original constituents in dolomitic limestone at Långban and at Nordmark, Sweden. The methods successful in the artificial production of these minerals are, on account of the high temperature employed, not in accordance with those which must have occurred in their natural formation. Analysis by R. Mauzelius of the pure dolomitic limestone, which is the matrix of periclase, gave

Insol.	SiO_2.	Fe_2O_3.	MnO.	CaO.	MgO.	CO_2.	Total.
1·26	0·18	0·08	6·38	30·62	16·21	[45·27]	100·00.

The dolomitic matrix of manganosite contains more manganese and less magnesium than shown in this analysis.

Since alkali carbonates precipitate both hydroxides and carbonates from cold dilute solutions of magnesium and manganese salts, the hydroxides could have been deposited at the same time as the dolomite; these hydroxides are now partly represented by original brucite, $Mg(OH)_2$, and pyrochroite, $Mn(OH)_2$, and partly by the periclase and manganosite, the dehydration probably taking place at the same time that the limestone became crystalline. Secondary brucite and pyrochroite, derived by the subsequent alteration of the periclase and manganosite respectively, also occur in the dolomitic limestone.

L. J. S.

Smithsonite from Arkansas. By W. W. Miller, jun. (*Amer. Chem. J.*, 1899, **22**, 218—219).—Smithsonite, from the "Morning Star" mine, Searcy Co., Arkansas, gave on analysis,

ZnO.	CdO.	CuO.	FeO.	CO_2.	SiO_2.	Total.
63·67	1·06	0·21	0·07	34·69	0·52	100·22

It occurs in botryoidal form and encloses zinc blende in layers 6—8 mm. thick. It is greyish-white in colour with a pearly lustre, translucent, H = 5, sp. gr. 4·179.

W. A. D.

Manganese Silico-carbonates from Hautes-Pyrénées. By Hermann Lienau (*Chem. Zeit.*, 1899, **23**, 418—419).—*Viellaurite* is the name given to a massive, dark-grey mineral with granular structure from the Coustou mine near Vielle-Aure in Hautes-Pyrénées. On exposure to the air, it becomes black. The powder is almost white, and is completely decomposed by acids with separation of gelatinous silica. The mean results of the analyses are given under I; formula, $5MnCO_3,2Mn_2SiO_4$.

	SiO_2.	CO_2.	MnO.	FeO.	CaO.	MgO.	Al_2O_3.	S.	H_2O.	Total.	Sp. gr.
I.	11·93	21·09	63·01	1·56	1·06	0·77	—	0·55	—	99·97	3·7
II.	19·24	15·00	48·65	0·96	8·15	1·18	3·65	—	3·16	99·99	3·62

Torrensite is named from the Torrens mine near Ville-Aure, where the mineral occurs with rhodonite and friedelite. It is compact, and light sepia to reddish-grey, becoming brown on exposure to the air; the powder is pale greyish-rose, and is easily decomposed by acids. The mean (II) of two analyses gives the formula $MnSiO_3,MnCO_3,\frac{1}{2}H_2O$.

Homogeneous minerals containing both silicic and carbonic acids are of rare occurrence; thaumasite and cancrinite are examples.

L. J. S.

Deposition of Barium Sulphate as a Cementing Material of Sandstone. By Frank Clowes (*Proc. Roy. Soc.*, 1899, **64**, 374—377).—Some years ago, a certain sandstone occurring near Nottingham was found to contain 33—50 per cent. of barium sulphate, which evidently served to cement the sand grains together. The existence of the barium sulphate has now been explained by the discovery that the water from an artesian boring in the district contains barium chloride (White, this vol., ii, 420). This fact, together with the proximity of calcium sulphate veins, accounts for the peculiarly local occurrence of the sandstone referred to. J. C. P.

Quenstedtite from Iowa. By Otto Kuntze (*Amer. Geologist*, 1899, **23**, 119—121).—In the dry season of the year, the sandstone walls beneath the overhanging ledges on the banks of a small creek near Montpelier, Muscatine Co., are encrusted with a sulphur-yellow material 1—2 inches in thickness. It is readily soluble in cold water, and effloresces on long exposure to the air. Sp. gr. 2·212 ; $H = 2\frac{1}{2}$. The mean of two analyses is,

SO_3.	Al_2O_3.	Fe_2O_3.	Insol. (SiO_2).	H_2O.	Total.
39·01	0·27	26·86	1·79	32·32	100·25

This agrees approximately with the formula of quenstedtite, namely, $Fe_2(SO_4)_3 + 10H_2O$. At 105°, there is a loss of 21·04 per cent., gradually increasing to 29·94 per cent. at 140°. The substance has been derived by the oxidation of pyrites, numerous specks of which occur in the sandstone. Such substances are of comparatively rare occurrence, and are only formed under favourable conditions.

L. J. S.

Formation of Minerals in Magmas. By József Morozewicz (*Tsch. Min. Mitth.*, 1898, **18**, 1—90, 105—240).—The numerous experiments were made on large amounts (up to 1 cwt. or more) of material heated in fire-clay crucibles in a Siemens' furnace. After fusion of the material in the hottest part (1600°) of the furnace, the crucibles were moved to successively cooler places (down to 500°), allowing the magmas to cool and crystallise slowly for several weeks or months. The materials used were rocks, or mixtures of minerals or pure chemicals, of known composition. Numerous (54) analyses were made of the resulting rocks and crystallised minerals.

Formation of Corundum, Spinel, Sillimanite and Cordierite in Silicate-magmas (compare Abstr., 1895, ii, 275).—In attempts to produce certain types of volcanic rocks, some of the resulting crystalline masses were found to contain much corundum and spinel, and this led the author to determine the chemical conditions under which these minerals were formed. In these cases, the magmas were all rich in alumina, and in the crystalline products the corundum and spinel were set in a ground-mass, consisting of olivine, magnetite, nepheline, anorthite and glass, with sometimes melilite, augite, hypersthene and labradorite. The corundum crystals are tabular in habit and reach a diameter of 1·5 mm. ; the various colours—blue, red, yellow—may be explained by the presence of oxides of iron. The material contains 99·5—99·8 per cent. of alumina ; sp. gr. 4·03. The spinel octahedra are colourless, yellow, green, or black, depending on the amount of iron ; in five analyses, the composition varies from $13MgAl_2O_4,MgFe_2O_4$ to $MgAl_2O_4,4FeAl_2O_4$, &c.

After isolating the corundum and spinel by means of hydrofluoric and sulphuric acids, analyses of the ground-mass showed that in all cases the ratio of $Al : M(=K_2, Na_2, Ca)$ is unity ; the excess of alumina over this amount in the original magma has separated as corundum, or as corundum and spinel when magnesia and iron oxides are also present. Magmas of the composition $MO,Al_2O_3,2SiO_2$ (anorthite) and $MO,Al_2O_3,6SiO_2$ (albite), are therefore capable of dissolving excess of alumina, which crystallises out on cooling in the form of corundum. An anorthite magma dissolves about 5 per cent. of alumina (in the form of bauxite), and a nepheline magma about

29·5 per cent., whilst in an orthoclase magma it is almost insoluble. Excess of silica and alumina in an albite magma crystallises out as sillimanite, in colourless prisms, and corundum. Corundum also crystallises from sodium aluminate containing an excess of alumina; hence the formation of corundum is not connected with the acidity or basicity of the magma. From an andesitic magma with $MO:MgO:Al_2O_3:SiO_2 = 1:0·9:1·25:7$, there was a separation of cordierite and spinel with labradorite, augite, magnetite and glass, and the product closely resembled the cordierite-vitrophyrite from South Africa described by Molengraaff.

The conditions for the separation of these minerals are summarised as follows: In supersaturated alumino-silicate magmas of the general composition $MO,mAl_2O_3,nSiO_2$ ($n =$ or > 2), the whole of the excess of alumina $(m - 1)$ separates out: (*a*) as corundum if no magnesia or ferrous oxide is present, and if $n < 6$; (*b*) as sillimanite, or sillimanite and corundum, if $n > 6$. When the magmas are rich in magnesia and ferrous oxide, the excess of alumina separates out: (*c*) as spinel, or spinel and corundum, if $n < 6$; and (*d*) as cordierite, or cordierite and one or more of the other minerals, if $n > 6$.

Natural magmas containing an excess of alumina are of comparatively rare occurrence: descriptions and analyses are given of some rocks of this type occurring as veins in the granites, &c., of the Ilmen Mountains, Urals. *Kyschtymite* is the name given to a corundum-anorthite rock from the Kyschtym district; it contains 50—60 per cent. of corundum and some spinel. Corundum-pegmatite and corundum-syenite from the same region consist respectively of corundum and orthoclase, and of corundum, orthoclase and biotite; in both cases, the orthoclase (microperthite) contains a considerable amount of soda. Such magmas containing an excess of alumina crystallising out as corundum are analogous to magmas containing an excess of silica, which crystallises out as quartz, and on this is based a classification of rocks. In other cases, where a separation of corundum, spinel, sillimanite and cordierite has taken place, there has been an absorption by the magmas of clay-slate at the contacts.

Composition of Pyroxene from Silicate-fusions.—Analysis I is of colourless crystals of enstatite, isolated from a magma having the composition of a basalt rich in magnesia. II (contains also a trace of TiO_2) of augite crystals 1·5 mm. long, from a magma having the composition of a melilite-basalt. III (contains also MnO, 4·08 per cent.) of reddish-brown, prismatic crystals of augite from a fusion containing also haüyne, anorthite and magnetite; it contains, as shown by the analysis, 73 per cent. of Tschermak's hypothetical molecule, MR_2SiO_6, and it is more readily decomposed by hydrochloric acid than other pyroxenes. IV and V of alkali-augite, forming spherulites in quickly cooled basalt magmas.

	SiO_2.	Al_2O_3.	Fe_2O_3.	FeO.	CaO.	MgO.	K_2O.	Na_2O.	Total.	Sp. gr.	Extinction on (010).
I.	53·07	4·12	6·08	0·94	2·85	33·75	—	—	100·81	3·087	0°
II.	46·93	6·76	10·82	0·70	20·00	12·70	trace	1·72	99·63	3·177	45
III.	30·87	13·82	25·35	1·12	22·17	1·54	0·43	1·51	100·89	$>$3·18	8
IV.	53·72	7·87	7·19	5·17	8·70	5·73	1·10	10·03	99·51	2·886	18
V.	58·91	10·81	7·12	1·86	10·12	4·34	1·00	4·98	99·14	2·724	10

All these pyroxenes can be expressed as isomorphous mixtures of three silicates; the metasilicate $M''SiO_3$, Tschermak's hypothetical molecule $M''R'''_2SiO_6$, and the ægirite-jadeite molecule $M''R'''_2Si_4O_{12}$. The optical characters vary with the composition, the angle of extinction on $b(010)$ decreasing with an increase in the amount of MR_2SiO_6 and $MR_2Si_4O_{12}$; the pure compound, MR_2SiO_6, would be expected to be orthorhombic.

In magmas rich in silica (>50 per cent.) and alkalis, the ægirite-jadeite molecule combines with the metasilicate, whilst in more basic magmas Tschermak's molecule takes its place. In magmas with about 50 per cent. of silica and poor in alkalis, orthorhombic pyroxenes separate when $(MgO + FeO) : CaO$ equals or exceeds $3:1$, whilst monoclinic pyroxene separates when this ratio is less than $3:1$.

Wollastonite, in white, acicular crystals several cm. long, was found in the lower layers of ordinary glass, which had remained for a considerable length of time in contact with the hearth of the furnace, and were richer in lime than the upper layers. The crystals are elongated parallel to the axis of symmetry; analysis gave the formula $CaSiO_3$; sp. gr. 2·8075.

Synthesis of Nosean, Haüyne, Sodalite and Lagoriolite (compare Abstr., 1893, ii, 19, 422).—Nosean, as white, grey, or blue isotropic dodecahedra and rounded grains, was formed when mixtures of kaolin and soda, or of kaolin, calcium carbonate and gypsum, were fused at a red heat (600°) for several days with excess of sodium sulphate. Five analyses of the material give the formula $3(Na_2Al_2Si_2O_8) + Na_2SO_4$, with, in some cases, a little sodium replaced by calcium; this formula also expresses the composition of natural nosean better than the usually accepted formulæ $2(Na_2Al_2Si_2O_8) + Na_2SO_4$, and $3(Na_2Al_2Si_2O_8) + 2Na_2SO_4$. The blue colour of the crystals is due to the presence of sulphides, probably iron sulphide.

Haüyne was not formed by fusing mixtures of the composition of haüyne with sodium sulphate. It was produced together with augite (anal. III. above) in a magma having the composition of haüyne-basalt.

Sodalite in white dodecahedra or grains was formed when kaolin or nepheline was fused with soda and excess of sodium chloride. Analyses give the formulæ $2(Na_2Al_2Si_2O_8) + NaCl$ and $3(Na_2Al_2Si_2O_8) + 2NaCl$, both of which agree with natural sodalites.

Lagoriolite (soda-garnet) is the name given to a new product obtained by fusing at a dark red-heat mixtures of silicic acid and hydrargillite, $Al(OH)_3$, with sodium and calcium sulphates and carbonates. The square plates are flattened cubes which are either isotropic or birefringent with twin lamellæ. Analyses give the formula $3(Na_2,Ca)O,Al_2O_3,3SiO_2$ with $Na_2O : CaO = 3:2$; in one analysis, there is only a trace of calcium, and in all there are small quantities of sulphuric anhydride. This is the garnet formula, and the substance forms a connecting link between the garnet and the nosean groups. The largest amount of alkali yet found in natural garnet is 4·22 per cent. in melanite from the phonolite of Oberschaffhausen.

Liparite magmas.—Acid magmas do not readily crystallise, and as a rule they solidify to a glass. When, however, the experimental magmas have crystallised, the excess of silica has separated as tridymite, or in a prismatic modification the characters of which are as yet unknown. A liparite magma, fused with 1 per cent. of tungstic acid, gave crystals of quartz, biotite and sanidine proving that the essential constituents of granite can be formed by dry fusion.

A list of minerals which have been formed artificially by the author includes all the important rock-forming minerals except hornblende, and the crystallised fusions represent almost all the known typet of alumino-silicate rocks. The structure of these artificial rocks depends on the chemical composition of the magma and on the rate of cooling. The order in which the various minerals separate from the magmas is discussed; it does not depend, as has been stated, on the fusibility or basicity of the minerals, but on their solubility and the relative amounts in which they are present in the solution. Several cases are noticed in which there has been a differentiation in the artificial magmas, as shown by a separation into layers of different chemical composition and specific gravity.

Incidentally, the following analyses are given of material used in the experiments: A, (by F. Dutkowski), of kaolin from Schneeberg; B. nepheline, from Låven, Norway.

	SiO_2.	Al_2O_3.	Fe_2O_3.	CaO.	K_2O.	Na_2O.	H_2O.	Total.
A.	45·75	40·17		0·20	—	—	13·98	100·10
B.	44·51	33·38	—	0·45	5·50	15·69	1·37	100·90.

L. J. S.

Asbestos. By Paul Kersting (*Chem. Centr.*, 1898, ii, 125; from *Chem. Ind.*, **21**, 171—174).—The best commercial asbestos is from North Italy; Canadian and South African are now coming into use. Analyses I and II are of Canadian [chrysotile], and III of blue South African [crocidolite]. For I and II, the formula is given as $MgSiO_3,Mg_2SiO_4 + 2H_2O$, and for III, $(Mg,Fe)SiO_3 + H_2O$. When treated with hydrochloric acid, there is dissolved 41·24 per cent. of I, 37·48 of II, and 12·62 of III. The South African is softer and finer than the Canadian, but it is less refractory and falls to pieces when ignited.

	SiO_2.	Al_2O_3.	Fe_2O_3.	FeO.	CaO.	MgO.	K_2O.	Na_2O.	P_2O_5.	SO_3.	H_2O.	Total.

II.	41·56	3.42	0·41	6·67	0·83	33·38	0·11	0·30	—	0·08	13·15	99·91
III.	43·61	0·21	16·57	12·15	0·89	7·02	3·06	2·14	0·06	0·06	14·30	100·07

L. J. S.

Thalite and Bowlingite from Lake Superior. By Newton H. Winchell (*Amer. Geologist*, 1899, **23**, 41—44).—Thalite was described in 1852 as occurring in cavities in trap at several places on the north shore of Lake Superior. It is soft with a soapy feel, and is dirty white or grey; it is easily gelatinised by hydrochloric acid. Sp. gr. 2·20. Thin sections show a confused vermicular aggregate, sometimes with bands formed of minute transverse fibres; the fibres show a positive bisectrix parallel to their length with a small axial angle. Analysis by L. B. Pease gave,

SiO_2.	Al_2O_3.	Fe_2O_3.	MgO.	CaO.	K_2O.	Na_2O.	H_2O.	Total.
42·38	7·37	2·65	23·29	5·52	0·19	0·36	18·18	99·94

At 100°, there is a loss of 10·38 per cent.

Pseudomorphs after olivine occurring in the same rocks are supposed to be bowlingite; the optical characters of this are described.

L. J. S.

Thalénite, a new Mineral. By Carl Benedicks (*Geol. För. Förh.*, 1898, **20**, 308—312; and *Bull. Geol. Inst. Univ. Upsala*, 1899, **4** (1898), 1—15).—The new mineral occurs, massive and in crystals, with fluocerite, gadolinite and allanite in quartz at Österby in Dalecarlia, Sweden. It is flesh-red and translucent, with a greasy lustre. Fracture uneven to splintery; brittle; no cleavage; H = $6\frac{1}{2}$. Approximate measurements of the dull, monoclinic crystals gave [$a : b : c$ = 1·154 : 1 : 0·602; $\beta = 80\frac{1}{5}°$]. Optically negative, axial plane ⊥ b(010), $\beta\chi_a$ nearly ⊥ a(100), 2V = 67° 35′, α = 1·7312, β = 1·7375, γ = 1·7436 (Na). The material is easily decomposed, with separation of gelatinous silica, by dilute hydrochloric acid. The mean of five partial analyses made on fresh, transparent material of sp. gr. 4·227 is given under I; formula, $H_2O,2Y_2O_3,4SiO_2$. The molecular weight of the yttrium earths is 245·3; the absorption spectrum of the nitrates shows the presence of erbium, holmium and didymium. The gas liberated when the mineral is heated or treated with acids was examined spectroscopically and found to contain nitrogen and helium.

	SiO_2.	Y_2O_3.	Fe_2O_3.	Al_2O_3.	BeO.	CaO.	MgO.	Na_2O.	SnO.	H_2O.	CO_2.	Gas.	Total.

Analysis II is of weathered thalénite; this is lighter in colour and softer; sp. gr. 3·945. Some organic matter is present, and to this the colour of the mineral is probably due.

Minerals allied to thalénite are yttrialite, rowlandite, and kainosite. There are also analogies in the chemical formulæ and crystal angles of thalénite and laumontite.

In an appendix to the second paper, new material is described. This is yellow in colour. It is more transparent, has a stronger lustre and weaker birefringence; μ = 1·713, sp. gr. 4·11—4·16; fracture conchoidal. Analysis III shows it to be a purer form of thalénite. The molecular weight of the yttrium earths is 246·2.

L. J. S.

[Analyses of Felspars.] By Franz Loewinson-Lessing (*Jahrb. f. Min.*, 1899, ii, Ref. 232—238; from *Travaux Soc. des Nat. St. Pétersbourg*, 1898, **26**, livr. 5, 404 + xl. pp. (Russ.) + 7 pp. Résumé (French).—The following analyses of felspars are given in a petrographical paper dealing generally with a chemical classification of rocks, and on the eruptive rocks of a portion of the Central Caucasus: numerous analyses of rocks are also given.

I, partly pelitised felspar from porphyritoid; II, albite from an adinole; III, pelitised felspar; IV, felspar in porphyrite from the Basboika River, Urals; V—VII, pelitised felspar; VIII, felspar in gabbro from Höllmühle, near Penig; IX, in gabbro-diorite from Kühler Grund, near Eberstadt; X, in gabbro from Thalhorn, Vosges; XI, orthoclase from Baveno granite:

	SiO_2.	Al_2O_3.	Fe_2O_3.	FeO.	CaO.	MgO.	K_2O.	Na_2O.	Loss on ignition.	Total.
I.	50·09	29·64	—	—	14·09	1·11	—	—	5·43	100·36
II.	64·18	21·37	—	—	—	—	—	11·30	0·45	97·30
III.	52·00	22·95	0·21	0·47	18·50	0·44	0·42	2·40	3·24	100·63

V.	45·11	28·58	1·28	—	18·24	1·27	0·30	2·52	2·97	100·27
VI.	48·15	32·38	—	—	16·09	0·47	0·38	2·13	1·18	100·78
VII.	59·60	23·66	—	—	4·57	—	6·21	3·72	1·80	99·56
VIII.	50·52	31·37	—	—	13·25	—	—	4·13	0·55	99·82
IX.	53·78	31·19	—	—	8·02	0·37	0·84	5·00	0·88	100·08
X.	53·22	29·85	—	—	4·53	1·30	3·33	4·70	2·96	98·89
XI.	67·66	18·73	—	—	—	—	8·43	3·75	0·67	99·24

In several so-called "kaolinised" plagioclases, it is shown that the alteration product is not kaolin, but a mixture of various hydrated silicates of aluminium and magnesium, zeolites, &c.; for this mode of alteration of felspar the term pelitisation is proposed. L. J. S.

Constitution of Tourmaline. By Frank W. Clarke (*Amer. J. Sci.*, 1899, [iv], **8**, 111—121).—The author argues in favour of the formula of tourmaline, $2[Al(SiO_4)_3R'''_2(Al{\cdot}BO_2)]:Al(BO_3)R'_2$, proposed by him (Abstr., 1897, ii, 52), as opposed to the formula recently given by Penfield and Foote, namely, $(H,R', \&c.)_9Al_3(B{\cdot}OH)_2Si_4O_{19}$ (this vol., ii, 304). Reducing both formulæ to the ultimate acids, they become respectively $H_{29}B_3Si_6O_{31}$ and $H_{30}B_3Si_6O_{31\frac{1}{2}}$. The small difference between these formulæ hardly amounts to more than the uncertainties of the analyses. Clarke's formula expresses the relation between the micas and tourmaline, and it is shown to agree closely with several of Riggs' analyses. Analyses from which Penfield and Foote's formula may be deduced may also be made to agree with Clarke's formula by assuming the presence of the basic divalent group $Al{\cdot}OH$ or AlF, and by replacing some Ca by NaH; and the few analyses in which boric acid is low may be explained by partial replacement of $Al{\cdot}BO_2$ by $Al{\cdot}OH$ and AlF. [Clarke's acid, $H_{29}B_3Si_6O_{31}$, is identical with that recently deduced by Rheineck (this vol., ii, 601).]
L. J. S.

Composition of Moldavite. By Conrad H. von John (*Verh. k.k. geol. Reichs.*, 1899, 179—182. Compare Abstr., 1896, ii, 434).—F. E. Suess (*Verh. k.k. geol. Reichs.*, 1898, 387; *Anzeiger Akad. Wiss. Wien*, 1898, No. XXIV.) has recently given reasons, mainly based on the peculiar surface markings, for considering moldavites to be of cosmic origin, and he concludes that they represent a hitherto unrecognised type of aerolites. The following analyses are given of the material examined by Suess: I, moldavite from Budweis in Bohemia; II and III, from Trebitsch in Moravia.

	SiO_2.	Al_2O_3.	Fe_2O_3.	FeO.	MnO.	CaO.	MgO.	K_2O.	Na_2O.	H_2O.	Total.
I.	82·68	9·56	—	1·13	0·18	2·06	1·52	2·28	0·63	—	100·04
II.	78·61	12·01	0·16	3·09	0·11	1·62	1·39	3·06	0·44	—	100·49
III.	77·96	12·20	0·14	3·36	0·10	1·94	1·48	2·70	0·61	—	100·49
IV.	52·32	0·30	—	1·20	1·02	17·52	3·60	22·84	0·24	0·80	99·84

Analysis IV is of material from Netin, Moravia, which was considered by Suess to be an artificial glass since it differed from true moldavite in colour and the characteristic surface markings; the analysis also shows it to be quite distinct. Nine earlier analyses of moldavite are quoted, and there is seen to be very little variation in composition. L. J. S.

Riebeckite and Ægirine in Granite from Turcoaia, Roumania. By L. Mrazec (*Bull. Soc. Sci. Bucarest*, 1899, **8**, 106—111).—A grey, medium-grained granite extensively quarried at Mt. Jacob Deal, near Turcoaia, in the district of Dobrogea [Dobrudscha], contains magnetite, allanite?, zircon, ægirine, riebeckite, albite, anorthoclase, orthoclase, quartz, hæmatite, limonite, epidote and chlorite. The riebeckite occurs as black prisms sometimes 2 cm. long; it is strongly pleochroic, and the angle of optical extinction on (010) is 5°. Chlorite and limonite are formed by its alteration. Analysis of impure material gave,

SiO_2.	Al_2O_3,ZrO_2.	Fe_2O_3.	FeO.	MnO.	CaO.	MgO.	Na_2O.	K_2O.	H_2O.	Total.
[45·69]	7·01	14·33	17·62	3·24	4·28	1·77	4·62	0·99	0·45	100·00

L. J. S.

Alteration Products of Magnesia-mica; Variation of the Optical Characters with the Composition. By Eberhard Zschimmer (*Jahrb. f. Min.*, 1899, ii, Ref. 210—214; from *Inaug.-Diss. Jena*, 1898).—The following analyses are given of lepidomelane, in various stages of alteration, from the granite of the Schneidemüllerskopf, near Ilmenau, in Thuringia; optical determinations are also given. The fresh mica has the composition of lepidomelane, and all the altered forms can be expressed as mixtures of Tschermak's two molecules, $H_2K(Al,Fe)_3Si_3O_{12}$ and $Mg_6Si_3O_{12}$.

SiO_2.	TiO_2.	Al_2O_3.	Fe_2O_3.	MgO.	CaO.	FeO.	K_2O.	Na_2O.	H_2O.	Total.	Sp. gr.
32·75	1·85	14·79	23·53	10·25	3·09	5·35	4·30	—	3·79	99·70	3·09
35·38	0·81	15·63	16·27	12·30	1·59	8·06	5·34	0·22	5·38	100·98	3·00
35·69	0·14	17·85	18·62	11·83	2·22	4·64	3·27	0·39	5·82	100·47	2·94
33·93	1·23	16·02	17·75	13·53	1·85	3·68	3·29	—	7·80	99·08	2·85
35·88	1·25	18·88	14·97	13·66	1·34	3·69	2·25	—	7·73	99·65	2·82
36·87	1·61	21·21	11·97	12·34	1·78	3·63	2·36	—	7·64	99·41	2·78

With progressive alteration (or "bleaching") there is a separation of iron as ferric oxide, and a replacement of potash by water; at the same time, the specific gravity, pleochroism, and indices of refraction decrease, whilst the optic axial angle increases.

A connection is traced between the optic axial angle of various micas and the chemical composition. The position of the optic axial plane in the two classes of micas does not depend on the chemical composition, but is possibly connected with a kind of dimorphism.

L. J. S.

Sandstone from Augusta Co., Virginia. By W. W. Miller, jun. (*Amer. Chem. J.*, 1899, **22**, 216—217).—The sandstone, which consists of angular fragments interspersed with small seams of clay, possesses the peculiar property of becoming firm and compact when it is laid and beaten down for a pathway and left undisturbed. Analysis gave

	SiO_2 (amorphous, free.)	SiO_2 (combined.)	Al_2O_3.	TiO_2.	Fe_2O_3.	MgO.	K_2O.	Na_2O.	H_2O at 100°.	H_2O by ignition.	Total.
Clay...	0·53	63·68	24·23	0·94	3·57	1·25	4·04	0·77	0·49	4·83	99·29
Rock..	0·00	96·72	2·37	0·00	0·46	0·00	0·00	0·19	0·00	0·26	100·00

These results do not explain the peculiar packing power of the material, which must, therefore, be attributed to physical causes. W. A. D.

The Parent-rock of the Diamond in South Africa. By Thomas George Bonney (*Proc. Roy. Soc.*, 1899, **65**, 223—236).—In the "blue ground" of the Newlands mines, West Griqualand, about 40 miles N.W. of Kimberley, are rounded boulders of eclogite (a holocrystalline, igneous rock composed of garnet and diopside), which occasionally contains colourless octahedra of diamond apparently as an original constituent. It has long been recognised that the diamonds have not been formed *in situ* in the "blue ground," but until now the only mineral found intimately associated with them is garnet. The water-worn character of the eclogite boulders proves that the "blue ground" is not of igneous origin, but a true breccia produced by the destruction of various rocks, including the eclogite which has contributed the diamonds to the mixture. L. J. S.

Rhyolites of the Hauraki Goldfields, New Zealand. By James Park and Frank Rutley, with Analyses by Philip Holland (*Quart. Journ. Geol. Soc.*, 1899, **55**, 449—469).—A geological and petrographical description is given of the Pliocene rhyolites of the Hauraki goldfields. The gold-bearing rocks are andesites. Analysis I is of a pale lithoidal rock from Omahu, consisting almost exclusively of small spherulites with some quartz, sanidine and oligoclase. II is of a pale greyish-white or yellowish rhyolite from Waihi, with numerous minute crystals of oligoclase and andesine, with some sanidine and labradorite:

	SiO_2.	TiO_2.	Al_2O_3.	Fe_2O_3.	FeO.	CaO.	BaO.	MgO.	K_2O.	Na_2O.	SO_3.	H_2O.	Total.	Sp. gr.
I.	77·59	0·63	12·75	0·67	Nil	0·04	0·10	0·16	3·99	2·56	0·07	1·54	100·10	2·511
II.	73·08	0·62	13·50	2·60	0·13	1·07	0·06	0·15	3·19	3·95	0·12	1·33	99·80	2·514

Also traces of MnO and P_2O_5. L. J. S.

Clay from Russia. By R. Thal (*Jahrb. f. Min.*, 1899, ii, Ref., 210; from *Chem. Zeit.*, 1898, 690).—Thirteen analyses are given of clay from the Gov. Novgorod. L. J. S.

Origin of the Gases Evolved on Heating Mineral Substances, Meteorites, &c. By Morris W. Travers (*Proc. Roy. Soc.*, 1898, **64**, 130—142).—Some minerals containing water, carbonic anhydride, and ferrous oxide give off hydrogen and carbonic oxide when heated, but not when decomposed with dilute sulphuric acid, indicating that the gases are not present in the mineral in the free state. The amount of hydrogen and carbonic oxide liberated on heating is proportional to the quantity of water, carbonic anhydride, and ferrous oxide in the mineral; hence it is probable that these substances interact according to the equations $2FeO + H_2O = Fe_2O_3 + H_2$ and $2FeO + CO_2 = Fe_2O_3 + CO$.

A specimen of Peterhead granite when heated gave off carbonic anhydride, carbonic oxide, and hydrogen, and further investigation showed that the greater part of the carbonic anhydride is derived from the quartz, whilst the hydrogen comes chiefly from the mica and felspar. The carbonic anhydride is probably contained in cavities in the quartz, and the absence of hydrogen in the quartz is against the view that it also is contained in cavities. Analysis showed that the felspar contained both free iron and ferrous oxide.

When heated in a sealed tube with copper sulphate and water, meteoric iron gave only traces of hydrogen and carbonic oxide, whilst a considerable quantity of these gases was evolved when the iron was heated in a vacuum. It thus appears that the gases obtained by heating meteorites are not present as such, but are produced by the interaction of their non-gaseous constituents.

Microscopic examination of minerals which yield helium fails to reveal the presence of cavities, and on certain grounds it is probable that the helium is combined with some constituent of the mineral. The gas is associated with particular minerals, and in some cases the liberation of helium is accompanied by a considerable development of heat. The quantity of helium obtained from cleveite by treatment in an exhausted tube with 30 per cent. sulphuric acid is about double that obtained by merely heating the mineral, and this suggests the possibility of helium being in a state of binary combination, and being evolved according to the equation $XHe_2 = XHe + He$. If the helium were combined with a metal, treatment of the mineral with sulphuric acid would liberate it as a hydride, which would probably be an unstable compound; this may account for the fact that both cleveite and fergusonite yield hydrogen when decomposed with sulphuric acid.

J. C. P.

Meteorite from Mighei, Russia. By **Petr G. Melikoff** and **W. Krschischanowsky** (*Jahrb. f. Min.*, 1899, ii, Ref. 30—31; from *J. Russ. Chem. Soc.*, 1896, **28**, 429, 651—657. Compare Abstr., 1890, 346).—Analyses of this stone, which fell at Mighei, Kherson, in South Russia, on June 18th, 1889, gave I for the portion soluble in water, II for the portion soluble in hydrochloric acid, and III for the insoluble portion.

	SiO_2.	CaO.	MgO.	FeO.	MnO.	Na_2O.	K_2O.	Al_2O_3.

II.	3·52			0·46	2·94	1·01	—	—

There is also 1·62 per cent. of chromite, and some amorphous carbon and organic matter. L. J. S.

Meteorite from Zmjenj, Russia. By PETR G. MELIKOFF (*Jahrb. f. Min.*, 1899, ii, Ref., 31—33; *J. Russ. Chem. Soc.*, 1896, **28**, 114, 299—307).—Analysis of the stone which fell at Zmjenj, Minsk, in West Russia, in August, 1858, gave I for the portion soluble in hydrochloric acid and II for the insoluble portion; in I also FeS, 1·32; Fe_2Ni, 0·32; P_2O_5, 0·08.

	SiO_2.	MgO.	CaO.	FeO.	MnO.	Al_2O_3.	K_2O.	Na_2O.	$FeCr_2O_4$.	Total.
I.	9·72	1·20	3·98	1·03	0·41	6·27	0·13	0·56	—	25·02
II.	38·46	15·61	1·86	13·45	1·76	1·79	0·25	1·19	0·56	74·93

The mineralogical composition is: Anorthite, 23·3; bronzite, 74·36; troilite, 1·32; chromite, 0·56; nickel-iron, 0·32 per cent. In the ground-mass of anorthite and bronzite are porphyritic crystals of yellow bronzite with the composition $2MgSiO_3,FeSiO_3$. The crust of the meteorite contains magnetite which has originated by the fusion of the bronzite. L. J. S.

Meteoric Iron from Tombigbee River, Alabama, U.S.A. By WARREN M. FOOTE (*Amer. J. Sci.*, 1899, [iv], **8**, 153—156).—Six masses, weighing in the aggregate 43795 grams, were found between (about) 1859 and 1886 in a north and south line, nine miles in length, near the Tombigbee River in Choctaw and Sumter Counties, Alabama. One of the masses shows minute Widmanstätten figures on the etched surface; another shows schreibersite in large, graphic characters, and the plessite in places presents a glistening, frosted effect. Analysis by J. E. Whitfield of the mass showing the Widmanstätten figures gave

L. J. S.

Mineral Water from Árva-Polhora, Hungary. By WILHELM KALMANN and MORIZ GLÄSER (*Tsch. Min. Mitth.*, 1899, **18**, 443—446).—Water for the baths at Árva-Polhora, Hungary, is clear and faint yellow; it turns litmus paper violet, and has a faint odour resembling that of iodiform; on long standing in the air, a flocculent, rusty-coloured precipitate is produced. Sp. gr. at 15° = 1·02178. A litre of the water (at 15°) contains the following constituents (in grams): K_2O, 0·15084; Na_2O, 14·74420; Li_2O, 0·14451; CaO, 0·46307; BaO, 0·02746; SrO, 0·12332; MgO, 0·14812; FeO, 0·05603; Cl, 17·66109; Br, 0·11333; I, 0·04109; SO_3, 0·03071; CO_2, 0·23650; P_2O_5, 0·00378; B_2O_3, 0·19382; SiO_2, 0·00865; organic matter, 0·04781; fixed solids, 30·14185. The amounts of some of these constituents differ considerably from those shown in the earlier analysis of this water by C. von Than. L. J. S.

Water of Bagnoli, Tuscany. By RAFFAELE NASINI and ROBERTO SALVADORI (*Gazzetta*, 1899, **29**, ii, 161—180).—This water, which issues at a constant temperature of 21°, is very clear, has a pleasing taste, and is faintly acid to litmus paper. It has a sp. gr. 1·00014 at 12°/4°, its freezing point is $-0{\cdot}007°$, and its electrical conductivity 0·1243 at 25°. When allowed to stand in an open vessel for a long time, a yellowish-white, flocky deposit is obtained, and, on prolonged boiling, beautiful laminæ of gelatinous silica are formed. The water is bacteriologically pure. On analysis, the following results were obtained (grams per litre): Li, 0·000005; K, 0·00382; Na, 0·00935; Mg, 0·004175; Ca, 0·00867; Al, 0·00064; Fe, 0·00041; SO_4, 0·02952; HCO_3, 0·03298; Cl, 0·00776; SiO_2, 0·07336; and TiO_2, 0·000025; total, 0·170745. There are present also traces of rubidium, manganese, strontium, iodine, phosphoric and boric acids, and organic matter. The dissolved gases are 4·10 c.c. of oxygen and 13·16 c.c. of nitrogen per litre; the water has a permanent hardness 5·00, and a temporary hardness 0·33, expressed in French degrees. Its therapeutic and antiseptic properties are probably due to the relatively large amount of silica. T. H. P.

Deposition of Sulphur and Pyrites from Carlsbad Thermal-water. By JOSEF KNETT (*Jahrb. f. Min.*, 1899, ii, 81—84).—The small quantities of sulphur and pyrites deposited from Carlsbad thermal-water have probably originated in the reduction of sulphates by wood. L. J. S.

Mineral Water from the Stanislawa Spring, Galicia. By VON DUNIN-WASOWICZ and J. HOROWITZ (*Chem. Centr.*, 1899, ii, 491; from *Pharm. Post.*, **32**, 295—297, 307—309, 319—320).—The Stanislawa spring is in the Matkow forest, near Karlsdorf. One kilo. of the water contains, in grams: $NaHCO_3$. 2·589612; $FeH_2(CO_3)_2$, 0·024325; $MnH_2(CO_3)_2$, 0·001471; $CaH_2(CO_3)_2$, 0·918375; $BaH_2(CO_3)_2$, 0·097319; $SrH_2(CO_3)_2$, 0·215678; NaCl, 3·497792; KCl, 0·063051; LiCl, 0·004916; NaI, 0·000379; NaBr, 0·000603; $NaNO_3$, 0·000020; Na_2SO_4, 0·075956; SiO_2, 0·043350; CO_2 (free), 2·157232; organic matter, 0·106650. Also traces of copper oxide, nickel oxide, cobalt hydroxide, rubidium chloride, cæsium chloride, ammonium chloride, sodium arsenite, sodium borate, calcium phosphate, and calcium sulphide. L. J. S.

Periodic Analyses of the Rivers of the West Riding of Yorkshire. By EDWARD HALLIWELL (*J. Soc. Chem. Ind.*, 1899, **18**, 348—355).—This is a paper of great local interest, showing the variation in composition and pollution of several streams in Yorkshire. Complete tables are given. L. DE K.

Physiological Chemistry.

Taste in Relation to Chemical Composition. By WILHELM STERNBERG (*Chem. Centr.*, 1899, i, 1216; from *Zeit. Verein. Rübenzuck.-Ind.*, 1899, 376—388).—Whilst the hydrocarbons themselves are colourless and tasteless, derivatives containing oxygen or nitrogen in certain groupings, for instance, as OH- or NH_2-groups, possess both colour, odour, and taste, the last only, however, when these groups are combined with a positive alkyl or a negative carboxyl group respectively. The NO_2-group also confers the property of taste on compounds, and such groups are named "sapiphore." For a compound to have a sweet taste, it must contain at least two oxygen atoms, and every positive group must be united to a negative group, every alkyl group being combined with a hydroxyl group. Thus all polyatomic alcohols taste sweet. The introduction of positive groups, however, changes the sweet to a bitter taste (acetyl compounds of glucose). Aromatic sugars, such as phenyltriose, have a bitter taste. A certain regularity and symmetry of the arrangement of the groups is also a condition of sweetness. In the case of inorganic compounds, the property of a sweet or bitter taste is dependent on certain elements, and these elements the author arranges in a system. E. W. W.

Physiology of Pregnancy. By ALBERT CHARRIN and GUILLEMONAT (*Compt. rend.*, 1899, **128**, 1180—1182).—Inanition in pregnant guinea pigs was compared with that in normal animals. In all cases, a few c.c. of a saline solution were injected daily under the skin. The pregnant animals waste more rapidly, excrete less urine and less urea, develop less heat, are poorer in iron, and offer more marked alterations of structure than the others. W. D. H.

Iron in the Spleen during Pregnancy. By ALBERT CHARRIN (*Compt. rend.*, 1899, **128**, 1614—1615).—The determinations of iron in the spleen confirm the fact, previously recorded by others, that during pregnancy the iron diminishes in that organ, and passes to the fœtus. Microchemical examination confirms this result.

W. D. H.

Influence of the Grape Cure on Human Metabolism. By B. LAQUER (*Chem. Centr.*, 1899, i, 893; from *Centr. inn. Med.*, **20**, 193—203).—During the grape cure, there is proteid-sparing, and in consequence, a putting on of proteid. The aromatic substances contained in grapes which are not too sour produce a lessening of uric acid, and cause it to be separated in a relatively soluble form; this depends on the relationship between the mono- and di-sodium phosphates. Hippuric acid is not markedly influenced, Large quantities (4—5 pounds) of grape juice increase proteid putrefaction, and cause a rise in the ethereal hydrogen sulphates of the urine. W. D. H.

Metabolism in Inanition. By FRIEDRICH N. SCHULZ (*Pflüger's Archiv*, 1899, **76**, 379—410).—During inanition, or when the nutriment given is insufficient, as when carbohydrate alone is given, there is, on the day or two preceding death, an increase in the nitrogen excreted in the urine. This rise, which has been noted by previous observers, is usually accompanied with albuminuria; the nitrogen of the albumin is not, however, sufficient to account for the total increase of nitrogen, but it probably is an indication of the breakdown of the kidney cells. The experiments recorded on rabbits and dogs show that this ante-mortem rise of nitrogen is not a criterion that the animal has reached an absolute minimum of fat, although probably the fat which is left is, in the condition of the animal, not capable of proper utilisation. W. D. H.

Metabolic Experiments with Proteids containing, or not containing, Phosphorus. By H. Zadik (*Pflüger's Archiv*, 1899, **77**, 1—21).—Experiments were carried out on dogs, and the course of their metabolism followed when a proteid containing phosphorus (casein) was given; this was compared with what occurs when a phosphorus-free proteid (edestin) was administered. The animals receiving casein showed that they are able to absorb and assimilate the organic phosphorus, but that the living cells are not able to manufacture phosphorus-holding materials from inorganic phosphates and proteids which are free from phosphorus.

In a further comparison of the two phosphorus-holding proteids, vitellin and casein, it was found that the nitrogenous balance during the administration of the former is the more favourable. W. D. H.

The Course of Peptic Proteolysis Examined Quantitatively. By E. Zunz (*Zeit. physiol. Chem.*, 1899, **28**, 132—173. Compare this vol., ii, 504).—Artificial gastric digestion experiments were carried out with purified proteids such as crystallised egg-albumin and serum-albumin. The digestion was stopped at varying intervals, and the products separated by fractional precipitation with zinc sulphate. The results represented in curves show much the same course in all cases; as the primary products disappear, the secondary products increase. The primary products are acid-albumin, proto- and hetero-proteose, and deutero-proteose *B*. The secondary products are the remaining deutero-proteoses, peptone, and a number of unknown substances which do not give the biuret reaction, as well as ammonia and amido-substances. A portion of these unknown substances must be regarded as primary products. W. D. H.

Metabolism in the Submaxillary Gland. By Yandell Henderson (*Amer. J. Physiol.*, 1899, **3**, 19—25).—In the submaxillary gland, proteid metabolism is more or less distinct from the processes of combustion and liberation of energy; this accords with Heidenbain's hypothesis that the elimination of water and salts, and that of the organic constituents of saliva, are controlled by different mechanisms. On the one hand, in proteid metabolism controlled by *trophic* nerve-fibres, anabolism occurs coincidentally with katabolism, for the nitrogen in the saliva is greater than that lost by the active gland; the gland tends to remain in nitrogenous equilibrium. On the other hand, the processes controlled by the *secretory* nerve-fibres are apparently performed at the expense of a combustion of carbonaceous material stored within the cells during rest, to become the source of heat and secretory work. W. D. H.

Influence of the Removal of the Large Intestine on Metabolism in Dogs. By Vaughan Harley (*Proc. Roy. Soc.*, 1898—1899, **64**, 77—88; 255—307).—In normal dogs, an increase of fat in the food leads to a decrease of urine and urinary nitrogen. After partial removal of the large intestine, the results are similar, except that the fæces are not so greatly increased. Total removal of the large intestine leads to the same effect on the urine, but the nitrogen and fat in the fæces are not influenced; the water in the fæces rises.

Removal of the large intestine does not affect the absorption of carbohydrates, or the breaking up and absorption of fat; but the absorption of proteids is lessened by about 10 per cent. In these animals, large quantities of bile pigment with little or no urobilin are found in the fæces. The alkaline sulphates of the urine are diminished by an increase of fat in the food, but the ethereal hydrogen sulphates are not affected; the same is true for normal dogs. The secretion of the large intestine contains proteids, fats, and salts, but no pigment; the small intestine secretes pigment. W. D. H.

Intestinal Absorption. By E. Waymouth Reid (*Proc. Roy. Soc.*, 1899, **65**, 94—95).—The physiological activity of the intestinal epithelium in absorption is demonstrated by the absorption by an animal of its own serum or plasma under conditions in which filtration, osmosis, and adsorption are excluded; and by the cessation or lessening of the absorption when the epithelium is removed or injured, in spite of the fact that facilities for osmosis and filtration are thereby increased. The chief factor in the absorption of peptone is assimilation (or adsorption) by the cells, whereas in the absorption of sugar, diffusion, variable by the permeability of the cells (and so probably related to their physiological condition), is the main factor. Alcohol stimulates the cells, bile does not. Details are added which show differences in different parts of the intestinal canal. The cells take up organic solids most slowly, then water, then inorganic salts. W. D. H.

Absorption of Iodine Oils. By Robert Rösel (*Pflüger's Archiv*, 1899, **77**, 22—25).—Experiments on human beings show that the iodine of iodised fats is more quickly absorbed than is the iodine from inorganic compounds. In 51—58 hours, from 43 to 79 per cent. of the iodine was recovered in the urine. W. D. H.

Artificial Nutrition of a Normal and of an Atrophic Infant. By Max Rubner and Otto Heubner (*Zeit. Biol.*, 1899, **38**, 315—398).—A lengthy and detailed account of the metabolism and heat formation in two infants brought up by hand; one child was healthy, the other atrophic and feeble. The points of difference are numerous, as would be expected. W. D. H.

Formation of Fat from Proteid in the Cat. By Max Cremer (*Zeit. Biol.*, 1899, **38**, 309—314).—By feeding cats on flesh free from fat and glycogen, carbon is put on in too large a quantity to be accounted for as glycogen. The opinion that it is present as fat is defended in view of Pflüger's criticisms on this point. W. D. H.

The Source of Fœtal Fat. I. By Martin Thiemich (*Chem. Centr.*, 1899, 939; from *Centr. Physiol.*, **12**, 850—852).—The fat of new born children differs considerably in composition. In order to see whether this is due to the mother's diet, one dog during the pregnant period was given a cocoa fat with low iodine number (8), and another linseed oil (iodine number, 120). There was, however, no difference in the composition of the fat of the fœtuses.

W. D. H.

Formation of Sugar in Animals. By **Maneo Kumagawa** and **Rentaro Miura** (*Chem. Centr.*, 1899, i, 299; from *His-Engelmann's Archiv. Physiol. Abth.*, 1898, 431—450).—In starving dogs, injection of phloridzin leads to glycosuria, although such animals had no glycogen and but little fat in their bodies; the sugar must arise from proteid. In another animal, which was fat, the same result followed the injection. The amount of sugar stands in constant relation to the amount of proteid metabolism. W. D. H.

Formation of Sugar from Proteid. By **Rudolf Cohn** (*Zeit. Physiol. Chem.*, 1899, **28**, 211—218).—It is known that aspartic acid and glycocine, when given to animals, increase the amount of liver glycogen; the present experiments on rabbits show that the same is true for leucine. Now leucine is the largest product of proteid decomposition (50 per cent. in the case of casein). It is regarded as probable that leucine is the source of sugar from proteid. A comparison of the formulæ of leucine, $CH_3 \cdot [CH_2]_3 \cdot CH(NH_2) \cdot COOH$, and dextrose, $OH \cdot CH_2 \cdot [CH(OH)]_3 \cdot CH(OH) \cdot COH$ shows this to be by no means impossible. No complicated synthesis is involved; oxidation, splitting off of the amido-group, and reduction are all that are necessary. The fact that leucine leads to glycogen formation lends support to this view. W. D. H.

Fibrin Formation. By **Olof Hammarsten** (*Zeit. physiol. Chem.*, 1899, **28**, 98—114. Compare Abstr., 1897, ii, 152).—By means of repeated precipitations, fibrinogen was obtained almost free from calcium (0·006 per cent.). Ferment solutions were prepared from oxalated plasma which contained only 0·00004 to 0·0007 per cent. of calcium. On mixing the two solutions, typical fibrin was formed which contained only 0·006 per cent. of calcium, or in some cases even less. Fibrin is therefore not a calcium compound of fibrinogen. The small amount of calcium present must be regarded as an impurity, for if it were in chemical combination the molecular weight of fibrin must be greater than 800,000, or fifty times greater than that of oxyhæmoglobin. Quantitative experiments on the relationship of fibrin and fibrinogen showed that from 63 to 83 per cent. of the fibrinogen appeared as fibrin. In some of these experiments, calcium chloride was added, in others not; the difference in the amount of fibrin formed is always insignificant; if only a small amount of the calcium salt is added, fibrin formation is rather more rapid; if the amount of calcium salt is increased, the amount of fibrin formed is slightly diminished; in other words, it acts like other neutral salts.

The formation of fibrin from fibrinogen is usually regarded as a process of hydrolysis, the fibrinogen splitting into fibrin and fibrinoglobulin. Schmiedeberg's equation (*Arch. exp. Path. Pharm.*, **39**) for this would require that only 48—49 per cent. of the fibrinogen should appear as fibrin. The difference between the elementary composition of fibrin, fibrinogen, and fibrino-globulin is so slight as to suggest that the process is not necessarily one of hydrolysis at all. It may be that it is simply a matter of intramolecular rearrangement, varying quantities of the altered fibrinogen reappear as fibrin, and part remains in solution as fibrino-globulin. Possibly casein formation is similar.

W. D. H.

Origin of Fibrinogen. By ALBERT MATHEWS (*Amer. J. Physiol.*, 1899, **3**, 53—85).—The experiments recorded are believed to support the conclusion that the fibrinogen of the blood originates from the decomposing leucocytes, especially of the intestinal area. Fibrinogen increases when the number of leucocytes increases; after removal of the intestine, there is little or no renewal of the fibrinogen if the animal's normal blood has been previously replaced by defibrinated blood. This is not so when organs other than the intestine are removed. W. D. H.

Formation of 3-Methylxanthine from Caffeine in the Animal Organism. By MANFREDI ALBANESE (*Ber.*, 1899, **32**, 2280—2282. Compare Abstr., 1896, ii, 319, 492).—The change which caffeine undergoes on passing through the animal organism is somewhat different from that suffered by theobromine, which by dogs and rabbits is transformed into 7-methylxanthine (heteroxanthine). In dogs, caffeine is changed into 3-methylxanthine; in rabbits, into xanthine, and in man into dimethylxanthine, the latter being probably the 1 : 3-derivative. J. F. T.

Glycocine. By KARL SPIRO (*Zeit. physiol. Chem.*, 1899, **28**, 174—189).—Glycocine is obtained among the amido-acids which are decomposition products of many true proteids, and not only from albuminoids like gelatin. If this occurs also in the body, glycocine must be regarded as one of the precursors of urea. W. D. H.

The Melanin of the Eyeball. By HANS LANDOLT (*Zeit. physiol. Chem.*, 1899, **28**, 192—210).—The pigment granules of the retina have no stroma; the elementary composition of the pigment is C, 54·56; H, 5·34; N, 12·7; O, 27·4 per cent. The ratio C : N = 5 : 1. By the action of acids and alkalis, the composition changes, the carbon percentage rising, the nitrogen falling. Many previous observers have attempted to separate the pigment by a method involving gastric digestion; this accounts for the higher C : N ratio they have obtained. The end product of the action of boiling with acid, or of fusing with alkali, has a composition in which C : N = 13 : 2. By fusing with alkali, indole, ammonia, and volatile fatty acids are given off. By the action of acid, an aromatic complex giving Millon's reaction is formed. Although there is a probable relation between the pigment and proteid matter, the experiments given do not bear witness to any intimate relationship between the pigment and hæmoglobin or hæmatin. W. D. H.

"**Crystalline Fibrin.**" By S. DZIERZGOWSKI (*Zeit. physiol. Chem.*, 1899, **28**, 65—72).—Maillard (this vol., i, 466) has described a crystalline deposit which occurs in phenolised blood serum (ox and horse) when it is allowed to stand; he termed it crystalline fibrin.

The deposit, however, is partly amorphous; and by means of suitable solvents can be separated into four constituents; (1) calcium salts of the higher fatty acids; (2) compounds of these acids with glycerol and cholesterol; (3) proteid matter which is digestible by gastric and pancreatic juices; (4) nuclein. It is the two first upon which the crystalline character of the deposit depends. W. D. H.

Uric Acid in Mammals. By Oskar Minkowski (*Chem. Centr.*, 1899, i, 212—213; from *Arch. exp. Path. Pharm.*, **41**, 375—420).—Uric acid is synthetically formed in the liver of birds; the question investigated is whether mammals have a similar synthesising power. It was found, however, that after administration of large quantities of urea and ammonium sarcolactate, or allantoin, there is in dogs no rise in the amount of uric acid secreted.

Feeding on calves' thymus or nuclein from the salmon leads to a rise of the uric acid in the urine; but the nuclein bases do not act in this way. W. D. H.

Uric Acid Infarcts in New Born Children. By H. Spiegelberg (*Chem. Centr.*, 1899, 211—212; from *Arch. exp. Path. Pharm.*, **41**, 428—438).—The kidneys of children who die during the first weeks of life, show, as a rule, a deposit of urate crystals, the so-called uric acid infarcts. Experiments on dogs show that the adult organism is able to decompose far more uric acid than the young animal. After subcutaneous injection of uric acid in new-born animals, typical infarcts are formed. This relationship of the young animal to uric acid is something quite special. With other substances, there is no evidence of diminished power of oxidation. W. D. H.

Xanthine Bases in the Suprarenals. By Johann Okerblom (*Zeit. physiol. Chem.*, 1899, **28**, 60—64).—From 1·8 kilos. of fresh suprarenals, only 0·5 gram of xanthine bases was obtained; the principal base present is xanthine; then follow 1-methylxanthine, hypoxanthine, epiguanine, and adenine. W. D. H.

Oxidising Ferment of the Liver. By Martin Jacoby (*Virchow's Archiv*, 1899, **157**, 235—280).—The oxidising ferment of the liver resists to some extent the action of alcohol; small quantities of chloroform increase its activity, but in larger quantities of this reagent the activity of the ferment, as tested by the action of the minced organ on salicylaldehyde, is destroyed. The addition of small quantities of alkali furthers, but of larger quantities (beyond 0·3 per cent. of sodium hydroxide) destroys, its activity. Very small quantities of hydrochloric acid do not lessen its action, but when the concentration reaches 0·1 per cent., only traces of salicylaldehyde are oxidised. A temperature of 75° does not completely destroy the ferment, but one of 100° does so. Various substances were subjected to the action of the minced liver in order to see which of them were oxidised; no oxidising action was observed on sodium thiosulphate, sodium acetate, stearic, or palmitic acids. Sugar is not formed from these fatty acids. Uric acid also is not destroyed by calves' liver; but with dogs' liver there is some indication of oxidising action. In diabetes, the oxidising action of the liver is normal. The glycolytic ferment is not identical with the oxidising ferment; the former is destroyed at the comparatively low temperature of 58°, and is differently affected by chemical reagents as compared with the latter. Glycolysis appears to be a function of the cells. The liver is able to oxidise small quantities of arabinose. The change of glycogen into sugar does not appear to be due to the oxidising ferment. Oxidations in the body fall under three main headings: (1) those which are not fermentative; (2) those brought about by cells; and (3) those produced by oxidases in the body-juices. W. D. H.

Thyroid Gland. By Ernst Roos (*Zeit. physiol. Chem.*, 1899, **28**, 40—59).—A large number of estimations of the iodine in the thyroids of different animals are given. As a rule, this element is more abundant in the vegetable feeders; but it is sometimes absent even among these.

Renewed researches confirm the author's previous statements that the main active substance is iodothyrin. No actual observations are recorded on myxœdema, but other diseased conditions were observed, and experiments made on metabolism. W. D. H.

Physiology of the Iodine-containing Substance of the Thyroid Gland. By F. Blum (*Pfluger's Archiv*, 1899, **77**, 70—106). —Fresh experiments are recorded to confirm the author's previous conclusions (this vol., ii, 115) that the thyroid is an excretory organ removing poisonous substances from the blood, and that the iodine found there originates in this way. Iodothyrin is regarded as an artificial product; the iodine of the thyroid is in combination with proteid; the proteid is not fully saturated with iodine, and the amount of iodine per cent. varies considerably. The proteid itself belongs to the toxalbumins. Ostwald's thyreoglobulin, obtained by half-saturation with ammonium sulphate, is not a single substance. The thyroid gland is not to be regarded as an organ pouring a useful internal secretion into the circulation; the lymph leaving it, and the lymphatic glands in its vicinity do not contain iodine; and the blood and central nervous system in healthy animals are also free from iodine. Removal of the thyroid is followed by disease and death, because the organ which removes poisonous substances from the blood can no longer protect the animal. It is the central nervous system which principally suffers, and by Nissl's method great changes (chromatolysis) can be demonstrated in the ganglion cells. The thyroid therefore appears to be the great protective organ to the central nervous system. The poisonous substances are destroyed by oxidation, and this appears to be assisted by combination with iodine. W. D. H.

Coagulating Action of the Liquid of the External Prostate of the Hedgehog on the Contents of the Vesiculæ Seminales. By L. Camus and Eugène Gley (*Compt. rend.*, 1899, **128**, 1417—1419). —The prostatic liquid of several rodents coagulates the contents of their vesiculæ seminales. In the hedgehog, one of the Insectivora, there is a substance of the same order. This animal possesses a gland which appears to be an accessory prostate, and is termed the external prostate; its secretion, which is very alkaline, contains a ferment termed *vesiculase*, which causes a flocculent clot in the secretion (*vesiculin*) of the vesiculæ seminales. Its activity is destroyed at 69°. It does not act on the vesiculin of the guinea-pig, or *vice versâ*.

W. D. H.

Agglutination produced by the Albuminous Gland of Helix Pomatia. By L. Camus (*Compt. rend.*, 1899, **129**, 233—234).—An aqueous or saline extract of the albuminous gland of the snail, *Helix pomatia*, possesses the power of causing agglutination of milk globules and of blood corpuscles. W. D. H.

A Substance in the Blood which prevents the Action of Rennet on Milk. By A. Briot (*Compt. rend.*, 1899, **128**, 1359—1361). By L. Camus and Eugène Gley (*ibid.*, 1416—1417).—The blood serum of the horse and other animals contains a substance which is capable of neutralising the effects of a certain quantity of rennet. It does not dialyse, is destroyed by heat, and is precipitable by alcohol and by ammonium sulphate. On these grounds, it is believed to be an enzyme. Egg-white has the same power. The anti-rennet action of the serum of an animal can be augmented by repeated injections of rennet subcutaneously.

Camus and Gley point out that they have previously described the anti-rennet action of serum, and that serum also acts counter to pepsin and trypsin. W. D. H.

Composition of Cerebro-spinal Fluid. By Guerbet (*J. Pharm.*, 1899, [vi], **10**, 59—61. Compare Abstr., 1898, ii, 36).—The reducing substance present in cerebro-spinal fluid is not precipitated by lead acetate, and its solution is not darkened by alkalis or coloured by ferric chloride. The author concludes that it is not catechol, nor can it be glucose, since its solution is without action on polarised light, and gives no precipitate with phenylhydrazine acetate. Unsuccessful attempts were made to isolate the reducing substance.

H. R. Le S.

Fate of Cholesterol in the Animal Organism. By Vincenz Humnicki (*Chem. Centr.*, 1899, i, 369; from *Dissert. Freiburg*, 1898).—In the human body, chloresterol is discharged in the fæces as coprosterol. Particulars are given of the crystalline form, melting point, &c., of compounds of this substance with acetyl, propionyl, benzoyl, and other radicles.

Coprosterol was not obtained by the putrefaction of cholesterol *in vitro*. In dogs, cholesterol is contained in the fæces as such. In horses, a different reduction product, hippocoprosterol, was obtained; but its formula was not determined; it crystallises in short needles, and melts at 74—75°. W. D. H.

Excretion of Uric Acid. By Schreiber and Waldvogel (*Chem. Centr.*, 1899, i, 849; from *Arch. exp. Path. Pharm.*, **42**, 69—82).—Two students fasted for three days. At the beginning of the research, they passed daily 0·477 and 0·718 gram of uric acid respectively, and on the third day 0·197 and 0·205 gram. The amount of uric acid does not run parallel to the total nitrogen or to the acidity of the urine; it does not disappear with vegetable diet. Animal food causes a rise in the xanthine bases, but not in the uric acid excreted, whilst salicylic acid causes a rise in both. W. D. H.

Action of Hydrogen Peroxide on Urine. Origin of Acetone. By S. Cotton (*J. Pharm.*, 1899, [vi], **10**, 193—200).—Acetone is present in all animal liquid secretions, and in urine more than in any other; it is also present in the breath. Besides acetone, normal urine may also contain other ketones which give the iodoform reaction. Acetone is produced from nearly all organic compounds when they are heated with hydrogen peroxide. Citric acid, tartaric acid, glycerol, and the sugars give a large amount of acetone; the oils and fats give a small amount of acetone but much acraldehyde, and the proteids give a large amount of acetone and benzaldehyde.

H. R. Le S.

Action of Mineral Substances and Organic Acids on the Resistance of the Body to Disease. By Albert Charrin, Guillemonat, and Levaditi (*Compt. rend.*, 1899, **129**, 305—307. **Immunity and Specificity.** By Charles Bouchard (*ibid.*, 308—311).—During several weeks, rabbits received every day or two subcutaneous injections of increasing quantities of a saline solution containing sodium sulphate, phosphate and chloride, and potassium phosphate. Other rabbits received injections of organic acids like lactic, oxalic, and citric. The diet throughout was constant. Finally, they were inoculated with cultures of *Bacillus pyocyaneus*. The 'acid animals' died more quickly and the 'saline animals' lived much longer than normal animals; *post mortem*, the bone marrow of the saline animals was found to be hypertrophied, and had lost some of its fat.

Bouchard points out that these results confirm his theories of immunity. W. D. H.

Orthamidophenetidine [Relation of Constitution and Physiological Action]. By Georg Cohn (*Ber.*, 1899, **32**, 2239—2243).—See this vol., i, 944.

Effect of Inorganic Solutions, and Solutions containing Serum-albumin on the Frog's Heart. By E. C. Walden (*Amer. J. Physiol.*, 1899, **3**, 123—133).—If a heart is stopped by irrigation with normal saline solution, Ringer's solution sets it going again, and if this brings it, as it will in many hours, to a standstill, increase of the calcium in the fluid once more causes recovery. Blood serum, or milk, has little or no effect in this direction. Experiments with pure serum-albumin show that it has none of the special nutritive value in connection with the heart which has been attributed to it by Kronecker. W. D. H.

Behaviour of Salol and Distearyl Salicyl Glyceride in the Organism. By Vincenz Humnicki (*Chem. Centr.*, 1899, i, 369; from *Dissert. Freiburg*, 1898).—After taking salol, the separation of salicylic acid in the urine occurs more slowly than after taking salicylic acid. Distearyl salicyl glyceride, in contradistinction to trisalicyl glyceride, is almost completely absorbed. The passage of salicylic acid into the urine takes place more slowly after taking salol than after the administration of sodium salicylate. W. D. H.

Physiological Action of Choline and Neurine. By Frederick W. Mott and William D. Halliburton (*Proc. Roy. Soc.*, 1899, **65**, 91—94; *Phil. Trans.*, 1899, **191**, B, 211—267. Compare Abstr., 1897, ii, 222; 1898, ii, 242; this vol., ii, 315).—A full account of a research of which preliminary communications have already been made.

W. D. H.

Physiological Effects of Extracts of the Pituitary Body. By Edward Albert Schäfer and Swale Vincent (*J. Physiol.*, 1899, **25**, 87—97. Compare this vol., ii, 441).—Extracts of the infundibular (not the hypophysal) part of the pituitary body contain two substances, one of which, when injected intravenously, produces a rise, the other a fall, of blood pressure. The rise is partly of cardiac origin, and is partly due to constriction of the peripheral vessels. After atropine, the rise is enormous; it differs from that produced by suprarenal extract in that a second dose given soon after the first fails to produce any effect. This allows the second substance to have full play, and the fall of blood pressure may be obtained any number of times with successive doses. The subcutaneous injection of the extracts in small mammals causes paralytic symptoms, similar to those obtained by injecting suprarenal extracts.

The characteristic effects produced by extracts of the infundibular body are probably not due to the grey, nervous matter of which it is largely composed. The substance which produces the fall of blood pressure is not choline, although like it at first sight. After a small dose of atropine, the action of the infundibular depressor substance is unaffected, whereas that of choline is abolished, or even a rise of blood pressure produced. The chemical nature of neither of the active substances was made out; they are not destroyed by boiling, and are dialysable; they are not proteid in nature; the depressor substance is soluble in salt solution, in absolute alcohol, and in ether; the pressor substance is soluble in salt solution, but not in absolute alcohol or in ether. W. D. H.

The Relation of the Toxin and Anti-Toxin of Snake Venom. By Charles James Martin (*Proc. Roy. Soc.*, 1898—1899, **64**, 88—94. Compare this vol., ii, 234).—This is a record of fresh experiments to support the previous conclusions of the author that the reaction of toxin and anti-toxin is a chemical one. About the same quantity of anti-venen necessary to neutralise the venom *in vitro* is capable of doing so when the former is injected into the blood stream and the latter subcutaneously. In fact, the two can be accurately titrated against one another with the life of a rabbit as indicator. Fraser's statement is, however, confirmed that at least ten to twenty times the amount of anti-venen is necessary if both it and the venom are injected subcutaneously. In other words, anti-venen is slowly absorbed from the subcutaneous spaces; this is owing to the large size of its molecules. In snake bite, therefore, the curative serum should be injected intravenously. W. D. H.

Echidnase. By C. Phisalix (*Compt. rend.*, 1899, **129**, 115—117).—The experiments recorded are considered to show that a ferment (echidnase) in the venom of vipers exercises a digestive action, not only on the tissues of the animals inoculated, but also on the active principle (echidno-toxin) of the venom. This is supposed to be an internal cause of the destruction of the poison, which aids various external forces (oxygen, light, heat, electricity) that act in the same way. W. D. H.

Immunity of certain Animals to the Poisonous Action of Eel's Serum. By L. Camus and Eugène Gley (*Compt. rend.*, 1899, **129**, 231—233).—The frog, toad, fowl, pigeon, and other animals resist the toxic action of eel's serum. This is not due to any material in the blood-plasma (*humoral* immunity) but to a special cellular organisation giving to the red corpuscles a specific resistance. This is termed *cytological* immunity. W. D. H.

Phosphorus Poisoning and Phloridzin Diabetes. By W. E. Ray, T. S. McDermott, and Graham Lusk (*Amer. J. Physiol.*, 1899, **3**, 139—155).—In dogs diabetic with phloridzin, phosphorus poisoning does not materially increase the proteid metabolism nor change the excretion of sugar. In dogs poisoned with phosphorus, phloridzin causes the usual sweeping out of the body sugars; then the establishment of the ratio in the urine of dextrose to nitrogen of 3·75 to 1. It causes further an increase of proteid metabolism, and the urine, from being ammoniacal, becomes acid. In one animal, tyrosine crystals were excreted temporarily. The vomit in phloridzin diabetes does not contain sugar. Six minutes after the subcutaneous injection of phloridzin, sugar may be detected in the urine. *Post mortem* after phloridzin diabetes, much fat is found in liver, kidneys, heart muscle, and voluntary muscle. After both phloridzin and phosphorus, the same is found, *plus* fragmentation of the liver nuclei. After phosphorus alone, fat is found in the liver, and in the kidney (slightly), but none in muscle; there is fragmentation of the liver nuclei.

The following general explanation is offered for phloridzin poisoning: the high proteid decomposition is due to the non-burning of the carbohydrate-like radicle of the proteid molecule. In phosphorus poisoning, the high proteid decomposition is due to the conversion of this radicle into leucine, tyrosine, and fat (fatty *degeneration* in Virchow's sense); wherever the sugar from proteid is not burned, pathologically hungry cells are found, which attract fat to themselves in larger quantities than can be utilised (fatty *infiltration*). Infiltration takes place generally in the tissues in phloridzin diabetes; infiltration and degeneration take place in phosphorus poisoning, especially in the liver. W. D. H.

Chemistry of Vegetable Physiology and Agriculture.

Artificially increasing the Quantity of Zymase in Yeast. By Robert Albert (*Ber.*, 1899, **32**, 2372—2374).—When yeast, which, under treatment by Buchner and Rapp's method (Abstr., 1898, ii, 127), yields an aqueous extract of feeble activity, is allowed to ferment a solution of cane-sugar, dipotassium phosphate, and magnesium sulphate to which hop-infusion has been added, it is found that the extract subsequently obtained from the yeast possesses considerably increased fermenting power. An extract prepared from the yeast when most actively fermenting the nutrient solution contains less zymase than at any other time; when the fermentation is complete, the proportion of zymase present is a maximum, and is not increased either by lowering the temperature during nutrition or by leaving the yeast in contact with the nutrient medium for a longer period, although rendered greater by increasing the amount of cane sugar originally present in the latter. W. A. D.

Variations in the Production of Glycerol in the Alcoholic Fermentation of Sugar. By J. B. VINCENT LABORDE (*Compt. rend.*, 1899, **129**, 344—347).—The fermentation of grape juice by different yeasts yields proportions of glycerol varying from 2·5 to 7·75 per 100 grams of sugar, according to the nature of the yeast, the highest quantity being obtained with Sauterne yeast and with a Martinique yeast from the fermentation of sugar-cane syrup. The feebler the activity of the yeast, or the less favourable the conditions with respect to active fermentation, the higher the proportion of glycerol formed. An increase in the proportion of sugar increases the proportion of glycerol, and increased acidity has a similar effect. If all the natural acid exceeding 1 per cent. is carefully neutralised, the variations in the proportion of glycerol become very small. Increased temperature promotes the formation of glycerol. With the same sugar and the same yeast, the proportion of glycerol is highest in the early stages of fermentation and diminishes as the change proceeds, because alcohol tends to prevent the formation of glycerol.

The proportion of glycerol is affected by the nature of the sugar as well as by the nature of the yeast, and different sugars may, from this point of view, arrange themselves in different orders with different yeasts.

The high proportion of glycerol found in special wines such as Sauternes is in part due to the action of *Botrytis cinerea* on the must before fermentation. C. H. B.

Fermentation of Barbary Figs. By ROLANTS (*Ann. Agron.*, 1899, **25**, 395—396; from *Ann. Inst. Pasteur*, **13**, 152).—Indian or Barbary figs (*Cactus opuntia*) contain the following amounts of constituents per cent.: water, 84·65; sugar, 10·00; pectic substances, 1·573; extractive substances, 2·614; ash, 1·057. The acidity (as sulphuric acid) is 0·036.

The chief difficulty in utilising figs for obtaining alcohol is the presence of pectic substances, which, however, are rendered insoluble by heating for 20 minutes at 120°. The yield of alcohol is 41 litres from 1000 kilos. of fruit. The alcohol is of good quality and contains aromatic etheric salts of agreeable odour which can be readily removed by rectification. N. H. J. M.

Acetic Acid Bacteria. By D. P. HOYER (*Chem. Centr.*, 1899, i, 854; from *Arch. Néerl. Sci.*, [ii], **2**, 191—240).—*Bacterium aceti* and *B. xylinum* differ from *B. rancens* and *B. pasteurianum* in their power of inverting sugar. Malic and citric acids and their salts induce fundamental changes in the form of the bacteria of beer vinegar. Acetic acid bacteria live in absence of air, and under this condition reduce indigotin, methylene-blue, and litmus. The development of the bacteria is accompanied by elimination of carbonic anhydride. As sources of nitrogen, they can utilise peptone, asparagine, nitrites, and ammonium salts, whilst acetic acid, sodium acetate, potassium lactate (and for *B. aceti* and *B. xylinum* also cane-sugar) serve as sources of carbon. The nature of the carbonaceous food determines the assimilability of certain nitrogenous substances, and *vice versâ*. A distinction is made between the substances essential for the growth of the cells ("genetic") and others ("zymotic") such as lactic, succinic, malic, and gluconic acids, and calcium lactate, acetate, and propionate. Tartaric acid is not attacked. Less than 4 per cent. of alcohol has no effect on the growth of the bacteria; a larger amount hinders, and about 9 per cent. stops their development. Acetic acid hinders the growth.

N. H. J. M.

Nitragin and the Nodules of Leguminous Plants. By Maria Dawson (*Proc. Roy. Soc.*, 1898, **64**, 167—168).—The parasitic nature of both the filaments and the bacteroids in root nodules is confirmed. The infection tubes and the filaments in the cells consist of straight rodlets imbedded in a colourless matrix which does not consist of cellulose, chitin, or any form of slime. When the rodlets are liberated by the bursting of the filaments, they become transformed into X-, V-, and Y-shaped bacteroids. This change of form does not occur outside the plant on solid media, but takes place in liquid pea extract. It is uncertain whether the change in form is due to branching or to fusion of two or more individuals. Their multiplication by division would indicate that the organisms are members of the *Schizomycetes*. The bacteroids seem to be incapable of further growth. They are aërobic.

Nitragin consists of minute, micrococcus-like bodies all straight and immobile. Crossing of kinds supplied for different genera and species is successful within the tribe of *Vicieæ*. Infection of quite young radicles is tolerably certain, and of older roots when the condition under which they germinated is maintained. The accumulation of carbonic anhydride round the roots is not the cause of failure in direct infection.

Application of nitragin to soils rich in nitrates seems to be inadvisable; when nitrates are deficient, its application results in an increased yield, but the addition of nitrates instead of nitragin gives still better results. N. H. J. M.

Respiration of Mould Fungi in different Nutritive Solutions. By Konstantin A. Puriewitsch (*Chem. Centr.*, 1899, i, 1251, from *Ber. deut. botan-Ges.*, **16**, 290, and *Centr. Bakt. Par.* [ii], **5**, 223—224). —The results of experiments in which *Aspergillus niger* was cultivated in solutions containing dextrose, saccharose, mannitol, and tartaric acid showed that the quotient CO_2/O_2 rises with the concentration of the solution up to a certain point, and then falls again.

N. H. J. M.

Action of some Poisons on Yeast and on Fermentation. By Carl Wehmer (*Chem. Zeit.*, 1899, **23**, 163—165).—The want of agreement in the results of experiments hitherto made on the effect of poisons on yeast is attributed to the amount of yeast employed not being taken sufficiently into account. In the experiments now described, the amounts of yeast were the same in each case, and also the amounts of wort.

With 5 grams of yeast and 50 c.c. of wort, 1 gram of potassium and sodium arsenite had in 80 hours no effect, whilst formalin (0·5 c.c. = 0·2 c.c. formaldehyde), chloroform (0·5 c.c.), mercuric chloride (0·25 gram), and benzoic acid (0·5 gram) almost completely checked fermentation. Even 10 per cent. of potassium arsenite did not entirely suppress fermentation. In absence of yeast, or with very little yeast, 1—2 per cent. of arsenite will prevent decomposition of wort for months.

Yeast which has ceased to be active after addition of arsenites, &c., is not necessarily dead. Alkali arsenites (1—2 per cent.) generally destroy yeast after 2—3 weeks, but had no appreciable effect in 3—4 days; with mercuric chloride (0·1—0·25 gram in 100 c.c.), most of the yeast cells were alive after 3 days, but were all killed in 5 days. Benzoic acid, which at once checked fermentation, required more than 1—2 weeks to destroy the yeast, whilst chloroform proved to be the least destructive. N. H. J. M.

Chemical Physiology of Ethereal Oils. By THOMAS BOKORNY (*Chem. Zeit.*, 1899, **23**, 60—61 and 75—76. Compare this vol., ii, 318).—Although ethereal oils probably play no part in plant assimilation, the author suggests that their function may be that of antiseptics. The action of the following substances, which occur in various ethereal oils on different minute organisms such as bacteria, moulds, &c., has been studied, and, with the single exception of saligenin, all have proved to have antiseptic properties. Eugenol, cinnamaldehyde, vanillin, salicylaldehyde, saligenin, benzaldehyde, piperonal, coumarin, borneol, carvacrol, thymol, oil of lavender, oil of turpentine, menthol, carvene, carvol.

Most of the substances were employed in 0·1 per cent. aqueous solution. J. J. S.

Antiseptic Action of Salicylaldehyde and Benzoic Anhydride. By ERNST SALKOWSKI (*Virchow's Archiv*, 1899, **157**, 416—424).—Bokorny has recently (this vol., ii, 318) called attention to the poisonous action of salicylaldehyde on fungi. The author has already pointed out the antiseptic action of this substance and of benzoic anhydride (*Centr. med. Wiss.*, 1887, No. 51); he now presents experiments which illustrate this action. W. D. H.

Action of Enzymes and Substances which kill Bacteria. By SACHAROFF (*Chem. Centr.*, 1899, i, 941—942; from *Centr. Bakt.*, *Par.*, [i], **25**, 346—350).—Iron nuclein can be separated from papayotin more readily by water and hydrogen peroxide than by water alone, and the filtrate is almost free from iron. Addition of ammonium or hydrogen sulphide to the liquid again induces the property of dissolving gelatin, owing, probably, to the presence of traces of iron-nuclein remaining even after repeated filtration. The checking of the dissolving action of papayotin is attributed, not to its destruction, but to the presence of hydrogen peroxide.

Oxidation in dead or living organisms and in blood is due to the presence of enzymes, and the iron-nuclein present in cell-protoplasm. Active iron-nucleins, the author terms bionucleins.

The author assumes that a bionuclein is present in diphtheria toxin. Toxoids (Ehrlich, *Deut. Med. Woch.*, **24**) are probably toxins which have lost their bionuclein through oxidation. N. H. J. M.

Mutual Relations of the Decompositions of Albumin and of Respiration. By Dmitri N. Prianischnikoff (*Landw. Versuchs-Stat.*, 1899, **52**, 137—164. Compare Abstr., 1896, ii, 380).—Experiments on the germination of peas, lupins, and vetches in the dark showed that the maximum decomposition of proteids and the maximum production of asparagine took place at nearly the same period (about the 7th to 9th day), and some days earlier than the maximum elimination of carbonic anhydride. At the conclusion of the germinating period, the energy of accumulation of asparagine became greater than the rate of decomposition of proteids, asparagine being then produced from amido-acids, if the possibility of its production from newly-formed proteids (at a period when the conditions are favourable to destruction rather than formation of proteids) is not admitted. This involves the breaking up of two mols. of amido-acid, one of which must be oxidised in order to furnish the NH_2-group, the other only sufficiently oxidised to yield aspartic acid.

Whilst, according to Loew and Palladin, the decomposition of proteids is a process of oxidation, and according to E. Schulze a process of hydration, the author considers that both processes are successively involved: first a hydration of the proteid molecule, and subsequently oxidation with production of ammonia and also asparagine. This would be analogous to what takes place in the animal organism.

N. H. J. M.

Progress of Assimilation in Oats in the Field and in Pots. By Adam Karpinski (*Bied. Centr.*, 1899, **28**, 546—550; from *Zeit. landw. Versuchswesen Österr.*, 1898, i, 387).—Field experiments with oats were made at Dublany, in which four plots received (1) no manure, (2) Chili saltpetre, (3) Chili saltpetre applied at two different periods, and (4) ammonium sulphate. A similar set of experiments was made with the same soil in pots. Samples of the plants from both sets were taken at four successive periods of growth.

The results of the two series of experiments differed in several respects. The pot plants contained about half as much nitrogen again as those grown in the field, and were in every respect more strongly developed. This difference is attributed to the difference in the amounts of water at the disposal of the two sets of plants, and to the fact that there was no loss of soluble manure in the pots through leaching.

In the field, ammonium sulphate proved to be better than the nitrate, whilst in pots the nitrate was more effective. Phosphoric acid was taken up chiefly in the first two periods in the field experiments, whilst in the pots it was taken up in the third and fourth periods, although to a less extent than in the first and second.

The roots of both field and pot plants were found to be rich in nitrogen and phosphoric acid during the first period of growth. The roots of the pot plants were much richer in these constituents than those of the field plants, owing, perhaps, to the greater amount of water in the soil of the pots. N. H. J. M.

Influence of Light on the Growth of Clover. By AIMÉ PAGNOUL (*Ann. Agron.*, 1899, **25**, 353—356).—Incarnate clover was grown in pots, one pot being exposed to strong light, whilst the other was shaded. Under the influence of strong light, the growth was normal, but the plants screened from direct light developed very badly. The evaporation from both pots was determined during the whole period of growth (May 1 to June 7). At the conclusion, the following results were obtained:

	Evaporation. c.c.	Fresh produce. Grams.	Dry produce. Grams.	Nitric N. in dry produce. Per cent.
1. Plants in strong light......	3475	31·68	6·23	0·0
2. ,, shade	1715	4·54	0·40	0·001125

There was thus an accommodation of nitrates in the shaded plants which the plants were unable to reduce. At an earlier stage (May 11), the plants exposed to full light contained a small amount of nitric nitrogen (0·000035 per cent.), but this was completely used up during the next month. N. H. J. M.

Forms and Conditions under which Chlorine is usually taken up by Plants. By P. PICHARD (*Compt. rend.*, 1899, **128**, 615—617).—In most soils, chlorine is present in the form of sodium chloride, but in some calcareous and magnesia soils, which are common in Algeria, calcium and magnesium chlorides occur. The drainage from such soils is alkaline and contains sodium carbonate (*ibid.*, 1876).

Experiments are described in which tobacco was grown in artificial and in natural soils containing varying amounts of chlorides, in addition to nitrates; more or less potash was present in most cases. All the plants were found to contain some chlorine, and when the soil contained only a little sodium chloride, the whole of the chlorine was absorbed by the plants. Generally, the proportion of chlorine in the plants increases in the relation to the amount in the soil under conditions otherwise equal. Most, if not all, of the chlorine in the plants was in the form of potassium chloride; an increase in the amount of potash in the soil induces increased absorption of chlorine by the plants. Tobacco leaves may contain as much as 11·23 per cent. of potassium chloride.

Sodium chloride occurs only exceptionally in tobacco, and only when the soil contains as much as 0·1 per cent.; the sodium in tobacco occurs only in the form of chloride. It is concluded that, in contact with roots, sodium chloride decomposes potassium salts, with production of potassium chloride, which is retained by the plants, whilst the newly-formed sodium salts are returned to the soil.

It was previously shown that the nitric acid of the soil has a very marked tendency to penetrate into the tobacco plant as potassium salt, and to utilise potassium originally present in very insoluble forms, such as clay and various silicates (Abstr., 1895, ii, 60). The presence of chlorides in soil, and their tendency to be absorbed by plants, is antagonistic to the taking up of nitrates; and it is only owing to their predominance in the soil that nitrates can be absorbed. Diminution of the amount of nitrates in soil gives rise to increased absorption of chlorides. N. H. J. M.

The Rôle of Sodium in Plants. By M. STAHL-SCHRÖDER (*Chem. Centr.*, 1899, ii, 693; from *J. Landw.*, **47**, 49—84).—The results of field and pot experiments with oats showed that in presence of plenty of potassium, sodium is only taken up largely when in combination with some acid of which the plant requires considerable amounts, such as phosphoric and nitric acids. In accordance with Contejean's and Guitteau's results, it was found that the sodium remained mainly in the lower parts of the plants. Oats can assimilate large amounts of sodium without injury.

Further experiments with peas, oats, carrots, and buckwheat showed that sodium cannot replace the potassium necessary for the production of the organic matter of plants. The alleged economising of potash manures by soda is attributed to indirect action, only observed in the case of soils which contain plant food in sparingly soluble forms.

N. H. J. M.

Physiological Functions of Calcium Salts. By OSCAR LOEW (*Bied. Centr.*, 1899, **28**, 541—542; from *Bot. Centr.*, 1898, **74**, 257—265).—Calcium salts assist in the organisation of the cell-nucleus and chlorophyll substances by forming compounds of calcium with proteids. Whilst strontium salts are injurious to plants in absence of lime, a sufficient quantity of lime renders strontium almost harmless; analogous results were obtained with magnesium salts in the place of strontium salts. It is concluded that in absence of sufficient lime, the partial exchange of strontium or magnesium for calcium in the calcium-nuclein compounds of the nucleus results in local structural disturbances. If the functions of calcium were merely connected with metabolism, strontium might be expected to perform such functions equally well. The view that calcium is mainly of importance in precipitating oxalic acid is opposed to the fact that certain plants which require much lime are as free from oxalic acids as some other plants which require less lime. The importance of lime for chlorophyll substances is indicated by the fact that leaves are the organs which contain the most lime, that etiolated leaves contain less lime than green ones, and that the whole leaf suffers in absence of a sufficient supply of lime (compare Abstr., 1896, ii, 446).

N. H. J. M.

Spontaneous Asphyxia and Production of Alcohol in the Deep Tissues of Woody Stems growing under Normal Conditions. By HENRI DEVAUX (*Compt. rend.*, 1899, **128**, 1346—1349).—The internal atmosphere of woody stems frequently contains less than 10 per cent. of oxygen, whilst that of the deeper tissues must contain still less. On increasing the respiration by keeping stems at 35° for 3 days, the percentage amount of oxygen in the internal atmosphere was greatly reduced, in one case to as little as 0·22 per cent., in four cases to much less than 1 per cent., whilst with two other stems the amounts were reduced from 16·32 and 13·12 to 8·62 and 4·04 respectively.

The respiratory coefficient, CO_2/O_2, is usually constant and less than unity. In these experiments, with increased respiration, this coefficient was, with one exception, greater than unity, and in some cases much greater. These results indicate decomposition of the sugar of the living cells, and it was found that alcohol is, in fact, produced, both at the ordinary temperature and to a greater extent at 35°. N. H. J. M.

Formation, Storage, and Depletion of Carbohydrates in Monocotyledons. By John Parkin (*Proc. Roy. Soc.*, 1898, **64**, 122—123).—The investigation of about 70 species, belonging to the principal groups of monocotyledons, showed that the amount of starch, due to normal assimilation in the leaves, varies considerably in different genera. Relatively few produce much, and some none, but species from most of the principal families form some starch in their mesophyll.

On comparing the type of leaf, its position and age, some connection seems to exist with the storage or non-storage of temporary starch; broad leaves, those of aquatic monocotyledons and those working at higher temperatures in the summer, seem more liable to have starch than narrow radical leaves, leaves in dry situations and those of spring species. It was found that starch is developed in the young leaves of *Allium*, a genus long known not to form starch under ordinary conditions, so that the age of the leaf would also seem to affect the question.

Cane sugar was found to produce starch far better than any other sugar in pieces of leaves floated on the solution, invert sugar, glucose, and fructose following next in order, whilst maltose is almost useless.

Inulin is by no means uncommon in monocotyledons, and may coexist with starch in the same cell. It is not stored in aquatic species. Whilst ordinary inulin from *Helianthus* and other *Compositæ* dissolves at about 50°, inulin from *Scilla* dissolves readily in cold water, and inulin from *Galanthus* requires water at 80° for solution. N. H. J. M.

Darkening of Sugar Beet Juice. By Max Gonnermann (*Chem. Zeit.*, 1899, **23**, 213—215 and 240—242).—Albuminous compounds present in sugar beet are converted by the catalytic action of enzymes into tyrosine, and subsequently into dihydroxyphenylacetic acid, a substance which, when exposed to air, acquires a cherry-red colour or becomes black. No coloration takes place in absence of oxygen or in presence of mineral acids. Slight alkalinity at once produces the coloration.

The process takes place to a slight extent in leaf stems and in the roots; in cut roots and expressed juice, the rate of darkening increases as access of air is increased.

Dihydroxyphenylacetic acid can be detected after keeping fresh beet-root juice for a week in an atmosphere of hydrogen.

N. H. J. M.

Root Excretions. By Rudolf Kohn (*Landw. Versuchs.-Stat.*, 1899, **52**, 315—326).—On inserting acid roots in one arm (A) of a U-tube containing very dilute red litmus solution, it was found that the litmus in the other arm (B) soon became blue. The alkalinity could also be observed with very sensitive litmus paper when water alone, or water containing neutral manures, was employed. The action was more rapid in direct sunlight than in diffused light. In some cases, it was found possible by removing the root from (A) to (B) to reverse the colours. With some plants, the red colour in the arm containing the root extended to the end of the other arm. Plants with very slightly acid roots produced little or no alkalinity. Weeds were found to be more suitable than cultivated plants, as the latter generally died quickly.

The results are attributed to electrochemical action; and attention is called to the fact that roots, like electrodes, are able to withdraw the last traces of dissolved substances. N. H. J. M.

Production of Sugar in Beet. By Max Gonnermann (*Bied. Centr.*, 1899, **28**, 550—554; from *Bl. Zuckerrübenbau*, No. 20, 309, No. 21, 327)—The seeds of sugar beet do not contain saccharose; the first product of the decomposition of starch seems to be amidulin, after which monosaccharides are produced. The seeds contain an enzyme which is not diastatic. In leaves of eight day plants, neither saccharose nor amidulin could be detected, and the presence of starch was doubtful.

New leaves from old roots contained an inverting enzyme, but the extract had no diastatic effect on starch. Neither the roots nor the new growth of leaves contained lævulose.

Leaves of winter rye contain amidulin and glucose, but no starch. Young leaves of summer rye contain saccharose, but no amidulin, starch, or reducing sugar; the roots contain saccharose, but no amidulin, indicating that the starch is rapidly converted directly into saccharose by a ferment (which was isolated) in the seeds. Diastase is present in undeveloped barley grain. It is concluded that, speaking generally, all seeds contain ferments to decompose the starch, and that amidulin is first formed, and then glucose.

Sugar beet plants 14 days old contained a small amount of sugar in the roots; the leaves contained both an inverting and a diastatic enzyme, to which the production of amidulin in the leaves, and sugar in the roots are due. At a later stage, when the plant had eight leaves, the roots contained only saccharose, and no dextrose or starch; the leaves contained saccharose and reducing sugar, but no amidulin, and starch was only present on the upper sides of the leaves.

Bertrand's tyrosinase is one of the enzymes present in beet leaves and stems. The enzymes produce on the one hand the conversion of starch into amidulin, glucose, and saccharose, and, on the other hand, are the cause of the darkening of fresh beet juice.

It is proposed to designate the beet ferments, which differ from invertin of yeast, and the diastase of barley, beet-invertase, and beet diatase respectively. The author considers that he has established that sugar is only produced in beet by the intervention of enzymes.

N. H. J. M.

Physiological Importance of Furfuroids in Sugar Beet. By JULIUS STOKLASA (*Chem. Centr.*, 1899, i, 890; from *Zeit. Zucker-Ind. Böhm.*, **23**, 291—294).—The testa of sugar beet seed is very rich, the pure seeds poor, in furfuroids. During growth, there is a considerable increase in the amount of furfuroids in the seedlings. In the leaves of 10-day old plants, 66·9 per cent., and in the roots 19·6 per cent., of the furfuroids are soluble in water; after 120 days, 39·84 per cent. in the leaves and 14·1 per cent. in the roots dissolve in water, whilst at the end of the vegetating period the dry substance of the leaves yielded 5·88 per cent. of furfuraldehyde, of which the aqueous extract yielded only 0·92 per cent.

Manuring with excessive amounts of nitrate increases the amount of furfuroids and diminishes the production of sugar. Large amounts of soluble phosphates and potassium chloride have the same effect. The result with potassium chloride is in accordance with the fact that chlorine energetically induces the transformation of sugar and promotes the production of hemicelluloses and celluloses. Soil free from lime produced plants containing a smaller amount of substances yielding furfuraldehyde than lime soils.

The dry matter of sugar beet roots, in the first year, contained: hemicelluloses, 14·48; celluloses, 5·22; lignin, 5·03; and yielded 6·3 per cent. of furfuraldehyde. In the second year, the amounts were 11·66, 15·23, 29·84, and 9·02 per cent. respectively. In the first year, most of the pentosans are in the form of hemicelluloses, in the second year they increase in the cellulose groups, and especially in the lignin substances.

N. H. J. M.

Chlorophylls and the Chlorophylls of Ferns. By ALEXANDRE ÉTARD (*Ann. Agron.*, 1899, **25**, 393—394; from *Ann. Inst. Pasteur*, **13**, 456. Compare this vol., i, 381).—Several different chlorophylls may exist in the same plant, and the total number of chlorophylls is greater than the number of different species of plants. Although these substances do not seem to take part in the first stages of growth, it is probable that a trace of the matter which produces them exists among the latent functions of the germ.

As regards the theory that chlorophyll produces formaldehyde from the elements of carbonic anhydride and water, it is pointed out that the fatty or waxy character of chlorophyll is inconsistent with this property; and it is further suggested that all the elements usually found in plants are concerned in the synthesis. Hoppe-Seyler, Gautier and the author have always found associated with chlorophyll a certain amount of mineral matter which, it is suggested, may have a rôle analogous to that of manganese in the biological process of oxidation (compare Bertrand, Abstr., 1898, ii, 128).

The following substances were isolated from ferns (*Aspidium filix fœmina*): an alcohol, $C_{16}H_{32}O$; carrotene, and three *aspidiophylls*, having the formulæ $C_{208}H_{347}O_{32}N$, $C_{240}H_{320}O_{31}N_2$, and $C_{21?}H_{346}O_{48}N_{20}$ respectively. N. H. J. M.

A Proteid Compound of Arginine. By U. Susuki (*Chem. Zeit.*, 1899, **23**, 658).—According to Loew, the greater quantity of the arginine obtained from the seeds of conifers exists ready formed, but in a loose combination with the proteid material. The author supports this view, as he finds that the proteids from various Japanese conifers yield small quantities of amido-acids when boiled for some hours with 0·5 per cent. hydrochloric acid; in some cases, 2/3 of the arginine appears to be thus loosely combined. J. J. S.

Peptonising Enzyme (Peptase) in Malt. Separation of Nitrogenous Constituents of Malt, Wort, and Beer. By Boleslaw de Verbno Laszczynski (*Chem. Centr.*, 1899, i, 698—699, 852—853, and 939—940; from *Zeit. ges. Brauw.*, **22**, 71—73, 83—86, 123—129, and 140—143).—Barley seedlings, beginning to become green, had no enzymic action on fibrin (compare Neumeister, Abstr., 1895, ii, 290), but green and dark kiln-dried malt showed a distinct action. In no case, however, was there any action in 6 hours at 40°, whilst addition of 10 milligrams of pepsin acts at once.

Malt, wort, and beer do not contain peptone, and the solubility of nitrogenous substances in malt depends on the conditions of extraction. The nitrogen compounds are (1) coagulable proteids, (2) albumoses, and (3) amides. The first are only completely separated by heating for 1 hour at 1½ atmospheres pressure, and are also precipitated by phosphotungstic acid and copper hydroxide. The latter, however, only partially precipitates those substances which can be separated by zinc sulphate. Copper sulphate precipitates a portion of the albumoses and amides. Phosphotungstic acid separates albumoses, xanthine bases, and a part of the amides.

Sodium hydrogen sulphate and copper sulphate precipitate the xanthine bases in malt extract, &c., but the proteids and albumoses must be first separated, as they are also precipitated.

Uranium acetate does not precipitate all the substances separated by phosphotungstic acid. The latter precipitates almost the same amount of nitrogen as copper hydroxide, but the nitrogen is in part in different forms in the two precipitates. The author rejects both agents and employs the following process. The malt extract is first heated with steam for 1 hour under 1½ atmospheres pressure, the filtrate precipitated with zinc sulphate, and a little sulphuric acid. After filtering from the albumoses, the xanthine bases are separated by means of sodium hydrogen sulphate, copper sulphate, and barium chloride. The difference between the total nitrogen and nitrogen in the various precipitates gives the amidic nitrogen.

The coagulated proteids include the substances which settle when pasteurised beer is kept, and the less nitrogen beer contains in this form the more suited is it for pasteurisation and keeping. Beer contains 0·01 per cent. of xanthine bases. N. H. J. M.

[Ash of] Cardamoms. By H. B. Yardley (*Chem. News*, 1899, **79**, 122).—Cardamom seeds and husks have been found to yield

4·19 per cent. of ash, of a grey colour, containing per cent.: CaO, 13·33; Fe_2O_3, 0·51; Al_2O_3, 1·53; MgO, 4·52; Na_2O, 20·43; K_2O, 10·42; P_2O_5, 6·00; SO_3, 12·66; Cl, 2·54; SiO_2, 24·81; CO_2, C, &c., 4·40.

Herbert Bridges (*ibid.*, 154) and W. Watson Will (*ibid.*, 167) call attention to the presence af manganese in the ash. The latter has found in undoubted specimens of *Elettaria cardamomum* the ash (1) of the whole seeds to be 3·26, crushed 3.52; (2) of the pericarp of fruit, 5·96 and 6·17; of the entire fruit and seeds, 3·8 and 4·219 per cent. D. A. L.

Coffee. By L. A. Warnier (*Rec. Trav. Chim.*, 1899, **18**, 351—357). —The paper contains details of the complete proximate analysis of two types of Java coffee, *Coffea arabica* and *C. liberica*; the results are given in tabular form. The aqueous extract of coffee amounts to 30 per cent. of the whole; the quantity of free acid is very variable and diminishes rapidly when the berries are kept for a long time. Coffee berries contain about 15 per cent. of fatty substances, 1¼ per cent. of caffeine, and 4 per cent. of ash; the latter contains 75 per cent. of potash and 10 per cent. of phosphoric acid. G. T. M.

Composition of the Water-chesnut (Trapa Natans). By Paul Neumann (*Chem. Zeit.*, 1899, **23**, 22—23, 38—39).— The shells yielded 3·15 per cent. of ash, the composition of which is given; it is characterised by a high percentage of lime, magnesia, and potash, and by an unusual amount of iron and manganese. The composition of the fruit was as follows: water, 10·41; ash, 2·78; fat, 0·73; cellulose, 1·38; crude proteids, 19·93; dextrose, 3·22; starch, 52·19; other nitrogen-free substances, 9·36 per cent. A full analysis of the ash of the fruit is given; this differs from that of the shells by containing more phosphoric acid and potash. L. de K.

Action of Acetic Acid Vapour, and Dilute Acetic Acid on Plants. By G. Fassbender and A. Y. Grevillius (*Landw. Versuchs-Stat.*, 1899, **52**, 195—208).—Young oat plants were destroyed by being kept 4 hours in air containing 0·3—0·4 per cent. of acetic acid. Peas resisted the action of the acid better, whilst beans were only locally and temporarily affected by 0·5 per cent. of acid. Peas were killed by frequently watering the leaves with 0·05 per cent. acetic acid; beans were only injured by 0·5 per cent. acid, and the injury was mainly confined to portions to which drops of the acid adhered.

Water containing 0·001—0·01 per cent. of acid promoted the germinating energy of beans and peas, but the effect was less in the case of flax; no effect was observed with rye. Stronger solutions hindered germination (0·1 per cent. with flax, 0·2 per cent. with beans, peas, and rye). The germinating power of flax was influenced by 0·05 per cent. acid; with peas and rye, the percentage of seeds which germinated was only diminished by 0·2 per cent. acid. None of the seeds germinated in 0·5 per cent. solutions.

The growth of seedlings of peas and beans was promoted by dilute solutions (to 0·01 per cent.).

The points of the roots of seedlings are the parts most readily injured by acid. N. H. J. M.

Phosphoric Acid and Cereals. By CH. GUFFROY (*Bied. Centr.*, 1899, **28**, 573—574; from *J. Agric. prat.*, 1898, **62**, ii, 52).—Experiments were made with wheat and barley on poor soil (unmanured for at least 15 years). Phosphoric acid was applied in the form of basic slag (500 kilos. per hectare).

The effect of phosphoric acid was to increase the length, thickness, and strength of the straw, whilst the ears were better developed and the sp. gr. of the grain was increased. N. H. J. M.

Potash Requirements of Brewery Barley. By THEODOR RÉMY (*Ann. Agron.*, 1899, **25**, 397—398; from *Untersuch. Kalibedürf. d. Gerste. Berlin*, 1898).—The results of laboratory and field experiments made by the Berlin Institute of Brewing showed that potash is only effective in the case of soils poor in potash, that climatic conditions, especially the distribution of water, are of great importance, and that it is necessary, by careful tillage, to enable the soil to derive benefit from the manures. Under favourable conditions, the effect of potash is to increase the crop and the amount of starch, to diminish the amount of proteids, and to increase the weight of grain.

In accordance with Liebscher's observations, the lowest limit of potash soluble in 25 per cent. hydrochloric acid which a soil should contain is fixed at 0·15 per cent. Soils containing less than this amount will be benefited by manuring with potash. Application of potash to richer soils is to be avoided, as it increases the demand for other constituents without any benefit to the crop. N. H. J. M.

Valuation of Meadow Hay. By WOLDEMAR VON KNIERIEM, (*Bied. Centr.*, 1899, **28**, 526—527; from *Landw. Jahrb.*, 1898, Heft. 3—4).—Digestion experiments with rabbits gave the following results with different plants (percentage amounts digested):

	Crude protein.	Crude fat.	Crude fibre.	Non-nitrogenous substances.
White clover	68·2	50·9	57·35	83·07
Red clover	64·4	75·3	26·46	68·16
Kidney vetch	65·8	60·1	27·08	73·53
Vetch	71·27	58·03	29·87	69·23
Couch grass (luxuriant) ...	76·01	64·48	15·22	58·47
„ (poor)	71·79	63·06	12·37	59·40

Experiments with *Lotus corniculatus* and bastard clover failed, whilst *Lolium perenne* and *Phleum pratense* caused the rabbits to die at the conclusion of the experiment.

As regards the effect of sour hay on milk production, it was found that feeding with sour hay after clover hay at once caused a diminished production of milk, whilst a return to clover hay again raised the yield. Cows utilise sour hay better than sheep. N. H. J. M.

Tobacco Plant. By JOHANNES BEHRENS (*Landw. Versuchs.-Stat.*, 1899, **52**, 213—246. Compare Abstr., 1895, ii, 524).—The toughness and pliability of tobacco leaves cannot be due, as is frequently assumed, to the presence of substances allied to india-rubber or gum, as these cannot be detected in the leaves. The chief differences in composition between pliable and "dead" or brittle leaves are in the percentages of water and of substances soluble in water, both of which are higher in well-developed leaves. The composition of the soluble matter also differs, the amount of organic salts (mainly malate) being much higher in normal than in "dead" leaves; the normal leaves were found besides to contain more wax than brittle ones, and it is perhaps to this that their gloss is due. It was found that brittleness could be induced by covering portions of leaves with tinfoil. This is, however, only one cause of defective leaves; excessive manuring with Chili saltpetre produces leaves with lower percentages of soluble matter.

The liability to decay of tobacco from plants manured with nitrate and other soluble manures is attributed to the fact that the leaves take longer to dry, and to the danger of the drying process being stopped before the minimum amount of water required by the putrefying bacteria is reached. The leaves contain, moreover, more nutritive matter suitable for the bacteria than leaves of plants which have received no nitrate. N. H. J. M.

Importance of Chemical Analysis in Estimating the Value of Hops. By THEODOR RÉMY (*Bied. Centr.*, 1899, **28**, 563—568; from *Woch. Brauerei*, 1898, Nos. 41—43).—The chemical analysis of hops is not in itself sufficient for estimating their value, but may furnish useful information on a number of points. The amount of resin in hops is determined by extracting the ethereal extract with alcohol, evaporating carefully, and drying the residue at 60° under 1/10th atmospheric pressure. The results of a number of analyses showed that whilst samples of good quality contained 18·5—22·8 per cent. of resin in the dry matter, inferior samples contained only 14·0—17·4 per cent. The percentage of resin does not seem to vary much in hops from different districts.

The portion of the resin soluble in light petroleum (soft resin) is, according to Hayduck, Briant, and Meacham, the substance to which the preserving and bitter qualities of hops are due. Determinations of soft resin in hops from different districts gave results varying from 9·5—17·0 per cent. in dry matter. The amount of soft resin depends, not only on the amount of total resin, but is influenced by the methods of drying, storing, &c.

The determination of tannin in hops seems to be of little use in estimating the value of hops, whilst the total nitrogen and the soluble nitrogen give no indications at all.

The amounts of potash and phosphoric acid in hops were found to be 1·85—3·75 and 1·02—1·63 per cent. in the dry matter respectively.

N. H. J. M.

Linseed in its Botanical, Chemical, and Agricultural Relations. By AL. HERZOG (*Bied. Centr.*, 1899, **28**, 544—545; from *Publ. Versuchs-Stat., Flachsbau Trautenau*, No. 3).—Linseed contains, on the average, water, 7·5; crude protein, 23; crude fat, 35; nitrogen-free extract, 22·2; crude fibre, 8·8, and ash, 3·5 per cent. The pure ash contains K_2O, 28·41; MgO, 13; and P_2O_5, 44 per cent.

During the growth of the plant oil migrates from the leaves to the seeds, where it is first transformed into starch. Subsequently (chiefly between the periods of flowering and ripening) the starch is transformed again into oil. According to Schischkin, the amount of oil in the seeds is influenced by manuring. N. H. J. M.

Composition of Walnut-cake. By B. FALLOT (*Bied. Centr.*, 1899, **28**, 531—532; from *J. d'agric. prat.*, 1898, 628).—The percentage composition of walnut-cake prepared by the cold (1) and by the hot processes (2—4) was found to be as follows:

	Water.	Proteids.	Fat.	N.-free extract.	Crude fibre.	Ash.	K_2O.	P_2O_5.
1. Cold process	9·40	31·79	27·17	20·61	6·83	4·20	0·87	1·77
2. Hot ,, (max.)	15·04	44·87	20·06	33·62	9·01	5·27	1·59	2·40
3. ,, ,, (min.)	4·11	29·29	9·26	21·96	3·11	4·36	1·27	0·40
4. ,, ,, (av.)	11·40	37·77	13·68	27·75	4·56	4·77	1·39	1·71

As a concentrated food only to be used in conjunction with other foods, the composition of walnut-cake is very favourable. The following ration for cows was found to be very suitable; walnut-cake (1·5), green maize (15·0), sugar beet (15·0), and oat, chaff, and straw (5 kilograms). N. H. J. M.

Experiments on Rape. By WILHELM GRASHOF (*Chem. Centr.*, 1899, i, 858; from *J. Landw.*, **47**, 85—90).—The experiments were conducted in large zinc cylinders filled with soils of different kinds and differently manured. Both the nature of the soil and of the manure influenced the amount of oil in the produce. Phosphatic manure increased the percentage of oil rather more than 2 per cent. When the percentage of oil in rape is high, the nitrogen is low, whilst with a high percentage of nitrogen there is less oil. N. H. J. M.

Volatile Mustard Oils [Thiocarbimides] in different Rape Cakes. By GUNNER JÖRGENSEN (*Landw. Versuchs-Stat.*, 1899, **52**, 269—290. Compare this vol., ii, 46).—The seeds of *Camelina sativa*, *Eruca*, *Erysinum orientale*, *Sinapis arvensis*, and *S. dissecta* do not give off volatile thiocarbimide. The Indian seeds of *Brassica dichotoma*, *B. glauca*, *B. juncea*, *B. ramosa*, and the seeds of *B. napus*, *B. Rapa*, and *B. campestris* all yielded volatile thiocarbimide, but in the case of the first two and last three the odour is only slight, and does not last long.

Several different cakes were examined, the amount of thiocarbimide, the nitrogen as thiosinamine, and the melting point of the thiosinamine being determined when crystalline. It was found that all cakes which contained much rape, or seeds which do not yield volatile thiocarbimide, gave low percentages of thiocarbimide, whilst in the case of *B. Rapa* and Indian seeds the yield was decidedly higher. The determination of the thiocarbimide alone is, however, not sufficient to decide the suitability or unsuitability of a sample of cake for cattle feeding. When, however, two cakes contain the same amount of nitrogen as thiosinamine, the one which gives the larger proportion of thiocarbimide is almost sure to be the more injurious as cattle food.

As regards the percentage of nitrogen as thiosinamine, the amount required for the allyl compound (24·14 per cent.) was never reached.

Four samples, of which three were injurious, gave results very near to 22·6 per cent., whilst the nitrogen of the others was always below 22 per cent.

The melting points of these thiosinamines which crystallised showed no relation to the composition; in cases where the percentage of nitrogen was about 22·6, the thiosinamines never crystallised.

N. H. J. M.

Decomposition of Feldspar Rocks by Roots. By FAUSTO SESTINI (*Ann. Agron.*, 1899, **25**, 399—400; from *Bull. Soc. Chim.*, [iii], **21**, 515).—Gramineous plants were grown in a pot containing feldspar sand, whilst a second pot of the same sand was left without vegetation. At the end of the experiment, it was found that the pot with vegetation contained 33·5 grams of fine soil (containing 4·02 per cent. of clay), whilst the second pot contained only 14·99 grams of fine soil (containing 1·05 per cent. of clay). It is probable that microbes and algæ exercise a similar effect. It is evident therefore that biological as well as physical action is of importance in the production of soil from rocks (compare Müntz, Abstr., 1887, 1135, and 1890, 1183).

N. H. J. M.

Forms of Phosphoric Acid in Peaty Soil. By G. NANNES (*Chem. Centr.*, 1899, i, 856—857; from *J. Landw.*, **47**, 45—48).—The soil examined was well decomposed peat soil from Kalmar (Sweden), and contained: organic matter, 82·3; N, 2·66; CaO, 1·36, and P_2O_5, 0·38 per cent. Lecithin and chlorophyllan were only present in traces. Extraction with 2 per cent. hydrochloric acid yielded 0·05 per cent. of free phosphoric acid, but no phosphoric acid in organic compounds. Subsequent extraction with 10 per cent. ammonia dissolved 0·13 per cent. P_2O_5, of which 0·098 was precipitated with humus on adding hydrochloric acid. Direct extraction with ammonia (without previous acid extraction) gave 0·05 per cent. P_2O_5 as free acid, and 0·133 per cent. in humus. All the percentage results refer to the original soil.

Treatment with nitric acid and precipitation of the filtrate with lead acetate yielded a substance rich in phosphoric acid. N. H. J. M.

Solubility of the Phosphoric Acid of Surface Soil and Subsoil. By JOSEF SEISSL (*Chem. Centr.*, 1899, i, 1136; from *Zeit. landw. Versuchswesen. Österr.*, 1899, **2**, 120—134).—Phosphoric acid, total and soluble in citric acid (Maercker's method), lime, and sesquioxides were determined in a number of soil samples. In most cases, the surface soil was poorer in lime and sesquioxides than the subsoil, and it is concluded that the relation between phosphoric acid and sesquioxides is closer in the former than in the latter. The solubility of phosphoric acid is mainly influenced by the sesquioxides and organic matter, and also to some extent by the amount of lime.

Similar results were obtained with the coarser particles of soil (2—3 mm. sieve), but the amount of total phosphoric acid was so small that it is proposed, in soil analysis, to use only the fine soil (1 mm. sieve).

N. H. J. M.

The Franzenbad Mineral Peat Soil. By ERNST LUDWIG, CARL HÖDLMOSER, and THEODOR PANZER (*Chem. Centr.*, 1899, i, 1221—1223; from *Wien. klin. Woch.*, **12**, 463—468).—The humus dissolved from the soil by alkali and precipitated by acid contained C, 58·38 ; H, 3·78 ; N, 2·1, and ash, 1·75 per cent. When distilled with steam, the soil yielded small amounts of formic and higher fatty acids. The aqueous extract of the weathered soil was strongly acid, and contained free sulphuric acid, whilst that of unexposed soil was neutral or slightly acid. The soil contains considerable amounts of pentosans.

The soil which has been long exposed to air is employed for baths, and contains much iron sulphate ; in soil which has not been exposed, the iron is present as sulphide. Experiments made by Landsteiner indicate that the reduction of sulphates in peat soil is due to microbes.

Analyses of a number of samples of the soil are given.

N. H. J. M.

Soil of Bad-Pyrmont. By Ulrich Kreusler (*Zeit. anal. Chem.*, 1899, **28**, 411—429).—The soil contains more or less partly decomposed vegetable matter derived from marsh-plants, as well as the remains of roots and branches of woody plants. The absence of the specific peat-moss indicates the character of "meadow-moor" as opposed to peat-producing moorland. The soil is similar to that of Franzenbad and Marienbad.

The dry soil (1) not weathered, and (2) weathered, was found to contain the following percentage amounts of organic matter, &c.

	Soluble in water.			Not dissolved by water.					
	Ammonia.	Formic acid.	Humic acids.	Ammonia.	Humic acids.	Humin.	Wax.	Resin.	N.
1.	0·0095	0·0584	0·9085	0·0228	16·8195	13·2983	1·3080	0·3480	2·238
2.	0·0464	trace	1·7575	0·0183	17·0875	7·8700	1·0260	0·6610	1·562

The dry soil contained (1) 14·5144, and (2) 20·2850 per cent. of mineral matter soluble in hot hydrochloric acid of sp. gr. 1·15, and 22·8847 and 29·5624 per cent. of insoluble mineral matter. Complete analyses of the soluble (in water and in acid) and insoluble mineral matter are given for both soils. The chief differences in the amounts of substances soluble in water in the two samples are :—Ferric sulphate (1, trace ; 2, 1·647), ferrous sulphate (1, 1·083 ; 2, 1·885), aluminium sulphate (1, 0·083 ; 2, 1·165), and free sulphuric acid (as SO_3, 1, 0·214 ; 2, 0·992).

N. H. J. M.

Occurrence of Perchlorate in Chili Saltpetre. Injurious Action on Cereals and Sugar Beet. By Al. J. Zaharia (*Bied. Centr.*, 1899, **28**, 511—516 ; from *Bul. Soc. Sci. Bucarest*, 1898, 361. Compare this vol., ii, 513).—The examination of 206 samples of Chili saltpetre at Halle showed that one sample contained 5—6, one 3—4, three 2—3, eleven 1·5—2 per cent. of perchlorate ; whilst thirty-nine samples contained 1—1·5, and the rest (151) less than 1 per cent. of perchlorate.

Solutions containing 0·05—0·1 per cent. of perchlorate were found to have no effect on the germination of sugar beet, rye, and wheat, and practically no effect on barley, but a slight effect was observed in the case of oats. Even 1 per cent. solutions had very little effect on the germination of wheat.

As regards the influence of perchlorate on the development of seedlings, oats were most affected, then rye, wheat, and, least of all, barley. A 0·001 per cent. solution had no effect on barley and wheat, but had a distinct effect on oats and rye.

The results of experiments with oats in different soils show that with Chili saltpetre containing 1 per cent. of perchlorate, the decrease of grain and straw amounted to 4 per cent. With 2 per cent. of perchlorate, the decrease in grain may be as much as 25 per cent., whilst the effect on straw production is less marked.

Sugar beet is much less affected by perchlorate than oats, and the effect may be only temporary. Even nitrate containing 6 per cent. of perchlorate will not destroy a crop of sugar beet, although it will diminish the yield of roots; nitrate containing 2 per cent. of perchlorate is not injurious, and when only 1 per cent. is present the perchlorate is even beneficial, giving an increased percentage of sugar and a somewhat higher purity coefficient. N. H. J. M.

Denitrification and Farmyard Manure. By Robert Warington (*J. Roy. Agr. Soc. Eng.*, 1897, [iii], **8**, 577—607).—After discussing the results of the various investigations on the subject of denitrification, and the recent results of the pot experiments of Wagner and Maercker indicating that the destruction of nitrates in the soil is the chief cause of unsatisfactory results obtained after application of dung, some results of Rothamsted experiments bearing on the question are described.

In experiments with mangel-wurzel during the six years 1878—1883, it is shown that when sodium nitrate, or ammonium salts, were applied in conjunction with superphosphate, the increase in the quantity of nitrogen in the roots, due to the nitrogenous manures, was practically the same as when they were applied in conjunction with farmyard manure (14 tons per acre per annum). The farmyard manure had therefore no depressing effect on the action of the nitrate or ammonia. This conclusion still holds good if the nitrogen of the leaves, which are returned to the land, is taken into account, since the production of the leaf is greatest on the dung plot. In more recent years, since the nitrate has been applied as a top-dressing in July, instead of being applied before the dung, the effect of nitrate in presence of farmyard manure was still greater.

Sodium nitrate and ammonium salts have a greater effect on the yield of roots without than with farmyard manure, but the increase is much less nitrogenous.

With regard to the effect of straw, further Rothamsted experiments with wheat and on permanent meadow are described, in which considerable amounts of wheat straw were applied with ammonium salts. The results do not bear out the conclusion that straw is injurious in promoting denitrification.

When very large amounts of dung are employed, as in horticulture, the danger of considerable loss of nitrogen will increase with the quantity of fermentable organic matter, and will be much aggravated by a wet condition of the land. N. H. J. M.

Losses of the Nitrogen [of Farmyard Manure] in the Free State. By Pierre P. Dehérain and Dupont (*Ann. Agron.*, 1898, **25**, 401—420).—Aërobic and anaërobic fermentation experiments with farmyard manure are described, in which weighed quantities of the manure (about 1 lb.) were kept in flasks through which air or carbonic anhydride was passed. The differences in the amounts of nitrogen in different forms before and after the experiment were ascertained, and in some cases the amounts of methane and hydrogen produced were determined.

It is concluded that whilst, as in Schlœsing's experiments (Abstr., 1892, 1123), farmyard manure may ferment for several weeks without liberation of free nitrogen, other conditions may prevail under which nitrogen is eliminated. Slow fermentation, in which hydrogen as well as methane is produced, seems to be favourable to loss of nitrogen; when the fermentation is vigorous, carbonic anhydride and methane, without hydrogen or free nitrogen, are given off. To induce this vigorous fermentation, the manure must be rendered very alkaline by addition of liquid manure, and must, besides, be frequently watered. This prevents loss of ammonia, as well as of nitrogen, in the free state. Further experiments with the object of confirming this important conclusion are in progress. N. H. J. M.

Production of Citrate-soluble Phosphate. By H. Knoop (*Bied. Centr.*, 1899, **28**, 516—517; from *Zeit. angew. Chem.*, 1899, 66).—The process consists in heating phosphorite, bones, &c., mixed with silicates of the alkalis (in the form of broken glass, &c.) and alkaline earths at a yellow-white heat. In the case of phosphorites containing a high percentage of phosphorus, the amounts employed are alkaline earth silicates (60) and alkali silicates (30 parts) to 100 of phosphorite. When potassium silicate is employed, the amount should be somewhat increased, and when much magnesia is present less silicate should be employed. With glass as the silicate, an addition of calcium carbonate is desirable to obtain the suitable relation of silicic acid and bases.

The fusion may be conducted in Siemens furnaces, and there is no danger of loss of phosphoric acid at high temperatures. Two mixtures of phosphorite, with chalk, sand, and sulphate, yielded products having a citrate solubility of 99 per cent. N. H. J. M.

Analytical Chemistry.

Asbestos Filters. By Otto Lohse (*Ber.*, 1899, **32**, 2142—2146).—The author describes a modified asbestos filter tube constructed on the same principle as a Gooch filter (*Chem. News*, 1878, **37**, 181). It consists of a glass tube, 12 cm. long and 15 mm. in diameter, closed at one end and slightly widened at the open end; the closed end is perforated with a number of minute holes, so arranged that the tube can be heated without risk of breaking. The advantage the tube appears to have over the ordinary Gooch filter is that the precipitate can be somewhat more conveniently heated in a reducing atmosphere.

Convenient forms of aluminium holder, desiccator, and tongs for removing the asbestos from the tube, are also described. J. J. S.

Weighing Corrosive or Fuming Liquids. By RUDOLF SCHWARTZ (*Chem. Zeit.*, 1899, **23**, 451).—The apparatus is essentially a pipette, ending in two capillary tubes, and weighing about 2—3 grams. One end is placed in the liquid, and suction is applied at the other end with a pump until the bulb is three parts filled; the top tube is then sealed. By removing the pipette and turning it upside down, it becomes possible to seal the other end, and the pipette is then reweighed. The pipette may be readily broken under water to obtain the required solution. L. DE K.

Apparatus for the Extraction of Liquids with Ether. By FRITZ BAUM (*Chem. Zeit.*, 1899, **23**, 249—250).—Ether is boiled in a flask, and the vapour being condensed, the ether (or similar non-miscible solvent) flows down the condenser tube to the bottom of a cylindrical vessel containing the liquid (or solid matter) to be extracted. While ascending through the liquid, it dissolves any fatty matter, and when a certain quantity has collected on the top it is syphoned back into the boiling flask. An illustration is given.

When the liquid has been thoroughly extracted, it is removed with a pipette, thus leaving plenty of room for the collection of the recovered ether. L. DE K.

Estimation of some Inorganic and Organic Acids by means of the Volume of Hydrogen evolved on Treatment with a Metal. By KARL ULSCH (*Chem. Zeit.*, 1899, **23**, 624—625).—Platinised iron (iron powder treated with solution of platinum chloride) is quantitatively acted on by fairly concentrated solutions of sulphuric, hydrochloric, and phosphoric acids, and the amount of these acids may be readily ascertained from the volume of hydrogen evolved. Phosphoric acid causes some trouble as the platinised iron gets gradually coated with ferrous phosphate.

The process may also be extended to the estimation of oxalic, acetic, and lactic acids; the author has not, as yet, applied it successfully to tartaric and citric acid (compare this vol., i, 868). L. DE K.

Iodometric Acidimetry. By FRANZ FESSEL (*Zeit. anal. Chem.*, 1899, **38**, 449—453; from *Inaug. Dissert. Tech. Inst. Univ. Würzburg*, 1898).—The author has submitted to a careful study the conditions under which the reaction $KIO_3 + 5KI + 6HCl = 6KCl + 3H_2O + 6I$ can be employed for the estimation of a free acid. It is important that both the iodate and the iodide should be in excess, otherwise too little thiosulphate will be required. A deficiency of the former will be indicated by a liberation of iodine on adding iodate to the colourless liquid at the end of the titration. A deficiency of the latter is shown by the deposition of solid iodine.

Boiled water must be used, since carbonic anhydride liberates iodine from the mixture of iodide and iodate. The iodide solution (10 per cent.) should be preserved from air and light, but even if coloured by free iodine it may be used after decolorising with thiosulphate. Excessive dilution lowers the results, but as this seems to be due to a retardation of the reaction, it is recommended that where great dilution is unavoidable there should be a delay of half an hour before titrating the liberated iodine. The method cannot be employed for organic acids.

J. Kjeldahl points out that, in applying the iodometric method to the estimation of ammonia, accurate results are only obtained by working strictly in the same manner in all cases. Sulphuric acid either alone or after absorption of ammonia does not immediately liberate the theoretical amount of iodine from a mixture of iodide and iodate, but the deficiency in the quantity of thiosulphate required will be the same in the two cases if the volumes of the solutions are equal. The thiosulphate should be standardised by titrating with it the acid to be employed both before and after the absorption of ammonia from a known weight of an ammonium salt. M. J. S.

Delicate Reaction of Hydrogen Peroxide. By Edgar S. Barralet (*Chem. News*, 1899, **79**, 136).—Ferrous ferrocyanide, prepared from a solution of a ferrous salt and potassium ferrocyanide, is quickly turned deep blue by hydrogen peroxide, even when the amount of the latter is as little as 1 part in 165,000 parts of water.

D. A. L.

Estimation of Hydrochloric Acid in the Stomach Contents. By Giuseppe Siringo (*Gazzetta*, 1899, **29**, i, 476—479).—The author finds that the use of Günzberg's reagent—an alcoholic solution of phloroglucinol and vanillin (Abstr., 1888, 617)—does not afford an infallible test for the presence of hydrochloric acid in the stomach contents, and suggests instead the employment of salts of nitrohydroxylamine which even in very dilute solutions are decomposed by hydrochloric and the other more energetic acids, nitric oxide being immediately evolved in almost theoretical quantity; the weak organic acids, as also acid phosphates, are without effect. 5 c.c. of the stomach contents are placed in a graduated tube which is filled with mercury and inverted in a mercury trough; a small piece of the nitrohydroxylamine salt, for instance, the sodium salt, is then introduced into the tube and after a few minutes the volume of the evolved gas is read off and corrected in the usual way. T. H. P.

Estimation of Chlorine, Bromine, and Iodine. By J. Bougault (*J. Pharm.*, 1899, [vi], **10**, 18—20).—Instead of converting the mixed silver haloids into silver chloride, they are reduced by pure metallic zinc and dilute sulphuric acid (1 of acid to 10 of water), and the precipitated metallic silver weighed. The reduction takes place easily and the results obtained are accurate. H. R. Le S.

Detection of Chlorates, Bromates, and Iodates in the Presence of Each Other. By Dioscoride Vitali (*Chem. Centr.*, 1899, i, 1083—1084; from *Boll. Chim. Farm.*, **38**, 201—209).—When manganous sulphate is treated with sulphuric acid and potassium bromate, a violet-red solution is obtained; this coloration is not due to permanganic acid, but to a manganic salt. Chlorates or iodates do not give this reaction. On boiling, the manganese is completely precipitated as hydrated dioxide.

Salts of hydroxylamine (but not the free base) act on iodates in the cold with liberation of iodine; bromates are only reduced on heating, and chlorates are not affected at all; salts of phenylhydrazine act similarly. Phosphorous and hypophosphorous acids do not act on bromates or chlorates, but in contact with iodates, iodine is first liberated, and then redissolved as hydriodic acid. The author recommends the following process for the separation of the three compounds. By cautious addition of silver nitrate, the iodates and bromates are alone precipitated; the silver compounds are then decomposed with hydrogen sulphide, and after filtering from the silver sulphide, the excess of the former is expelled by gentle warming, and the filtrate neutralised with soda and concentrated. The iodine is liberated by means of sulphuric acid and potassium nitrite, and removed by shaking with chloroform; the liquid is then tested for bromine with chlorine water. L. DE K.

[Detection and Estimation of Small Amounts of Iodine in Cuprite and Malachite.] By WILHELM AUTENRIETH (*Chem. Zeit.*, 1899, **23**, 626—627).—The finely divided mineral is fused with 3—4 times its weight of pure sodium hydroxide (from metal) and a small quantity of water in a nickel crucible; the mass is then extracted with water, the filtered solution transferred to a glass cylinder and mixed with 10—20 c.c. of chloroform, a few drops of a 1 per cent. solution of pure sodium nitrite solution, and then acidified, while well cooled, with 20 per cent. sulphuric acid; after vigorous shaking, the colour of the chloroform solution is compared with that produced by the addition of a known quantity of potassium iodide solution (0·0001 gram iodine in 1 c.c.) to 20 c.c. chloroform, several c.c. of saturated sodium sulphate solution, dilute sulphuric acid, and a little sodium nitrite solution. The results are correct to within 0·1 milligram of iodine. If siliceous ores are present in the mineral, it is necessary to filter after fusing and rendering acid with sulphuric acid. The fusion must not be carried out at too high a temperature, as in such circumstances the sodium iodide volatilises. J. J. S.

Detection of Fluorine in Wine. By GIULIO PARIS (*Chem. Zeit.*, 1899, **23**, 685—686).—The ash obtained from 50 c.c. of wine is mixed with a little precipitated silicic acid, introduced into a platinum crucible, and 0·5—1 c.c. of sulphuric acid added. The crucible is then covered with an inverted lid containing cold water, the under side being also moistened with a drop of water. The mixture is now heated over a very small flame for 5 minutes, and when cold the drop of liquid adhering to the lid is put on to a slide covered with a thin layer of Canada balsam, and a few particles of sodium chloride are added. After about an hour, the slide is examined under the microscope for the very characteristic crystals of sodium silicofluoride.

L. DE K.

Estimation of Sulphur in Iron, Iron Pyrites, Slags, Coal, Coke, Asphalt, Rubber, and Gas Purification Material. By OTTO HERTING (*Chem. Zeit.*, 1899, **23**, 768—769).—Mainly a review of recent improved methods for the estimation of sulphur in these materials.

The use of stannous chloride for reducing ferric sulphate before precipitating with barium chloride is suggested. L. DE K.

Estimation of Sulphuric Acid in the Presence of Iron. By Georg Lunge (*Zeit. anorg. Chem.*, 1899, **21**, 194—200).—An answer to Küster and Thiel (this vol., ii, 247).—A comparison of the results obtained in the estimation of sulphur in iron pyrites by the author's and Küster and Thiel's methods shows that there is no practical difference in the results obtained, being 49·93 per cent. and 49·86 per cent. respectively, and the time employed on each method is about equal. In the estimation of sulphur in pyrites residues, the results obtained by the different methods are as follows: Watson-Lunge, 1·96 per cent.; Meineke's, by fusion with sodium carbonate and potassium chlorate, 2·00 per cent.; Lunge's ammonia method, 1·94 per cent.; Küster and Thiel's, 1·94 per cent.; Meineke's, by reduction with zinc (this vol., ii, 518), 1·92 per cent. E. C. R.

Valuation of Persulphates. By G. H. Mondolfo (*Chem. Zeit.*, 1899, **23**, 699).—2 or 3 grams of the sample are dissolved in 100 c.c. of cold water, and 10 c.c. then heated at 60—80° in a stoppered bottle with half a gram of potassium iodide for 10 minutes. The liberated iodine is titrated with $N/10$ sodium thiosulphate, 1 c.c. of which represents 0·0114 gram of ammonium, or 0·0135 gram of potassium persulphate. L. de K.

Gas Washing Apparatus. By Otto Foerster (*Chem. Zeit.*, 1899, **23**, 196—197).—The apparatus is based on the principle of the dephlegmator used in fractional distillation. The steam evolved when boiling a solution of an ammonium salt (such as a reduced nitrate) with excess of alkali, partly condenses, and when a certain quantity of liquid has accumulated, it is syphoned back into the boiling flask. By this means, the liquid cannot become over concentrated whilst the ammonia is still fully expelled. Two drawings are given. L. de K.

The Diphenylamine Test for Nitric Acid in Natural Waters. By Raffaele Cimmino (*Zeit. anal. Chem.*, 1899, **38**, 429—431).—The sensitiveness of this test depends greatly on the mode of performing it. That recommended by Emmerich and Trillich has hitherto been the most sensitive, being capable of detecting nitric acid at a dilution of 1 : 100,000, but by the addition of a little hydrochloric acid the sensitiveness is increased tenfold. The reagent employed therefore is a solution of diphenylamine and sulphuric acid in 5 per cent. hydrochloric acid; three or four drops of this reagent are added to 1 c.c. of the liquid to be tested, then 2 c.c. of concentrated sulphuric acid, and the whole shaken. In presence of nitric acid, the mixture acquires a blue colour. No other constituent of natural water gives a similar reaction. M. J. S.

Estimation of Ammonia and Nitric and Nitrous Acids in Natural Waters. By Ludwig W. Winkler (*Chem. Zeit.*, 1899, **23**, 454—455; 541).—Preformed ammonia may be estimated without previous distillation by removing the calcium and magnesium salts by means of sodium hydroxide and carbonate; the clarified solution may then be at once Nesslerised. If too little standard ammonia has been added to the comparison liquid, it does not do to add a little more, but a fresh solution must be prepared. To obviate this, and also to save the removal of the calcium and magnesium salts, the author recommends the addition of a soluble tartrate (Rochelle salt) both to the water and to the comparison liquid.*

The ordinary Nessler solution is not well adapted to this process, but a delicate solution may be prepared by dissolving 10 grams of mercuric iodide and 5 grams of potassium iodide in a little water, and then adding a solution of 20 grams of sodium hydroxide, and finally diluting to 100 c.c.

For the estimation of nitric acid, a slight modification of Lunge and Lwoff's process is recommended (Abstr., 1894, ii, 398). Nitrous acid is estimated by the amount of iodine liberated by the addition of hydrochloric acid and potassium iodide; the liquid is then titrated with standard solution of sodium thiosulphate, using starch-water as indicator. To get trustworthy results, the air should be excluded, which is best effected by operating in a sufficiently small flask with narrow neck, and displacing the air by carbonic anhydride generated by dropping into the acid liquid a sufficiency of solid potassium hydrogen carbonate. L. de K.

A Source of Error in the Estimation of Nitric Nitrogen by Ulsch's Method. By L. Brandt (*Chem. Zeit.*, 1899, **23**, 22).—Ulsch (Abstr., 1891, ii, 617) reduces nitrates to ammonia by the action of sulphuric acid and reduced iron. The author shows the necessity of always making a blank experiment to ascertain whether the reagents are free from nitrogen. In one case, it was found that the iron used in the experiment contained a considerable amount of nitrogen in some form capable of conversion into ammonia when the metal was dissolved in dilute sulphuric acid. L. de K.

Gasometric Estimation of Nitric Oxide. By Georg von Knorre and Kurt Arndt (*Ber.*, 1899, **32**, 2136—2141).—As the usual methods for the estimation of nitric oxide, namely, (1) absorption by solution of a ferrous salt; (2) titration with potassium permanganate; (3) conversion into nitric peroxide by the aid of oxygen, are considered unsatisfactory, the authors have elaborated another method which consists in passing the gas, together with an excess of hydrogen, through a Drehschmidt's platinum capillary tube heated to bright redness and measuring the contraction. According to the equation $2NO$ (2 vols.) $+ 2H_2$ (2 vols.) $= N_2$ (1 vol.) $+ 2H_2O$, the amount of nitric oxide is equal to 2/3 of the contraction. Very good results have been obtained by this method, but it is absolutely necessary that the mixed gases should pass very slowly through the capillary, as otherwise a certain amount of ammonia is formed. The method also admits of the estimation of nitrous oxide in the presence of nitric oxide. From the equation N_2O (1 vol.) $+ H_2$ (1 vol.) $=$ N_2 (1 vol.) $+ H_2O$ and the one given above, it follows that if $x =$ vol. of nitric oxide and $y =$ vol. of nitrous oxide, then $x + y = V$ (volume of mixture), $1{\cdot}5\,x + y = C$ (contraction on leading through the capillary, and $x = 2(C - V)$.

---

* Note by Abstractor.—Romijn (*Ber. Deut. Pharm. Ges.*, 1898, **8**, 9) has already advocated the use of Rochelle salt.

If nitrogen is present in addition to nitrous and nitric oxides, then the amount of hydrogen used up must be determined, and the volumes of the three constituents can be calculated. J. J. S.

Detection and Estimation of Free Phosphorus in Oils and Fats. By Émile Louïse (*Compt. rend.*, 1899, **129**, 394—395).—When a solution of silver nitrate is added to a solution of phosphorus in oil, the silver solution is reduced, and a black precipitate is produced as long as any free phosphorus is present. By previously mixing the oil with 20 times its volume of acetone, the production of any turbidity is prevented when the aqueous silver nitrate solution is added. A 10 per cent. and a 1 per cent. solution of silver nitrate are prepared, and these titrated by taking 5 grams of oil, containing a known quantity of phosphorus, and diluting to 100 c.c. with acetone. To 10 c.c. of this solution, the 10 per cent. silver nitrate solution is added drop by drop until the filtered liquid is no longer darkened in colour on the addition of another drop of silver nitrate. Suppose two drops of the silver nitrate solution were insufficient, but that after the addition of three drops the filtered liquid was not darkened on the addition of another drop, then evidently the correct amount of silver nitrate solution was between two and three drops. To determine the exact amount, another 10 c.c. of the solution are taken, two drops of the 10 per cent. solution added, the liquid filtered, and then the 1 per cent. solution added drop by drop until the filtered liquid is not darkened in colour by the further addition of silver nitrate. In this way, the strengths of the silver solutions in terms of phosphorus are ascertained. The determination of an unknown amount of phosphorus in an oil is carried out in exactly the same way. To obtain drops of exactly the same size, Duclaux's apparatus was used. H. R. Le S.

Limits of Error in the Estimation of Phosphoric Acid Soluble in Citric Acid. By Max Maercker (*Landw. Versuchs-Stat.*, 1899, **52**, 119—136).—A Report to the Verband der Versuchs-Stationen on the results of two series of determinations of phosphoric acid soluble in citric acid in samples of basic slag, the first comprising 468 analyses of 116 samples, the second 504 analyses of 252 examples.

In the second series of determinations, 92·1 per cent. showed a difference of, at most, 0·5 per cent. between the highest and the lowest result, or an error of ±0·25 per cent. N. H. J. M.

Estimation of Total Phosphoric Acid in Basic Slags. By C. Aschman (*Chem. Zeit.*, 1899, **23**, 435—436).—The following solutions are required: nitrosulphuric acid, made by taking 420 grams of nitric acid of sp. gr. 1·2, 50 grams of strong sulphuric acid, and diluting with water to 10 litres. Solution of citric acid, made by dissolving 500 grams of the acid to 1 litre. Wagner's magnesia mixture, made by dissolving 110 grams of crystallised magnesium chloride and 140 grams of ammonium chloride in 700 c.c. of ammonia (of 8 per cent. strength) and 1300 c.c. of water. Molybdate solution, made by dissolving 150 grams of ammonium molybdate and 400 grams of ammonium nitrate to 1 litre, and pouring the solution into a litre of nitric acid of sp. gr. 1·19.

5 grams of the sample are put into a half-litre shaking bottle, which is then filled up to the mark with nitrosulphuric acid. After rotating for half an hour in a Wagner apparatus, the liquid is left overnight. 50 c.c. of the filtrate are then mixed with 10 c.c. of citric acid solution and neutralised with ammonia; 50 c.c. more water are added, and the whole left to cool for 20 minutes. To the liquid, which must be perfectly clear, are now added 20 c.c. of magnesia mixture; after a few hours standing with frequent stirring, the magnesium phosphate precipitate is collected as usual.

If the neutralised liquid deposits silicic acid, another portion of the acid solution must be precipitated with molybdate in the usual manner. L. DE K.

Basic Slag. By ARMAND DEZSÖ HERZFELDER (*Landw. Versuchs-Stat.*, 1899, **52**, 291—314. Compare Abstr., 1897, ii, 344).—The assimilable phosphoric acid in basic slag is in the form of tricalcium phosphate. The slag contains also calcium phosphates of higher basicity, iron phosphates, iron silicophosphates, calcium silicophosphates, calcium oxide and carbonate, silicon chiefly in combination with calcium, iron oxide, sulphide, and carbonate, &c.

The difficulties in the way of determining the tricalcium phosphate by extraction with citric acid are the presence of lime, which neutralises some of the acid, and the dissolution of a portion of the silicate, most of which is precipitated with the molybdate, redissolves in ammonia, and is again precipitated by the magnesia mixture. In this way, 0·01 and 0·02 gram of SiO_2 will cause an error of 0·6 and 1·27 per cent. in the phosphoric acid. This source of error and the error (in the other direction) caused by the presence of lime, can be avoided by altering the process, but the presence of iron in the slag involves another difficulty, since iron compounds diminish the solubility of tricalcium phosphate in citric acid.

It is concluded that the error of the Wagner method is as much as 2—3 per cent., and varies according to the nature of the slag. With slags which do not contain much total phosphoric acid and silica, relatively little soluble phosphoric acid, but much lime and iron, the results will be too low; whilst with slags which contain much phosphoric acid (both total and soluble) and silica, but only a little lime and iron, the results for soluble phosphoric acid may be even higher than the total phosphoric acid. N. H. J. M.

Estimation of Boric Anhydride in Boracite. By RUDOLF SCHWARTZ (*Chem. Zeit.*, 1899, 497).—Gilbert's process of carefully estimating the other constituents of the mineral and thus obtaining the boric anhydride by difference is difficult of application. Hönig and Spitz's volumetric process yields very good results. In order to prepare the solution for titration, 1—2 grams of the finely powdered sample are digested for several hours with 100 c.c. of water, and 5—10 c.c. of hydrochloric acid; if a reflux apparatus is employed, half-an-hour's heating on the water-bath will be sufficient. The filtrate is carefully neutralised with *N*/5 soda, using methyl-orange as indicator. The solution may also be prepared by attacking the mineral suspended in water with carbonic anhydride for about half-an-hour;

after remaining for a few hours in a closed flask, the liquid is filtered, evaporated to about 20 c.c., and carefully neutralised with dilute hydrochloric acid, using methyl-orange as indicator; the carbonic anhydride is then expelled by boiling for a short time. The liquid obtained in either way is then titrated with *N*/5 soda in the presence of glycerol, using phenolphthalein as indicator (Abstr., 1897, ii, 159).
L. DE K.

Estimation of Carbon in Iron Products. By ADOLPHE CARNOT and E. GOUTAL (*Chem. Centr.*, 1899, i, 903; from *Anal. Chim. Appl.*, **4**, 73—76).—Blair separates carbon from iron by treating the sample with a solution of potassium cuprous chloride containing 15 c.c. of hydrochloric acid in 200 c.c. The authors having tested the method, state that the temperature should not exceed 70°, otherwise there will be a loss of carbon. They, however, prefer their own process of treating the sample at 95° with the slightly acidified copper solution for about half-an-hour in a current of carbonic anhydride. Ferromanganese with more than 75 per cent. of manganese should be treated in the cold. The drying of the carbonaceous residue is often a source of decided loss.
L. DE K.

A Rapid Eggertz Process. By JOSEF SPÜLLER (*Chem. Zeit.*, 1899, **23**, 476—478).—Some practical hints as to the quickest way of applying the well-known Eggertz test for estimating carbon in iron. The details do not admit of condensation.
L. DE K.

Two Simple Methods for estimating Carbonic Anhydride in Quick Lime, Limestone, Animal Charcoal, Marls, &c., and Soils. By V. SCHENKE (*Chem. Zeit.*, 1899, **23**, 612—614).—The first method and apparatus present no novel features.

A new process is proposed for the estimation of carbonic anhydride combined with lime and magnesia in soils. The soil is ignited, finally over the blowpipe and the ash weighed; it is then moistened with ammonium carbonate and again dried over a low rose-burner; the increase in weight represents the carbonic anhydride in combination with the lime and magnesia.
L. DE K.

Estimation of Potash. By E. WIGHTMAN BELL (*Chem. News*, 1899, **79**, 135—136).—In the case of manures, 5 or 10 grams are boiled with about 150 c.c. of water, with or without addition of hydrochloric acid; ammonia is then added to slight alkalinity, and is followed by barium carbonate to the extent of about double the weight of the manure taken, the boiling being continued for half-an-hour. The mixture is filtered, the precipitate is washed, and the combined filtrate and washings made up to 500 c.c., of which 50 to 100 c.c. are evaporated to dryness, along with a small quantity of ammonium oxalate, gently ignited, treated with hot water, and filtered. The filtrate is evaporated with hydrochloric acid and platinic chloride, and the estimation completed in the usual way. With soils, either the solution in hydrochloric acid is boiled, treated with ammonia, &c., as above, or the soil is moistened with strong sulphuric acid, gently ignited, boiled with water, treated with barium carbonate, boiled again, filtered, and an aliquot portion of the filtrate evaporated with hydrochloric acid and platinic chloride, &c. The sulphuric acid treatment serves also for the estimation of potash in vegetable substances.

D. A. L.

Estimation of Alkalis in Natural Waters. By E. Bohlig (*Zeit. anal. Chem.*, 1899, **38**, 431—432).—Half a litre of the water is rapidly boiled down to 50 c.c. in a large porcelain basin, then strongly acidified with sulphuric acid, and evaporated without ebullition until fumes of sulphuric acid are given off. The residue is then washed into a 200 c.c. flask with 150 c.c. of water, some barium carbonate added, and carbonic anhydride passed through the mixture as long as any is absorbed; the insoluble matter is removed by filtration and washing, the filtrate evaporated to dryness, and the dry residue digested with 50 c.c. of a mixture of equal parts of alcohol and water. The alkali carbonates dissolve in this menstruum, whilst all other carbonates remain undissolved. After filtration, the total alkalis present can at once be estimated by titration with *N*/10 hydrochloric acid. The potassium is then precipitated as platinochloride, and the sodium calculated from the difference.

M. J. S.

Estimation of the Alkalis in Urine. By Richard Přibram and Georg Gregor (*Zeit. anal. Chem.*, 1899, **38**, 401—411).—With the object of establishing a method which, without loss of accuracy, should be sufficiently rapid and convenient for clinical purposes, the authors have examined the methods of Neubauer, Lehmann, Bunge, Salkowski-Munk and Heintz. Neubauer's method is far from satisfactory, Lehmann's process (Abstr., 1885, 609) is theoretically free from sources of error, and as it gives higher values for the potassium found than any of the other processes, it is presumed to be the most accurate. It may be improved by substituting concentrated sulphuric acid for the ammonium sulphate added before incineration of the urine residue; a white ash is then much more rapidly obtained, and there is less danger of loss of alkali. Another improvement introduced by Kretzschmar consists in evaporating to dryness, and drying at 110° after the addition of barium chloride, ammonia, and ammonium carbonate. On treating the residue with hot water containing a little ammonia, the alkali chlorides can be washed out with great facility. Both this method and Bunge's are, however, tedious. That of Salkowski-Munk is equally so, and of lower accuracy, whilst Heintz's process is confined to the estimation of the potassium, and gives seriously low results. The authors therefore propose a new process which gives results identical with those of Lehmann, but is more rapid and requires less caution on the part of the operator. 50 c.c. of urine are mixed with 10 c.c. of dilute (1 ; 10) sulphuric acid and a sufficient quantity of a 10 per cent. solution of barium permanganate (10—20 c.c.), and the mixture is boiled; after boiling for 10—15 minutes, a red coloration must still remain; this is removed by a few drops of oxalic acid. Barium chloride is then added in small excess followed by ammonia and ammonium carbonate; the precipitate is removed by filtration, and the filtrate evaporated in a platinum basin; the alkali chlorides thus obtained are usually quite free from carbonaceous matter. Should magnesium be present, as may occur in all processes in which the alkalis are weighed as chlorides, it may be eliminated by keeping the chlorides at a dull red heat in a covered platinum crucible for an hour or longer, by which means magnesium chloride is converted into oxide. It is then desirable to estimate the total chlorine by silver, and the potassium by platinum, and calculate the sodium indirectly.

M. J. S.

Separation of Zinc from Nickel. By E. Döhler (*Chem. Zeit.*, 1899, **23**, 399—400).—Zinc may be separated from nickel by precipitation with hydrogen sulphide in the presence of free acetic acid when mineral acids are absent. Good results may be obtained by using a very large excess of acetic acid, but even then the precipitated zinc sulphide may be of a dark colour and contain an admixture of nickel sulphide. It may be freed from nickel by dissolving it in dilute hydrochloric acid, which leaves most of the nickel sulphide undissolved, and after neutralising the filtrate with ammonia and adding sodium acetate and free acetic acid, again precipitating by means of hydrogen sulphide, pure white zinc sulphide being then obtained. Instead of using sodium acetate and acetic acid, the neutralised solution may be advantageously mixed with sodium formate and formic acid; the precipitate produced by hydrogen sulphide is then free from nickel, and needs no purification.

L. de K.

Electrolytic Estimations and Separations. By Lily G. Kollock (*J. Amer. Chem. Soc.*, 1899, **21**, 911—928).—Some of the older methods for electrolytic determinations and separations in potassium cyanide solutions have been repeated. The exact conditions as to current density, ampèrage and voltage and other factors have been worked out for the estimation of cadmium, silver, and mercury, and for the separation of silver, mercury, or gold from platinum, copper, zinc, nickel, or cobalt; of silver or mercury from cadmium or iron, and of gold from palladium.

Mercury may be deposited from alkali sulphide solution under the following conditions: 25 c.c. of sodium sulphide are added to a solution of mercuric chloride containing 0·1403 gram of mercury; this solution, diluted to 125 c.c., is electrolysed at 70° by a current of $N.D._{100} = 0·11$ ampère, and voltage $= 2·5$, and, at the end of 5 hours, the mercury is completely deposited. Copper can be deposited from nitric acid solution by using a current of $N.D._{100} = 0·09$ and voltage $= 1·9$ in 5 hours at 65°; mercury can also be deposited in a similar manner.

Cadmium is deposited from sulphuric acid solution in 5 hours at 65° when a current of $N.D._{100} = 0·078$ and voltage $= 2·61$ is employed. Mercury may also be estimated in a somewhat similar manner.

The conditions necessary for the accurate determination of bismuth in citric acid, ammonium citrate, or potassium citrate solution have also been determined. In the case of ammonium citrate, the solution is made ammoniacal and is electrolysed at 65°, first with a current of 0·02 ampère and 1·8 volts, the current being finally increased to

0·09 ampère and 2·3 volts. A certain amount of bismuth peroxide is always deposited on the anode and must be weighed. A current of much the same density was employed in both citric acid and potassium acetate solutions, and in the latter case the solution was made strongly alkaline by the addition of potassium hydroxide.

Iron may be deposited in the course of 7 hours from a solution containing sodium citrate and free citric acid when a current of 0·58 ampère and 5·7 volts is employed, or in 4·5 hours at 50° with a current of 0·4—1 ampère and 7—11 volts. J. J. S.

Precipitation of Cadmium by Hydrogen Sulphide. By Robert Meldrum (*Chem. News*, 1899, **79**, 170—171).—The author attributes failure to detect small quantities of cadmium, by means of hydrogen sulphide in the way usually employed, to the too liberal use of hydrochloric acid, which dissolves the sulphide. He has further investigated the precipitation by means of hydrogen sulphide of neutral solutions of cadmium sulphate varying in strength from 0·5 to 0·00125 per cent. Solutions from 0·5 to 0·25, in the cold give a curdy precipitate which settles quickly and a dense, opaque, yellow solution; when heated to boiling, the precipitate becomes orange-yellow, settles rapidly, and turns paler on cooling, but does not regain its former colour; the solution is clear with a slight yellow tinge. Agitation while cooling, and when cold, makes the precipitate settle less rapidly and renders the solution opaque. Solutions containing from 0·2 to 0·02, yield less precipitate on boiling, give little or no precipitate in an hour in the cold, and the solution remains opalescent. Solutions of greater dilution (except the 0·00125, which shows no colour in a thickness of 2 inches) yield yellow solutions, but no immediate precipitate. The filtrates from the solutions of greater strength than 0·0175 per cent. are almost free from colour in a thickness of 2 inches, but from the solutions of still greater dilution the filtrates are always coloured. By repeated filtrations, this colour may be removed from the 0·0175 to the 0·015 per cent. solutions but not from the weaker filtrates; these, however, deposit a small precipitate in 24 hours, but still retain a yellow colour.

A colorimetric method of estimating cadmium is suggested for solutions not exceeding in strength 0·02 per cent. of the sulphate.

D. A. L.

Solubility of Lead Sulphate in Aqueous Ammonium Acetate. By J. C. Long (*Amer. Chem. J.*, 1899, **22**, 217—218).—Lead sulphate is most soluble in a solution of ammonium acetate containing 33 grams per 100 c.c. To dissolve lead sulphate in analysis, it is best to add, for each gram, 10 c.c. of the ammonium acetate solution, heat to boiling, and filter promptly; to recover the lead sulphate, 0·5 gram of sulphuric acid should be added, this facilitating the evaporation and expulsion of the ammonium acetate. W. A. D.

Separation of Copper and Zinc. By W. Dederichs (*Chem. Centr.*, 1899, i, 950; from *Pharm. Zeit.*, **44**, 198).—Zinc is estimated in brass by dissolving in the smallest possible amount of nitric acid, diluting with water containing 2—3 per cent. of hydrochloric acid, and removing the copper by means of hydrogen sulphide; the filtrate is then boiled and the zinc precipitated with sodium carbonate.

To estimate copper, the nitric acid solution of the brass is digested with sodium hydrogen sulphite, and an excess of a standard solution of ammonium thiocyanate is added to precipitate the copper; the excess of the reagent is then titrated with silver nitrate in an aliquot part of the filtrate.

Traces of lead are estimated in the usual way as sulphate.

L. DE K.

Separation of Copper from Cadmium as Oxalate. By G. BORNEMANN (*Chem. Zeit.*, 1899, **23**, 565—566).—The solution of copper and cadmium, which must not be too concentrated, is mixed with a moderate quantity of nitric acid, heated to boiling, and then mixed with a slight excess of oxalic acid previously dissolved in boiling water; the liquid is then placed in a water-bath until it has become quite clear. The precipitated copper oxalate is first washed by decantation with boiling water containing a little nitric and oxalic acids, and then collected on a suitable filter and washed with boiling water containing at first a few drops of oxalic acid; in this way, the precipitate is obtained free from cadmium. The oxalate is finally converted into sulphide by ignition with sulphur in a current of hydrogen.

L. DE K.

Modification of Eschka's Mercury Assay. By K. E. CHISM (*Chem. Centr.*, 1899, i, 996; from *Trans. Amer. Inst. Min. Eng.*, Oct., 1898).—Eschka's method of mercury assay by collecting the mercury vapour on a weighed golden lid, gives accurate results, but is somewhat expensive, as the gold soon wears out. The author now substitutes a lid made of silver of about 0·02 mm. thickness; this may be used three times, and costs but little.

0·5—1 gram of the ore is mixed in a porcelain crucible with 5 grams of clean iron filings, another gram of the iron being sprinkled on the top. The crucible is placed on a perforated plate and the lid is put on, and cooled by placing on it a silver or copper basin filled with cold water. The bottom of the crucible is now heated for 15 minutes with a spirit lamp, and when cold the lid is taken off and re-weighed. On applying heat, the mercury volatilises, and the lid may be used again.

L. DE K.

Volumetric Estimation of Manganese in Manganates by means of an Alkaline Solution of Arsenious Acid. By C. REICHARD (*Chem. Zeit.*, 1899, **23**, 801—802).—The process is based on the fact that on adding an alkaline solution of arsenious acid of known strength to a solution of a manganate, the latter is reduced to manganous hydroxide. The unoxidised arsenious acid is then estimated by standard iodine; or the manganous hydroxide may be at once redissolved by adding sulphuric acid and the arsenious acid then estimated in acid solution with standard permanganate.

Five molecules of arsenious acid used for reduction are equivalent to four atoms of metallic manganese. The test experiments are satisfactory. L. DE K.

The Presence of Carbon in Electrolytically Deposited Iron. By SAMUEL AVERY and BENTON DALES (*Ber.*, 1899, **32**, 2233—2238. Compare this vol., ii, 251, and Verwer and Groll, *ibid.*, 387).—The authors maintain the accuracy of their former conclusion that the ordinary methods for the electrolytic estimation of iron do not yield satisfactory results, because a small amount of iron remains in the solution, and the deposited metal contains carbon.

In the presence of oxalic acid, the reaction with potassium thiocyanate is not delicate, and cannot therefore be depended on for indicating the completion of the deposition. Oxalic acid is converted by electrolytic reduction into glycollic acid, and the presence of this in the solution causes the deposited metal to contain carbon. A. H.

Potassium Ferrocyanide as a Source of Iron in the Volumetric Analysis of Iron. By K. SCHRÖDER (*Chem. Zeit.*, 1899, **23**, 533—534, 540—541, 557—559).—The author states that potassium ferrocyanide may be obtained almost absolutely pure and be advantageously utilised as a source of pure iron when standardising solutions for the technical estimation of iron.

Four or five grams of the pure salt are heated in a Kjeldahl flask with 20—25 c.c. of strong sulphuric acid; heat is applied, moderately at first, and then gradually increased until boiling sets in, which is then kept up for half-an-hour. When cold, 25 c.c. of water and 10—15 c.c. of hydrochloric acid of sp. gr. 1·19 are added and the mixture warmed until completely dissolved. This solution may now be reduced with zinc, or by means of stannous chloride followed by mercuric chloride, and will then be fit for standardising purposes. L. DE K.

Estimation of Iron in Organic Matter. By FRANZ RÖHMANN and FRANZ STEINITZ (*Zeit. anal. Chem.*, 1899, **38**, 433—435).—Instead of destroying the organic matter by incineration, it is far preferable to employ Neumann's method of heating with concentrated sulphuric acid and ammonium nitrate. The operation is performed in a Jena glass flask over the naked flame, the ammonium nitrate (1 gram for each c.c. of acid) being added in several portions, and the heating continued until a clear, pale yellow liquid is obtained. This is now made alkaline with ammonia and the iron precipitated as sulphide by adding a few drops of colourless ammonium sulphide with the usual precautions. The iron sulphide is collected on an ash-free filter, from which it is redissolved by sulphuric acid, the solution being run back into the precipitation flask, where it dissolves any iron sulphide adhering to the sides. Here it is concentrated by boiling and transferred to a platinum basin, in which, meanwhile, the filter has been incinerated and its ash fused with potassium hydrogen sulphate. By introducing a rod of zinc for about half-an-hour, the ferric salt is completely reduced, and is then titrated with permanganate.

In dealing with fæces, the large amount of calcium sulphate formed is an inconvenience. It is best not to attempt to remove it from the original acid solution, but to precipitate the iron sulphide in the turbid liquid. Urine (300—400 c.c.) should be mixed with 25—30 c.c. of fuming nitric acid and boiled down to a small volume before adding sulphuric acid (20—30 c.c.) and ammonium nitrate. M. J. S.

Iron Separations with Alkali Salts. I. By HARRY BREARLEY (*Chem. News*, 1899, **79**, 193—194).—It is pointed out that for the separation of iron from manganese, zinc, nickel, cobalt, and sometimes copper, alkali acetates, phosphates, sulphates, chromates, tungstates, and molybdates are amongst the available reagents. *Separation with acetates* has already been investigated (Abstr., 1896, ii, 676; 1897, ii, 388; 1898, ii, 96 and 143); it is, however, now shown that it is best not to add the acetate to the cold solution, and then to heat to boiling, but that the acetate should be added to the hot solution. Furthermore, it is shown that with a constant quantity of nickel or other metal and varying quantities of iron, the exactness does not necessarily increase with the decrease in the proportion of iron; but with fixed proportion of iron and a varying proportion of nickel, probably the separation is better for small than for large amounts of nickel.

D. A. L.

Detection of Cobalt in the Presence of Ferric Compounds. By HENDRIK WEFERS BETTINK (*Chem. Centr.*, 1899, i, 904; from *Ned. Tydschr. Pharm.*, **11**, 64—66).—When a solution of cobalt is mixed with potassium thiocyanate and a mixture of ether and alcohol poured on to the surface, a blue coloration is observed in the upper layer. In the presence of ferric salts, however, the red colour given by ferric thiocyanate interferes with the test, but in this case the iron compound may be removed by first extracting the mixture with pure ether, which dissolves the ferric thiocyanate but not the cobalt compound; the ether-alcohol mixture is then added to the residual liquid.

The author has improved the method by operating as follows: Potassium thiocyanate is added and the red coloration is destroyed by adding powdered sodium thiosulphate; the liquid is then covered with a layer of ether-alcohol. 0·001 gram of cobalt nitrate may thus be detected in the presence of 1 gram of ferric chloride.

L. DE K.

Reduction of Chromic Acid by Acetic Acid and its Effect in Anthracene Testing. By HENRY BASSETT (*Chem. News*, 1899, **79**, 157).—When the mixture of acetic acid with chromic acid used in anthracene testing is stored, the latter suffers some reduction, a reaction that is still more marked when undiluted acetic acid is boiled with chromic acid; but it also takes place with aqueous solutions of acetic acid when boiled, not, however, when the volumes of the acetic acid and water are equal. The reduction is more marked with acid crystallising at 13·5° than with the purer acid crystallising at 17°.

In anthracene testing, the less pure acetic acid and mixed solutions of acetic and chromic acids that have been kept too long (more than 15 days) will give results which are too high. D. A. L.

Testing Oil of Turpentine for Mineral Oils. By C. SCHREIBER and F. ZETZSCHE (*Chem. Zeit.*, 1899, **23**, 686—687).—The following method is suggested as a good preliminary test: 1 c.c. of the sample of turpentine is diluted to 50 c.c. with alcohol of 90—95 per cent. 20 c.c. of this solution are put into a 75 c.c. glass cylinder and 20 c.c. of a solution containing exactly 15 grams of potassium bromate and 50 grams of potassium bromide in a litre are added, followed by 20 c.c. of dilute sulphuric acid (1 : 3). The stopper is inserted and the mixture well shaken for half a minute. If the liquid should not be quite decolorised, the sample is likely to contain mineral oil and should be submitted to further analysis, but otherwise it may pass as commercially pure. L. DE K.

Estimation of Dry Substance in Glycerol. By G. BENZ (*Zeit. anal. Chem.*, 1899, **38**, 436—438).—It is commonly accepted that glycerol cannot be estimated by drying at 100°, because the glycerol begins to volatilise as soon as all the water has evaporated. The author shows, however, that this occurs only in shallow, uncovered vessels. By employing a wide-necked flask covered with a loose glass cap resting on the neck, glycerol can be dried to a constant weight either at 100° or 110°, and that this takes place without loss is shown by dissolving glycerol, so dried, in water and re-evaporating the solution in the same flask, when exactly the same weight of dry substance will be obtained. M. J. S.

Estimation of Glycerol in Fermented Liquids. By J. B. VINCENT LABORDE (*Chem. Centr.*, 1899, i, 905—906, 1086; from *Ann. chim. anal. appl.*, **4**, 76—80; 110—114. Compare Abstr., 1896, ii, 77).—The process is based on the fact, noticed by the author, that at 150—200°, glycerol is quantitatively decomposed by sulphuric acid with liberation of the whole of the carbon; 1 part of carbon represents 2·56 parts of glycerol. A quantity of liquid containing from 0·1—1·0 gram of glycerol is mixed with 10 drops of sulphuric acid and boiled down in a 250 c.c. flask with small, flat bottom until about 2 c.c. are left. 6 c.c. of sulphuric acid are then added and the flask closed with a rubber cork through which passes a glass tube drawn out to a fine point. The mixture is now heated on a sand-bath to 150°, and when the action takes place the temperature rises to 200°. After a few minutes, 5 c.c. of dilute hydrochloric acid (1 : 1) are added, and the whole is heated on the sand-bath until white fumes begin to form; the carbon is now thoroughly washed by decantation with boiling water, and then transferred to a weighed platinum dish; a little ammonia is added, and the whole dried first at 110° and then over a small rose-burner until no more ammoniacal odour is noticed. When cold, the carbon is weighed and allowance made for any ash.

To estimate glycerol in saccharine liquids, any sugar must first be removed. If the amount does not exceed 0·5 gram per litre, 50 c.c. are mixed with 100 grams of small shot, evaporated down to 2—3 c.c. and gradually mixed with 1—2 grams of calcium hydroxide; 75 c.c. of ether-alcohol mixture (2 : 1) are then added to dissolve the glycerol; the liquid is filtered, and the residue is washed with more of the ether mixture until the filtrate reaches 200 c.c. After adding 10 drops of sulphuric acid, the ether-alcohol is distilled off and the residue treated as already described.

If the amount of sugar amounts to 5—20 grams per litre, the sufficiently concentrated solution is mixed with 2 grams of calcium hydroxide which has been moistened with alcohol; if the mass does not readily set, a little more dry lime should be added; the mass must then be extracted as before with ether-alcohol mixture. If the liquid contains more than 20 grams of sugar per litre, a volume of it which will contain about 5—6 grams of sugar is mixed with 2 grams of calcium hydroxide suspended in 10—20 c.c. of proof spirit and then boiled with 100—200 c.c. of 80 per cent. alcohol. When cold, an aliquot portion of the filtrate is acidified with tartaric acid, and the alcohol having been expelled, the residue is treated as before with the ether-alcohol mixture.

The test analyses are very satisfactory. L. DE K.

Behaviour of Iron Salts with Pyrogallol. By A. HIRSCH (*Chem. Centr.*, 1899, i, 927; from *Pharm. Zeit.*, **44**, 205).—When 2 drops of a solution of ferric chloride containing 10 grams of liq. ferri. sesquichlor., in 90 of water are added to a few c.c. of a 1 per cent. solution of pyrogallol, an amethyst-blue coloration is first formed, which rapidly changes to reddish-brown, but if 1 c.c. of a 0·1 per cent. solution of sodium hydroxide or 0·5 c.c. of a 0·5 per cent. solution of sodium carbonate be then added, the solution becomes deep blue. The brown coloration is restored, however, by adding very small quantities of mineral acids. Zinc oxide or barium carbonate acts like the alkalis, hence the brown coloration must be due to the mineral acid contained in the ferric salt. Organic iron salts give blue colorations, which become brown only on addition of mineral acids. A solution of pyrogallol, rendered reddish-brown by the addition of a very dilute solution of ferric chloride, may be used to test for faint alkalinity, as, for instance, in the case of dilute solutions of alkaloids, which give the blue coloration. When pure ferrous salts are mixed with solutions of pyrogallol, a white turbidity is formed, and if a very dilute solution of sodium hydroxide is then added, the solution becomes blue, probably owing to partial oxidation of the ferrous salt.

E. W. W.

Estimation of Mannose in Mixtures of Sugars. By ÉMILE BOURQUELOT and HENRI HÉRISSEY (*Compt. rend.*, 1899, **129**, 339—341). —The solution of mannose is mixed with a solution of equal volumes of phenylhydrazine and glacial acetic acid, allowed to remain for 8 hours at the ordinary temperature, and the precipitate washed successively with ice-cold water, alcohol, and ether, and dried in a vacuum. The results are not affected by the presence of galactose, arabinose, maltose, or dextrin, and are accurate if the solution contains 3 to 6 per cent. of mannose, and the operations are conducted at as low a temperature as possible. A correction should be made by adding 40 milligrams to the weight of the precipitated hydrazone for every 100 c.c. of solution. C. H. B.

Influence of Sucrose on the Estimation of Pentosans by the Phloroglucinol Method, with special reference to Products from Sugar Refineries. By KARL ANDRLÍK (*Chem. Centr.*, 1899, i, 905; from *Zeit. Zuck. Ind. Böhm.*, **23**, 314—323).—When pentoses are estimated by the phloroglucinol method, the result, calculated as arabinose, may be from 0·60—0·89 per cent. too high if cane sugar is present.

Substances yielding furfuraldehyde are found in the diffusion syrup to the extent of only 0·2 part for every 100 parts of cane sugar; the concentrated juice contains 0·13, and the first crop of crystals 0·03 part; the greater portion of these passes into the "scum" or the molasses. L. DE K.

Cobalt Derivatives of Sucrose and of Dextrose. By W. HERZOG (*Chem. Zeit.*, 1899, **23**, 627—628).—Papasogli (Abstr., 1898, 194) states that an aqueous solution of cane-sugar, when treated with a few drops of a solution of a cobalt salt and then with an excess of sodium hydroxide, gives an amethyst-violet coloration which is moderately stable, whereas an aqueous solution of dextrose, when treated in the same manner, yields a blue colour which is remarkably evanescent, changing quickly to a dirty green, and he recommends this reaction as a test for sucrose in the presence of dextrose. The author finds that the colours produced in the two cases are very similar, that with dextrose, however, is not so stable—it immediately turns blue and then a dirty green; with saccharose, too, the final colour is dirty green. The method is therefore of no use in testing for sucrose in the presence of dextrose. With regard to the nature of the products, it is thought probable that they are compounds of the cobalt salts with alkali sucrates or dextrosates, the colour depending to a certain extent on the actual cobalt salt employed. J. J. S.

Analyses of Honey. By C. HOITSEMA (*Zeit. anal. Chem.*, 1899, **38**, 439—441).—In 10 samples of honey of known origin, the following estimations have been made: (1) specific gravity at 15° of a filtered solution of 1 part of honey in 2 parts of water; (2) pollen and wax, the constituents insoluble in warm water; (3) moisture estimated by drying without heat in a vacuum desiccator; (4) polariscopic rotation (after König, *Unters. landw. gew. wicht. Stoffe*, 1898, 474; (5) ash; (6) reducing and invertible sugars. The sp. gr. ranged from 1·102 to 1·14, water from 8·3 to 17·8 per cent.; polarisation from −3·1 to −9·1, being in all cases negative, ash, 0·12 to 0·34 per cent., pollen and wax, 0·02 to 0·46 per cent.; reducing sugar, 71·2 to 74·4; and sucrose, 0·2 to 2·6 per cent., whilst a sample of unknown origin showed 6·4 per cent. of the latter. M. J. S.

Estimation of Sugar in Fodder containing Molasses. By OTTO FOERSTER (*Chem. Zeit.*, 1899, **23**, 196).—The analysis is generally made by mixing a weighed quantity of the sample with water up to a definite volume, and afterwards making a correction for the volume of the undissolved matter; but this process can hardly lay claim to accuracy. The author recommends weighing out a multiple of 13·024 grams of the fodder and then extracting this in a Sickel's apparatus with absolute alcohol; after 12 hours, it may be taken for granted that all the sugar has been extracted. After distilling off the spirit, the residue is dissolved in water and diluted to a volume representing 75 c.c. for each 13·024 grams of the sample, and the sugar is then estimated either chemically or polarimetrically. L. DE K.

[Estimation of Caramel.] By N. FRADISS (*Chem. Centr.*, 1899, i, 1160—1161; from *Bull. de l'Assoc.*, **16**, 280).—The amount of caramel contained in sugar products is determined by treating the dry substance with a small quantity of methylic alcohol of 95°, evaporating on the water-bath, drying the gummy residue in a vacuum or in a current of dry air, and again digesting it with methylic alcohol for 2 hours. The caramel is precipitated from the solution by amylic alcohol, the precipitate redissolved, reprecipitated once or twice more, and finally dried at 90° and weighed. The caramel may also be determined by titrating with Violette's or Fehling's solution, but if dextrose is present it is necessary to titrate the original solution before and after treating with an excess of lead acetate. Then if A = c.c. of copper solution required, a = c.c. of original solution required for 5 c.c. of copper solution, the volume of the copper solution corresponding with the caramel is $5(1-a/A)$. Allowance must also be made for the amount of lead acetate solution (1/10 vol.) used. The dextrose may also be destroyed by boiling with calcium carbonate and then precipitating with carbonic anhydride. Traces of caramel are estimated by treating 200 c.c. of the solution with excess of ammoniacal lead acetate. The precipitate, after washing with water free from carbonic anhydride, is suspended in water and decomposed with hydrogen sulphide. The filtrate is again treated with lead acetate, and the solution, from which the hydrogen sulphide has been expelled by evaporating to 10 c.c., is titrated with copper solution. Determinations of the amount of caramel in various sugar products are quoted. E. W. W.

Estimation of Glycogen. By EDUARD PFLÜGER and JOSEPH NERKING (*Pflüger's Archiv*, 1899, **76**, 531—542. By EDUARD PFLÜGER, *ibid.*, 543—551. Compare this vol., ii, 529).—These two papers contain more criticisms of Külz's method, and show that it can be improved by certain modifications. A new method, which is simpler and gives practically the same results as the improved Külz method, depends on the fact that in an alkaline solution of glycogen, or extract of flesh or liver, alcohol will completely precipitate the glycogen, and if the solution contains potassium iodide, the proteid matter remains in solution. W. D. H.

Detection of "Saccharin" in Foods. By ALFRED HASTERLIK (*Chem. Zeit.*, 1899, **23**, 267—268).—The author, having tried a large number of sweetened beverages for "saccharin" by Börnstein's resorcinol test, finds that this process is absolutely worthless, as the green fluorescence is often obtained when the liquids are quite free from "saccharin," as proved by other tests. The green colour is often caused by succinic acid, traces of which are always present in fermented liquids. L. DE K.

Detection of Formaldehyde in Milk. By ALEXANDER LEYS (*J. Pharm.*, 1899, [vi], **10**, 108—114).—Gayon's solution (Abstr., 1888, 326), as used by the author for the detection of small quantities of formaldehyde in milk, is prepared by adding 10 c.c. of pure hydrochloric acid to a mixture of 10 c.c. of sodium hydrogen sulphite solution (30° B.) and 1000 c.c. of a 0·1 per cent. aqueous solution of magenta. It produces a well marked coloration with the distillate from milk containing one part of formaldehyde in a million.

H. R. LE S.

Estimation of Formaldehyde by the Aid of Hydrogen Peroxide. By OSKAR BLANK and HERMANN FINKENBEINER (*Ber.*, 1899, **32**, 2141. Compare this vol., ii, 188).—A reply to Harden's criticism (Proc., 1899, **15**, 158). The authors' contention that their method is extremely accurate has been proved by numerous determinations. J. J. S.

Iodine Number of Fatty Acids. By ALEXANDER ZEGA and R. MAJSTOROVIĆ (*Chem. Zeit.*, 1899, **23**, 597).—From experiments with fatty acids from maize oil, olive oil, sesamé oil, and cotton seed oil, the conclusion is drawn that the iodine number largely decreases when the fatty acids are kept too long in the air-bath. In the case of maize oil, it was found that the dried acids, when kept at the ordinary temperature for some days, gave a gradually decreasing iodine number, falling in 8 days from 118·6 to 102·3 per cent. L. DE K.

Modification of Kaemer's Method for the Analysis of Cream of Tartar. By G. LOMBARD (*Chem. Centr.*, 1899, i, 1086; from *Staz. sperim. agrar. ital.*, **32**, 123—126).—In Kaemer's method, a weighed quantity of the sample is dissolved in the calculated amount of normal soda, the solution diluted to 200 c.c., and 20 c.c. are acidified with acetic acid and evaporated to dryness; the residue is washed with alcohol until the washings are no longer acid, and the undissolved potassium hydrogen tartrate then estimated by means of standard alkali.

The author has successfully modified this test. 20 c.c. of the solution are mixed with 1·5 c.c. of acetic acid and then with 100 c.c. of a mixture of equal parts of commercial absolute alcohol and ether. After the lapse of 4 hours, the potassium hydrogen tartrate has separated completely, and may be freed from acid by washing with ether-alcohol mixture; it is then titrated as before. L. DE K.

Calcium Citrate and its Analysis. By ARTURO SOLDAINI and E. BERTÈ (*Gazzetta*, 1899, **29**, i, 489—497).—The authors assign the considerable differences found in the results of analyses by different workers of commercial calcium citrate to two causes. Firstly, the amount of water retained by the sample varies with the method of storage, with the time of exposure to the air, &c. Secondly, when estimated as calcium citrate, the solubility of the latter in the washing water is not properly allowed for. Error is also sometimes caused by excessive drying of the citrate which then becomes to a slight extent insoluble in acetic acid. The authors find that crystallised calcium citrate loses $2H_2O$ at 100—130°, and the remaining $2H_2O$ at 175—185°. The following method of analysis is recommended. 1 gram of the finely powdered substance is heated in an Erlenmeyer flask with 10 c.c. of water, about 20 drops of hydrochloric acid of sp. gr. 1·18 added, and when solution has taken place, the liquid is cooled, made distinctly alkaline to phenolphthalein with $N/2$ sodium hydroxide, and then about 3 c.c. of acetic acid added. The liquid is filtered and the residue washed until it is no longer acid to litmus paper, The filtrate is evaporated to dryness on the water-bath, the dry mass being taken up with 15—20 c.c. of boiling water and the solution filtered on a hot water funnel through an ashless filter of 9 cm. diameter. The residue is then washed with 55 c.c. of water in such a way as to have the last drops of the washings almost or quite colourless. The precipitate is dried, burnt, and calcined strongly for 10 minutes. T. H. P.

Estimation of Non-volatile Organic Acids in Tobacco. By Richard Kissling (*Chem. Zeit.*, 1899, **23**, 2—4. Compare Abstr., 1898, ii, 659).—I. *Separation and estimation of oxalic, citric, and malic acids by the baryta method.*—The barium salts of these acids may be obtained practically anhydrous by drying them at 70° under 100 mm. pressure; they then yield almost the theoretical amount of barium carbonate. Calcium oxalate also becomes quite anhydrous when thus treated.

The mixed acids are titrated with standard baryta, and 20 per cent. by volume of alcohol is then slowly added with constant stirring. Barium citrate and oxalate are almost completely precipitated, whilst the malate practically remains in solution, the two errors fairly compensating each other. The malate is then recovered from the filtrate by adding alcohol until its amount reaches 70 per cent. by volume, and leaving the mixture for 24 hours. Both precipitates are collected and weighed. The oxalic acid is estimated in a fresh portion of the solution of the acids by precipitation with calcium chloride in the presence of ammonium acetate.

II. *Estimation of oxalic, citric, and malic acids in tobacco.*—The process (*loc. cit.*) has been slightly modified. The first extraction of the tobacco with ether is now continued for 40—50 hours, and then again for 20 hours, this being repeated two or three times. After making up to 200 c.c., it is better to use 50 c.c. in place of 25 c.c. After shaking out the ether with 90 c.c. of water, the acids are separated as already described. L. de K.

Influence of the Quality of the Ether on the Estimation of Fat in Food-stuffs. By Theodor Methner (*Chem. Zeit.*, 1899, **23**, 37—38).—When foods contain substances readily soluble in water or alcohol, it is as well to extract the fat by means of ether which is free from either water or alcohol. Absolutely anhydrous ether may be obtained by allowing ether to stand over metallic sodium, but the author states that a very good ether may be prepared by placing the commercial article of sp. gr. 0·720 for three weeks over quicklime and then distilling. This will extract about 0·1 per cent. more than the ether prepared by means of sodium. L. de K.

Estimation of Fat in Animal Organs. By Wilhelm Knöpfelmacher (*Chem. Centr.*, 1899, i, 860—861; from *Österr. Chem. Zeit.*, **2**, 122—124. Compare Dormeyer, Abstr., 1895, ii, 540; Frank, 1898, ii, 174; Voit, *ibid.*, 175).—Fat occurs in organs in two forms, one readily extractable with ether, whilst the other seems to be mechanically combined with proteid matters and cannot be extracted by the Soxhlet apparatus in 1000 hours. According to the author, the best plan is to digest the matter with pepsin; this dissolves the proteids and so renders all the fat soluble in ether.

L. DE K.

Preservation of Hübl's Reagent. By RANDOLPH BOLLING (*Amer. Chem. J.*, 1899, **22**, 213—214).—The author's experiments show that the alteration of Hübl's reagent as regards the free iodine present is very rapid and is only slightly delayed by using absolute alcohol in preparing it or by excluding air and light. W. A. D.

Estimation of Fat in Milk. By RICHARD WINDISCH (*Landw. Versuchs-Stat.*, 1899, **52**, 209—211).—A number of samples of milk were analysed by the methods of Liebermann and Székely (Abstr., 1893, ii, 308) and Gerber. The results, which are given, indicate that both methods are satisfactory. N. H. J. M.

Aërometric Estimation of Fat in Milk. By H. TIMPE (*Chem. Zeit.*, 1899, **23**, 436—437, 455—457. Compare Abstr., 1895, ii, 95). —When milk is mixed with aqueous potash, a small but fairly definite quantity of the fat is saponified and becomes insoluble in ether; this constitutes a slight error in Soxhlet's aërometric process. Another slight source of error is the fact that the usual figures representing the mutual solubility of ether and water are not absolutely correct. Finally, the following modified formulæ are proposed: (1) $Z = A - 0{\cdot}075\ W$; (2) $F = 1{\cdot}4566\ Z\dfrac{S - 0{\cdot}7222}{(0{\cdot}9520 - S)\frac{vs}{100}}$, where A represents the weight of the ether saturated with water, W the weight of the water, Z the weight of the aqueous ether left after shaking, S the sp. gr. of the ethereal fat solution, v, the original volume of the milk, s, its sp. gr., and F, the weight of the fat it contains.

L. DE K.

Estimation of Fat in Milk. By A. A. BONNEMA (*Chem. Zeit.*, 1899, **23**, 541—542).—10 c.c. of milk are put into a 100 c.c. cylindrical glass and mixed with 1·5 c.c. of aqueous caustic potash (20 grams per 100 c.c.). After shaking for a moment, 25 c.c. of ether are added and the whole thoroughly shaken for 5 minutes, the glass being held in the warm hand. The glass is placed in cold water, the stopper removed for a moment, 2 grams of tragacanth are added, and the whole is again thoroughly shaken. The tragacanth absorbs all the water and forms a clot, whilst the ether becomes quite clear; 10 c.c. of the ethereal solution are now pipetted off and evaporated in a weighed dish. The results agree with those obtainable by the "Gerber process." L. DE K.

Varying Composition of Butter. By J. J. L. VAN RIJN (*Chem. Zeit.*, 1899, **23**, 453 - 454).—The results obtained by the author again confirm the fact that the Reichert-Meissl number for genuine butter varies from 17—32, although the majority of butters give figures varying from 23—26. The variation is due to the condition of the cows and to the quality of the food. L. DE K.

Adulteration of Butter. By Theodor Pfeiffer (*Chem. Zeit.*, 1899, **23**, 39—40).—A sample of absolutely pure butter gave, on analysis, a Reichert-Meissl number of only 19·4, and a Koetstorfer number as high as 219·4. It would therefore have been liable to be reported as adulterated with a considerable amount of margarine. It was made from the milk of three cows fed on the usual mixed diet.

L. de K.

Butter Analysis. By Alexander Zega (*Chem. Zeit.*, 1899, **23**, 312).—Butter is melted and filtered, and some of the fat is put into a test-tube and heated for 2 minutes in the boiling water-bath. One c.c. is drawn off with a small pipette previously heated and put into a glass-stoppered cylinder containing 20 c.c. of a mixture of 6 parts of ether, 4 parts of alcohol, and 1 part of glacial acetic acid. The cylinder is placed in water at 15—18°, when, if the sample is pure, the liquid remains clear or only deposits an inappreciable amount of fatty matter. With butter containing 10 per cent. or more of margarine, however, a more or less abundant deposit is obtained which may be examined microscopically. Drawings are given showing the considerable differences in appearance between the deposits from butter and from margarine. The process is also serviceable for the detection of tallow in lard; drawings of deposits from lard and tallow being also given.

L. de K.

Butter Analysis. By W. Lawrence Gadd (*Chem. News*, 1899, **80**, 113).—In the application of Reichert's test, the use of alcoholic potash that has been kept may lead to erroneous results which may be obviated by the use of solid potash in the following manner: about 2·5 grams of butter fat just at its melting point is treated in an 8 oz. flask with 20 c.c. of methylated spirit freshly distilled from caustic potash; about 1 gram of solid caustic potash is added, and the flask plunged into hot water. The saponification being complete, the alcohol is evaporated with the aid of a current of filtered air, the mass dissolved in hot water, acidified with sulphuric acid, and subjected to distillation, &c.

D. A. L.

Halphen's Test for Cotton Seed Oil. By Paul Soltsien (*Chem. Centr.*, 1899, i, 1049; from *Zeit. öffent. Chem.*, **5**, 106—107).—Halphen's test for cotton seed oil (Abstr., 1898, ii, 358) works well even without addition of amylic alcohol and sodium chloride. 10 grams of the sample of fat are mixed with 2 grams of a 1 per cent. solution of sulphur in carbon bisulphide and introduced into a test-tube which is closed with a cork through which passes a tube blown out to a bulb; the mixture is then heated for 15 minutes on a water-bath, and the colour compared with that of a known mixture of fat and cotton seed oil treated in like manner. The colour, which is very permanent, strongly resembles that of a solution of potassium dichromate.

The test is very useful, because age or rancidity of the fats do not impair it in the least, and it shows the presence of cotton seed oil, even if this has been previously heated to 200°. Lard, tallow, fats from cheese, sesamé oil, olive oil, rape oil, linseed oil, poppy oil, arachis oil, hazelnut oil, and cod-liver oil are not affected.

L. de K.

Presence of Chlorinated Organic Compounds and Absence of Sulphur Compounds in Cotton Seed Oil. By P. N. Raikow (*Chem. Zeit.*, 1899, **23**, 769—770 and 802).—Although cotton seed oil does not contain sulphur, it gives the phloroglucinol-vanillin test (this vol., ii, 52); this is due to the presence of chlorinated compounds, which, on burning, yield hydrogen chloride. By means of the tubular lamp previously described, the oil was burnt in a beaker placed on its side and the inner surface of the beaker was kept moistened with potassium hydroxide solution. Dupont's method (Abstr., 1896, i, 409) has also been employed, but no sulphur could be detected. The chlorinated compound is not extracted by water, but is somewhat volatile in superheated steam.

Olive oil and walnut oil, although they give the phloroglucinol reaction, are free from both sulphur and chlorine (compare Fox and Riddick, *Chem. News*, 1895, **71**, 296; also Dupont and Charabot, *Bull. Soc. Chim.*, 1896, [iii], **15**, 341). The presence of chloro-derivatives in cotton seed oil may be made use of in determining whether this oil has been employed in adulterating other oils. J. J. S.

"Vegetale" (Cotton-Stearin): Isolation of Cholesterol and Phytosterol from Fats. By F. Wirthle (*Chem. Zeit.*, 1899, **23**, 250).—"Vegetale" consists of crude cotton-stearin, and occurs as a yellow, semi-solid mass which, after being melted, does not readily solidify. Its iodine number is 89·24, and its saponification number 196·1. It gives the Bechi test in a very marked degree, and shows a refraction of 63·3° at 25°. By using Böhmer's process for the isolation of cholesterol and phytosterol, the latter may be readily detected, and mixed crystals of both these substances may be obtained from lard adulterated with only 10 per cent. of "vegetale." Böhmer's process gives satisfactory results even with very rancid fats, and it is only when the samples have been kept for many years under unfavourable conditions that no crystals can be obtained. Kreis's process for the isolation of cholesterol and phytosterol (this vol., ii, 343) requires 50 grams of fat, whilst Böhmer's test may be made with 25 grams only, so it possesses no decided advantages. L. de K.

Isolation of Cholesterol and Phytosterol from Fats. By Otto Foerster (*Chem. Zeit.*, 1899, **23**, 188).—The author objects to the process recommended by Kreis and Wolf (this vol., ii, 343), as in the case of a sample of oil of mustard it only gave 0·03 gram of phytosterol, whilst in another experiment, conducted by the author's process (this vol., ii, 121), 0·6 gram was obtained. L. de K.

New Reactions of Sesamé Oil. By Ferdinand Breinl (*Chem. Zeit.*, 1899, **23**, 647).—The author states that, in place of testing for sesamé oil with hydrochloric acid and a 2 per cent. alcoholic solution of furfuraldehyde, a 3 per cent. alcoholic solution of hydroxybenzaldehyde, vanillin, or piperonal may, with advantage, be substituted.
L. de K.

Bishop's Test for Sesamé Oil. By Hans Kreis (*Chem. Zeit.*, 1899, **23**, 802—803).—Stale sesamé oil, when shaken with an equal volume of hydrochloric acid of sp. gr. 1·19, turns green, and if sugar is also added, a blue colour is developed.

A remarkable result was obtained by the author: a very rancid olive oil gave no colour with hydrochloric acid, but on adding some fresh sesamé oil, which also gave no test with hydrochloric acid, the green colour was at once apparent. Further results are promised.

L. DE K.

Analysis of Human Urine. By WILLIAM CAMERER and FRIEDRICH SÖLDNER (*Zeit. Biol.*, 1899, **38**, 227—290).—The principal methods of urine analysis are criticised and experimentally compared. The most important outcome appears to be that, in the estimation of urea by the Mörner-Sjöquist method, part of the nitrogen of hippuric acid, allantoin, and creatinine is reckoned as urea nitrogen. The methods of estimating uric acid, alloxuric bases, ammonia, and other substances are also examined. W. D. H.

[Estimation of Allylthiocarbimide in] Seeds of some Varieties of Brassica and Sinapis. By WILHELM KINZEL (*Landw. Versuchs-Stat.*, 1899, **52**, 169—193).—The method employed was that of Dirck as modified by Schlicht (Abstr., 1892, 1035), except that the substance was steam-distilled, as proposed by Förster (*Landw. Versuchs-Stat.*, 1898, **50**, 419). Powdered rape cake (15 grams) and white mustard (4 grams) are mixed with water (150 c.c.) and tartaric acid (0·25 gram) in a 500 c.c. Erlenmeyer flask. The heating of the steam flask is so arranged that steam begins to pass over in about half-an-hour; the Erlenmeyer flask is now heated with a small flame until, in 1½ hours, 200 c.c. has distilled over. The vapours pass through a 0·6 cm. tube, 70 cm. long, into three receivers (an Erlenmeyer flask, a Will-Varrentrapp apparatus, and a second Erlenmeyer flask) containing 100, 18, and 10 c.c. respectively of alkaline permanganate solution. As the distillation proceeds, the heating of both flasks must be increased to avoid violent rising of the liquid in the Will-Varrentrapp apparatus. The safety tube of the steam flask is only opened in the case of the permanganate flowing backwards to the flask containing the substance. The liquid in the three receivers is mixed, heated for an hour on a water-bath, and after cooling to 70°, treated with alcohol (25 c.c.) and diluted to 501 c.c. Every 3·333 grams of precipitate ($KH_3Mn_4O_{10}$) corresponds with 1·012 c.c. of solution at 17·5°. After filtration and addition of a little acid and iodine, the sulphuric acid is determined in the manner described by Schlicht (*loc. cit.*), the result being corrected by adding 0·00319 to the amount of barium sulphate from 400 c.c.

The results obtained with a number of samples of different varieties of brassica from India are given. N. H. J. M.

Estimation of Urea. By SERGEI SALASKIN and J. ZALESKI (*Zeit. physiol. Chem.*, 1899, **28**, 73—87).—The estimation of urea in urine by the Mörner-Sjöquist method gives results which are too high. This is because part of the hippuric acid nitrogen is reckoned as urea nitrogen; and the more hippuric acid the urine contains the greater the error. The method suggested is to heat the residue after the ether and alcohol are evaporated off, in a glass tube, and to estimate the urea from the ammonia thus given off. W. D. H.

Volumetric Estimation of Aniline and Bromine. By GEORGES DENIGÈS (*J. Pharm.*, 1899, [vi], 10, 63—66).—A claim for priority with respect to the method proposed by François (this vol., ii, 713) for the estimation of aniline. H. R. LE S.

Methods of Estimating Alkaloids. By OTTO LINDE (*Arch. Pharm.*, 1899, **237**, 392—408. Compare this vol., ii, 534).—Keller's method (compare Abstr., 1897, ii, 84) is open to the following objections. (1.) The assumption is made that the solvent either extracts all the alkaloid, or, at least, contains it in equal concentration throughout, whether within or without the drug; it is found, however, that the residual part, including the much-swollen drug, contains proportionally more alkaloid. (2.) The amount of solution removed is assumed to contain 100/120 of the alkaloid; as a matter of fact, the total amount of the solution may have suffered an increase owing to the solution in it of fat, and even of soap. (3.) The repeated shaking and the large amount of solvent used are objectionable; shaking once with a smaller quantity suffices if the volume of the aqueous solution is kept relatively small; it may also be saturated with some salt. (4.) It is better to measure the quantities of solvent used than to weigh them; pipettes graduated for use with water may be employed.

Ekroos' method (this vol., ii, 74) cannot be used with drugs from which ammonia or an aliphatic amine is liberated by treatment with soda; neither can it be used with drugs which contain oil, as in these cases a soap is formed which dissolves in the chloroform-ether, and uses up some of the sulphuric acid.

Katz's method (Abstr., 1898, ii, 547) is equally unavailable for drugs from which soda liberates ammonia or an amine.

It is better not to estimate an alkaloid only by titrating its solution, but first to weigh it after evaporation of the solution, in which process volatile alkalis are removed, and then to titrate the residue; a serious discrepancy between the two results would indicate adulteration. C. F. B.

Hydrastine Pentiodide Hydriodide. Volumetric Estimation of Hydrastine and Berberine in the Root of Hydrastis Canadiensis. By HARRY MANN GORDIN and ALBERT B. PRESCOTT (*Arch. Pharm.*, 1899, **237**, 439—446).—When a dilute solution of hydrastine is added to a large excess of a solution of iodine in aqueous potassium iodide, a dark brown compound, $C_{21}H_{21}O_6N,HI,I_5$, is precipitated; this melts readily under water; it loses 5I when treated with sulphurous acid or sodium thiosulphate.

For the estimation of the alkaloids in *Hydrastis canadiensis*, 10 grams of the powdered root are stirred into a paste with a mixture of alcohol, concentrated ammonia, and ether (1 : 1 : 6 parts by volume), and allowed to remain in a well-closed vessel for several hours. The mixture is then dried, at first in a good draught and then over sulphuric acid under diminished pressure; the residue is transferred to a Soxhlet apparatus, being rinsed out with powdered barium nitrate, and the hydrastine is extracted completely with absolute ether; the ether is evaporated from the extract, and the residue dissolved in acidified water, and the solution diluted to 100 c.c. In a graduated 100 c.c. flask, 20—30 c.c. of a standard iodine solution (of about 1 per cent. strength) are placed, 20 c.c. of the filtered hydrastine solution run in, and the mixture diluted to the mark and shaken until the pentiodide has all separated; the mixture is then filtered, and the excess of iodine determined by titrating 50 c.c. of the filtrate with standard sodium thiosulphate solution. Every 1 part of iodine used corresponds with 0·60403 part of hydrastine. Or the alkaloid may be estimated gravimetrically by shaking 20 c.c. of the filtered hydrastine solution with benzene and ammonia, removing the alkaloid from the benzene solution by shaking with acidified water, and then from the acid solution with ammonia and ether, the ethereal solution is finally evaporated in a dark place at the ordinary temperature, and the residue of hydrastine weighed.

The residue in the Soxhlet apparatus contains the berberine, which is not soluble in absolute ether; it is dried by passing a current of dry air through the apparatus, and is then extracted with alcohol. The alcohol is removed from the extract by heating it with 200 c.c. of water on the water-bath; the residual liquid is acidified with acetic acid, cooled, and filtered into a conical flask; in this it is shaken for 10—15 minutes with 6—8 c.c. of acetone and enough 10 per cent. caustic soda solution to render the reaction alkaline, and set aside for 2—3 hours. The precipitated acetone compound is washed, and warmed in the same flask with 200—300 c.c. of very dilute sulphuric acid until it has all dissolved, the solution is poured into a long-necked Kjeldahl flask and boiled for 1½—2 hours; when cold, it is added to 100 c.c. of *N*/20 potassium iodide solution contained in a graduated 1000 c.c. flask, diluted to the mark, shaken, and left overnight. Then 500 c.c. are filtered from the precipitate of berberine hydriodide into another 1000 c.c. flask, treated with 50 c.c. *N*/20 silver nitrate and nitric acid, diluted to the mark, and filtered; the excess of silver is determined by titrating 500 c.c. of the filtrate with *N*/40 ammonium thiocyanate. The number of c.c. of the iodide solution used, multiplied by 0·167125, gives the percentage of berberine in the root. C. F. B.

Vitali's Test for Veratrine. By IWAN L. KONDAKOFF (*Chem. Zeit.*, 1899, **23**, 4).—The author confirms Kunz-Krause's statement that when veratrine is evaporated with fuming nitric acid and the residue treated with alcoholic potash, the mixture turns blood-red and evolves a strong odour of coniine. The odorous substance is really coniine, and not β-picoline. L. DE K.

Melzer's Picrotoxin Reaction. By HANS KREIS (*Chem. Zeit.*, 1899, **23**, 21—22).—The author warns toxicologists that cholesterol and phytosterol also give reactions with benzaldehyde and sulphuric acid very similar to that described as characteristic for picrotoxin by Melzer (Abstr., 1898, ii, 650). L. DE K.

Estimation of Proteids in Blood Serum. By GUSTAVE PATEIN (*J. Pharm.*, 1899, [vi], **10**, 244—249).—*Alkaliseralbumin* is the name given by the author to the albumin precipitated by acidifying diluted human blood serum with 10 per cent. acetic acid. For its estimation, 100 c.c. of the serum are diluted with 900 c.c. of water, and the liquid is rendered faintly acid with 10 per cent. acetic acid. The mixture is left for 24 hours, and the precipitate washed by decantation with water slightly acidified with acetic acid. It is then dissolved in 60 c.c. of water previously acidified with acetic acid, 1 to 2 grams of sodium sulphate or chloride are added, and the solution boiled. From this stage, the process is the same as for the estimation of albumin.

Estimation of total albumin.—10 c.c. of the serum are diluted to 100 c.c. with water, the liquid is rendered very faintly acid with acetic acid, and 2 grams of sodium sulphate are added. The mixture is boiled, and the precipitate, collected on a tared filter, washed with boiling water, alcohol, and ether, and dried and weighed.

Estimation of serin and serum-globulin.—The serum previously diluted with 9 times its volume of water, is rendered faintly acid with acetic acid and the mixture left for 24 hours. It is then heated to boiling, and the precipitate collected, dried, and weighed.

Estimation of serin.—The serum is diluted with 9 times its volume of water, and 100 c.c. of this solution are saturated with magnesium sulphate. The liquid is filtered, and an aliquot part of the filtrate, faintly acidified with acetic acid, is boiled, and the precipitated serin dried and weighed. The serum-globulin is estimated by difference. 1000 grams of blood serum were found to contain: total proteids, 75·4; alkaliseralbumin, 2·45; serin and other proteids, 45·03; and globulin, 27·92. H. R. Le S.

Estimation of Albumin in Urine. By Georges Denigès (*J. Pharm.*, 1899, [vi], 10, 97—102).—The author's method for the estimation of casein in milk (Abstr., 1897, ii, 532) is applicable to the estimation of albumin in urine. For urine containing not more than 1·1 grams of albumin per litre, the method is as follows: 20 c.c. of mercuric potassium iodide and 2 c.c. of glacial acetic acid are added to 150 c.c. of the urine, and the whole diluted to 200 c.c. The mixture is filtered, and 25 c.c. of an ammoniacal solution of potassium cyanide (equivalent to $N/20$ silver nitrate) are added to 125 c.c. of the filtrate, the whole left for 2 or 3 minutes, and again filtered. To 120 c.c. of the last filtrate, $N/10$ silver nitrate is added until a faint, but permanent, opalescence is produced. The number of tenths of a c.c. of silver nitrate less 48 (a constant) gives the number of decigrams of albumin in a litre of urine.

If the urine contains more than 1·1 grams of albumin in a litre, then the number of c.c. of urine used must be such that it shall not contain more than 0·15—0·16 gram of albumin, and shall be a simple ratio of 150. If the urine contains less than 0·2 gram of albumin in a litre, the amount is determined by comparing the opalescence produced by the addition of 2 c.c. of a 5 per cent. solution of sodium metaphosphate and 4 drops of sulphuric acid to 10 c.c. of the urine and heating in boiling water for 5 minutes, with that produced, under the same conditions, with urine solutions containing a known weight of albumin.

H. R. Le S.

Anschütz, *Richard*, constitution of tartrazine, A., i, 638.

Anschütz, *Richard*, and *Thomas* **Clarke**, synthesis of methylocitric [methoxytricarballylic] acid from oxalic and malonic acids, A., i, 577.

Anschütz, *Richard*, and *Julius* **Stiepel**, action of ammonia and substituted ammonias on methylic dichloroxalate and on methylic semiorthoxalate: diamido-esters, A i, 572.

Anschütz, *Richard*. See also *Hans* **Geisenheimer**.

Antipoff, *J. A.*, lonchidite from Olkusch, A., ii, 109.

—— thallium in marcasite from Poland, A., ii, 667.

Antony, *Ubaldo*, potable waters that have flowed through lead pipes. A., ii, 290.

Antony, *Ubaldo*, and *Adolfo* **Lucchesi**, action of sulphurous anhydride on ruthenium sulphate, A., ii, 299.

—— —— estimation of the total sulphur in coal, A., ii, 517.

—— —— ruthenium and its compounds, A., ii, 558.

—— —— ruthenium and its compounds. II. Potassium ruthenichloride, A., ii, 756.

Antony, *Ubaldo*, and *E.* **Manasse**, action of sulphurous acid on metallic sulphates, especially ferric sulphate, A., ii, 753.

Antony, *Ubaldo*, and *G. H.* **Mondolfo**, Reynoso's method for the analysis of phosphates, A., ii, 330.

Apitzsch, *H.* See *Carl* **Paal**.

Archbutt, *Leonard*, the arachidic and lignoceric acids of earth-nut oil, A., ii, 260.

—— the constants of curcas oil, A., ii, 261.

—— arachidic acid in rape and mustard oils, A., ii, 340.

—— maize oil (corn oil), A., ii, 711.

Archibald, *E. H.* See *James G.* **MacGregor**.

Arlt, *F. von*, pseudocinchonine and the behaviour of hydrochlorocinchonine, A., i, 962.

Armstrong, *Henry Edward*, an explanation of the laws which govern substitution in the case of benzenoid compounds (third notice), P., **1899**, 176.

Arnaud, *Albert*, action of nitric acid on ouabain, A., i, 70.

Arndt, *Kurt.* See *Georg von* **Knorre**.

Arnold, *V.*, Heller's test for detecting blood in urine, A., ii, 194.

Arrhenius, *Svante*, chemical reaction velocities, A., ii, 359.

Arsonval, *Arsène d'*, action of certain gases on caoutchouc, A., i, 771.

Arth, *Georges*, caustic lime in ancient masonry, A., ii, 483.

—— dissolution of an iron anode in a solution of sodium acetate and acetic acid, A., ii, 723.

Arzruni, *Andreas*, *Konstantin* **Thaddéeff**, and *A.* **Dannenberg**, new minerals from Chili, A., ii, 562.

Aschan, [*Adolf*] *Ossian*, preparation of amides, A., i, 14.

—— camphoronic acid, A., i, 68.

—— stereochemistry of quinquevalent nitrogen and quadrivalent sulphur, A., i, 542.

—— formation of adipic acid from the fraction of Russian petroleum which boils at 80°, and consists of naphthenes, A., i, 672.

Aschman, *Camille*, estimation of the iodine number, A., ii, 71.

—— estimation of total phosphoric acid in basic slags, A., ii, 807.

Aschman, *Camille.* See also *Louis* **Henry**.

Asher, *Léon*, properties and formation of lymph, A., ii, 165.

Asher, *Léon*, and *Horatio C.* **Wood**, influence of choline on the circulation, A., ii, 373.

Aston, *Henry.* See *Percy F.* **Frankland**.

Astruc, *A.* See *Henri* **Imbert**.

Athanasiu, *J.*, glycogen in the frog at different seasons, A., ii, 438.

—— fat in the animal body under the influence of phosphorus, A., ii, 441.

Atkinson, *Elizabeth A.*, indium in tungsten minerals, A., ii, 600.

—— separation of metals by means of hydrogen bromide, A., ii, 615.

Atterberg, *Albert*, modification of Kjeldahl's process, A., ii, 124.

—— methods for estimating potassium, and the best precipitants of platinum, A., ii, 125.

Aubel, *Edmond van*, thermal conductivity of liquids, A., ii, 354.

Auchy, *George*, rapid estimation of tungsten in steel, A., ii, 524.

Auden, *Harold Allden*, *William Henry* **Perkin**, jun., and *J. L.* **Rose**, experiments on the synthesis of camphoric acid, Part II. T., 909; P., **1899**, 162.

Auerbach, *Max*, and *Richard* **Wolffenstein**, action of hydrogen peroxide on tertiary bases, A., i, 935.

Auger, *Victor*, preparation of glycocine, A., i, 667.

—— vacuum regulator for distillations under reduced pressure, A., ii, 474.

Austin, *Martha.* See *Frank Austin* **Gooch**.

Autenrieth, *Wilhelm*, action of dilute acids on potassium ferrocyanide, A., ii, 387.

—— occurrence of iodine in cuprite and malachite, A., ii, 760.

—— [detection and estimation of small amounts of iodine in cuprite and malachite], A., ii, 804.

Autenrieth, *Wilhelm*, and *K.* **Wolff**, trimethylene mercaptan and the trimethylenedisulphones, A., i, 579.

—— —— cyclic disulphides and disulphones, A., i, 580.

Auwers, *Karl*, isomeric tribromo-derivatives of pseudocumenol, A., i, 343.

Auwers, *Karl*, and *H.* **Allendorff**, anhydroparahydroxymesitylic alcohol and its products of change, A., i, 32.

Auwers, *Karl*, and *G.* **Büttner**, bromination products of saligenin, A., i, 36.
Auwers, *Karl*, and *H.* **Czerny**, Beckmann's transformation, A., i, 131.
Auwers, *Karl*, and *H.* **Ercklentz**, parahydroxypseudocumylic alcohol and its products of bromination, A., i, 35.
Auwers, *Karl*, and *F.* **Rapp**, nitration and oxidation products of phenols which are soluble in alkalis, A., i, 30.
Auwers, *Karl*, and *H. van de* **Rovaart**, derivatives of anhydroparahydroxyortho-xylylic alcohol and of anhydro-orthohydroxypseudocumylic alcohol, A., i, 34
Auwers, *Karl*, and *A. J.* **Walker**, constitution and cryoscopic behaviour of orthocyanophenols, A., i, 198.
Auzenat, *R.*, nitrification of glycerol with nitrous acid, A., ii, 132.
Avery, *Samuel*, and *Benton* **Dales**, sources of error in the electrolytic estimation of iron, A., ii, 251.
—— —— presence of carbon in electrolytically deposited iron, A., ii, 814.
Axelrod, *S.* See *Wilhelm* **Marckwald**.

B.

Babel, *A.* See *Philippe A.* **Guye**.
Bach, *A.*, formaldoxime as a reagent for detecting traces of copper, A., ii, 385.
Baebenroth, *Fr.* See *Emil* **Knoevenagel**.
Bäckström, *Helge*, thaumastite from Skottvång, Sweden, A., ii, 36.
Baeyer, *Adolf von*, and *Conrad* **Baumgärtel**, orientation in the terpene series. XXIII. Hydroxycarone and ketoterpin, A., i, 223.
Baeyer, *Adolf von*, and *Victor* **Villiger**, orientation in the terpene series. Exhaustive bromination of isogeraniolene and of ionene, A., i, 921.
Bagnall, *Ernest Harold*, methanetrisulphonic acid, T., 278 ; P., **1898**, 182.
Bahatrian, *Gabriel*. See *Friedrich* **Kehrmann**.
Bailey, *Edgar Henry Summerfield*, and *Wm.* **Lange**, action of sulphuric acid on strychnine when separating this alkaloid from organic matters, A., ii, 194.
Bailey, *George Herbert*, and *J. H.* **Johnston**, analysis of water, A., ii, 697.
Bailey, *James*. See *Johannes* **Thiele**.
Baillie, *Thomas B.*, and *Julius* **Tafel**, reduction of acylamines to alkylamines, A., i, 268.
Bain, *William*, and *Wilfrid* **Edgecombe**. excretion of urea and uric acid, A., ii, 314.
Baker, *Julian Levett*. See *Arthur R.* **Ling**.
Baker, *T. J.*, and *T. J.* **Baker**, *jun.*, electro-deposition of brass, A., ii, 749.
Balbiano, *Luigi*, constitution of camphoric acid, A., i, 537.
—— oxidation products of camphoric acid, A., i, 867.
Baldwin, *Herbert B.*, toxic action of sodium fluoride, A., ii, 605.
Balland, composition and feeding value of millet, A., ii, 118.
—— composition and feeding value of French haricots, A., ii, 174.
Baltzley, *Edwin B.* See *Charles D.* **Mabery**.
Bamberg, *F.* See *Ludwig* **Gattermann**.
Bamberger, *Eugen*, the so-called "nitroazoparaffins," A., i, 108
—— mercurial compounds of β-naphthol, A., i, 156.
—— mercurydimethyl, A., i, 263.
—— alphylhydroxylamines, A., i, 270.
—— hydrolysis of mixed azo-compounds, A., i, 355.
—— oxidation of aromatic bases, A., i, 495.
—— action of diazo-compounds on oximes, A., i, 589.
—— detection and isolation of ketones and aldehydes, A., i, 666.
—— conversion of phenylhydrazine into diazobenzene, A., i, 688.
—— action of benzenesulphonic chloride on asymmetrical alkylphenylhydrazines, A., i, 701.
—— acetylation of α-naphthylamine, A., i, 708.
—— a new class of diazo-compounds: triazolens, A., i, 720.
—— anhydro-formation of β-naphthol-azo-dyes, A., i, 722.
—— history of diazonium salts, A., i, 750.
—— demonstration of the laws of mass action as applied to weak electrolytes, A., ii, 548.
—— detection of hydroxylamine, A., ii, 576.
Bamberger, *Eugen*, *Hans* **Büsdorf** and *B.* **Szolayski**, action of hydrogen chloride and hydrogen bromide on nitrosoalphyls, A., i, 341.
Bamberger, *Eugen*, and *Anton von* **Goldberger**, characteristic oxidation reaction of some cyclic amines, A., i, 170.
—— —— action of alkalis on orthomethyldiazonium salts, A., i, 543.

Bamberger, *Eugen*, and *Roland* **Scholl**, the so-called benzil reaction, A., i, 701.

Bamberger, *Eugen*, and *Fred* **Tschirner**, oxidation of aromatic bases, A., i, 347.

—— —— dimethylaniline oxide, A., i, 682.

—— —— orthamidodimethylaniline, A., i, 683.

—— —— direct conversion of aniline into phenylhydroxylamine, A., i, 687.

Bamberger, *Eugen*, and *Max* **Weiler**, reduction of 2-nitro-3:5-dimethylphenylnitromethane [ω-2-dinitromesitylene], A., i, 123.

Bamberger *Max*, and *Anton* **Landsiedl**, natural resins [Überwallungsharze], A., i, 929.

Bancroft, *Wilder Dwight*, equilibria of stereoisomerides, A., ii, 145, 411.

—— variance of the voltaic cell, A., ii, 394.

—— electromotive force between amalgams, A., ii, 395.

—— transference number of hydrogen, A., ii, 398.

—— pressure-temperature diagrams for binary systems, A., ii, 402.

—— dissociation studies. I. A., ii, 411.

—— ternary mixtures, A., ii, 469.

Bang, *Ivar*, guanylic acid from pancreas and its decomposition products, A., i, 179.

—— histons, A., i, 836.

Barbier, *Philippe*, pulegenacetone, A., i, 299.

—— synthesis of dimethylheptenol, A., i, 323.

—— lemonal from the essential oil of *Lippia citriodora*, A., i, 769.

Barbier, *Philippe*, and *Victor* **Grignard**, ethylic β-isopropylacetobutyrate and stereoisomeric di-isopropylbutenedicarboxylic acids, A., i, 112.

Barbier, *Philippe*, and *Georges* **Léser**, dextrolicarhodol, A., i, 100.

—— —— acetylmethylheptenone (2-methyl-2-nonene-6 : 8-dione), A., i, 110.

Barfield, *C. E.* See *T. C.* **Whitlock**.

Barillé, *A.*, dicalcium phosphate, A., ii, 97.

Barker, *E. R.* See *S. P.* **Mulliken**.

Barlow, *Alfred E.*, dykes containing huronite, A., ii, 565.

Barlow, *Willy*. See *Johannes* **Thiele**.

Barmwater, *F.*, cause of osmotic pressure, A., ii, 274.

—— conductivity of mixtures of electrolytes, A., ii, 396.

Barnes, *Bayard*. See *Henry Lord* **Wheeler**.

Barnes, *H. T.*, molecular weight of sulphur in carbon bisulphide solutions, A., ii, 415.

Barnes, *H. T.*, and *A. P.* **Scott**, solution densities, A., ii, 405.

Barral, *Étienne*, colour reaction of anhydrosulphuric acid, A., ii, 123.

Barral, *Étienne*, and *Albert* **Morel**, phenylic chlorocarbonates, A., i, 747, 802.

Barralet, *Edgar S.*, delicate reaction of hydrogen peroxide, A., ii, 803.

Barratt, [*John Oglethorpe*] *Wakelin*, elimination of water and carbonic anhydride by the skin, A., ii, 313.

Barratt, *Wakelin*. See also *Frederick Walker* **Mott**.

Barrillot. See *Léo* **Vignon**.

Barth, *Georg*, decomposition of cement under the influence of bacteria, A., ii, 607.

Barth, *Hermann*, microchemical proof of the presence of alkaloids in medicinal drugs, A., ii, 46.

Barth, *Max*, analysis of wines, A., ii, 699.

Barthe, *Léonce*, estimation of sulphur and alkalis in liver of sulphur, A., ii, 329.

Bartolotti, *Pietro*, derivatives of benzophenone, A., i, 368.

Barvíř, *Jindřich Ladislav*, fibrous forms of silica from Moravian serpentines, A., ii, 671.

Base, *Daniel*, double halogen salts of zinc with aniline and the toluidines, A., i, 40.

Baskerville, *Charles*, occurrence of vanadium, chromium, and titanium in peats, A., ii, 666.

Basset, *Henry*, reduction of chromic acid by acetic acid and its effect on anthracene testing, A., ii, 815.

Baubigny, *Henri*, separation and estimation of the halogens in their silver compounds, A., ii, 244, 328.

—— detection, separation, and estimation of bromine in the presence of excess of chlorides, A., ii, 516.

—— detection and estimation of small quantities of chlorine in presence of large quantities of bromine, A., ii, 611.

Baucke, *H.*, technical examination of ferruginous pigments, A., ii, 128.

Baude, *S.*, and *Albert* **Reychler**, piperonal derivatives, A., i, 142.

Bauer, a delicate test for solanine, and the amount yielded by potatoes, A., ii, 392.

Bauer, *Eugen*. See *Carl* **Haeussermann**.

Bauer, *Max*, rocks and minerals from the Seychelles, A., ii, 565.

Baugé, *Georges*, new hydrate of the saline oxide of chromium [Cr_3O_4], A., ii, 157.

Baum, *Fritz*, apparatus for extracting liquids with ether, A., ii, 802.

Baum, *Herm.*, and *Richard* **Seeliger**, action of copper on the animal organism, A., ii, 167.

Baumann, *Karl*, detection of maize starch in wheat flour, A., ii, 703.

Baumann, *Karl*, and *A.* **Bömer**, precipitation of albumoses by zinc sulphate, A., ii, 195.

Baumert, *Georg*, and *Fr.* **Falke**, changes in butter produced by feeding with fat, A., ii, 689.

Baumgärtel, *Conrad*. See *Adolf von* **Baeyer**.

Baur-Breitenfeld, *H. von*. See *Max* **Busch**.

Baxter, *Gregory Paul*. See *Theodor W.* **Richards**.

Bayrac, *Pierre Henri*, preparation of paraquinones from indophenols, A., i, 125.

Beatty, *W. A.* See *J. H.* **Kastle**.

Beck, *K.* See *Ludwig* **Gattermann**.

Becke, *Friedrich* [*Johann*], [rock analyses], A., ii, 500.

Becker, *J.* See *Max* **Busch**.

Beckh, *Walter*, ethylic α-phenylacetoacetate, A., i, 211.

Beckurts, *Heinrich*, ureides and acylated alkylic carbamates, A., i, 795.

Beckurts, *Heinrich*, and *W.* **Grothe**, evaluation of *Secale cornutum* (ergot of rye), A., ii, 389.

Beckurts, *Heinrich*, and *Julius* **Troeger**, ethereal oil of Angostura bark, A., i, 64.

Beckurts, *Heinrich*. See also *G.* **Frerichs**.

Becquerel, *Henri*, anomalous dispersion of incandescent sodium vapour, A., ii, 266.

—— radiations from uranium and other substances, A., ii, 393.

Bednarski, *E.* See *Stanislaus von* **Kostanecki**.

Beeson, *Jasper L.*, nitric nitrogen produced by the pea, A., ii, 175.

Béhal, *Auguste*, a new series of cyclic ketones, A., i, 121.

—— mixed anhydrides of formic acid, A., i, 734.

Behrend, *Robert*, two modifications of ethylic β-amidocrotonate, A., i, 331.

Behrens, *Johannes*, tobacco plant, A., ii, 795.

Bein, *Willy*, dependence of the transference ratio of salts on the nature of the dividing membrane, A., ii, 398.

Bekaert, *A.* See *Alexander von* **Hemptinne**.

Beketoff, *Nicolai N.*, direct determination of heats of combustion of halogen compounds: aluminium bromide, A., ii, 726.

Bell, *E. Wightman*, estimation of potash, A., ii, 809.

Belugou, *Guillame*, etherification of phosphoric acid by the aid of methylic alcohol, A., i, 659.

Bemmelen, *Jacobus Martinus van*, absorption. II. Formation of colloids, and their structure, A., ii, 12.

—— absorption. III. Hydrogels, A., ii, 84.

—— chalybite and vivianite in Dutch peat, A., ii, 371.

—— absorption. IV. Colloidal ferric oxide, A., ii, 487.

—— ferric "hydrogel," A., ii, 599.

Bénard, *H.* See *E.* **Mascart**.

Benda, *Louis*. See *Paul* **Monnet**.

Bender, *Carl*, refraction of pure water and of normal salt solutions, A., ii, 621.

Bènech, *Elophe*, toxalbumin from the common eel, A., ii, 439.

Benedicks, *Carl*, thalénite, a new mineral, A., ii, 766.

Benedict, *Francis Gano*, and *Olin F.* **Tower**, use of compressed oxygen and soda lime in organic analysis, A., ii, 520.

Benevento, *Alberto*, orthobromoparanisidine, A., i, 349.

Benker, *C.* See *Carl* **Paal**.

Bennett, *J. F., jun.*, modification of Pierce's method for the estimation of arsenic in ores, A., ii, 519.

Benz, *G.*, estimation of dry substance in glycerol, A., ii, 816.

Berend, *Ludwig*, and *Joachim* **Herms**, action of hydrazine hydrate on acenaphthenequinone, A., i, 823.

Berendes, *R.* See *Ludwig* **Gattermann**.

Berg, *Armand*, double iodates of manganese dioxide [double manganic iodates], A., ii, 426.

Bergesio, *B.*, and *Luigi* **Sabbatani**, formation of pentabromacetone from acetone, A., i, 733.

Bergsöe, *Paul*, barium platinocyanide, and platinum free from iridium, A., i, 320.

Berju, *G.* See *Friedrich* **Krüger**.

Berkey, *Charles P.*, Minnesota minerals, A., ii, 371.

Berlemont, *G.* See *Paul* **Bourcet**.

Bernert, *Richard*, oxidation of albumin with permanganate, A., i, 315.

Bernhard, *Carl.* See *Carl Adam* **Bischoff.**

Bertè, *E.* See *Arturo* **Soldaini.**

Berthelot, *Daniel,* recalculation of atomic weights by the method of limiting density, A., ii, 207.
—— an equation representing the molecular weight of liquids in terms of their densities and critical constants, A., ii, 404.
—— increase of pressure caused by the mixture of two gases, and the compressibility of the mixture, A., ii, 466.
—— calculation of the compressibility of a gaseous mixture from that of its components, A., ii, 466.

Berthelot, *Daniel,* and *Paul* **Sacerdote,** mixtures of gases and their compressibility, A., ii, 404.

Berthelot, *Marcellin Pierre Eugène,* synthesis of phenol from acetylene, A., i, 264.
—— action of sulphuric acid on acetylene, A., i, 397.
—— absorption of oxygen by potassium pyrogallol, A., i, 427.
—— synthesis of ethylic alcohol, A., i, 471.
—— chemical action of the silent electric discharge on carbon compounds, A., i, 657.
—— hydration of acetylene, A., i, 841.
—— double cyanides, A., i, 846.
—— action of argon and nitrogen on mercury methyl and mercury phenyl, A., i, 871.
—— trimethylene [cyclopropane], A., i, 872.
—— relation between luminous energy and chemical energy, A., ii, 1.
—— decomposition of nitric acid by heat at moderate temperatures, A., ii, 21.
—— action of free hydrogen on nitric acid, A., ii, 21.
—— decomposition of water by chromous salts and their use for the absorption of oxygen, A., ii, 30.
—— heats of formation of cyanic acid and carbamide, A., ii, 142.
—— decomposition of hydrogen peroxide by silver oxide, and by ammoniacal silver oxide, A., ii, 149.
—— relation between luminous energy and chemical energy. The reciprocal displacement of oxygen and the halogens, A., ii, 197.
—— heat developed on adding water to excess of sulphuric acid, A., ii, 271.
—— combustion of mixtures of hydrogen and oxygenated gases, A., ii, 282.
—— action of hydrogen on sulphurous anhydride, A., ii, 282.

Berthelot, *Marcellin Pierre Eugène,* action of sulphuric acid on metals A., ii, 283.
—— heat evolved by the action of water on excess of nitric acid, A., ii, 285.
—— action of sulphuric acid on carbon at low temperatures, A., ii, 286.
—— chemical equilibrium between hydrogen and the oxides of carbon, A., ii, 286.
—— reactions with carbon oxysulphide, A., ii, 287.
—— action of alkali chlorides on silver, A., ii, 288.
—— [chlorine, phosphorus, and sulphur in plants], A., ii, 323.
—— presence and estimation of chlorine in plants, A., ii, 327.
—— estimation of phosphorus and sulphur in plants and plant ashes, A., ii, 330.
—— action of hydrogen sulphide and alkali sulphides on double cyanides: cyanosulphides, A., ii, 421.
—— estimation of sulphur in organic compounds, A., ii, 575.
—— combination of carbon disulphide with hydrogen, nitrogen, [argon and carbonic oxide], A., ii, 648.
—— combination of nitrogen with oxygen, A., ii, 648.
—— argon and its combinations, A., ii, 653.
—— formation of alcohol and carbonic anhydride, and absorption of oxygen in plant tissues, A., ii, 685.
—— thermochemical measurements, A., ii, 726.
—— equilibrium between hydrocyanic and other acids in combination with alkalis, A., ii, 737.

Berthelot, *Marcellin,* and *Gustave* **André,** simple and complex magnesium pyrophosphates, A., ii, 156.
—— —— general progress of vegetation, A., ii, 319.
—— —— heats of combustion and formation of organic compounds, A., ii, 400.

Berthelot, *Marcellin,* and *Marcel* **Delépine,** ammonio-silver nitrate, A., ii, 748.
—— —— silver derivatives of acetylene, A., i, 841.

Berthelot, *Marcellin,* and *Henri* **Le Chatelier,** velocity of explosion of acetylene, A., ii, 734.

Berthelot, *Marcellin,* and *Paul* **Vieille,** explosion of acetylene when mixed with inert gases, A., ii, 412.

Bertini, *Corrado,* ethylic benzalanilacetoacetate [anilinobenzylacetoacetate], A. i, 896.

Bertolo, *P.*, reaction of santonin and the desmotroposantonins with ferric chloride, A., i, 931.

Bertolo, *P.* See also *Amerigo* **Andreocci.**

Bertozzi, *V.*, constitution of dichloroparacresol, A., i, 877.

Bertrand, *C. Eg.*, preliminary generalisation on humous coal, A., ii, 161.

—— humic lignite and humin, A., ii, 430.

Bertrand, *Gabriel*, laccase, a new oxidising ferment, A., i, 313.

—— molecular aggregation of dihydroxyacetone, A., i, 860.

—— action of the sorbose bacterium on xylose (wood sugar), A., ii, 44.

—— action of the sorbose bacterium on aldoses, A., ii, 170.

—— silicotungstic acid as a reagent for alkaloids, A., ii, 456.

Best, *Friedrich.* See *Max* **Busch.**

Bethmann, *Fritz*, ortho-xylalphthalide, A., i, 520.

Betti, *Mario*, desmotropic forms of camphor methylenephenylhydrazone, A., i, 771.

Bettinelli, *D.* See *Giuseppe* **Plancher.**

Bettink, *Hendrik Wefers*, detection of cobalt in the presence of iron compounds, A., ii, 815.

Bevan, *Edward John.* See *Charles Frederick* **Cross.**

Bianchi. See *Emilio* **Noelting.**

Bianchi, *Al.* See *Wenzel* **Hanzlik.**

Bickel, *Adolf*, estimation of dextrose, A., ii, 529.

Biedermann, *Wilhelm*, and *P.* **Moritz**, comparative physiology of digestion. II. An enzyme which dissolves cellulose in the secretion of the liver of the snail, *Helix pomatia*, A., ii, 166.

—— —— comparative physiology of digestion. III. Function of the so-called liver of molluscs, A., ii, 438.

Bierbrauer, *Karl.* See *Arthur* **Rosenheim.**

Bihan, *Richard.* See *Johannes* **Thiele.**

Biltris, *Alfred*, phenol-quinones and -quinhydrones: mixed phenol-quinones, A., i, 199.

Biltz, *Heinrich*, triphenylvinylic alcohol or triphenylethanone, A., i, 439.

—— oxidation of benzaldehydephenylhydrazone and salicylaldehydephenylhydrazone by air, A., i, 502.

—— nitrosalicylaldehydephenylhydrazones, A., i, 503.

Biltz, *Heinrich*, and *Albert* **Wienands**, oxidation of aldehydephenylhydrazones to *α*-diketoneosazones, A., i, 910.

Biltz, *Wilhelm*, cryoscopic researches on the terpene series, A., i, 297.

Biltz, *Wilhelm*, essential oil of *Origanum majorana*, A., i, 535.

—— cryoscopic behaviour of alcohols, A., ii, 634.

Biron, *Eugen von*, decomposition of barium isobutylic sulphate, A., i, 408.

Bischoff, *Carl Adam*, formation of chains. XXVII. Benzylaniline. XXVIII. Diphenylamine, A., i, 125.

—— formation of chains. XXXII. Comparison of aromatic bases in their behaviour towards ethereal salts of *α*-bromo-acids, A., i, 202.

—— formation of chains. XXXV. Formaldehyde and diacid bases, A., i, 279.

—— formation of chains. Ethylic salts of *α*-bromo-fatty acids with (XXXVI.) sodium methoxide, (XXXVII.) sodium ethoxide, and (XXXVIII.) sodium propoxide and isopropoxide, A., i, 669.

—— formation of chains. Ethylic salts of *α*-bromo-fatty acids with (XXXIX.) sodium butoxides, (XL.) sodium isoamyloxide, octyloxide, and isocapryloxide, and (XLI.) sodium derivatives of saturated monhydric alcohols, A., i, 670.

Bischoff, *Carl Adam* [with *Carl* **Bernhard, Brodsky, Grünberg**, and **Taraschtschansky**], formation of chains. XXXI. Dimethylaniline and ethereal salts of *α*-bromo-acids, A., i, 201.

Bischoff, *Carl Adam* [with **Hirschfeld, Päpke, Tschunkew**, and **Watschjanz**], formation of chains. XXXIII. Aromatic monacid bases and the bromides of *α*-bromo-fatty acids, A., i, 277.

Bischoff, *Carl Adam* [with **Holm, Kuszell, Maisel, Pakis**, and **Stefanowski**], formation of chains. XXIX. Piperidine, A., i, 229.

Bischoff, *Carl Adam* [with **Hurewitsch, Kaiserstein, Karukowski, Sobolewski** and **Waldmann**], formation of chains. XXX. Carbazole, A., i, 231.

Bischoff, *Carl Adam* [with **Päpke, Schatz**, and **Tschunkew**], formation of chains, XXXIV. Aromatic diacid bases and the bromides of *α*-bromo-fatty acids, A., i, 278.

Bischoff, *H.*, and *Fritz* **Foerster**, electrolysis of solutions of calcium chloride, A., ii, 89.

Bistrzycki, *Augustin*, and *D. W. Yssel de* **Schepper**, parahydroxyphenylphthalide and its conversion into derivatives of anthracene, A., i, 151.

Bistrzycki, *Augustin*, and *Hugo* **Simonis**, condensation of mandelonitrile with phenols, A., i, 153.

—— —— synthesis of pyridazone derivatives, A., i, 392.

Bistrzycki, *Augustin*, and *Fritz* **Ulffers**, peracetylation of phenacetin, A., i, 126.
Blaise, *Edmond E.*, synthesis of terebic acid, A., i, 115, 419.
—— chlorides of monethylic salts of dibasic acids, A., i, 331.
—— ***αα***-dimethylglutaric acid, A., i, 480.
—— synthesis of lævulic acid, A., i, 793.
Blaise, *Edmond E.*, and *G.* **Blanc**, amidocampholenes, A., i, 820.
Blanc, *G.*, camphor and its derivatives, A., i, 442.
—— camphoric acid, A., i, 443.
—— constitution of camphoric acid, A., i, 443, 536, 924, 925, 928.
—— molecular transformations effected by hydriodic acid at high temperatures, A., i, 444.
—— constitution of isolauronolic acid, A., i, 536, 630, 924.
—— isolauronolic acid : constitution of camphoric acid, camphor, and its derivatives, A., i, 924.
Blanc, *G.* See also *Edmond E.* **Blaise**.
Blank, *Oskar*, and *Hermann* **Finkenbeiner**, estimation of formaldehyde by the aid of hydrogen peroxide, A., ii, 188, 820.
Blank, *Rubin*, and *E.* **Samson**, new method of preparing ethylic dicarbintetracarboxylate [ethylenetetracarboxylate], A., i, 484.
Blattner, *N.*, and *J.* **Brasseur**, estimation of oxide of iron and alumina in phosphates, A., ii, 128.
—— —— estimation of perchlorate in alkali nitrates, A., ii, 328.
Blau, *Fritz*, new organo-metallic compounds, A., i, 387.
Bleier, *Leopold*, secondary bases derived from ethylenediamine, A., i, 664.
Bleier, *Otto*, measurement of gases, A., ii, 51.
Bleier, *Otto*, and *Leopold* **Kohn**, determination of vapour density under arbitrary pressure, A., ii, 643.
Bloch, *C.* See *Alfred* **Werner**.
Bloch, *M.* See *Emil* **Fromm**.
Blonay, *H. W. de.* See *William* **Borel**.
Blondel, combination of chromic and titanic acids, A., ii, 369.
—— compounds of titanium dioxide with sulphuric acid, A., ii, 556.
Blum, *F.*, functions of the thyroid gland, A., ii, 115.
—— halogen metabolism, A., ii, 164.
—— physiology of the iodine-containing substance of the thyroid gland, A., ii, 779.
Blumenthal, *Ferdinand*, formation of sugar from albumin, A , i, 465.
Blumenthal, *Ferdinand*, and *Paul* **Mayer**, formation of sugar from albumin, A., i, 465, 968.
Blumer, *Esaias*. See *Robert* **Gnehm.**
Blyth, *Alexander Wynter*, the estimation of boric acid mainly by physical processes, T., 722, P., **1899**, 51 ; discussion, P., 51.
—— the ultra violet absorption spectrum of proteids in relation to tyrosine, T., 1162 ; P., **1899**, 175.
—— the estimation of nitrites and nitrates by means of ferrous chloride ; P., **1899**, 50 ; discussion, P., 50.
Bodenbender, *Guillermo*, cerium in bismutite from Argentina, A., ii, 758.
Bodenstein, *Max*, gaseous reactions in chemical kinetics. I., A., ii, 548.
—— gaseous reactions in chemical kinetics. II. Influence of temperature on the formation and decomposition of hydrogen iodide, A., ii, 637.
—— gaseous reactions in chemical kinetics. III. Formation of hydrogen sulphide from its elements, A., ii, 638.
—— gaseous reactions in chemical kinetics. IV. Formation and decomposition of hydrogen selenide, A., ii, 639.
—— gaseous reactions in chemical kinetics. V. Gradual combination of oxyhydrogen gas, A., ii, 733.
Bodländer, *Guido*. See *Richard* **Abegg**.
Bodroux, *F.*, action of bromine on 1 : 4-tertiary-butylphenol in presence of aluminium chloride, A., i, 29.
—— action of acid solutions of the lead salts of monobasic fatty acids on monochloro- or bromo-aromatic hydrocarbons in which the halogen is in the side chain, A., i, 678.
—— action of lead acetate in acetic acid solution on benzylidenic chloride and benzotrichloride, A., i, 678.
Bödtker, *Eyvind*, the sulphur water of Sandefjord, A., ii, 39.
Boehm, *Rudolf*, homologous phloroglucinols from filicic acid and from aspidin, A., i, 32.
—— filicic acid, A., i, 804.
Bömer, *A.*, analysis of fats. IV. Preparation and crystallisation of cholesterol and phytosterol, A., ii, 191.
—— analysis of fats. V. Melting points of cholesterol and phytosterol : amount of unsaponifiable matter in fats, A., ii, 192.
—— analysis of fats. VI. Detection of cotton-seed oil in lard, A., ii, 259.
Bömer, *A.* See also *Karl* **Baumann.**
Boeseken, *J.*, formation of ketones with the aid of aluminium chloride, A., i, 435.

Böttcher, *O.*, estimation of citrate soluble phosphoric acid in bone meals, superphosphates, &c., A., ii, 55.

Boggio-Lera, *Enrico*, boiling points of compounds of the general formula $CH_3{\cdot}(CH_2)_n{\cdot}R$, A., i, 843.

Bogojawlensky, *A.*, crystallisation velocity, A., ii, 206.

Bogojawlensky, *A.*, and *Gustav* **Tammann**, influence of pressure on the electrical conductivity of solutions, A., ii, 137.

Bogorodsky, *Alexis*, hydrates of magnesium chloride, A., ii, 656.

Bohlig, *E.*, estimation of alkalis in natural waters, A., ii, 810.

Bohm, *J.*, preparation of zinc isopropyl, A., i, 872.

Bohr, *Christian*, determination of invasion and evasion coefficients in the solution of gases in liquids: carbonic anhydride in water and aqueous salt solutions, A., ii, 641.

Bokorny, *Thomas*, action of ethereal oils on fungi, A., ii, 318.

—— chemical physiology of ethereal oils, A., ii, 786.

Bolezzi, *Giovanni*, salicylparaphenetidine and its derivatives, A., i, 358.

Bollemont, *E. Grégoire de*, oxymethylene derivatives of alkylic cyanacetates, A., i, 736.

—— methylic hydroxymethylenecyanacetate and some of its homologues, A., i, 791.

Bolling, *Randolph*, preservation of Hübl's reagent, A., ii, 822.

Bolm, *Friedrich*, estimation of potassium as platinochloride, A., ii, 695.

Bolschakoff, *I.*, hydrates of cobalt iodide and ferric bromide, A., ii, 427.

Boltzmann, *Ludwig*, and *H.* **Mache**, modifications of van der Waals' equation, A., ii, 635.

Bone, *William Arthur*, a new method for preparing unsymmetrical dimethyl- and trimethyl-succinic acids, P., **1899**, 5.

Bone, *William Arthur*, and *Charles H. G.* **Sprankling**, researches on the alkyl-substituted succinic acids. Part I. Methods of preparation, T., 839; P., **1899**, 181.

—— —— the symmetrical di-isopropylsuccinic acids, P., **1899**, 149.

Bonjean, *Edmond*, analyses of volcanic rocks from the peripheral series of Mont-Dore, A., ii, 500.

—— rock analyses, A., ii, 674.

—— estimation of potassium and sodium [in rocks], A., ii, 695.

Bonnefoi, *J.*, combination of lithium chloride with methylamine, A., i, 185.

Bonnefoi, *J.*, ammoniacal lithium chlorides, A., ii, 96.

Bonnema, *A. A.*, detection of dextrin, gelatin, and gum in desiccated albumin, A., ii, 196.

—— estimation of fat in milk, A., ii, 822.

Bonney, *Thomas George*, the parent rock of the diamond in South Africa, A., ii, 769.

Bonnier, *Gaston* [*Eugène Marie*], production of alpine characters in plants by extreme variations of temperature, A., ii, 686.

—— [respiration] of plants rendered alpine artificially A., ii, 686.

Borel, *William*, and *H. W. de* **Blonay**, estimation of tannin in the oak barks of the Canton of Geneva, A., ii, 241.

Bornemann, *G.*, qualitative separation of antimony and tin, A., ii, 615.

—— separation of copper from cadmium as oxalate, A., ii, 813.

Bornträger, *Arthur*, and *G.* **Paris**, analyses of pomegranates, A., ii, 447.

Bornträger, *Hugo*, analyses of silicon, A., ii, 695.

Boscogrande, *Stefano di*, derivatives of guaiacol, A., i, 427.

Bose, *Emil*, electromotive force required to decompose electrolytes, A., ii, 348.

—— theory of diffusion, A., ii, 729.

Bose, *Emil*. See also *Walther* **Nernst**.

Bossi, *Ugo*, phenyldimethylcoumalin, A., i, 521.

Bottazzi, *Filippo*, properties of nucleoproteids, A., i, 839.

Bottenfield, *P. B.* See *E. F.* **Ladd**.

Bouchard, *Charles*, cryoscopic examination of urine, A., ii, 314.

—— immunity and specificity, A., ii, 781.

Bouchardat, *Gustave*, and *J.* **Lafont**, synthetical isoborneols; their identity with the fenchylic alcohols, A., i, 156.

Boudouard, *Octave*, decomposition of carbonic oxide in presence of metallic oxides, A., ii, 287, 365, 417, 595.

—— decomposition of carbonic anhydride in presence of carbon, A., ii, 417, 596.

Boudouard, *Octave*. See also *Paul* **Schützenberger**.

Bougault, *J.*, decomposition of iodoform solutions, A., i, 1.

—— action of iodine on antipyrine: estimation of antipyrine or of iodine, A., ii, 193.

—— estimation of chlorine, bromine, and iodine, A., ii, 803.

Bouilhac, *Raoul*, researches on the vegetation of certain algæ, A., ii, 238.

Bouilhac, *Raoul*. See also *Alexandre* **Étard**.

Boullanger. *E.* See *E.* **Kayser.**

Bouma, *Jacob,* estimation of urinary indican, A., ii, 568.

Bourcet, *Paul,* absinthin, A., i, 538.

—— synthesis of glycocine, A., i, 563.

—— detection and colorimetric estimation of traces of iodine in organic matters, A., ii, 516.

Bourcet, *Paul,* and *G.* **Berlemont,** new compound air pump, A., ii, 413.

Bourcet, *Paul.* See also *P.* **Genvresse.**

Bourgeois, *Léon,* crystallised basic cupric chlorate, A., ii, 157.

—— crystallised uranium phosphate, A., ii, 160.

Bourgougnon, *A.,* estimation of sulphur in sulphites, A., ii, 517.

Bourquelot, *Émile* [*Elie*], pectins, A., i, 652.

Bourquelot, *Émile,* and *Henri* **Hérissey,** action of soluble ferments on the pectic products of gentian roots, A. i, 93.

—— —— hydrolysis of the pectin of gentian root, A., i, 93.

—— —— presence in malt of a soluble ferment acting on pectin, A., i, 93.

—— —— presence of a soluble proteolytic ferment in certain fungi, A., i, 313.

—— —— pectin present in gooseberry, A., i, 653.

—— —— composition and hydrolysis of the albumin of the carob seed (*Ceratonia siliqua*), A., i, 839, 968.

—— —— cellular membrane of gentian root, A., i, 840.

—— —— pectin from the fruit of the wild rose, A., i, 967.

—— —— occurrence of tyrosine, leucine, and asparagine in the pod of the broad bean, A., ii, 325.

—— —— estimation of mannose in mixtures of sugars, A., ii, 817.

Boutroux, *Léon,* products of oxidation of hydroxygluconic acid, A., i, 259.

Bouveault, *Louis,* 1 : 2-acetylfurfuran and its occurrence in wood tar, A., i, 120.

—— derivatives of guaiacol, A., i, 264.

—— action of ethylic chloroglyoxylate on aromatic hydrocarbons, A., i, 286.

—— glyoxylic acids and aldehydes derived from phenylic ethers, A., i, 287,

—— phenylglyoxylic acids, A., i, 288.

—— constitution of camphoric acid, A., i, 300, 536.

—— action of ethyloxalic chloride [ethylic chloroglyoxylate] on ethylic sodiomalonate, A., i, 416.

—— hydroxyphenylglyoxylic acids. Synthesis of vanillin, A., i, 437.

Bouveault, *Louis,* condensation of semicarbazide with β-diketones, A., i, 456.

—— separation of the dibasic acids formed by the oxidation of fats, A., i, 480.

—— constitution of the campholenic acids and their derivatives, A., i, 536.

—— constitution of camphoric acid and camphor, A., i, 536.

—— isomeric aldehydes from oil of lemon grass, A., i, 711.

—— nature of the isomerism of the two lemonals (citrals), A., i, 767.

—— identification and separation of fatty acids by means of tetrachloroquinol, A., i, 790.

Bouyssy, *Marius.* See *Félix* **Marboutin.**

Boyd. See **Haven-Boyd.**

Bradford, *John Rose,* influence of the kidney on metabolism, A., ii, 310.

Bradley, *Walter Parke,* hydrogen sulphide generator, A., ii, 413.

Bräutigam, *W.,* behaviour of acetanilide in solutions of zinc chloride and hydrogen peroxide, A., i, 754.

Brand, *Ph.* See *Paul* **Friedländer.**

Brandt. See *Albert* **Ladenburg.**

Brandt, *L.,* source of error in the estimation of nitric nitrogen by Ulsch's method, A., ii, 806.

Brasseur, *J.* See *N.* **Blattner.**

Brauner, *Bohuslav,* gases of the argonhelium type and the periodic system, A., ii, 360.

Brauns, *Reinhard,* diopside (salite) as a weathering product in palæopicrite from Medenbach (Nassau), A., ii, 36.

Brearley, *Harry,* anaylsis of molybdenum compounds, A., ii, 129, 336.

—— estimation of manganese by means of potassium permanganate, A., ii, 334.

—— estimation of tungsten, A., ii, 337.

—— iron separations with alkali salts. I., A., ii, 815.

Bréaudat, *L.,* formation of indigo by industrial processes. Diastasic functions of indigo-yielding plants, A., i, 232, 832.

Bredig, *Georg,* and *Fritz* **Haber,** pulverisation of metal cathodes during electrolysis with a constant current, A., ii, 78.

Breinl, *Ferdinand,* new reactions of sesamé oil, A., ii, 824.

Breitenbach, *Paul,* internal friction of gases and its alteration with temperature, A., ii, 403.

Bremer, *Gustav Jacob Wilhelm,* determination of the specific gravity of pulverulent substances, A., ii, 81.

—— appparatus for determining the specific gravity of pulverulent substances, A., ii, 271.

Brendler, *Wolfgang*, and *Julius* **Tafel**, chemical activity of organic ammonium salts, A., i, 104.

Breteau, *F.* See *Paul* **Cazeneuve**.

Brétignière, *L.*, and **Dupont**, employment of mangel-wurzel in cattle feeding, A., ii, 608.

Breustedt, *G.*, detection of salicylic and benzoic acids in milk, A., ii, 532.

Bridge, *John L.*, and *William Conger* **Morgan**, ethers of toluquinoneoxime and their bearing on the space-isomerism of nitrogen, A., i, 130.

Bridges, *Herbert*, ash of cardamoms, A., ii, 794.

Briot, *A.*, substance in the blood which prevents the action of rennet on milk, A., ii, 780.

Brissemoret and **Joanne**, *Digitalis* ferment, A., ii, 319.

Britton, *W. E.* See *Edward H.* **Jenkins**.

Brizard, *L.*, composition of osmiamates, A., ii, 559.

—— a ruthenium potassium nitrite, A., ii, 664.

Brizzi, *N.* See *Augusto* **Piccini**.

Brjuchonenko, *A.*, identity of the four affinities of sulphur in sulphines, A., i, 189.

—— influence of elements on the optical activity of the amyl radicle, A., ii, 265.

Brochet, *André*, action of chlorine on secondary alcohols, A., i, 99.

—— action of chlorine on primary alcohols, A., i, 99.

—— action of chlorine on tertiary amylic alcohol, A., i, 100.

—— action of formaldehyde on menthol and borneol, A., i, 530.

Brodsky. See *Carl Adam* **Bischoff**.

Bronstein, *S.* See *Edgar* **Wedekind**.

Brooke, *Arthur.* See *Rudolph* **Fittig**, *Henry Lloyd* **Snape**.

Brown, *Ernest W.*, cholesterylic salts of birds' blood, A., ii, 311.

Brown, *Harold.* See *Wyndham R.* **Dunstan**.

Brown, *Horace T.*, and *James Hills* **Millar**, maltodextrin: its oxidation products and constitution, T., 286; P., **1899**, 11; discussion, P., 14.

—— —— attempts to prepare pure starch derivatives through their nitrates, T., 308; P., **1899**, 13; discussion, P., 14.

—— —— the stable dextrin of starch transformations, and its relations to the maltodextrins and soluble starch, T., 315; P., **1899**, 13; discussion, P., 14.

Brown, *Oliver W.*, distribution of mercuric chloride between toluene and water, A., ii, 83.

Browne, *C. A.*, physical and chemical constants of butter fat, A., ii, 709.

Browning, *Philip Embury*, and *Ernest* **Howe**, detection of sulphides, sulphites, sulphates, and thiosulphates in the presence of each other, A., ii, 124.

Brühl, *Julius Wilhelm*, physical properties of some camphors and allied substances, A., i, 625.

—— alkyldiazourethanes (so-called nitrosoalkylurethanes, A., i, 871.

—— theory of unsaturated and aromatic compounds, A., i, 873.

—— cause of the dissociative power of a solvent, A., ii, 10.

—— constitution of hydroxylamime, A., ii, 285.

—— function of the medium in chemical change, A., ii, 735.

Bruger, *P.* See *Richard Jos.* **Meyer**.

Brugnatelli, *Luigi*, asbestos deposits of Val Malenco, A., ii, 372.

Bruhn, *Bruno*, constitution and origin of naphthenes, A., i, 422.

Bruhn, *Bruno.* See also *Wilhelm von* **Miller**.

Bruhns, *Gustave*, Kjeldahl's process for estimating sugar, A., ii, 254.

Bruni, *Giuseppe*, phenomena of physical equilibrium in mixtures of isomorphous substances, A., ii, 356, 407.

—— equilibrium in systems of two and three components with a liquid phase, A., ii, 406.

—— cryohydric phenomena in solutions of enantiomorphous isomerides, A., ii, 731.

Bruni, *Giuseppe*, and *R.* **Carpené**, cryoscopic behaviour of the picrates, A., ii, 8.

Bruni, *Giuseppe*, and *F.* **Gorni**, solid solutions and isomorphous mixtures of saturated and non-saturated open-chain compounds, A., ii, 731.

Brunner (Wetzlar), examination of sodium phosphate for sodium carbonate and reaction of sodium phosphate with phenolphthalein, A., ii, 152.

Brunner, *Heinrich*, homologues of theobromine, A., i, 306.

Brunner, *Heinrich*, and *Heinrich* **Leins**, separation and estimation of caffeine and theobromine, A., ii, 261.

Brush, *Charles F.*, a new gas [etherion], A., ii, 287.

Bruyn, *B. de*, equilibrium of three component systems forming two liquid phases, A., ii, 591.

Bruyn, *Cornelis Adriaan Lobry de*, free chitosamine, A., i, 5.

—— action of water on acraldehyde dibromide, A., i, 110.

Bruyn, *Cornelis Adriaan Lobry de*, an ammoniacal derivative of fructose, A., i, 732.
—— relative strength of acids, A., i, 861.
—— free hydrazine, A., ii, 745.
Bruyn, *C. A. Lobry de*, and *William* **Alberda van Ekenstein**, action of alkali on the sugars. VI. Maltose, lactose, and melibiose, A., i, 661.
—— —— compounds formed by polyhydric alcohols with benzaldehyde, A., i, 661.
—— —— free chitosamine, A., i, 732.
—— —— preparation of formose by means of amorphous lead hydroxide, A., i, 850.
Bruyn, *C. A. Lobry de*, and *Alphonse* **Steger**, comparative study of the three dinitrobenzenes, A., i, 744.
—— —— influence of water on the velocity of transformation of orthodinitrobenzene by sodium methoxide and ethoxide, A., i, 745.
—— —— influence of water on the velocity of ether formation, A., i, 849.
Bruyn, *C. A. Lobry de*. See also *William* **Alberda van Ekenstein.**
Bryant, *Edward G.*, displacement of metals by magnesium, A., ii, 289.

Cabot, *Godfrey L.*, solubility of lime in aqueous solutions of sodium and potassium chloride, A., ii, 25.

Cady, *Hamilton P.*, naphthalene and aqueous acetone, A., ii, 82.

—— constant temperature device, A., ii, 139.

—— electromotive force between amalgams, A., ii, 394.

—— solid solutions, A., ii, 405.

Cahen, *E.*, action of isobutylic bromide on β-naphthylic methylic ether in presence of anhydrous aluminium chloride, A., i, 617.

Cajar, *Hermann*, orthaldehydophenoxyacids, A., i, 146.

Calame, *Paul*, dissociation of polyvalent salts, A., ii, 145.

Calzolari, *F.* See *Felice* **Garelli**.

Camerer, *William*, and *Friedrich* **Söldner**, analysis of human urine, A., ii, 825.

Cameron, *Frank Kenneth*, benzoate of acetohydroxamic acid, A., i, 206.

—— benzaldoxime, A., ii, 411.

Cameron, *Frank Kenneth*, and *H. A.* **Holly**, acetonechloroform, A., i, 323.

Camozzi, *G.* See *Antonio* **Piccinini**.

Campanaro, *G.*, action of malic acid on paramidophenetoil, A., i, 349.

Campani, *R.* See *Fausto* **Sestini**.

Campbell, *Edward D.*, and *E. C.* **Champion**, electrolytic estimation of tin in tin ores, A., ii, 62.

Campbell, *Edward D.*, and *William E.* **Hartman**, influence of silicon on the heat of solution of coke cast irons, A., ii, 29.

Camus, *L.*, agglutination produced by the albuminous gland of *Helix pomatia*, A., ii, 779.

Camus, *L.*, and *Eugène* **Gley**, coagulating action of the liquid of the external prostate of the hedgehog on the contents of *vesiculæ seminalis*, A., ii, 779.

—— —— substance in the blood which prevents the action of rennet on milk, A., ii, 780.

—— —— immunity of certain animals to the poisonous action of eel's serum, A., ii, 783.

Carette [*Denis*] *Henri*, methyl nonyl ketone, A., i, 860.

Carles, *P.*, estimation of sugar in chocolate, A., ii, 67.

—— detection and estimation of lead in tin plate and "tinned" foods, A., ii, 183.

—— fluorine in the water of Néris-les-Bains, A., ii, 308.

Carlinfanti, *E.*, derivatives of pinacolin, A., i, 671.

Carnot, *Adolphe*, and **Goutal**, carbides of iron and other metals in metallurgical products, A., ii, 293.

—— —— estimation of carbon in iron products, A., ii, 809.

Carpené, *A.*, detection and estimation of glucose in diabetic urine, A., ii, 66.

Carpené, *R.* See *Giuseppe* **Bruni**.

Carpenter, *H. C. H.*, and *William Henry* **Perkin**, *jun.*, the action of ethylene dibromide and trimethylene dibromide on the sodium compound of ethylic cyanacetate, T., 921; P., **1898**, 133.

Carpenter, *Harold*. See *Johannes* **Wislicenus**.

Carpiaux. See *Em.* **Laurent**.

Carrara, *Giacomo*, and *U.* **Rossi**, energy of some bases of mixed function, A., ii, 358.

Carveth, *Hector R.*, acetaldoxime, A., ii, 81.

—— single differences of potential, A., ii, 137.

—— study of a three component system, A., ii, 141.

—— composition of mixed vapours, A., ii, 467.

Cash, *John Theodore*, and *Wyndham Rowland* **Dunstan**, pharmacology of aconitine, diacetylaconitine, benzaconine, and aconine, A., ii, 42.

Caspari, *William Augustus*. See *Ludwig* **Knorr**.

Castoro, *Nicola*, acetanilide and hypochlorites, A., i, 430.

—— molecular weights of some inorganic salts, A., ii, 360.

Cathelineau and *Jean* **Hausser**, empyreumatic oil of juniper, A., i, 536, 711.

Cattaneo, *Carlo*, temperature coefficients of solutions of salts in mixtures of alcohol and ether, A., ii, 355.

Causse, *Henri* [*Eugène*], antimonylphenolic compounds, A., i, 362.

—— triacetylmorphine and the oxidation of morphine, A., i, 394.

Cavalier, *Jacques*, methylic phosphates, A., i, 558.

—— velocity of hydrolysis of alkylic phosphates, A., ii, 13.

Cavalier, *Jacques*, volumetric analysis of a mixture of alkyl phosphates with phosphoric acid, A., ii, 55.

Cavalier, *Jacques*, and **Pouget**, glycerophosphoric acid, A., i, 660.

Caven, *Robert Martin*, and *Alfred* **Hill**, metallic phosphates, A., ii, 28.

—— —— estimation of cuprous oxide by permanganate, A., ii, 59.

Cazeneuve, *Paul*, application of Schiff's reaction to some substituted magentas, A., i, 296.

—— transformation of orthotolylic carbonate into a phthalein derivative, A., i, 296.

Cazeneuve, *Paul*, and *P.* **Breteau**, solanine, A., i, 551.

—— —— decomposing action of water on hæmatins, A., i, 840.

—— —— hæmatin from blood, and the varieties derived from various species of animals, A., ii, 440.

Cazeneuve, *Paul*, and **Moreau**, action of piperidine on carbonates derived from phenols : transformation of aromatic urethanes, A., i, 132.

—— —— aromatic urethanes of conicine, A., i, 133.

—— —— aromatic diurethanes of piperazine, A., i, 167.

—— —— aromatic urethanes of tetrahydroquinoline, A., i, 305.

—— —— action of sulphuric acid on symmetrical aromatic carbamides, A., i, 430.

Cazeneuve, *Paul*, and *Albert* **Morel**, general method for the preparation of mixed carbonates of the fatty and aromatic series, A., i, 29.

—— —— mixed phenylic alkylic carbonates, A., i, 29.

Cecchi-Mengarini, *Ettore*, Italian petroleums, A., i, 841.

Centnerszwer, *M.*, melting points of mixtures of optical isomerides, A., ii, 725.

Ceppellini, *Italo*, detection of elderberry juice in extract of ergot, A., ii, 135.

Cesàro, *Giuseppe*, Belgian minerals, A., ii, 433.

Chabrié, *Camille*, apparatus for the separation of organic products, A., ii, 362.

Chalmot, *Guillame J. L. de*, iron silicides with a high percentage of silicon, A., ii, 488.

Champion, *E. C.* See *Edward D.* **Campbell**.

Chancel, *Felix*, preparation of hydroxyethylamines, A., i, 411.

—— amount of ash and cellulose present in *Posidonia caulini*, A., ii, 682.

Chapin, *Edward S.* See *Arthur A.* **Noyes**.

Chapman, *Alfred Chaston*, quantitative separation of isovaleric and acetic acids, A., ii, 704.

Chapman, *David Leonard*, the allotropic modifications of phosphorus, T., 734 ; P., **1899**, 102.

—— rate of explosion in gases, A., ii, 591.

Chapman, *David Leonard*, and *F. Austin* **Lidbury**, non-existence of the so-called suboxide of phosphorus, T., 973 ; P., **1899**, 186.

Chapman, *Edgar Marsh*. See *Arthur* **Lapworth**.

Chappelle, *Ph.* See *G.* **Meillère**.

Charabot, *Eugène*, the so-called inversion of linalool, A., i, 767.

Charabot, *Eugène* [and in part **Ebray**], French essence of peppermint, A., i, 441.

Charabot, *Eugène*, and **March**, action of silver nitrate on the fatty acids of cotton seed oil, A., ii, 618.

Charabot, *Eugène*, and *Louis* **Pillet**, essential oils of neroli and petit grain, A., i, 620.

—— constituents of oil of petit grain, A., i, 711.

Charitschkoff, *K.*, properties of naphthenates and their qualitative distinction from salts of fatty acids, A., i, 423.

Charon, *Ernest*, electronegative nature of certain unsaturated organic radicles, A., i, 469.

—— crotonaldehyde, A., i, 848.

Charrin, *Albert*, iron in the spleen during pregnancy, A, ii, 773.

Charrin, *Albert*, and *A.* **Guillemonat**, physiology of pregnancy, A., ii, 773.

Charrin, *Albert*, *A.* **Guillemonat**, and **Levaditi**, action of mineral substances and organic acids on the resistance of the body to disease, A., ii, 781.

Charrin, *Albert*, and **Levaditi**, action of the pancreas on the diphtheric toxin, A., ii, 441.

Chassevant, *Allyre*, precipitation of urea by phosphotungstic acid, A., ii, 390.

Chatanay, *Georges*, apparatus for preventing the backward flow of water during exhaustion with a water pump, A., ii, 646.

Chattaway, *Frederick Daniel*, the composition of nitrogen iodide, P., **1899**, 18 ; discussion, P., 21.

Chattaway, *Frederick D.*, and *Kennedy Joseph Previte* **Orton**, a series of substituted nitrogen chlorides and their relation to the substitution of halogen in anilides and anilines, T., 1046 ; P., **1899**, 152.

Chattaway, *Frederick D.*, and *Kennedy Joseph Previte* **Orton**, preparation and properties of nitrogen iodide, P., **1899**, 17; discussion, P., 21.

—— —— action of light on nitrogen iodide, P., **1899**, 18; discussion, P., 21.

—— —— the action of alkali hydroxides, of water, and of hydrogen peroxide on nitrogen iodide, P., **1899**, 18; discussion, P., 21.

—— —— theory of the formation and reactions of nitrogen iodide, P., **1899**, 20; discussion, P., 21.

—— —— recovery of iodine from waste products, A., ii, 650.

Chattaway, *Frederick D.*, and *Henry Potter* **Stevens**, action of reducing agents on nitrogen iodide, P., **1899**, 17; discussion, P., 21.

—— —— the action of acids on nitrogen iodide, P., **1899**, 19; discussion, P., 21.

Chavastelon, *R.*, compound of acetylene with cuprous oxychloride, A., i, 22.

Cherry, *Thomas*. See *Charles James* **Martin.**

Chesneau, *Gabriel*, action of nitric oxide on chromous salts, A., ii, 661.

Chiari, *K.*, γ-amino-$\alpha\beta$-propylenic glycol, A., i, 325.

Chibret, *Paul*, detection and estimation of proteids, diastases, alkaloids, leucomaines, and toxins, especially in urine, A., ii, 459.

Chism, *K. E.*, modification of Eschka's mercury assay, A., ii, 813.

Chittenden, *A. S.*, solution of mercury in the body juices, A., ii, 311.

Chittenden, *Russell H.*, and *Alice H.* **Albro**, formation of melanin-like pigments from proteids, A., i, 468.

Chittenden, *Russell H.*, *Lafayette B.* **Mendel**, and *Yandell* **Henderson,** physiological action of certain derivatives of proteids, A., ii, 233.

Chittenden, *Russell H.*, and *Arthur B.* **Siviter**, inulin in the gastro-intestinal tract, A., ii, 310.

Chlopin, *Grigori V.*, estimation of oxygen in gaseous mixtures by titration, A., ii, 574.

Chrétien, *Paul*, action of acids on iodic acid and iodates, A., ii, 362.

Christomanos, *Anastasios*, detection of quinine in urine by means of picric acid, A., ii, 344.

Chuard, *Ernest*, action of water on calcium carbide, A., ii, 155.

Churchill, *Jesse Briggs*. See *Theodore W.* **Richards.**

Ciamician, *Giacomo Luigi*, and *Paul G.* **Silber,** crystalline constituents of galanga root, A., i, 537.

Cieslar, *Adolf*, amount of lignin in the wood of trees with acicular leaves, A., ii, 447.

Cimmino, *Raffaele*, the diphenylamine test for nitric acid in natural waters, A., ii, 805.

Cioci, *A.*, double thiocyanates of vanadium and the alkalis, A., i, 321.

Claflin, *Alan A.*, manufacture and applications of lactic acid, A., i, 12.

Claisen, *Ludwig*, condensing action of potassium cyanide on aldehydes and on mixtures of aldehydes and ketones, A., i, 667.

Clark, *J. F.*, electrolytic dissociation and toxic effect, A., ii, 627.

Clarke, *Frank Wigglesworth*, alkaline reaction of some natural silicates, A., ii, 109.

—— constitution of tourmaline, A., ii, 767.

Clarke, *Frank W.*, and *Nelson H.* **Darton,** hydromica from New Jersey, A., ii, 496.

Clarke, *Frank W.* See also *William F.* **Hillebrand.**

Clarke, *Thomas*. See *Richard* **Anschütz.**

Claude, *Georges*, explosibility of acetylene at low temperatures, A., i, 397.

Cleghorn, *Allen*, action of animal extracts, bacterial cultures and culture filtrates on mammalian heart muscle, A., ii, 310.

—— physiological action of extracts of sympathetic ganglia, A., ii, 569.

Clemm, *Hans*. See *Emil* **Fischer.**

Clough, *Charles Thomas*, and *William* **Pollard,** spinel and forsterite from the Glenelg limestone (Inverness-shire), A., ii, 667.

Clowes, *Frank*, deposition of barium sulphate as a cementing material of sandstone, A., ii, 761.

Cobbett, *Louis*, nature of the action of antitoxins, A., ii, 680.

Cobleigh, *W. M.* See *Frank W.* **Traphagen.**

Coburn, *D. L.* See *Erastus* **Hopkins.**

Cochenhausen, *E. von*, oxidation of ketones, A., i, 251.

Cochran, *C. B.*, butter and its adulterations, A., ii, 709.

Cockburn, *George Bertram*, isomeric fencholenic acids, T., 501; P., **1899**, 106.

Coehn, *Alfred*, electrolytic separation of cobalt and nickel, A., ii, 127.

Cohen, *Emil Wilhelm*, meteoric iron from Beaconsfield, A., ii, 113.

Cohen, *Emil Wilhelm*, meteoric iron from San Cristobal, Chili, A., ii 113.
—— meteoric irons, A., ii, 307, 674.
Cohen, *Ernst*, velocity of inversion in aqueous alcohol, A., ii, 275.
—— internal resistance of normal cells, A., ii, 462.
Cohen, *Julius Berend*, and *Henry D.* **Dakin**, the aluminium-mercury couple. Part II. Action of bromine on organic compounds in presence of the couple, T., 893; P., **1899**, 183.
Cohen, *Julius Berend*, and *Frederick William* **Skirrow**, the aluminium-mercury couple. Part I. Action of sulphur chloride on some hydrocarbons in presence of the couple, T., 887; P., **1899**, 183.
Cohn, *Georg*, acetylleucomethylene-blue, A., i, 809.
—— orthamidophenetidine, A., i, 944.
Cohn, *Paul*, two new hydrocarbons, A., i, 295.
Cohn, *Rudolf*, decomposition of albumin by hydrochloric acid. II., A., i, 315.
—— formation of sugar from proteid, A., ii, 776.
Cole, *Grenville A. J.*, flame reaction of potassium in silicates, A., ii, 521.
Coles. See **Cowper-Coles**.
Collet, *A.*, action of chloracetic chloride on various aromatic hydrocarbons in presence of aluminium chloride, A., i, 55.
—— aromatic ketones containing iodine, A., i, 434.
—— action of parachloro- and parabromo-phenyl bromomethyl ketones on aniline, A., i, 698.
—— parabromophenyl methyl ketone, A., i, 699.
—— parachlorophenyl methyl ketone, A., i, 699.
Collie, *John Norman*, and *Thomas* **Tickle**, the salts of dimethylpyrone and the quadrivalence of oxygen, T., 710; P., **1899**, 148.
Colman, *James*. See *Siegmund* **Gabriel**.
Colson, *Albert*, methods of synthesis derived from the study of cyanals (aldehyde cyanhydrins), A., i, 251.
—— reaction zones, A., ii, 205.
—— displacement of metals by hydrogen, A., ii, 215.
—— displacement of mercury by hydrogen, A., ii, 485.
—— copper reduced at a low temperature, A., ii, 597.
Comanducci, *E.* See *C.* **Manuelli**.
Combe, *A.* See *William* **Oechsner de Coninck**.
Compan, *P.* See *Henri* **Imbert**.
Conen, *Fr.*, α- and β-trimethylphosphortolubetaines, and their carboxylic acids, A., i, 208.
Coninck. See **Oechsner de Coninck**.
Conrad, *Max*, formation of olefine-dicarboxylic acids from ethylic dibromomonalkylacetoacetates, A., i, 481.
Conrad, *Max*, and *Richard* **Gast**, constitution of tetric acid and of the lactone of γ-hydroxydimethylacetoacetic acid, A., i, 114.
—— —— derivatives of ethylic diethylacetoacetate, A., i, 193.
—— —— methylic paracyanodimethylacetoacetate, A., i, 258.
Conrad, *Max*, and *Karl* **Hock**, 4 : 4-dimethyl-3-keto-5-pyrrolidone and its derivatives, A., i, 632.
—— —— action of orthophenylenediamine on ethylic bromodimethylacetoacetate, A., i, 642.
Conroy, *James Terence*, composition and solubility of sodium ferrocyanide, A., i, 2.
Conroy, *Sir John*, refractive indices and densities of normal and semi-normal aqueous solutions of hydrogen chloride and the chlorides of the alkalis, A., ii, 717.
Conzetti, *Alfred*. See *Richard E.* **Meyer**.
Cook, *A. D.*, method of preparing a strictly neutral ammonium citrate solution, A., ii, 55.
Copaux, *H.*, alkylic borates: properties of ethylic borate, A., i, 183.
—— non-existence of monethylic borate [metaborate], A., i, 847.
—— volumetric estimation of boric acid, A., ii, 181.
Coppet, *Louis Casimir de*, freezing point of mixtures of acetic acid and water, A., ii, 546.
—— temperatures of maximum density of aqueous solutions of alkali chlorides, A., ii, 590.
Cottle, *George J.* See *Arthur Amos* **Noyes**.
Cotton, *S.*, action of hydrogen peroxide on urine: origin of acetone, A., ii, 780.
Cottrell, *F. G.*, heat of solution of liquid hydriodic acid, A., ii, 401.
Cottrell, *F. G.*, and *Roy Ravone* **Rogers**, action of liquid hydrogen iodide on ether, A., i, 324.
Coupin, *Henri*, poisonous effects of cupric salts on higher plants, A., ii, 118.
—— toxicity of chromium compounds with respect to the higher plants, A., ii, 242.
Coupin, *Henri*. See also *E. C.* **Teodoresco**.

Cousin, *H.*, halogen derivatives of guaiacol and veratrole, A., i, 200.

—— derivatives of catechol, A., i, 346.

Cowper-Coles, *Sherard*, electro-deposition of vanadium, A., ii, 755.

—— electro-deposition of palladium, A., ii, 755.

Cramer, *Gustav*, γ-lactones of phenolic acids, A., i, 153.

Crampton, *Charles Albert*, and *F. D.* **Simons**, detection of caramel in spirits and vinegar, A., ii, 530.

Cremer, *Max*, chemico-physiological studies on phloridzin [diabetes], A., ii, 169.

—— formation of glycogen in yeast extract, A., ii, 606.

—— formation of fat from proteid in the cat, A., ii, 775.

Cristaldi. See **Grassi-Cristaldi.**

Crofts, *James Murray*. See *Robert Selby* **Morrell**.

Crookes, *Sir William*, position of helium, argon, and krypton in the scheme of elements, A., ii, 552.

—— photographic researches on phosphorescent spectra: victorium, a new element associated with yttrium, A., ii, 751.

Cross, *Charles Frederick*, *Edward John* **Bevan**, and *Thv.* **Heiberg**, oxidation of furfuraldehyde by hydrogen peroxide, T., 747; P., **1899**, 130; discussion, P., 131.

Crossley, *Arthur William*, some derivatives of dimethyldihydroresorcinol, T., 771; P., **1898**, 247.

—— the interaction of ethylic sodiomalonate and mesityl oxide, P., **1898**, 247, and **1899**, 52.

—— the interaction of ethylic malonate and acetylene tetrabromide in presence of sodium ethoxide, P., **1898**, 248.

Crossley, *Arthur W.*, and *Henry Rondel* **Le Sueur**, determination of the constitution of fatty acids. Part I., T., 161; P., **1898**, 218.

—— —— chemical and physical characters of some Indian edible oils, A., ii, 324.

Crossley, *Arthur W.* See also *Henry Rondel* **Le Sueur**.

Cumenge, *E.* See *Charles* **Friedel**.

Cuneo, *Gerolamo*, tetracetylhydrazide and derivatives of urazole, A., i, 9.

—— phenylimidotriazoline, A., i, 547.

—— new triazoline compounds, A., i, 548.

Cunnington, *Alfred Valentine*. See *Siegfried* **Ruhemann**.

Curtis, *Chester B.*, analysis of aqueous alcohol, A., ii, 184.

Curtius, *Theodor*, diazoacetonitrile, A. i, 9.

Curtius, *Theodor*, and *Adolf* **Burkhardt**, phenylsemicarbazide, A., i, 137.

Curtius, *Theodor*, and *Ferdinand* **Lorenzen**, hydrazides and azides of aromatic sulphonic acids, A., i, 148.

Curtius, *Theodor*, and *Ernst* **Mohr**, conversion of nicotinic acid into β-amidopyridine, A., i, 73.

Curtius, *Theodor*, and *Eduard* **Portner**, hydrazides of meta- and para-bromobenzoic acids, A., i, 136.

Curtius, *Theodor*, and *Erwin* **Quedenfeldt**, symmetrical dibenzylhydrazine, A., i, 276.

Curtius, *Theodor*, and *Johannes* **Rissom**, azoimide, A., ii, 90.

Curtius, *Theodor*, and *Ed.* **Zinkeisen**, transformation of fatty ketazines and aldazines into pyrazoline derivatives, A., i, 165.

Cushman, *Allerton Seward*. See *Theodore W.* **Richards**.

Czapek, *Friedrich*, so-called lignin reaction of wood, A., i, 560.

Czepinski, *Vincent*, alteration of free energy in melted halogen compounds of some heavy metals, A., ii, 267.

Czerny, *H.* See *Karl* **Auwers**.

—— resolution of racemic amido-acids into optically active components, A., i, 888.
—— importance of stereochemistry in physiology, A., ii, 169.
Fischer, *Emil*, and *Friedrich* **Ach**, 1 : 9-dimethyluric acid and 1 : 7 : 9-trimethyluric acid, A., i, 392.
Fischer, *Emil*, and *Hans* **Clemm**, new synthesis of paraxanthine, A., i, 173.

Fischer, *Louis A.*, facilities for standardising chemical apparatus offered by the American and other Governments, A., ii, 592.

Fischer, *Otto*, action of alcoholic hydrogen chloride on nitrosophenylglycine [nitrosoanilidoacetic acid], A., i, 349.

—— action of formaldehyde on orthodiamines. II., A., i, 353.

—— benzimidazolecarboxylic acid, A., i, 641.

Fischer, *Otto*, and *Karl* **Demeler**, action of phosphorus pentachloride on 1-alkylpyridones and 1-alkylquinolones, A., i, 635.

Fischer, *Otto*, and *Eduard* **Hepp**, isorosindones, A., i, 78.

—— —— hydroxyrosindones, A., i, 78.

—— —— synthesis of indulines, A., i, 79.

Fischer, *Otto* [with *W.* **Hoerger**, *R.* **Jaeger**, *Paul* **Klitzsch**, and *L.* **Leidel**], action of phosphorus pentachloride on 1-alkylpyridones and 1-alkylquinolones, A., i, 633.

Fischer, *Richard*, and *J. A.* **Anderson**, assay of spirit of nitrous ether, A., ii, 617.

—— —— assay of amylic nitrite, A., ii, 618.

Fittig, *Rudolph*, transformation of unsaturated α-hydroxy-acids into hydroxyfurfurancarboxylic acids, A., i, 191.

—— transformation of unsaturated acids, A., i, 332.

Fittig, *Rudolph*, and *Arthur* **Brooke**, phenylitaconic acid and its isomerides, A., i, 437.

Fittig, *Rudolph*, and *Arthur W.* **Burwell**, isopropylitaconic acid and its isomerides, A., i, 336.

Fittig, *Rudolph*, and *Edgar* **Erlenbach**, isobutylaticonic acid, A., i, 338.

Fittig, *Rudolph*, and *Fritz* **Fichter**, propylitaconic acid and its isomerides, A., i, 336.

Fittig, *Rudolph*, and *Fritz* **Glaser**, ethylitaconic acid and its isomerides, A., i, 333.

Fittig, *Rudolph*, and *Harold de* **Haven-Boyd**, methylallyllactic acid and dimethylhydrofurfurancarboxylic acid, A., i, 191.

Fittig, *Rudolph*, and *William D.* **Hoeffken**, hexylitaconic acid and its isomerides, A., i, 339.

Fittig, *Rudolph*, and *Friedrich* **Kaehlbrandt**, oxidation of isobutylitaconic, isobutylcitraconic, and isobutylmesaconic acids, A., i, 418.

Fittig, *Rudolph*, and *Arthur* **Kettner**, pyrocinchonic acid and its isomerides, A., i, 333.

Fittig, *Rudolph*, and *Wilhelm* **Köhl**, oxidation of unsaturated dibasic acids: A., i, 418.

Fittig, *Rudolph*, and *Hermann* **Krafft**, dimethylitaconic (teraconic) acid and its isomerides, A., i, 334.

Fittig, *Rudolph*, and *Charles Ford* **Langworthy**, itaconic, citraconic, and mesaconic acids, A., i, 332.

Fittig, *Rudolph*, and *Nicolaus* **Petkow**, dimethylaticonic acid, A., i, 335.

Fittig, *Rudolph*, and *Carl* **Schirmacher**, isobutylitaconic acid and its isomerides, A., i, 338.

Fittig, *Rudolph*, and *Emil* **Stuber**, transformation of unsaturated acids: hexylaticonic acid, A., i, 417.

Fittig, *Rudolph*, and *Heinrich* **Thron**, isopropylisoparaconic acid, A., i, 337.

Flatau, *Julien*, essential oils of lemongrass and citronella, A., i, 711.

Flatau, *Julien*, and *Henri* **Labbé**, acids in essence of geranium, A., i, 65.

—— —— characteristic derivatives of geraniol and citronellol, A., i, 409.

—— —— essential oil of Portugal (sweet orange), A., i, 442.

—— —— essential oil of mandarins, A., i, 442.

—— —— essential oils of geranium, citronella, and roses, A., i, 534.

—— —— essential oil of melissa, A., i, 535.

—— —— menthone from the essence of geranium from Bourbon, A., i, 621.

—— —— separation of citral and citronellal, A., i, 622.

—— —— sugar of orange peel, A., ii, 445.

Flawitzky, *Flavian*, optical activity of tannin, A., i, 805.

—— a hydrate theory of solution, A., ii, 730.

Fleischer, *Franz*, digitoflavone, a new substance isolated from *Digitalis purpurea*, A., i, 631.

Fleissner, *Franz*. See *Eduard* **Lippmann**.

Fleming, *John Ambrose*, and *James* **Dewar**, magnetic susceptibility of liquid oxygen, A., ii, 544.

Florence, *A.*, estimation of [dissolved] oxygen in water, A., ii, 179.

Florence, *Wilhelm*, crystals in blowpipe beads, A., ii, 51.

Floresco, *N.* See *A.* **Dastre**.

Flusin, *G.*, osmosis of liquids across a membrane of vulcanised caoutchouc, A., ii, 204.

Fock, *Andreas*, crystallographic relations of optically active substances and their racemic compounds [pinonic acids], A., i, 819.

Foerster, *Fritz*, electrolytic preparation of perchloric acid and its salts, A., ii, 88.

Foerster, *Fritz*, and *O.* **Günther**, electrolysis of solutions of zinc chloride and the nature of spongy zinc, A., ii, 220.

Foerster, *Fritz*, and *F.* **Jorre**, relations of hypochlorites to chlorates, A., ii, 278.

Foerster, *Fritz.* See also *H.* **Bischoff.**

Foerster, *Otto*, estimation of perchlorate in Chili saltpetre, A., ii, 57.

—— extraction of liquids, A., ii, 121.

—— gas washing apparatus, A., ii, 805.

—— estimation of sugar in fodder containing molasses, A., ii, 818.

—— isolation of cholesterol and phytosterol from fats, A., ii, 824.

Foglino, *Ernesto*, action of alkylic salts of β-ketonic acids on paraphenetidine, A., i, 132.

Fonzes-Diacon, *Henri*, distinctive reaction for creosote and guaiacol, A., ii, 388.

Foote, *H. W.* See *Samuel L.* **Penfield.**

Foote, *Warren M.*, meteoric iron from Tombigbee river, Alabama, U.S.A., A., ii, 771.

Forch, *Carl*, surface tension of aqueous solutions, A., ii, 640.

Forcrand, *Robert de*, aldehyde-ammonia, A., i, 109.

—— sodium oxides, A., ii, 95.

—— thermochemistry of sodium suboxide and peroxide, A., ii, 141.

—— heat of oxidation of sodium, A., ii, 588.

—— the oxides of sodium and the chemical function of water compared with that of hydrogen sulphide, A., ii, 589.

Forel, *G.* See *Emilio* **Noelting.**

Forster, *Martin Onslow*, influence of substitution on specific rotation in the bornylamine series, T., 934 ; P., **1899**, 71 ; discussion, P., 72.

—— camphoroxime. Part III. Behaviour of camphoroxime towards potassium hypobromite, T., 1141 ; P., **1899**, 193.

—— influence of an unsaturated linking on the optical activity of certain derivatives of bornylamine, T., 1149 ; P., **1899**, 194.

Fortey, *Emily C.*, action of light and of oxygen on dibenzyl ketone, T., 871 ; P., **1899**, 182.

Fortey, *Emily C.* See also *Sydney* **Young.**

Fosse, *R.*, action of some copper salts on β-naphthol, A., i, 529.

—— action of methylenic and of ethylenic bromides on ββ-dinaphthol, A., i, 529.

Fosse, *R.*, constitution of ββ-dinaphthol ; derivatives of ββ-dinaphthol, A., i, 817.

—— action of aldehydes and aldehydic chlorides on ββ-dinaphthol, A., i, 818.

Foster, *Arnott R.*, and *Edgar F.* **Smith**, persulphates of rubidium, cæsium, and thallium, A., ii, 747.

Fournier, *H.*, di-isoamylacetic acid, A., i, 735.

Fowler, *R. E.* See *Louis* **Kahlenberg.**

Fradiss, *N.*, [estimation of caramel], A., ii, 819.

Fraenkel, *A.*, analysis of alloys containing tin and antimony, A., ii, 524.

Fränkel, *Sigmund*, products of the digestion of albumin. II. Isolation of the so-called carbohydrate group of egg-albumin, A., i, 396.

Franchimont, *Antoine Paul Nicolas*, plumieride, A., i, 933.

Franchimont, *Antoine P. N.*, and *Herm.* **Umbgrove**, action of sulphuric acid on aliphatic nitramines and their isomerides, A., i, 106.

Franchimont, *Antoine Paul Nicolas.* See also *Herm.* **Umbgrove.**

Francis, *Francis E.*, some derivatives of dibenzyl ketone, T., 865 ; P., **1899**, 181.

Franck, *Léon*, formation of metallic sulphides by mechanical influences, A., ii, 28.

—— aluminium as a reducing agent, A., ii, 102.

Franck, *Michel.* See *Félix* **Marboutin.**

Francke, *Arthur*, thionyl compounds of substituted paraphenylenediamines, A., i, 46.

Franco, *Pasquale*, saline sublimation from Vesuvius, A., ii, 600.

François, *Maurice*, action of water on ammonium and potassium mercuriodides, A., ii, 597.

—— dissociation of diammoniomercuric iodide, A., ii, 657.

—— volumetric estimation of aniline, A., ii, 713.

—— action of potassium iodide on mercurous iodide, A., ii, 751.

Franke, *Adolf*, aliphatic hydrazine derivatives and their products of rearrangement, A., i, 247.

—— action of hydrazine hydrate on isobutaldol, A., i, 329.

Franke, *Adolf*, and *Leopold* **Kohn**, condensation products of isobutaldehyde, A., i, 10.

Franke, *E.* See *Theodor* **Pfeiffer.**

Frankforter, *George Bell*, occurrence of copper in the plant world, A., ii 323.

Frankforter, *George B.*, and *P. M.* **Glasoe**, derivatives of camphoroxime, A., i, 713.

Frankforter, *George B.*, and *Frank H.* **Keller**, narcotine and narceine, A., i, 781.

Frankforter, *George B.*, and *A. D.* **Mayo**, derivatives of camphoroxime, A., i, 713.

Frankland, *Sir Edward*, valency of boron, A., i, 246.

Frankland, *Percy Faraday*, some regularities of the rotatory power of homologous series of optically active substances, T., 347 ; P., **1899**, 26.

Frankland, *Percy F.*, and *Henry* **Aston**, position isomerism and optical activity. The comparative rotatory powers of methylic and ethylic ditoluoylglycerates, T., 493 ; P., **1899**, 105.

Frankland, *Percy F.*, and *Frederick Malcolm* **Wharton**, position isomerism and optical activity : the methylic and ethylic salts of benzoyl- and ortho-, meta-, and para-toluoylmalic acids, T., 337 ; P., **1899**, 25.

Franklin, *Arthur I.* See *James F.* **Norris**.

Franklin, *Edward C.*, and *C. A.* **Kraus**, molecular elevation in the boiling point of liquid ammonia, A., ii, 202.

—— liquid ammonia as a solvent, A., ii, 208.

—— —— metathetic reactions between certain salts in solution in liquid ammonia, A., ii, 284.

—— —— properties of liquid ammonia, A., ii, 284.

Freer, *Paul C.*, constitution of phenylhydrazones, A., i, 357.

Freer, *Paul C.*, and *George O.* **Higley**, action of metals on nitric acid, A., ii, 480.

Frerichs, *G.*, action of alkylsulphinates on chloracetylurethanes and chloracetocarbamides, A., i, 795.

—— action of potassium hydrosulphide and thiocyanate on chloracetylurethanes and chloracetocarbamides, A., i, 796.

Frerichs, *G.*, and *Heinrich* **Beckurts**, action of aromatic amines on chloracetylurethanes and chloracetocarbamides, A., i, 806.

—— —— action of phenylhydrazine on chloracetocarbamides and chloracetylurethane, A., i, 808.

Fresenius, *Heinrich*, mineral water from Selters, Nassau, A., ii, 114.

Fresenius, *Wilhelm*, indirect estimation of extractive matter in alcoholic beverages, A., ii, 253.

Fresenius, *Wilhelm*, detection of tartaric acid in presence of oxalic acid, A., ii, 257.

Fresenius, *Wilhelm*, and *Leo* **Grünhut**, behaviour of Prussian blue with solvents in the presence of fat, A., ii, 262.

—— —— estimation of salicylic acid, A., ii, 580.

Freund, *Ernst*, simplified test for peptone in urine, A., ii, 195.

Freund, *Martin* [and *Carl* **Holthof**], thebaine, A., i, 307.

Freund, *Martin*, and *Ludwig* **Mai**, copper acetylide, A., i, 657.

Freund, *Martin*, and *Heinrich P.* **Schwarz**, cevadine [veratrine], A., i, 464.

Freundler, *Paul*, hydrocarbon, C_3H_4, a secondary product of the decomposition of barium pyromucate, A., i, 98.

—— decomposition of pyromucates of the alkaline earths, A., i, 120.

Freundler, *Paul*. See also *L.* **Étaix**.

Freundlich, *J.*, estimation of citrate-soluble phosphoric acid in basic slags, A., ii, 331.

Freyss, *Georges*, simple method of etherification of phenols and aldehydes by means of an acid radicle, and quick method of acetylating aromatic amines containing a negative group, A., i, 874.

Freytag, *Fr.*, estimation of perchlorate in saltpetre, A., ii, 179.

Friderich, *L.* See *Paul* **Dutoit**, *Philippe A.* **Guye**.

Friedel, *Charles*, hydrated sodium silico-aluminate, A., ii, 563.

Friedel, *Charles*, and *E.* **Cumenge**, carnotite, a new uranium mineral, A., ii, 434.

Friedel, *Charles*, and *Alexandre* **Gorgeu**, decomposition of a normal saturated hydrocarbon by aluminium chloride, A., i, 181.

Friedel, *Georges*, calcium chloraluminate, A., ii, 366.

—— sodium silico-aluminate, A., ii, 564.

Friedenthal, *A.*, combination of colloidal with crystalloidal substances, A., i, 852.

Friedenthal, *H.*, molecular weight of soluble starch, A., i, 851.

Friedländer, *I.*, artificial production of diamond in silicates, A., ii, 559.

Friedländer, *Paul*, preparation of ketocoumaran and analogous compounds, A., i, 675.

Friedländer *Paul* [and, in part, *Ph.* **Brand**], ortho-substituted alkylanilines, A., i, 350.

Friedländer, *Paul*, and *Armin* **Fischer**, isomeric naphthalene derivatives, A., i, 709.

Friedländer, *Paul*, *H.* **Heilpern**, and *M.* **Spielfogel**, isomeric naphthalene derivatives, A., i, 708.

Friedland, *Leo*. See *Richard E.* **Meyer**.

Friedmann. See *Ludwig* **Gattermann**.

Friemehlt, *P.* See *Max* **Scholtz**.

Fritsch, *Paul*, and *Felix* **Feldmann**, synthesis of disubstituted acetic acids by means of chloral, A., i, 600.

Fritz, *Sigmund*. See *Ludwig* **Gattermann**.

Fritzmann, *E.*, detection of nitrates in milk by means of formaldehyde, A., ii, 54.

Fröhlich, *Alfred*, detection of glucose in urine by means of methylene-blue, A., ii, 185.

Fromm, *Emil*, and *M.* **Bloch**, transformation of alkylic dithiocarbamates, $NHR{\cdot}CS{\cdot}SR^1$, into alkylic imidodithiocarbonates, $NR:C(SR^1)_2$, A., i, 887.

Fromm, *Emil*, and *E.* **Philippe**, dithiobiurets, A., i, 484.

Frühling, *R.*, polarisation of honey, A., ii, 186.

Fuchs, *Paul*, temperature correction tables for pyknometric measurements, A., ii, 272.

—— aræometric valuation of crude sulphur, A., ii, 329.

—— correct values of empirically divided hydrometer scales, A., ii, 692.

Fürth, *Otto von*, active physiological substance of the suprarenal capsules, A., ii, 115.

Fulton, *Charles H.*, assay of telluride ores [of gold and silver], A., ii, 63.

Funk, *Robert*, solubility of salts. III. Solubility of some metallic nitrates, A., ii, 209.

Furnée, *A. L. C.*, trimethylacetonylammonium chloride, A., i, 5.

G.

Gabriel, *Siegmund*, and *James* **Colman**, synthesis of pyridazine and its derivatives, A., i, 390.

—— —— pyrimidine [*m*-diazine], A., i, 638.

Gabriel, *Siegmund*, and *Willy* **Landsberger**, pseudophthalimidine and orthocyanobenzylamine, A., i, 133.

Gabriel, *Siegmund*, and *Ernst* **Leupold**, benzisothiazole, A., i, 85.

—— —— derivatives of bromethylamine and bromopropylamines, A., i, 104.

Gabriel, *Siegmund*, and *Ernst* **Leupold**, action of potassium hydrosulphide on orthocyanobenzylic chloride, A., i, 121.

Gabriel, *Siegmund*, and *Theodor A.* **Maas**, ϵ-amidocaproic acid, A., i, 595.

Gadamer, *Johannes*, identity of Hesse's atroscine with Schmidt's *i*-scopolamine, A., i, 91.

—— *Hyoscyamus muticus*, A., i, 395.

—— essential oil of *Cochlearia officinalis*, A., i, 534.

—— essential oil of *Tropæolum majus*, A., i, 535.

—— fatty oil of *Tropæolum majus*, A., i, 864.

—— essential oils and glucosides of cresses, A., i, 930.

—— estimation of caffeine in tea, coffee, and kola, A., ii, 390.

—— testing of oil and spirit of mustard, A., ii, 455, 712.

—— preparation and testing of "*Spiritus Cochleariæ*," A., ii, 456.

Gadd, *W. Lawrence*, butter analysis, A., ii, 823.

Gaertner, *A.*, vivianite and chalybite in Mecklenburg peat, A., ii, 302.

Gärtner, *A. S.* See *Daniel* **Vorländer**.

Gaess, *Franz*, preparation of a hydroxynaphthaquinonesulphonic acid from naphthol-yellow-S., A., i, 374.

Gallard, *F.*, absorption of iodine by the skin and its localisation in certain organs, A., ii, 503.

Ganzert, *Robert*. See *Ludwig* **Gattermann**.

Garbarini, *G.*, organomercuric compounds of diphenylmethylamine, A., i, 361.

Garelli, *Felice*, stannic bromide as a solvent in cryoscopy, A., ii, 271.

Garelli, *Felice*, and *F.* **Calzolari**, cryoscopic behaviour of substances with constitutions similar to that of the solvent, A., ii, 731.

Garnier, *Léon*, volumetric estimation of glucose, A., ii, 701.

Garrigou, *F.*, absence of free iodine and gaseous iodides in the atmosphere of Toulouse, A., ii, 414.

—— detection of rare metals in mineral waters, A., ii, 616.

Garrod, *Archibald Edward*, extraction of homogentisic acid (quinolacetic acid) from urine, A., ii, 314.

Garzarolli-Thurnlackh, *Karl*, action of pyruvic acid on malonic acid. Synthesis of itaconic acid, A., i, 790.

—— action of benzylideneaniline on pyruvic acid and its ethylic salt, A., i, 823.

Garzarolli-Thurnlackh, *Karl*, action of acid chlorides on benzylidene-aniline, A., i, 881.
—— formation of 2′-alkylquinoline-4′-carboxylic acids, A., i, 940.
Gaspari, *Ausonio de*. See *Giacomo* **Ponzio**.
Gast, *Richard*. See *Max* **Conrad**.
Gattermann, *Ludwig* [and in part *F.* **Bamberg**, *R.* **Berendes**, *K.* **Beck**, **Eger**, **Feuerstein**, *W.* **Kreuder**, *Eugen* **Oberländer**, and **Paradeis**], replacement of the diazo-group by the sulphinic radicle, A., i, 516.
Gattermann, *Ludwig* [and in part *F.* **Bamberg**, *R.* **Berendes**, *Robert* **Ganzert**, *Carl G.* **Oehmichen**, and *G. de* **Ridder**], thiofluorescein and some derivatives of the phthaleins, A., i, 513.
Gattermann, *Ludwig*, and *F.* **Eggers**, synthesis of asarone, A., i, 347.
Gattermann, *Ludwig*, and *E.* **Ellery**, siliconesoxalic acid, A., ii, 418.
Gattermann, *Ludwig* [and in part **Friedmann**, **Knüttell**, *von* **Kuylenstjerna**, *J. A.* **Rölofsen**, *F.* **Schaar-Rosenberg**, **Tetzlaff**, **Tust**, and **Zimmer**, synthesis of aromatic thioanilides, A., i, 694.
Gattermann, *Ludwig*, *Sigmund* **Fritz**, and *K.* **Beck**, homologous hydrocarbons of the mesitylene type, A., i, 491.
Gattermann, *Ludwig*, and *Th. von* **Horlacher**, synthesis of hydroxy-aldehydes of the naphthalene series, A., i, 372.
Gattermann, *Ludwig* [and in part **Kjellbom**, *Eugen* **Oberländer**, **Prentice**, and *J. A.* **Rölofsen**], synthesis of aromatic carboxylic acids, A., i, 509.
Gattermann, *Ludwig*, and *M.* **Köbner**, synthesis of hydroxy-aldehydes of the benzene series, A., i, 363.
—— —— synthesis of daphnetin and æsculetin, A., i, 364.
Gauhe, *Ernst*. See *Friedrich* **Kehrmann**.
Gautier, [*Emile Justin*] *Armand*, presence of free hydrogen in the atmosphere, A., ii, 149.
—— estimation of carbonic oxide, A., ii, 451.
—— iodine in sea water, A., ii, 477, 649.
—— maximum quantity of chlorides contained in sea air, A., ii, 592.
—— existence of iodine in the atmosphere, A., ii, 593.
—— [presence of iodine in *Algæ* and *Beggiatoa*], A., ii, 649.
Gautier, *Armand*. See also *André* **Dubois**.
Gautier, *Henri*, thermal properties of quicklime prepared at different temperatures, A., ii, 399.
—— magnesium phosphide, A., ii, 484.
Gautrelet, *E.*, egols, new antiseptics, A., i, 802.
Gawalowski, *A.*, the most important sweetening materials, A., ii, 254.
—— oxygen æolopile, A., ii, 362.
—— novelties in laboratory apparatus, A., ii, 515.
Gayaux, detection of cane sugar in milk, A., ii, 254.
Gayon, *A.*, and *L.* **Laborde**, estimation of mercury in organic liquids, and especially liquids fermented in presence of mercuric chloride, A., ii, 385.
Gazzolo, *F. H.* See *Charles Loring* **Jackson**.
Geelmuyden, *H. Chr.*, acetonuria in phloridzin poisoning, A., ii, 235.
Geerligs. See **Prinsen-Geerligs**.
Geese, *W.* See *Rudolph* **Nietzki**.
Geisenheimer, *Hans*, and *Richard* **Anschütz**, action of carbamide on ethylic dioxysuccinate, A., i, 574.
Geisler, *Joseph F.*, paraffin as an adulterant of oleomargarine, A., ii, 710.
Genvresse, *P.*, an isomeride of diphenylene disulphide, A., i, 147.
—— phenylphosphoric and phenylenephosphoric acids, A., i, 342.
Genvresse, *P.*, and *Paul* **Bourcet**, combination of phenylhydrazine with alkylic iodides, A. i, 501.
Georgiadès, *Nicolas*, chemical examination of laben, A., i, 835.
—— resin of *Convolvulus althæoides*, A., i, 929.
Georgievics, *Georg von*, condensation of succinic anhydride and pyrogallol, A., i, 803.
Gérard, *Ernest*. See *E.* **Abelous**.
Geret, *L.*, and *Martin* **Hahn**, proteolytic enzyme of yeast extract, A., i, 94.
Gerland, *B. William*, indigotinsubsulphonic acids, A., i, 717.
—— indigotin and nitrobenzene, A., ii, 74.
—— use of hyposulphite for titration, especially for the estimation of oxygen in water and sewage effluents, A., ii, 697.
Gernez, *Désiré*, vapours emitted by the two varieties of mercuric iodide, A., ii, 597.
Gerngross, *Ludwig*. See *Wilhelm* **von Miller**.
Giese, *F.* See *Emil* **Knoevenagel**.
Gigli, *Guido*, action of carbonic anhydride on potassium ferrocyanide, A., ii, 387.
Gigli, *L.*, chloralacetone, A., i, 12.
Gigli, *Torquato*, test for uric acid and its volumetric estimation, A., ii, 71.
Gilbody, *Alexander William*, and *William Henry* **Perkin**, *jun.*, on brazilin and hæmatoxylin, P., **1899**, 27, 75.

Gill, *Augustus H.*, and *Israel* **Hatch,** *jun.*, the heat of bromination test for oils, A., ii, 533.

Gill, *Augustus H.*, and *Augustus C.* **Lamb,** constants of American linseed oil, A., ii, 533.

Gill, *David*, presence of oxygen in the atmospheres of certain fixed stars, A., ii, 718.

Gillespie, *H. N.* See *Claude F.* **Walker.**

Ginzberg, *Alexander*, pinol chlorhydrin, A., i, 618.

—— structure of the chlorhydrins and their derivatives obtained by the action of hypochlorous acid on pinene, A., i, 619.

Ginzberg, *Alexander*, and *E.* **Wagner,** action of hypochlorous acid on pinene, A., i, 618.

Giorgis, *Giovanni*, volumetric estimation of nickel, A., ii, 452.

Giorgis, *Giovanni*, and *G.* **Feliciani,** technical analysis and softening of water for boilers, A., ii, 453.

Girard, *Aimé*, and *Léon* **Lindet,** progressive development of grape clusters, A., ii, 445.

—— —— phlobaphen of the grape, A., ii, 445.

—— —— estimation of malic acid in grapes, A., ii, 454.

Giustiniani, *Ercole*, maleic derivatives of some aromatic amines, A., i, 349.

—— employment of ammoniacal manures on calcareous soils, A., ii, 692.

Giustiniani, *Ercole*. See also *R. Vittorio* **Matteucci.**

Gläser, *Moriz.* See *Wilhelm* **Kalmann.**

Glaser, *Charles*, double salts of nicotine hydrochloride and cadmium chloride, A., i, 829.

Glaser, *F.*, indicators for alkalimetry, A., ii, 572.

Glaser, *Fritz.* See *Rudolph* **Fittig.**

—— imines of benzophenone and the constitution of auramine, A., i, 702.

—— hydrogen sulphide as a reagent, A., ii, 178.

Graebe, *Carl*, and *J.* **Buenzod**, aniline salts of the phthalic acids, A., i, 762.

Graebe, *Carl*, and *F.* **Keller**, ortho-derivatives of benzophenonephenylimine, A., i, 703.

Graebe, *Carl*, and *Paul* **Röder**, oxime and phenylhydrazone of xanthone, A., i, 705.

Gräff, *Louis*, fibrous goslarite from Aachen, A., ii, 303.

Gramont, *Arnaud* [*Comte*] *de*, dissociation spectra of fused chlorides, bromides, and iodides, A., ii, 137.

—— spectra of compounds, A., ii, 197.

Gramont, *Arnaud* (*Comte*) *de*, dissociation spectra of fused salts. Alkali metals: sodium, lithium, potassium, A., ii, 198.

—— spectra of aluminium, tellurium, and selenium, A., ii, 199.

—— dissociation spectra of fused sulphates, phosphates, and salts containing both sulphur and phosphorus, A., ii, 345.

Granger, *Albert*, production of tungsten-blue by the reduction of tungsten in porcelain furnaces, A., ii, 32.

—— metallic phosphides and arsenides, A., ii, 211.

—— metallic phosphides, A., ii, 286.

Grashof, *Wilhelm*, experiments on rape, A., ii, 797.

Grassi-Cristaldi, *Giuseppe*, and *C.* **Maselli**, chlorinated derivatives of trioxymethylene, A., i, 409.

Grassi-Cristaldi, *Giuseppe*, and *A.* **Motta**, constitutional formulæ of hexamethylenetetramine, A., i, 473.

Gratton, *L. C.* See *Norman* **Dodge**.

Graul, *Otto*, and *Arthur* **Hantzsch**, isomeric salts of ethylnitrolic acid, A., i, 187.

Gray, *Andrew*, and *James J.* **Dobbie**, connection between the electrical properties and chemical composition of different kinds of glass, A., ii, 541.

Gray, *Thomas*, reduction of nitric oxide by copper with special reference to Dumas' method of estimating nitrogen, A., ii, 248.

Grebe, *E.* See *Alfred* **Werner**.

Greene, *Charles Wilson*, relation of the inorganic salts of the blood to the automatic activity of ventricular muscle, A., ii, 114.

Gregor, *Georg*. See *Richard* **Přibram**.

Greig, *E. D. W.* See *Ralph* **Stockman**.

Grevillius, *A. Y.* See *G.* **Fassbender**.

Griffin, *Martin L.*, agents for removing lime and magnesia from natural waters for industrial purposes, A., ii, 655.

Griffiths, *Arthur Bower*, æolosomin, A., ii, 115.

Griffon, *Ed.*, relation between the intensity of the green colour of leaves and their chlorophyllic assimilation, A., ii, 320.

Griggi, *Gioachino*, delicate test for gallic acid, serving to distinguish it from digallic acid and phloroglucinol, A., ii, 581.

Grignard, *Victor*, a new sexavalent hydrocarbon: 2-methyl-3-hexene-5-ine, A., i, 727.

—— 2-methyl-4-heptene-6-ine and 2-methyl-4:5:6-heptatriene, A., i, 727.

Grignard, *Victor*. See *Philippe* **Barbier**.
Grinberg, *S.* See *Fritz* **Haber**.
Gröger, *Max*, density and molecular weight of ozone, A., ii, 150.
—— red potassium copper chloride, A., ii, 289.
Groll, *Friedrich*. See *Hans* **Verwer**.
Gronover, *A.* See *Alfred* **Partheil**.
Groos, *A.* See *Emil* **Knoevenagel**.
Grosch, *E.*, orthochlorophenylthiocarbimide, A., i, 509.
Gross, *Rudolf*. See *Richard E.* **Meyer**.
Grosse, *Rudolf*. See *Paul* **Jacobson**.
Grossmann, *J.*, indigo testing by permanganate, A., ii, 74.
Grothe, *W.* See *Heinrich* **Beckurts**.
Grünbaum, *O. F. F.*, administration of suprarenal extract by the mouth in health and disease, A., ii, 441.
Grünberg. See *Carl Adam* **Bischoff**.
Grünhut, *Leo*, detection of glycerol, A., ii, 253.
—— table for the calculation of analyses of fuming sulphuric acid, A., ii, 381.
Grünhut, *Leo*. See also *Wilhelm* **Fresenius**.
Grüss, *J.*, oxydases and the guaiacum reaction, A., i, 314.
Grützner, *Bruno*, compounds of hexamethylenetetramine (urotropine), A., i, 6.
—— action of mercuric chloride on aqueous phenol solutions, A., i, 198.
—— estimation of oil and spirit of mustard, A., ii, 530.
Gruzewska, *S.*, crystallisation of blood albumin, A., i, 838.
Gucci, *Pietro*, action of isopropylic iodide on phthalic anhydride in presence of zinc dust: purification of propylphthalide, A., i, 513.
Günther, *Fritz*, cocaine, A., i, 963.
Günther, *O.* See *Fritz* **Foerster**.
Guerbet, *M.*, action of fermentation amylic alcohol on sodium amyloxide, A., i, 471.
—— action of alcohols on their sodium derivatives, A., i, 472.
—— direct conversion of acetamide into ethylamine by reduction, A., i, 795.
—— composition of cerebro-spinal fluid, A., ii, 780.
Guérin, *Gabriel*, detection of albumin in urine, A., ii, 716.
Guerlain, *Jacques*. See *Justin* **Dupont**.
Guffroy, *Ch.*, phosphoric acid and cereals, A., ii, 795.
Guglielmo, *Giovanni*, modifications of the Geissler pump, A., ii, 474.
Guichard, *Fr.*, chlorophosphines of the aliphatic series, A., i, 563.
Guichard, *P.*, composition of the water from wells on the sea-coast, A., ii, 566.
Guillemain, *Constantin*, composition of natural thio-salts, A., ii, 756.
Guillemonat, *A.* See *Albert* **Charrin**.
Guinchard, *J.*, derivatives of ethylic succinylsuccinate, A., i, 700.
—— coloured salts of violuric acid and other oximido-ketones, A., i, 779.
Gulewitsch, *Wladimir von*, neurine and its derivatives, A., i, 106.
—— action of trypsin on simple chemical compounds, A., i, 832.
—— arginine, A., i, 833.
—— thymine, A., i, 834.
—— leucomaines of the brain, A., ii, 439.
Guntz, *Antoine*, heat of formation of lithium carbide, A., ii, 24.
—— silver suboxide, A., ii, 418.
Gurewitsch, *A.*, action of tertiary butylic chloride on dihydric phenols in presence of ferric chloride, A., i, 880.
Gustavson, *Gabriel*, trimethylene from trimethylenic bromide, A., i, 421.
Gustavson, *Gabriel*, and (*Miss*) *O.* **Popper**, 1 : 1-dimethyltrimethylene, A., i, 263.
Guthzeit, *Max*, tautomeric forms of ethylic isaconitate and of ethylic dicarboxyglutaconate, A., i, 115.
—— ammonium salt of ethylic 2 : 6-dihydroxynicotinate, A., i, 450.
Guthzeit, *Max*, and *Leopold* **Laska**, methylic isaconitate ($\omega_2\Delta\omega_1$-propenetricarboxylate), A., i, 260.
Gutmann, *August*, double sulphates of antimony and the alkali metals, A., ii, 33.
Guye, *Philippe A.*, and *A.* **Babel**, specific rotatory power and position isomerism, A., ii, 718, 719.
Guye, *Philippe A.*, and *L.* **Friderich**, measurement of viscosity coefficients, A., ii, 358.
Guyot, *Alfred*, syntheses by means of phthalyl tetrachloride (m. p. 88°). II. Homologues of diphenylanthrone. I., A., i, 293.
Guyot, *Alfred*. See also *Albin* **Haller**.
Guyot, *H.*, syntheses by means of phthalyl tetrachloride (m. p. 88°). II. Homologues of diphenylanthrone. II., A., i, 294.
Gwillim, *J. C.*, and *W. S.* **Johnson**, ores and rocks from British Columbia, A., ii, 498.

H.

Haber, *Fritz*, electrolytic preparation of phenyl-β-hydroxylamine, A., i, 269.

Haber, *Fritz*, and *S.* **Grinberg**, electrolytic formation of hydrogen peroxide, A., ii, 17.
Haber, *Fritz*. See also *Georg* **Bredig**.
Haberkant, *Wanda*. See *Friedrich* **Kehrmann**.
Haberland, *K. R.*, estimation of acetic acid in commercial acetates and the separation of acetic, propionic, butyric, and formic acids, A., ii, 531.
Hada, *Seihachi*. See *Edward* **Divers**.
Haensel, *P.* See *Ernst* **Schmidt**.
Härtel, *Friedr.* See *Carl* **Paal**.
Haeussermann, *Carl*, potassiodiphenylamine, A., i, 126.
Haeussermann, *Carl*, and *Eugen* **Bauer**, tertiary aromatic amines. I. and II., A., i, 204, 684.
Häusermann, *Emil*, iron in blood-plasma and leucocytes, A., ii, 231.
Haga, *Tamemasha*. See *Edward* **Divers**, *Carl D.* **Harries**.
Hahn, *H. C.*, specific gravity of sodium chloride solutions, A., ii, 23.
Hahn, *Martin*. See *L.* **Geret**.
Haig, *Alexander*, excretion of uric acid, A., ii, 440.
Halbey. See *Alexander* **Tschirch**.
Halenke, *A.*, Kjeldahl's process for destroying organic matter, applied to the detection of metals in foods, &c., A., ii, 696.
Hall, *Miss L.* See *F. Stanley* **Kipping**.
Haller, *Albin*, combination of camphor with aldehydes, A., i, 770.
Haller, *Albin*, and *Alfred* **Guyot**, constitution of phthalyl-green, A., i, 155.
—— —— syntheses by means of orthophthalyl tetrachloride (m. p. 88°). I. Preparation of diphenylanthrone, A., i, 221.
Haller, *Albin*, and *Paul Th.* **Muller**, molecular refraction and dispersion and specific rotation of compounds of camphor and aromatic aldehydes, A., ii, 622.
Haller, *Albin*, and *Herm.* **Umbgrove**, dialkylbenzoyl- and dialkylbenzylbenzoic acids, A., i, 814.
Halliburton, *William Dobinson*, and *Frederick W.* **Mott**, physiological action of choline and neurine, A., ii, 315.
Halliburton, *William D.* See also *Frederick W.* **Mott**.
Halliwell, *Edward*, periodic analyses of the rivers of the West Riding of Yorkshire, A., ii, 772.
Hallopeau, *L. A.*, action of hydrogen on potassium paratungstate, A., ii, 32.
—— electrolytic production of crystalline tungsten, A., ii, 158.
Hallopeau, *L. A.*, crystallised tungsten dioxide and tungstolithium tungstate, A., ii, 159.
—— action of metallic sulphates on potassium paratungstate, A., ii, 159.
—— a tungsto-potassic tungstate, A., ii, 555.
Hallwachs, *Wilhelm*, double trough refractometer and experiments therewith on solutions of cadmium bromide, sugar, and di- and tri-chloracetic acids and their potassium salts, A., ii, 461.
Halsey, *John T.* See *Emil* **Erlenmeyer**, *jun.*
Hamburg, *A. Max*, new derivatives of gallic acid, A., i, 364.
Hamburger, *Arthur*, condensation of phthalaldehydic acid with acetone and acetophenone, A., i, 142.
Hamburger, *Hartog Jakob*, influence of carbonic anhydride and of alkali respectively on the anti-bacterial properties of blood and similar fluids, A., ii, 603.
Hamburger, *Hugo*. See *Zdenko H.* **Skraup**.
Hamburger, *J.* See *Wilhelm von* **Miller**.
Hammarsten, *Olof*, fibrin formation, A., ii, 776.
Hamner, *S. G.* See *James Lewis* **Howe**.
Hanamann, *Joseph*, lysimeter experiments, A., ii, 515.
Hanna, *D. C.*, and *Edgar F.* **Smith**, derivatives of aconitic acid, A., i, 577.
Hanriot, *Maurice*, direct oxidation of fat, A., i, 190.
Hanriot, *Maurice*, and *G.* **Reynaud**, oxazoles, A., i, 723.
Hanschke, *Gottfried*, quinazolone compounds, A., i, 775.
Hantower, *Ludwig*, and *Ernst* **Täuber**, chromotropic acid, A., i, 63.
Hantzsch, *Arthur* [*Rudolf*], determination of the structure of substances with labile atom-groupings, A., i, 399.
—— corrections with regard to diazocompounds, A., i, 685.
—— action of zinc ethyl on the so-called nitramines and isonitramines, A., i, 692.
—— structural isomerism in inorganic compounds, A., ii, 207.
—— silver disulphide, A., ii, 215.
Hantzsch, *Arthur*, and *G.* **Osswald**, cyanoform, A., i, 405.
Hantzsch, *Arthur*, and *A.* **Rinckenberger**, nitroform, A., i, 404.
Hantzsch, *Arthur*, and *M.* **Schümann**, diazotisation, A., ii, 549.
Hantzsch, *Arthur*, *M.* **Schümann**, and *A.* **Engler**, antidiazohydrates and primary nitrosamines, A., i, 685.

Hantzsch, *Arthur*, and *A.* **Veit**, isonitrocompounds, A., i, 401.
Hantzsch, *Arthur*. See also *William B.* **Davidson**, *Otto* **Graul**.
Hanzlik, *Wenzel*, and *Al.* **Bianchi**, derivatives of paratolualdehyde, A., i., 597.
—— derivative of paratolualdehyde, A., i., 890.
Harcourt, *Augustus George Vernon*, on a method for providing a current of gaseous chloroform mixed with air in any desired proportions, and on methods for estimating the gaseous chloroform in the mixtures, T., 1060; P. **1899**, 188; discussion, P., 190.
Harden, *Arthur*, action of hydrogen peroxide on formaldehyde, P., **1899**, 158; discussion, P., 159.
Harding, *M. C.*, reaction between some salt solutions and an alkaline solution of antimony trioxide, A., ii, 490.
Hardy, *W. B.*, action of the cells of frogs' lymph on bacilli, A., ii, 165.
—— structure of cell protoplasm, A., ii, 438.
—— coagulation of proteid by electricity, A., ii, 567.
Harlay, *V.*, products of the action of pepsin and pancreatic juice on fibrin, A., i, 656.
—— action of pepsin and pancreatic juice on albumin, A., i, 835.
—— two new reactions of the products of the digestive action of pepsin and pancreatic juice, A., i, 835.
—— action of heat on pepsin, A., i, 967.
—— action of heat on trypsin, A., i, 967.
Harley, *Vaughan*, the effect of compression of one lung on the respiratory gas exchange, A., ii, 675.
—— influence of the removal of the large intestine on metabolism in dogs, A., ii, 774.
Harnack, *Erich*, action of hydrogen sulphide on blood pigments, A., i, 467.
Harnack, *Erich*, and *Friedrich Karl* **Kleine**, sulphur in the urine under various conditions, A., ii, 375.
Harpf, *August*, some properties of liquid sulphurous anhydride, A., ii, 594.
Harries, *Carl D.*, behaviour of mesitylic oxide towards sodium hydrogen sulphite, A., i, 566.
—— reactions of unsaturated ketones, A., i, 578.
Harries, *Carl D.*, and *Richard* **Gley**, stereoisomeric mesityloximes, A., i, 566.
Harries, *Carl D.*, and *Tamemasa* **Haga**, stereochemistry of nitrogen compounds, A., i, 562.
Harries, *Carl D.*, and *Friedrich* **Kaiser**, reduction of $\alpha\beta$-unsaturated ketones, A., i, 578.
—— —— behaviour of mesitylic oxide towards semicarbazide, A., i, 637.
Harries, *Carl D.*, and *Israel* **Matfus**, hydroxylamino-oximes of certain cyclohexenones, A., i, 583.
—— —— constitution of camphorone, A., i, 629.
Harries, *Carl D.*, and *F.* **Mayrhofer**, hydroxylaminocarvoxime and its conversion into dihydrocarvyldiamine, A., i, 624.
Harrington, *Wentworth Lewis*. See *Theodore W.* **Richards**.
Harris, *S. H.*, a double citrate of zirconium and ammonium, A., i, 262.
Hartleb, *R.* See *Albert* **Stutzer**.
Hartley, *Ernald George Justinian*, chalcophyllite, A., ii, 433.
Hartley, *Ernald G. J.* See also *Henry Alexander* **Miers**.
Hartley, *Walter Noel*, on the absorption spectrum and constitution attributed to cyanuric acid, P., **1899**, 46.
—— chemical changes in oceanic deposits, A., ii, 437.
Hartley, *Walter Noel*, and *James J.* **Dobbie**, a study of the absorption spectra of isatin, carbostyril, and their alkyl derivatives in relation to tautomerism, T., 640; P., **1899**, 47; discussion, 48.
Hartman, *William E.* See *Edward D.* **Campbell**.
Hartwell, *Burt L.*, and *Homer J.* **Wheeler**, possible error in the estimation of nitrogen in nitrates due to impurities in reduced iron, A., ii, 519.
Hartwell, *Burt L.* See also *Homer J.* **Wheeler**.
Harvey, *Alfred William*. See *William J.* **Pope**.
Hasenbäumer, *Julius*, primary chlorostibines of the aromatic series, A., i, 209.
Hasterlik, *Alfred*, detection of "saccharin" in wines, A., ii, 819.
Hata, *S.* See *K.* **Katsuyama**.
Hatch, *Israel, jun.* See *Augustus H.* **Gill**.
Hausmann, *Walther*, the nitrogen in the proteid molecule, A., i, 653.
Hausser, *Jean* [*Louis*], filtration, A., ii, 277.
—— filtration of organic liquids, A., ii, 277.
—— laboratory sterilising apparatus, A., ii, 569.
—— vacuum regulator for distillations under reduced pressure, A., ii, 645.
Hausser, *Jean*. See also **Cathelineau**.

Haven-Boyd, *Harold de.* See *Rudolph* **Fittig**.

Havens, *Franke Stuart,* separation of nickel from cobalt by hydrogen chloride, A., ii, 127.

Haywood, *John K.*, estimation of calcium and magnesium in ashes, A., ii, 612.

—— some boiling point curves, A., ii, 632.

Heath, *George L.*, estimation of sulphur in coal, A., ii, 52.

Hébert, *Alexandre,* formation of proteids in plants by the reduction of nitrates, A., ii, 47.

—— presence of hydrocyanic acid in various plants, A., ii, 377.

Hébert, *Alexandre,* and *F.* **Heim**, active principles of certain aroids, A., i, 240.

Hébert, *Alexandre,* and *Georges* **Reynaud**, an X-ray photometer, A., ii, 586.

—— —— specific absorption of X-rays by metallic salts, A., ii, 586.

Hébert, *Alexandre,* and *Georges* **Truffaut**, degeneration of *Cattleya*, A., ii, 174.

Heddle, *Matthew Forster,* Scottish silicates, A., ii, 497.

Hefelmann, *Rudolf,* estimation of nicotine in tobacco, A., ii, 261.

Hefelmann, *Rudolf,* and *Ernst* **Steiner**, soap analysis, A., ii, 190.

Hehner, *Otto,* and *Charles Ainsworth* **Mitchell**, chemistry of drying oils, A., ii, 190.

Hehner, *Otto,* and *William Pearson* **Skertchly**, estimation of pentosans and its application to food analysis, A., ii, 702.

Heiberg, *Thv.* See *Charles Frederick* **Cross**.

Heidenreich, *Ole N.*, estimation of sulphur in pyrites in the presence of iron, A., ii, 517.

Heidrich, *Karl,* action of ethylic acetoacetate on benzidine, A., i, 366.

Heilpern, *H.* See *Paul* **Friedländer**.

Heim, *F.* See *Alexandre* **Hébert**.

Heim, *Karl,* determination of polarisation, A., ii, 77.

Heimann, *Wilhelm.* See *Paul* **Jannasch**.

Heinemann, *Adolf,* analysis of gallotannic acids, A., ii, 455.

Heinz, *R.*, physiological action of iodine and iodine compounds, A., ii, 440.

Heip, *F.* See *Ludwig* **Wolff**.

Hélier, *Henri,* combination of gases, A., ii, 85.

—— reducing power of the tissues: liver and pancreas, A., ii, 374.

—— reducing power of tissues: the blood, A., ii, 502.

—— reducibility of metallic oxides, A., ii, 555.

Hélier, *Henri,* reducing power of urine, A., ii, 679.

Hellsing, *Gustaf,* chrysean, A., i, 563.

Hempel, *Walther,* experimentation at low temperatures, A., ii, 139.

—— the absorption of nitrogen, A., ii, 594.

Hempel, *Walther,* and *W.* **Scheffler**, estimation of fluorine and carbonic anhydride, and the estimation of fluorine in teeth, A., ii, 380.

Hempel, *Walther,* and *Johannes* **Seidel**, compounds of carbonic anhydride with water, ethylic ether, and alcohols, A., ii, 151.

Hemptinne, *Alexander de,* catalytic action of platinum black, A., ii, 146.

—— catalytic action of platinum and palladium, A., ii, 228.

Hemptinne, *Alexander von,* and *A.* **Bekaert**, velocity of reaction, A., ii, 359.

Henderson, *George Gerald, Thomas Workman* **Orr**, and *Robert J. Gibson* **Whitehead**, the action of certain acidic oxides on salts of hydroxy-acids, T., 542; P., **1899**, 107.

Henderson, *James Alexander Leo,* norites [hypersthene, diallage, enstatite, and anorthoclase] from the Transvaal, A., ii, 111.

Henderson, *L. J.* See *Theodore W.* **Richards**.

Henderson, *William E.*, reactions of orthodiazobenzoic acid with sulphurous acid and copper powder, A., i, 430.

Henderson, *Yandell,* metabolism in the submaxillary gland, A., ii, 774.

Henderson, *Yandell.* See also *Russell H.* **Chittenden**.

Hendricks, *W. E.* See *Edward* **Kremers**.

Henrich, *Ferdinand,* derivatives of amido-orcinol, A., i, 171.

—— the negative nature of unsaturated groups of atoms, A., i, 469.

—— ethylic glutaconate. I., A., i, 794.

Henriet, *H.* See *Albert* **Lévy**.

Henriques, *Robert,* volatile and insoluble fatty acids of butter, A., ii, 258.

Henriques, *Robert,* and *Herm.* **Künne**, oleodistearin, and the iodine number, A., i, 330.

Henry, *Charles,* [zinc sulphide actinophotometer], A., ii, 394.

Henry, *Louis,* normal cyanobutylic alcohol, A., i, 182.

—— chlorine derivatives of nitriles containing three and four carbon atoms, and their volatility, A., i, 183.

—— aliphatic nitro-compounds with multiple functions, A., i, 251.

Henry, *Louis,* alkylic salts of the monochloro-derivatives of normal butyric acid and the volatility of chlorine and oxygen compounds, A., i, 255.
—— derivatives of aliphatic hydroxynitriles, A., i, 255.
—— nitracetone, A., i, 475.
—— hydroxynitriles containing five and six carbon atoms, A., i, 567.
—— preparation of ethylenic glycol, A., i, 660.
—— oxidation of trichlorethoxyethylene, A., i, 660.
—— ethyleneacetonitrile, A., i, 675.
—— derivatives of nitroethanol (nitroethylic alcohol), A., i, 728.
—— alternation in volatility in the series of the chlorides of the normal acids, A., i, 735.
Henry, *Louis* [and in part *Camille* **Aschman**], unsaturated compounds, A., i, 256.
Henry, *Thomas Anderson.* See *Wyndham R.* **Dunstan.**
Hentschel, *W.,* orthotolylamidoacetic acid, A., i, 815.
—— inflammation caused by the vapours of nitrogen chloride, A., ii, 569.
Henze, *Martin,* condensation of benzylic cyanide with aromatic aldehydes; symmetrical triphenylglutaric acid, A., i, 218.
Hepner, *Eberhard,* cholesterol of blood, A., ii, 311.
Hepp, *Eduard.* See *Otto* **Fischer.**
Hérissey, *Henri.* See *Émile* **Bourquelot.**
Herman, *H. N.* See *John* **Procházka.**
Herms, *Joachim,* condensation of acenaphthenequinone and hydrazine hydrate, A., i, 617.
Herms, *Joachim.* See also *Ludwig* **Berend.**
Herringham, *Wilmot Parker,* estimation of potassium and sodium in the urine, A., ii, 333.
—— toxicity of normal urine, A., ii, 679.
Herrmann, *Paul,* and *Daniel* **Vorländer,** behaviour of unsaturated compounds towards ethylic malonate, A., i, 812.
Herrmann, *Robert,* fatty oil of quince seeds, A., i, 822.
Herstein, *F.,* and *Stanislaus von* **Kostanecki,** 4-methoxybenzylidenecoumaranone, A., i, 369.
Herstein, *F.* See also *Stanislaus von* **Kostanecki.**
Herting, *Otto,* estimation of sulphur in iron, iron pyrites, slags, coal, coke, asphalt, and gas purifying material, A., ii, 804.
Hertz, *M.* See *Otto* **Wallach.**
Herz, *W.,* decomposition of ferric acetate, A., i, 416.
Herz, *W.,* solubilities of sparingly soluble liquids in water, A., ii, 83.
—— chemical equilibrium between manganous hydroxide and ammonium salts, A., ii, 752.
Herzfeld, *Alexander,* solubility of lime in water at different temperatures, A., ii, 25.
Herzfelder, *Armand Dezsö,* basic slags, A., ii, 808.
Herzig, *Josef,* condensation products of phloroglucinol and of phloroglucide, A., i, 31.
—— brazilin and hæmatoxylin, A., i, 381, 821.
Herzog, *Al.,* linseed in its botanical, chemical, and agricultural relations, A., ii, 796.
Herzog, *W.,* cobalt derivatives of sucrose and of dextrose, A., ii, 818.
Hess, *Arnold,* derivatives of picoline, A., i, 774.
Hess, *William H.,* and *Albert B.* **Prescott,** separation and estimation of coumarin and vanillin in flavouring extracts, A., ii, 531.
Hesse, *Albert,* and *Friedrich* **Müller,** ethereal oil of jasmine flowers, A., i, 377, 441.
Hesse, *Ludwig,* dionine, a new morphine derivative, A., i, 724.
Hesse, *Oswald,* *Datura alba* and hyoscine, A., i, 312.
—— lichens and their characteristic constituents, A., i, 381.
Hessler, *John C.,* alkylmalononitriles and their derivatives, A., i, 897.
Hett, *P.* See *C.* **Ahrens.**
Heubach, *Fritz.* See *Paul* **Jacobson.**
Heun, *Georg.* See *Hans* **Stobbe.**
Heusler, *Friedrich,* and *Heinrich* **Schieffer,** preparation of homophthalic acid (orthocarboxyphenylacetic acid) and β-hydrindone from the indene of coal tar, A., i, 365.
Hewitt, *John Theodore,* and *Arthur Ernest* **Pitt,** the condensation of oxalic acid and resorcinol, T., 518; P., **1899,** 100.
Heyl, *Georg,* hydroxydiphenylene ketone, A., i, 216.
—— hydroxydiphenylene ketone and orthophenylsalicylic acid, A., i, 701.
Hidden, *William Earl,* and *Julius Howard* **Pratt,** associated minerals of rhodolite, A., ii, 300.
Higley, *George O.* See *Paul C.* **Freer.**
Hilaire. See **Saint-Hilaire.**
Hilger, *Albert.* See *Adolf* **Juckenack.**
Hill, *Alfred.* See *Robert Martin* **Caven,** *Frederic Stanley* **Kipping.**

Hill, *Henry Barker* [with *Isaac K.* **Phelps** and *Alvin S.* **Wheeler**], preparation and reduction of dehydromucic acid, A., i, 576.

Hill, *Henry Barker*, and *Joseph* **Torrey**, *jun.*, nitromalonic aldehyde, A., i, 788.

Hill, *Leonard*, and *H. E.* **Ridewood**, permeability of animal membranes to gases in solution, A., ii, 437.

Hillebrand, *William Francis*, vanadium and molybdenum in rocks of the United States, A., ii, 112.

—— analyses of tysonite, bastnäsite, prosopite, jeffersonite, covellite, &c., A., ii, 301.

—— [mineral analyses], A., ii, 564.

Hillebrand, *William F.*, *Henry W.* **Turner**, and *Frank W.* **Clarke**, roscoelite, A., ii, 496.

Hillebrand, *William F.* See also *Henry W.* **Turner**.

Hinsberg, *Oscar*, derivatives of paramidophenol, A., i, 495.

Hirsch, *A.*, behaviour of iron salts with pyrogallol, A., ii, 817.

Hirschfeld. See *Carl Adam* **Bischoff**.

Hite, *B. H.*, a method for carrying out chemical reactions under high pressure, A., ii, 592.

Hittorf, [*Johann*] *Wilhelm*, and *Heinrich* [*Hermann*] **Salkowski**, a remarkable class of inorganic acids and their electrolytic behaviour, A., ii, 398.

Hjelt, *Edvard* [*Immanuel*], isobutylsuccinic acid, A., i, 332.

Hobbs, *William H.*, crystallography of a reduction product of Δ^4-terpene-3-one, A., i, 767.

—— goldschmidtite, a new mineral, A., ii, 493.

Hock, *Karl*. See *Max* **Conrad**.

Kiesow, *Friedrich*. See *Rudolf* **Höber**.

Kietaibl, *Carl*, action of nitrous acid on resorcinol monethylic ether, A., i, 343.

Kietreiber, *Franz*, condensation of the fatty aldehydes with propionic acid, A., i, 331.

Kiliani, *Heinrich*, digitoxin and digitalin, A., i, 70.

—— digitoxin and the products of its decomposition, A., i, 932.

—— *Digitalinum verum* and the products of its decomposition, A., i, 932.

Kiliani, *Heinrich*, and *Adolf* **Windaus**, digitalein, A., i, 932.
—— —— digitogenin and its derivatives, A., i, 932.
Kinzel, *Wilhelm*, [estimation of allylthiocarbimide in] seeds of some varieties of *Brassica* and *Sinapis*, A., ii, 825.
Kippenberger, *Karl*, calcium and magnesium hydrogen carbonates, A., ii, 220.
—— estimation of alkaloids by iodine solution, A., ii, 534, 584.
Kipping, *Frederic Stanley*, derivatives of camphoric acid. Part III., T., 125; P., **1898**, 249.
—— isomeric salts of hydrindamine containing quinquevalent nitrogen, P., **1899**, 172.
Kipping, *F. Stanley*, and *Miss L.* **Hall**, synthesis of phenoketoheptamethylene, P., **1899**, 173.
Kipping, *F. Stanley*, and *Alfred* **Hill**, α-ketotetrahydronaphthalene, T., 144; P., **1899**, 4.
Kipping, *F. Stanley*, and *Lorenzo L.* **Lloyd**, organic compounds containing silicon, P., **1899**, 174.
Kipping, *F. Stanley*, and *William J.* **Pope**, characterisation of racemic compounds, T., 36; P., **1898**, 219.
—— the characterisation of "racemic" liquids, T., 1119; P., **1899**, 200.
—— —— recognition of racemic compounds, A., ii, 733.
Kissel, *H.* See *Heinrich* **Ley**.
Kissling, *Richard*, estimation of non-volatile organic acids in tobacco, A., ii, 821.
Kistiakowsky, *Wladimir A.*, reactions in mixtures of alcohol and water, A., ii, 13.
—— laws of solution, A., ii, 730.
Kitt, *Moriz*, wood oil, A., i, 864.
Kitzing, analysis of antimony sulphide, A., ii, 525.
Kjeldahl, *Johan* [*Gustav Christophe Thorsager*], idometric acidimetry, A., ii, 803.
Kjellbom. See *Ludwig* **Gattermann**.
Klages, *August*, dihydroanethoil, A., i, 585.
—— transformation in the carvone group, A., i, 624.
Klages, *August*, and *E.* **Fanto**, 1 : 1-diphenylbutene-1-one-3, A., i, 615.
Klages, *August*, and *G.* **Lickroth**, elimination of substituting groups from the benzene ring, A., i, 598.
Klebs, *Richard*, cedarite, an amber-like resin from Canada, A., ii, 34.
Klein, *Hermann*. See *Conrad* **Willgerodt**.
Klein, *R.* See *Carl* **Schall**.
Kleine, *Friedrich Karl*. See *Erich* **Harnack**.
Klenker, *Otto*, antimony pentasulphide. I. and II., A., ii, 490, 557.
Kling, *André*, biochemical oxidation of propylenic glycol, A., i, 323.
—— action of titanium chloride on organic compounds, A., i, 429.
—— oxidation of propylenic glycol by bromine water, A., i, 787.
Klinger, *Heinrich* [*Conr.*], thioacetaldehydes, A., i, 859.
Klitzsch, *Paul*. See *Otto* **Fischer**.
Klobb [*Constant*] *Timothée*, syntheses with ethylic cyanacetate, A., i, 113.
—— action of aniline and phenylcarbimide on ketonic acids of the $C_nH_{2n-10}O_3$ series, A., i, 510.
Klobbie, *Eduard A.*, volumetric estimation of osmium tetroxide, A., ii, 184.
Kloepfer, *E.*, ammonium sulphate and sodium nitrate [as manures], A., ii, 512.
Klopfer, *Volkmar*. See *Richard* **Möhlau**.
Klostermann, *Max*, alkaloids contained in *Anagyris fœtida*, A., i, 959.
Knauthe, *Karl*, metabolism in fishes, A., ii, 310.
Knett, *Josef*, deposition of sulphur and pyrites from the Carlsbad thermal water, A., ii, 772.
Knierim, *Woldemar von*, valuation of meadow hay, A., ii, 795.
Knight, *Nicholas*. See *Harry C.* **Jones**.
Knitl, *A.* See *Alexander* **Tschirch**.
Knoblauch, *Oscar*, dissipation of electrostatic charges by light, A., ii, 622.
Knobloch, *Johannes*, estimation of the alkaline earths without separation, A., ii, 182.
Knöpfelmacher, *Wilhelm*, estimation of fat in animal organs, A., ii, 821.
Knöpfer, *Gustav*. See *Guido* **Goldschmiedt**.
Knoevenagel, *Emil*, two modifications of ethylic β-amidocrotonate, A., i, 478.
Knoevenagel, *Emil* [and in part *Fr.* **Baebenroth**, and *O.* **Wollweber**], condensation of malonic acid with aromatic aldehydes by means of ammonia and amines, A., i, 144.
Knoevenagel, *Emil*, and *W.* **Faber**, condensation of acid derivatives of ethylic malonate with ethylic benzylideneacetoacetate, A., i, 146.
—— —— condensing action of diethylamine, A. i, 146.

Knoevenagel, *Emil* [with *F.* **Giese**, *J.* **Goldsmith**, and *Konrad* **Wedemeyer**], hydrogenised aromatic compounds, A., i, 290.

Knoevenagel, *Emil* [and in part *F.* **Giese**, *A.* **Groos**, and *H.* **Hoffmann**], condensation of ethylic malonate with aldehydes under the influence of ammonia and organic amines, A., i, 116.

Knoevenagel, *Emil* [with *W.* **Goecke**, *A.* **Groos**, *H.* **Hoffmann**, *Alfred* **Schürenberg**, *Konrad* **Wedemeyer**, and *R.* **Weiss**], 1 : 5-diketones, A., i, 214.

Knoevenagel, *Emil*, and *J.* **Goldsmith**, stereoisomeric oximes in the hydroaromatic series, A., i, 25.

Knoevenagel, *Emil*, and *E.* **Reinecke**, polymerisation of hydroaromatic ketones, A., i, 340.

Knoll, *Rudolph Joh.*, Ogier's sulphur oxychloride, A., ii, 18.

Knoop, *H.*, production of citrate-soluble phosphate, A., ii, 801.

Knorr, *Eduard*. See *Ludwig* **Knorr**.

Knorr, *Ludwig*, influence of water on the addition of ethylenic oxide to ammonia and amines, A., i, 461.

—— breaking down of phenomorpholine by exhaustive methylation, A., i, 462.

—— decomposition of naphthalanmorpholine by exhaustive methylation, A., i, 463.

—— tautomerism, A., i, 673.

—— morpholine bases: naphthalanmorpholine, A., i, 782.

Knorr, *Ludwig*, and *William Augustus* **Caspari**, tautomerism: desmotropy of 2-acetylangelicalactone, A., i, 194.

Knorr, *Ludwig*, and *Paul* **Duden**, morpholine bases of the camphor series, A., i, 783.

Knorr, *Ludwig*, and *Eduard* **Knorr**, synthesis of propanediolamines by the action of ammonia and amines on glycide, A., i, 411.

—— —— 1 : 3-methylmorpholone, a basic δ-lactone, A., i, 784.

Knorr, *Ludwig*, and *Hermann* **Matthes**, breaking down of the morpholine ring by exhaustive methylation, A., i, 462.

Knorre, *Georg von*, and *Kurt* **Arndt**, gasometric estimation of nitric oxide, ii, 806.

Knüttel. See *Ludwig* **Gattermann**.

Knuttel, *Daniel*. See *Ernst* **Schmidt**.

Koch, *Waldemar*. See *Charles Loring* **Jackson**.

Köbner, *M.* See *Ludwig* **Gattermann**.

Köhl, *Wilhelm*. See *Rudolph* **Fittig**.

Köhler, *E.* See *August* **Michaelis**.

Kölle, *Martin*. See *William* **Küster**.

König, *A.*, and *Arnold* **Reissert**, synthesis of indazoles and phenotriazines, A., i, 457.

König [*Franz*] *Josef*, production of nitrogenous manures, A., ii, 49.

—— estimation of crude fibre in fodders and foods, A., ii, 68.

Koenigs, *Wilhelm*, derivatives of lepidine, A., i, 74.

—— condensation products of formaldehyde and quinaldine, A. i, 389.

Koenigs, *Wilhelm*, and *Max* **Höppner**, derivatives of cinchona alkaloids, A., i, 87.

Koenigs, *Wilhelm*, and *Emil* **Lossow**, 4-nitrocinchonic acid and 4-amidocinchonic acid, A., i, 456.

Köthner, *Paul*, action of acetylene on mercuric nitrate, A., i, 21.

Köthner, *Paul*. See also *Hugo* **Erdmann**.

Kœtschet, *J.* See *Paul* **Monnet**.

Kohl, *Friedrich Georg*, chlorophyll and its derivatives, A., i, 228.

Kohler, *Elmer P.*, aliphatic sulphonic acids. II. and III., A., i, 19, 488.

—— reaction between aliphatic thiocyanates and metallic derivatives of ethylic acetoacetate and analogous substances, A., i, 737.

Kohler, *Elmer P.*, and *Margaret B.* **MacDonald**, disulphones and ketosulphides, A., i, 904.

—— —— action of sulphonic chloride on the metallic derivatives of ethylic salts of ketonic acids, A., i, 907.

Kohlmann, *M.* See *Daniel* **Vorländer**.

Kohlmann, *Paul*. See *Paul* **Kulisch**, *Hans* **Stobbe**.

Kohlrausch, *Friedrich*, velocities of the electrical ions in dilute aqueous solution to one-tenth normal concentration at 18°, A., ii, 201.

Kohlschütter, *Volkmar*, and *Karl A.* **Hofmann**, inorganic hydroxylamine compounds, A., ii, 651.

Kohn, *Charles Alexander*, and *William* **Trantom**, the interaction of sodium hydroxide and benzaldehyde, T., 1155; P., **1899**, 194.

Kohn, *Leopold*, action of potassium cyanide on aliphatic aldehydes, A., i, 328.

Kohn, *Leopold*, and *Victor* **Kulisch**, strophanthin, A., i, 159.

Kohn, *Leopold*. See also *Otto* **Bleier**, *Adolf* **Franke**.

Kohn, *Rudolf*, root excretions, A., ii, 791.

Kolda, *Edmund*, action of ethylenediamine on isobutaldehyde, isovaleraldehyde, acetaldehyde, and glyoxal, A., i, 328.

Kollegorsky, *W.* See *Wilhelm von* **Miller**.

Kollock, *Lily G.*, electrolytic estimations and separations, A., ii, 811.

Komers, *K.*, and *Anton* **Stift**, *rôle* of pentosans in the manufacture of crude sugar, A., i, 185.

Komppa, *Gustav*, nitration of guaiacol, A., i, 346.

—— ethylic methylenemalonate, A., i, 416.

—— hydroxytrimethylsuccinic acid and its derivatives, A., i, 419.

—— ββ-dimethylglutaric acid, A., i, 573.

Kondakoff, *Iwan L.*, oxidation of unsaturated compounds with potassium permanganate, A., i, 555.

—— behaviour of tetramethylethylenic dibromide towards alcoholic potash, A., i, 556.

—— Vitali's test for veratrine, A., ii, 827.

—— dibromopinacolin, A., i, 859.

Koningh, *Leonard de*, milk analysis, A., ii, 707.

Konowaloff, *Dmitri P.*, combination of sulphur with hydrogen, A., ii, 415.

—— solubility of ammonia in aqueous solutions of silver nitrate, A., ii, 418.

Konowaloff, *Michaël I.*, thio-derivatives obtained by the action of aluminium haloids on organic compounds: synthesis of thio-compounds, A., i, 470.

—— action of reducing agents on nitrocompounds of the methane series and their derivatives. I. A method of converting primary and secondary nitrocompounds into the corresponding oximes, ketones, and aldehydes, A., i, 733.

—— isomerisation in the synthesis of aromatic hydrocarbons by Friedel's reaction. IV. Isomerisation of the isobutyl radicle, A., i, 801.

—— action of nitric acid on saturated hydrocarbons. VI. Nitration in sealed tubes and in open vessels. Separation of mono- from di-nitro-compounds, A., i, 844.

—— nitrating action of nitric acid on saturated hydrocarbons. VII. Nitration of methylbenzenes, A., i, 873.

—— preparation of aromatic aldehydes and the artificial production of indigo dyes, A., i, 891.

Konowaloff, *Michaël I.*, and *J.* **Egoroff**, isomerisation in the synthesis of aromatic hydrocarbons by Friedel's reaction. III. Synthesis of amylbenzene and its derivatives, A., i, 801.

Kopp, *Otto.* See *Karl* **Elbs**.

Koppel, *Ivan*, double compounds of cerium tetrachloride, A., ii, 98.

Koppel, *Ivan.* See also *Arthur* **Rosenheim**.

Koppeschaar, *W. F.*, estimation of indigo-blue and indigo-red in natural and synthetical indigos, A., ii, 262.

Kortright, *Frederick Lawrence*, deliquescence of potassium, sodium, and ammonium nitrates, A., ii, 644.

Koschlau. See **Kraatz-Koschlau**.

Koske, *E. C. W.* See *Edward* **Kremers**.

Kóssa, *Julius von*, toxic action of sugars, A., ii, 504.

Kossel, *Albrecht* [*Carl Ludwig Martin Leonhard*], protamines, A., i, 833.

—— preparation and detection of lysine, A., i, 833.

Kostanecki, *Stanislaus von*, new syntheses in the flavone group, A., i, 368.

Kostanecki, *Stanislaus von*, *R.* **Levi**, and *Josef* **Tambor**, synthesis of 2-hydroxyflavone, A., i, 370.

Kostanecki, *Stanislaus von*, and *A.* **Ludwig**, 2-bromoflavone, A., i, 220.

Kostanecki, *Stanislaus von*, and *E.* **Oderfeld**, 2 : 4′-dihydroxyflavone, A., i, 705.

Kostanecki, *Stanislaus von*, and *F. W.* **Osius**, 3 : 4′-dihydroxyflavone, A., i, 370.

Kostanecki, *Stanislaus von*, and *A.* **Różycki**, alkyl ethers of 3 : 3′ : 4′-trihydroxybenzylidenecoumaranone, A., i, 911.

Kostanecki, *Stanislaus von*, and *R. von* **Salis**, 3 : 2′-dihydroxyflavone, A., i, 523.

Kostanecki, *Stanislaus von*, and *Josef* **Tambor**, the six isomeric monohydroxybenzylideneacetophenones (monohydroxychalkones), A., i, 704.

Kostanecki, *Stanislaus von*, and *Josef* **Tambor** [with *B.* **Bednarski**, *T.* **Emilewicz**, and *F.* **Herstein**], experiments on the synthesis of chrysin derivatives, A., i, 891.

Kostanecki, *Stanislaus von.* See also *D.* **Alperin**, *T.* **Emilewicz**, *W.* **Feuerstein**, *F.* **Herstein**, *E.* **Keller**, *N.* **Prianischnikoff**.

Kouznezoff, *S. M.* See *Dm. N.* **Prianischnikoff**.

Kovář, *František*, ilmenite from Russia, A., ii, 668.

—— aluminium phosphate from Moravia, A., ii, 669.

—— minerals from Moravia, A., ii, 671.

Kozakowski, *Stanislaus.* See *Stefan von* **Niementowski**.

Kraatz-Koschlau, *K. von*, rhodochrosite from the Odenwald, A., ii, 302.

Kraemer, *Henry*, examination of commercial flour, A., ii, 703.

Krafft, *A.* See *Fritz* **Fichter**.

Krafft, *Friedrich*, regularities in the boiling points of liquids in exhausted vessels, A., ii, 464.

—— the boiling of aqueous colloidal solutions, A., ii, 470.

—— crystallisation of colloidal salt solutions, A., ii, 471.

—— colloidal salts as membrane-formers in dyeing, A., ii, 472.

Krafft, *Hermann*. See *Rudolph* **Fittig**.

—— new method of preparing triphenyltrimesic acid, A., i, 916.

Lanser, *Theodor.* See *Carl* **Liebermann**.

Lapicque, *Louis*, and *A.* **Vast**, action of tolylenediamine on the red corpuscles, A., ii, 505.

Lapworth, *Arthur*, derivatives of αα′-dibromocamphorsulphonic acid, T., 558; P., **1899**, 61.

—— action of hydrolytic agents on α-dibromocamphor. Constitution of bromocamphorenic acid, T., 1134; P., **1899**, 202.

Lapworth, *Arthur*, and *Edgar Marsh* **Chapman**, homocamphoronic and camphoronic acids, T., 986; P., **1899**, 159.

Laquer, *B.*, influence of the grape cure on human metabolism, A., ii, 773.

Laska, *Leopold.* See *Max* **Guthzeit**.

Lasne, *Henri*, estimation of phosphoric acid, A., ii, 54.

Lassar-Cohn, products of oxidation of cholic acid, A., i, 552.

—— detection of ethylic alcohol in ether, A., ii, 528.

Laszczynski, *Boleslaw de Verbno*, peptonising enzyme [peptase] in malt; separation of nitrogenous constituents of malt worts and beer, A., ii, 793.

Latimer, *Caroline W.*, modification of *rigor mortis* by fatigue, A., ii, 117.

Lauder, *Alexander.* See *James J.* **Dobbie**.

Lauenstein, *O.* See *Rudolph F.* **Weinland**.

Laurent, *Em.*, **Marchal**, and **Carpiaux**, assimilation of nitrogen as ammonia and nitrates by the higher plants, A., ii, 173.

Laurent, *Jules*, absorption of carbohydrates by the roots of plants, A., ii, 173.

La Valle, *Giuseppe*, new cobaltiferous and nickeliferous minerals from Messina, A., ii, 495.

Lawrence, *William Trevor*, hydrolysis of the γ-cyanides of di-substituted acetoacetates, T., 417; P., **1898**, 251.

—— synthesis and preparation of terebic and terpenylic acids, T., 527; P., **1899**, 104.

—— ethylic ββ-dimethylpropanetetracarboxylate, P., **1899**, 62.

—— methylisoamylsuccinic acid. I., P., **1899**, 163.

Lawroff, *D.*, oxyhæmoglobin of the horse, A., ii, 231.

—— peptic and tryptic digestion of proteid, A., ii, 309.

Lebbin, *Georg*, estimation of cellulose, A., ii, 67.
—— estimation of glycogen in meat extracts, A., ii, 256.
Lebeau, *Paul*, calcium arsenide, A., ii, 288.
—— new method for preparing iron silicide, A., ii, 427.
—— beryllium, A., ii, 554.
—— arsenides of strontium, barium, and calcium, A., ii, 655.
Le Chatelier, *Henri* [*Louis*], impurities in commercial calcium carbide, A., ii, 219.
—— dissociation of minium, A., ii, 221.
—— use of potassium chlorate in ammonium nitrate explosions, A., ii, 647.
—— fixed points of transformation, A., ii, 740.
—— porcelain from Egypt, A., ii, 751.
—— Egyptian pottery, A., ii, 752.
Le Chatelier, *Henri*. See also *Marcellin* **Berthelot**.
Leclerc du Sablon, digestion of starch in plants, A., ii, 239.
—— dextrin considered as reserve material, A., ii, 444.
Leduc, *Anatole*, researches on gases, A., ii, 354.
—— ratio of the atomic weights of hydrogen and oxygen, A., ii, 475.
—— specific heats of gases and mechanical equivalent of heat, A., ii, 725.
—— application of molecular volumes, A., ii, 729.
Lee, *Frederic S.*, muscle fatigue, A., ii, 312.
Lees, *Frederick H.*, and *William Henry* **Perkin**, *jun.*, on pseudocampholactone and pseudolauronolic acid, P., 1899, 23.
Léger, *Eugène*, aloins, A., i, 157, 820.
Le Goff, the sugar of diabetic urine, A., i, 242.
Lehfeldt, *R. A.*, properties of liquid mixtures, A., ii, 11.
—— vapour pressure of solutions of volatile substances, A., ii, 633.
Lehmann, *Adolf*. See *Johannes* **Wislicenus**.
Lehmann, *E.* See *Wilhelm* **Traube**.
Lehmann, *Karl Bernhard*, estimation of traces of hydrogen sulphide in the air, A., ii, 53.
—— estimation of copper in vegetable substances, A., ii, 59.
Lehnkering, *Paul*, valuation of iron and manganese ores, A., ii, 251.
Leidel, *L.* See *Otto* **Fischer**.
Leidié, *Émile*, purification of iridium, A., ii, 664.
Leidié, *Émile*. See also *Alexandre* **Joly**.
Leighton, *Virgil L.*, formation of phenylhydrazides by the action of phenylhydrazine on organic acids in the cold, A., i, 50.
Leins, *Heinrich*. See *Heinrich* **Brunner**.
Lemme, *Georg*. See *Ferdinand* **Tiemann**.
Lemmermann, *Otto*. See *Theodor* **Pfeiffer**.
Lemoine, *Georges*, action of magnesium on solutions of its salts, A., ii, 656.
Lemoult, *Paul*, researches on the polymerisation of cyanogen compounds, A., ii, 546.
Lengfeld, *Felix*, action of ammonia and amines on silicon chlorides, A., ii, 553.
Lengyel, *Béla von*, water of the Illyés Lake, Hungary, A., ii, 163.
—— calcium and calcium hydride, A., ii, 218.
Lenher, *Victor*, atomic weight and derivatives of selenium, A., ii, 18.
—— preparation of tellurium, A., ii, 478.
Lenher, *Victor*, and *James S. C.* **Wells**, tests for boric acid, A., ii, 520.
Lenk, *Hans*, rocks and minerals from Oaxaca, Mexico, A., ii, 305.
Lenormond, *C.*, a chloriodide of tin, A., ii, 33.
—— chloriodides [and bromiodides] of tin, A., ii, 754.
Lenz, *Wilhelm*, estimation of alkaloids in cinchona bark, A., ii, 391.
Leo, *Hans*, estimation of hydrochloric acid in the contents of the stomach, A., ii, 516.
Leonard, *Norman*, relation between the sp. gr. and the insoluble fatty acids of butter and other fats, A., ii, 190.
Leonard, *Norman*, and *Harry Metcalfe* **Smith**, examination of camphor liniment, A., ii, 193.
—— —— new test for formaldehyde, A., ii, 454.
Leonardi, *G.* See *Alberto* **Peratoner**.
Leontéeff, *J.* See *Hans* **Rupe**.
Lepeschkin, *N.*, lævorotation of dextrotartaric acid in concentrated aqueous solution, A., i, 576.
Lepierre, *Charles*, action of formaldehyde on proteids, A., i, 654.
—— acidity of urine, A., ii, 526.
—— fluorine in some mineral waters, A., ii, 602.
Lépine, *Raphael*, and **Martz**, stimulating action of pancreas on alcoholic fermentation, A., ii, 442.
Lépinois, *E.*, oxidising ferments in aconite and belladonna, A., i, 653.
—— acidity of urine, A., ii, 526.
Leprince, *Cascara sagrada*, A., i, 820.

Lera. See **Boggio-Lera.**

Le-Roy, *A.*, detection of sawdust in flour, A., ii, 453.

Leroy, *Émile* [thermochemistry of], morphine and its salts, A., ii, 465..

—— thermochemistry of some opium alkaloids, A., ii, 631.

Lescœur, *Henri*, alkalimetric estimation of metals: estimation of mercury, A., ii, 183.

Léser, *Georges*, derivatives of natural and of synthetical methylheptenone, A., i, 190, 329.

—— methyloctenonal, A., i, 414.

—— isomeride of hydroxymenthylic acid, A., i, 479.

—— cyclic isomeric change of acetylmethylheptenone, A., i, 743.

Léser, *Georges.* See also *Philippe* **Barbier.**

Lespieau, *Robert*, epidibromhydrins, A., i, 184.

—— action of hydrocyanic acid on epichlorhydrin, A., i, 243.

—— dichlorobutyric acid (dichloro-3 : 4-butanoic acid), A., i, 790.

Lessing. See **Loewinson-Lessing.**

Le Sueur, *Henry Rondel*, and *Arthur W.* **Crossley,** new method for the determination of the melting point of fats, A., ii, 271.

Le Sueur, *Henry Rondel.* See also *Arthur William* **Crossley.**

Leupold, *Ernst.* See *Siegmund* **Gabriel.**

Levaditi. See *Albert* **Charrin.**

Levat, *David*, the black phosphates of the Pyrenees, A., ii, 229.

Levene, *P. A.*, iodine in the tissues after the administration of potassium iodide, A., ii, 312.

Levene, *P. A.*, and *I.* **Levin,** absorption of proteids, A., ii, 309.

Levi, *R.* See *Stanislaus von* **Kostanecki.**

Levin, *I.* See *P. A.* **Levene.**

Lévy, *Albert*, and *H.* **Henriet,** atmospheric carbonic anhydride, A., ii, 94.

Lévy, *Albert*, and *Félix* **Marboutin,** estimation of dissolved oxygen in water, A., ii, 381.

Lévy, *Albert.* See also *Friedrich* **Kehrmann.**

Lévy, [*Auguste*] *Michel* [classification of the volcanic rocks of Mont-Dore], A., ii, 500.

Lewis, *Gilbert Newton.* See *Theodore W.* **Richards.**

Lewis, *J. Volney*, corundum from the Appalachians, A., ii, 561.

Lewkowitsch, *Julius*, cacao butter, A., ii, 712.

Ley, *Heinrich*, and *H.* **Kissel,** chemistry of mercury, A., ii, 485.

Leys, *Alexander*, estimation of formic acid in the presence of acetic acid and of easily oxidisable substances, A., ii, 132.

—— detection of formaldehyde in milk, A., ii, 819.

Lickroth, *G.* See *August* **Klages.**

Lidbury, *F. Austin.* See *David Leonard* **Chapman.**

Lieben, *Adolf*, presence of simple organic compounds in the vegetable kingdom, A., ii, 45.

Liebermann, *Carl* [*Theodor*], colour reactions of indones and of quinones with malonic acid derivatives, A., i, 219, 373.

Liebermann, *Carl* [*Theodor*] [and in part *E.* **Hoyer,** *Theodor* **Lanser,** *F.* **Michel,** and *Fritz* **Wiedermann**], reactions of indones and quinones with derivatives of malonic acid, A., i, 522.

Liebermann, *Carl*, and *S.* **Schlossberg,** Meldola and Hughes' bromindone derivatives and perinaphthaquinone, A., i, 372, 764.

Liebig, *Hans von*, condensation of benzil and benzoin with resorcinol, A., i, 915.

Liebknecht, *Otto.* See *Arthur* **Rosenheim.**

Liebmann, *Adolf*, paranitraniline-red [estimation of α-naphthol in β-naphthol], A., ii, 65.

Liebmann, *Adolf*, and *Arthur* **Studer,** analysis of aniline oils and aniline salt, A., ii, 583.

Liebrich, *A.*, estimation of traces of lead in water, A., ii, 58.

Liebscher, *Georg*, and **Edler,** determination of the manurial requirements of soils, A., ii, 691.

Lienau, *Hermann*, manganese silicocarbonates from the Hautes Pyrénées, A., ii, 761.

Lienau, *Hermann.* See *Arthur* **Rosenheim.**

Liesegang, *R. Ed.*, the latent photographic image, A., ii, 720.

Limpricht, *Heinrich*, compounds of benzoic or phthalic chloride and ethereal salts of the three hydroxybenzoic acids, A., i, 292.

Limpricht, *Heinrich*, and *H.* **Seyler,** dimethylanilidophthaloylic acid, A., i, 815.

Linck, *Gottlob Ed.*, the heteromorphic (allotropic) modifications of phosphorus and arsenic, and of ferrous sulphide, A., ii, 415.

—— meteorite from Meuselbach, Thuringia, A., ii, 566.

Lincoln, *Azariah T.* See *Louis* **Kahlenberg.**

Linde, *Carl*, machines for the manufacture of liquid air, A., ii, 414.

Linde, *Otto*, precipitates in *Extr. fluid. hydrastis*, A., i, 395.

—— is hydrastine free or combined in *Hydrastis* rhizome and in the liquid extract ? A., i, 395.

—— methods of estimating alkaloids, A., ii, 534, 826.

Lindet, *Léon*, Girard's researches on caoutchouc milk, A., ii, 507.

Lindet, *Léon*. See also *Aimé* **Girard.**

Linebarger, *Charles Elijah*, speed of coagulation of colloidal substances, A., ii, 12.

—— surface tensions of solutions of alkali chlorides, A., ii, 469.

Ling, *Arthur Robert*, Clerget's method of estimating saccharose, A., ii, 66.

—— malt. I. The ready-formed sugars of malt and the action of diastase on barley-starch, A., ii, 187.

Ling, *Arthur R.*, and *Julian L.* **Baker**, modification of Clerget's saccharimetric process applicable to after-products and molasses, A., ii, 67.

Lingenbrink, *Edmund*. See *Max* **Busch.**

Lintner, *Carl Joseph*, estimation of bitter principles in hops, A., ii, 264.

Lintner, *Carl J.*, and **Krober**, estimation of sugars as osazones, A., ii, 66.

Lipczynski, *E.* See *Otto* **Wallach.**

Lippmann, *Edmund O. von*, *d*-trihydroxyglutaric acid, A., i, 576.

—— occurrence of cholesterol in the products of the beet sugar manufacture, A., i, 586.

Lippmann, *Eduard*, and *Franz* **Fleissner**, the ketones of anthracene, A., i, 918.

Lischke, *W.* See *Paul* **Jacobson.**

Littmann, *Sigismund*, volumetric citrate process for the rapid and accurate estimation of phosphoric acid in superphosphates, A., ii, 330.

Lloyd, *Lorenzo L.*, and *John J.* **Sudborough**, diortho-substituted benzoic acids. Part IV. Formation of salts from diortho-substituted benzoic acids and different organic bases, T., 580 ; P., **1899**, 3.

Lloyd, *Lorenzo L.* See also *Frederic Stanley* **Kipping**, *John J.* **Sudborough.**

Locher, *C.* See *Friedrich* **Kehrmann.**

Locke, *James*, and *Gaston H.* **Edwards**, an isomeride of potassium ferricyanide, A., i, 407.

—— —— formation of potassium β-ferricyanide through the action of acids on the normal ferricyanide, A., i, 557.

Lockyer, *Sir Joseph Norman*, appearance of the clevite and the other new gas lines in the hottest stars, A., ii, 4.

—— spectrum of the corona, A., ii, 717.

—— chemical classification of the stars, A., ii, 718.

Loczka, *József*, behaviour of thallium in acid solutions with hydrogen sulphide in presence of arsenic, A., ii, 100.

Loeb, *Jacques*, physiological action of alkali and acids when greatly diluted, A., ii, 167.

—— similarity of the absorption of liquids in muscle and in soaps, A., ii, 503.

Löb, *Walther*, electrolytic reduction of the nitro-group, A., i, 122

Löhr, *H.* See *Otto* **Wallach.**

Loevenhart, *A. S.* See *J. H.* **Kastle.**

Loew, *Oscar*, new hexosazones from glycerol and formaldehyde, A., i, 850.

—— di-iodoacetylidene as a poison, A., ii, 169.

—— lability and energy in relation to protoplasm, A., ii, 607.

—— physiological functions of calcium salts, A., ii, 789.

Löwe, *K. Friedrich*, electrical dispersion of some organic acids, ethereal salts, and ten varieties of glass, A., ii, 200.

Löwenherz, *Richard*, stability of the halogen derivatives of benzene, A., ii, 639.

Loewinson-Lessing, *Franz*, [analyses of felspars], A., ii, 766.

Lohnstein, *Theodor*, areometric estimation of dextrose in urine, A., ii, 579.

Lohse, *Otto*, asbestos filters, A., ii, 801.

Lombard, *G.*, modification of Kaemer's method for the analysis of cream of tartar, A., ii, 820.

Long, *J. C.*, solubility of lead sulphate in aqueous ammonium acetate, A., ii, 812.

Long, *John Harper*, optical rotation of pinene hydrochloride, A., i, 819.

Longi, *Antonio*, analysis of organic substances containing sulphur and halogens, A., ii, 328.

Lorenz, *Richard*, alteration of free energy in molten halogen compounds of some heavy metals, A., ii, 269.

Lorenzen, *Ferdinand*. See *Theodor* **Curtius.**

Lossow, *Emil*. See *Wilhelm* **Koenigs.**

Lott, *Francis Edward*, influence of mineral constituents of water on the composition of worts and yeast ash, A., ii, 683.

Lottermoser, *Alfred*, colloidal metals : colloidal bismuth and copper, A., ii, 558.

Loubiou, *A.*, use of lead dioxide as a means of clarifying urine for analysis, A., ii, 72.

Louginine. See **Luginin.**

Louise, *Émile*, detection and estimation of free phosphorus in oils and fats, A., ii, 807.

Lowenhaupt, *Victor Cordier von*, bases isomeric with cinchonine, A., i, 176.

Lowry, *Thomas Martin*, studies of the terpenes and allied compounds. Nitrocamphor and its derivatives. IV. Nitrocamphor as an example of dynamic isomerism, T., 211; P., **1899**, 25.

—— crystallisation of dynamic isomerides: a correction, P., **1899**, 76.

Lucas, *Ad.*, nitroacetophenone and nitroacetone, A., i, 433.

Lucas, *Maurice*, estimation of oxygen in copper, A., ii, 52.

—— colorimetric estimation of copper, A., ii, 522.

—— separation of copper from antimony, A., ii, 523.

—— colorimetric estimation of nickel, A., ii, 614.

Lucchesi, *Adolfo*. See *Ubaldo* **Antony**.

Ludwig, *A.* See *Stanislaus von* **Kostanecki**.

Ludwig, *Ernst*, *Carl* **Hödlmoser**, and *Theodor* **Panzer**, the Franzenbad mineral peat soil, A., ii, 798.

Luginin, *Wladimir F.*, latent heats of vaporisation of liquids, A., ii, 269.

—— heat of vaporisation of piperidine, pyridine, acetonitrile and capronitrile, A., ii, 354.

Lumière, *Auguste*, *Louis* **Lumière**, and *Alphonse* **Seyewetz**, a reaction of aldehydes and ketones, A., i, 415.

Lumière, *Louis*. See *Auguste* **Lumière**.

Lunge, *Georg*, estimation of sulphur in presence of iron, A., ii, 329.

—— estimation of sulphuric acid in the presence of iron, A., ii, 805.

Lunge, *Georg*, and *E.* **Weintraub**, nitrocellulose, A., i, 559.

—— —— behaviour of nitric peroxide with sulphuric acid, A., ii, 479.

Luppe, *R.* See *Wilhelm von* **Miller**.

Lusini, *Valerio*, physiological and toxic action of methylxanthines, and their influence in muscular fatigue, A., ii, 317.

Lusk, *Graham*. See *F. H.* **Parker**, *W. E.* **Ray**.

Luther, *Robert*, a third class of electrodes, A., ii, 5.

Lyebyedyev, *A.*, assimilability of organic nitrogen in sterilised media, A., ii, 689.

M.

Maas, *Joseph*, nitro-alcohols, A., i, 322.

Maas, *Philipp*. See *Harry F.* **Keller**.

Maas, *Theodor A.* See *Siegmund* **Gabriel**, *Arthur* **Rosenheim**.

Maass, *Emil*, and *Richard* **Wolffenstein**, amidoaldehyles, A., i, 110.

Mabery, *Charles Frederic*, and *Edwin B.* **Baltzley**, sodium aluminate as a means for the removal of lime and suspended matter from water for use in boilers, A., ii, 476.

Mabery, *Charles F.*, and *Leo* **Goldsmith**, influence of antiseptics on the artificial gastric digestion of fibrin, A., ii, 164.

Macadam, *Ivison*. See *Diarmid* **Noël-Paton**.

Macallum, *A. B.*, the microchemical detection [localisation] of phosphorus in animal and vegetable tissues, A., ii, 232.

McCay, *Le Roy Wiley*, interaction of sodium arsenite and sodium thiosulphate, A., ii, 96.

—— thioxyarsenic acids, A., ii, 745.

McCoy, *Herbert N.*, hydrochlorides of carbophenylimide, A., i, 359.

McDermott, *T. S.* See *W. E.* **Ray**.

MacDonald, *Margaret B.* See *Elmer P.* **Kohler**.

Macdougald, *George D.*, apparatus for rapid analysis of milk, A., ii, 582.

MacGregor, *James G.*, and *E. H.* **Archibald**, conductivity method of studying moderately dilute aqueous solutions of double salts, A., ii, 201.

Mache, *H.* See *Ludwig* **Boltzmann**.

McIlhiney, *Parker C.*, method for determining the resistance of electrolytes, A., ii, 6.

McIntosh, *Douglas*, normal elements, A., ii, 77.

—— transference number for hydrogen, A., ii, 137.

McKee, *R. H.* See *Julius* **Stieglitz**.

McKenna, *Charles F.*, new apparatus for the determination of volume, A., ii, 467.

McKenzie, *Alex.*, active and inactive phenylalkyloxyacetic acids, T., 753; P., **1899**, 149.

—— a contribution to the chemistry of mandelic acid, T., 964; P., **1899**, 186.

McKenzie, *Alex.* See also *Wilhelm* **Marckwald**.

Mackey, *William McDonnell*, and *R. E.* **Middleton**, colorimetric estimation of dissolved oxygen in water, A., ii, 244.

MacMunn, *Charles Alexander*, pigments of *Aplysia punctata*, A., ii, 313.

Maercker, *Max* [*Heinrich*], influence of various plants on the amount of moisture in the soil, A., ii, 689.

Maercker, *Max* [*Heinrich*], manurial experiments with sugar beet, A., ii, 691.

—— manurial and variety experiments with barley, A., ii, 691.

—— limits of error in the estimation of phosphoric acid soluble in citric acid, A., ii., 807.

Maercker, *Max*. See also *H.* **Steffeck**.

Maey, *E.*, compounds of lithium, sodium, and potassium with mercury, as indicated by the specific volumes, A., ii, 547.

Magnier de la Source, *Louis*, estimation of potassium hydrogen tartrate in wines, A., ii, 70.

Mai, *Ludwig*. See *Martin* **Freund**.

Maillard, *Louis*, crystallised fibrin, A., i, 466.

—— ionisation and toxic action of metallic salts: copper sulphate and *Penicillium glaucum*, A., ii, 570.

Maisel. See *Carl Adam* **Bischoff**.

Majewski, *J.*, and *Georg* **Wagner**, camphenylic acid and its derivatives, A., i, 629.

Majstorović, *R.* See *Alexander* **Zega**.

Malagnini, *Giovanni*. See *Girolamo* **Daccomo**.

Malerba, *Pasquale*, detection of acetone, A., ii, 132.

Mallet, *E.*, estimation of uric acid, A., ii, 706.

Mallet, *John William*, claims of davyum to recognition as an element, A., ii, 107.

—— analytical methods for distinguishing proteid and amidic nitrogen, A., ii, 576.

Malpeaux, *L.*, employment of alinit in the cultivation of cereals, A., ii, 242.

—— manurial value of oil cakes, A., ii, 378.

Malpeaux, *L.* See also **Dickson**.

Manasse, *E.* See *Ubaldo* **Antony**.

Manasse, *Otto*, melting points of some derivatives of amidocamphor (correction), A., i, 300.

Manasse, *Otto*, and *Ernst* **Samuel**, reactions of camphoquinone, A., i, 300.

Manchot, *Wilhelm*, hydroxytriazolecarboxylic acid and hydroxytriazole, A., i, 84.

Manchot, *Wilhelm*. See also *Johannes* **Thiele**.

Mannino, *V.* See *Amerigo* **Andreocci**.

Manthey, *W.*, monobromotruxone from α-bromallocinnamic acid, A., i, 894.

Manuelli, *C.*, and *E.* **Comanducci**, action of primary amines on urethanes, A., i, 887.

Manuelli, *C.*, and *E.* **Ricca-Rosellini**, action of organic bases on urethane, A., i, 887.

Manuelli, *C.*, and *E. de* **Righi**, action of phenylhydrazine on tricarballylic and citric acids, A., i, 884.

Maquenne, *Léon*, change in composition of oleaginous seeds during germination, A., ii, 171.

—— estimation of dextrose by Lehmann's method, A., ii, 529.

Maquenne, *Léon*, and *E.* **Roux**, estimation of nitrogen by Kjeldahl's method, A., ii, 381.

Marboutin, *Félix*, volumetric method for the estimation of combined sulphuric acid, A., ii, 247.

Marboutin, *Félix*, and *Michel* **Franck**, estimation of organic matter in water by potassium permanganate, A., ii, 184.

Marboutin, *Félix*, and *Marcel* **Molinié**, volumetric estimation of combined sulphuric acid, A., ii, 247, 518.

Marboutin, *Félix*, and *Adrien* **Pécoul**, estimation of sulphuric acid, A., ii, 180.

—— —— apparatus for obtaining synchronous gaseous currents in the estimation of atmospheric gases, A., ii, 517.

Marboutin, *Félix*, *Adrien* **Pécoul**, and *Marius* **Bouyssy**, absorption of traces of carbonic anhydride in gaseous mixtures, A., ii, 577.

Marboutin, *Félix*. See also *Albert* **Lévy**.

Marburg, *Eduard C.* See *Karl A.* **Hofmann**.

March. See *Eugène* **Charabot**.

Marchal. See *Em.* **Laurent**.

Marchetti, *G.*, hydrated blue molybdenum oxide, A., ii, 295.

Marchis, *L.*, gradual change of glass and the variation of the zero point of thermometers, A., ii, 545.

Marchlewski, *Leo*, chlorophyll, A., i, 381, 822.

—— gossypol, a constituent of cotton seeds, A., i, 821.

Marchlewski, *Leo*, and *L. G.* **Radcliffe**, indigotin, A., i, 74.

—— —— constitution of indican and of some derivatives of indigotin, A., i, 386.

—— —— isatin, V., A., i, 719.

Marckwald, *Wilhelm*, hydrazo- and azo-compounds of the pyridine series, A., i, 72.

—— the silver salts of *d*-, *l*-, and *dl*-methylethylacetic acid and the synthesis of *d*-valeric acid, A., i, 477.

Marckwald, *Wilhelm*, stereoisomeric thiosemicarbazides, A., i, 503.

Marckwald, *Wilhelm*, and *S.* **Axelrod**, optically active α-methylmalic acid (2-methyl-2-butanoldioic acid), A., i, 418.

Marckwald, *Wilhelm*, and *Albert* (*Freiherr*) *von* **Droste-Huelshoff**, preparation of secondary amines from sulphonamides, A., i, 289.

—— —— methylethylpropylisobutylammonium base, A., i, 326.

Marckwald, *Wilhelm*, and *Alex.* **McKenzie**, new method for the resolution of racemic compounds into their active components, A., ii, 733.

Marckwald, *Wilhelm*. See also *Curtis C.* **Howard**.

Marcuse, *Arthur*, and *Richard* **Wolffenstein**, stereochemistry of the piperidine series, A., i, 937.

Mareeuw. See **Driessen-Mareeuw**.

Margosches, *B. M.* See *Eduard* **Donath**.

Margueles, *Max*, dissolving of platinum and gold in electrolytes, A., ii, 200.

Marino, *L.*, oxidising action of hydroxylamine, A., ii, 553.

Markownikoff, *Wladimir B.*, derivatives of the naphthene or cyclohexane series, A., i, 22.

—— action of nitric acid and of nitrosulphuric acid on saturated hydrocarbons, A., i, 553.

—— quaternary paraffins, CR_4, A., i, 554.

—— methylpentamethylene and its derivatives, A., i, 799.

—— structure of the so-called hexanaphthenecarboxylic acid, A., i, 800.

Markownikoff, *Wladimir B.*, and *Wladimir* **Rudewitsch**, cyclic compounds: symmetrical dimethylethylnaphthene, A., i, 581.

Marmier, *Louis*, and *Henri* **Abraham**, sterilisation of potable waters by ozone, A., ii, 506.

Maronneau, *Georges*, preparation and properties of a crystalline copper subphosphide, A., ii, 421.

Marquis, *R.*, benzoylfurfuran, A., i, 798.

Marschall, composition of the mycelium of mould fungi, A., ii, 44.

Marsh, *James Ernest*, the action of sulphuric acid on fenchone, T., 1058; P., **1899**, 196.

—— is camphene saturated? P., **1899**, 54.

Marshall, *Arthur*, estimation of carbonic anhydride in minerals, A., ii, 249.

—— preparation of standard solutions of sulphuric acid, A., ii, 575.

Marshall, *Arthur*, influence of ammonium salts on the precipitation of nickel by ammonia, A., ii, 696.

Martin, *Charles James*, the relations of the toxin and anti-toxin of snake venom, A., ii, 782.

Martin, *Charles James*, and *Thomas* **Cherry**, antagonism between toxins and anti-toxins, A., ii, 234.

Martin, *G. C.*, dunite in Massachusetts, A., ii, 112.

Martini, *C.*, constitution of dichlororthocresol, A., i, 877.

Martz. See *Raphael* **Lépine**.

Marzichi, *Giulio*. See *Hugo* **Schiff**.

Mascart, *Eleuthère* [*Élie Nicolas*], and *H.* **Bénard**, rotatory power of sugar solutions, A., i, 851.

Maselli, *C.* See *Giuseppe* **Grassi-Cristaldi**.

Mason, *William P.*, measurement of "turbidity" in water, A., ii, 615.

Massol, *Gustave*, relation between the melting points and the molecular weights of the normal and non-normal acids of the oxalic acid series, A., i, 738.

—— thermochemistry of suberic acid, A., ii, 80.

—— thermochemistry of sebacic acid, A., ii, 80.

—— normal dibasic acids of the oxalic series, A., ii, 80.

—— thermochemistry of isoamylmalonic acid, A., ii, 143.

—— thermal study of normal propylmalonic acid: heat of formation of the solid potassium salt, A., ii, 204.

—— thermochemistry of azelaic acid, A., ii, 353.

—— heat of formation of sodium meta- and para-hydroxybenzoates, A., ii, 353.

—— thermal study of the hydroxybenzoic acids: influence of the phenolic hydroxyl, A., ii, 353.

—— thermal relations of normal butylmalonic acid, A., ii, 547.

Massol, *Gustave*, and *F.* **Lamouroux**, solubility of substituted malonic acids, A., i, 479.

Masson [*David*] *Orme*, velocity of migration of ions, A., ii, 625.

Masson, [*David*] *Orme*, and *B. D.* **Steele**, the blue salt of Fehling's solution and other cuprotartrates, T. 725; P., **1899**, 120; discussion, P., 120.

Masson, *V.*, purification and preservation of chloroform, A., i, 786.

Mastbaum, *Hugo*, ignition of magnesium ammonium phosphate, A., ii, 55.

Matcovitch, *A.* See *Johannes* **Pinnow**.

Matfus, *Israel*. See *Carl D.* **Harries**.

Mathews, *John Alexander*, action of organic acids on nitriles, A., i, 56.

Matignon, *Camille*, change of entropy in the dissociation of similar heterogeneous systems, A., ii, 273.

Matignon, *Camille*, and **Deligny**, nitrosoderivatives of aromatic amines, A., i, 127.

Matis, *M.* See *Friedrich* **Kehrmann**.

Matteucci, *R. Vittorio*, iodine and bromine in fumarole products from Vesuvius, A., ii, 600.

—— sodium hydrogen carbonate on Vesuvian lava, A., ii, 600.

Matteucci, *R. Vittorio*, and *Ercole* **Giustiniani**, selenium in fumarole products from Vesuvius, A., ii, 600.

Matthaiopoulos, *Georg*, derivatives of monochloracetoxime, A., i, 10.

Matthes, *Hermann*. See *Ludwig* **Knorr**.

Matthews, *Albert*, origin of fibrinogen, A., ii, 777.

Matthews, *Charles George*, and *G. H.* **Woolcott**, phosphoric acid in barley and malt; presence of organic acids in malt, A., ii, 174.

Matthews, *J. Merritt*, derivatives of the tetrachlorides of zirconium, thorium, and lead, A., ii, 295.

—— derivatives of the tetrabromides of zirconium and thorium, A., ii, 296.

—— preparation of zirconium nitrides, A., ii, 296.

—— separation of iron from zirconium and allied metals, A., ii, 335.

Maxwell, *Walter*, estimation of the lime, potash, and phosphoric acid in Hawaiian soils probably available for the immediate crop, A., ii, 521.

Mayençon, *François*, detection of phosphorus in insoluble substances by sterelectrolysis, A., ii, 181.

Mayer, *Adolf*, estimation of calcium carbonate in marl and soil, A., ii, 385.

Mayer, *Paul*, formation of sugar from egg-albumin, A., i, 787.

Mayer, *Paul*. See also *Ferdinand* **Blumenthal**.

Mayo, *A. D.* See *George B.* **Frankforter**.

Mayr, *Ernst*. See *Johannes* **Thiele**.

Mayrhofer, *F.* See *Carl D.* **Harries**.

Mazé, *Pierre*, assimilation of oxidised and amidic nitrogen by the higher plants, A., ii, 237.

—— assimilation of carbohydrates and elaboration of organic nitrogen by higher plants, A., ii, 321.

—— physiological significance of alcohol in the vegetable kingdom, A., ii, 607.

Mazzara, *Girolamo*, action of sulphuryl chloride on alkylic hydroxybenzoates, A., i, 700, 810.

Mazzara, *Girolamo* [and *A.* **Roland**], action of sulphuryl chloride on alkylic parahydroxybenzoates, A., i, 811.

Meade, *Richard K.*, new volumetric method for the estimation of copper, A., ii, 58.

Mecke and **Wimmer**, alkaloid similar to strychnine found in a corpse, A., i, 311.

Megerle, *W.* See *Alfred* **Werner**.

Megraw, *H. A.* See *William Ridgely* **Orndorff**.

Meillère, *G.*, assay of iodoform, A., ii, 184.

—— use of a centrifugal machine to collect precipitates in quantitative analysis, A., ii, 610.

Meillère, *G.*, and *Ph.* **Chappelle**, estimation of sugars by weighing the copper precipitate, A., ii, 616.

Meineke, *C.*, estimation of sulphuric acid with especial reference to the estimation of sulphur in iron ores, and the products of the metallurgy of iron, A., ii, 518.

—— estimation of sulphur in substances rich in iron, A., ii, 693.

Meisenheimer, *Jakob*. See *Johannes* **Thiele**.

Meiser, *Wilhelm*, derivatives of cyclopentane and of dipentamethenyl, A., i, 741.

Meissel, *N.*, synthesis of organic compounds by means of ferric chloride, A., i, 880.

Meissl, *Emerich* and *Otto* **Reitmair**, field experiments on the effect of the phosphoric acid of basic slag and bonemeal, A., ii, 379.

Melchiker, *P.*, chlorophosphine of orthochlorotoluene, A., i, 207.

Meldola, *Raphael*, paranitro-orthanisidine, P., **1898**, 226.

—— the naphthaquinone from dibrom-α-naphthol, A., i, 372.

Meldola, *Raphael*, and *Percy Phillip* **Phillips**, amidoamidines of the naphthalene series, T., 1011; P., **1899**, 187.

Meldrum, *Andrew N.* See *Francis Robert* **Japp**.

Meldrum, **Robert**, action of water on metallic copper and lead, A., ii, 100.

—— action of water and saline solutions on metallic iron, A., ii, 103.

—— precipitation of cadmium by hydrogen sulphide, A., ii, 812.

Melikoff, *Petr G.*, mud volcanos of Achtala, A., ii, 229.

—— meteorite from Zmjenj, Russia, A., ii, 771.

Melikoff, *Petr G.*, and *W.* **Krschischanowsky**, meteorite from Migheja, A., ii, 230.

Melikoff, *Petr G.*, and *W.* **Krschischanowsky**, meteorites from Mighei, Russia, A., ii, 770.

Melikoff, *Petr G.*, and *L.* **Pissarjewsky**, peroxides, A., ii, 30.

—— —— permolybdates, A., ii, 31.

—— —— salts of pyropervanadic acid and the constitution of the peracid salts, A., ii, 298.

—— —— perniobic and pertantalic acids and their salts, A., ii, 491.

—— —— lanthanum peroxide, A., ii, 598.

Melnikoff, *Michail P.*, loranskite, a new mineral, A., ii, 669.

Melzer, *Herm.*, solubility of coniine in carbon disulphide, A., i, 394.

—— reactions of alkaloids with benzaldehyde and sulphuric acid, A., ii, 193.

Mendel, *Lafayette B.*, absorption of proteids, A., ii, 230.

—— absorption from the peritoneal cavity, A., ii, 309, 440.

Mendel, *Lafayette B.*, and *Holmes C.* **Jackson**, excretion of cynurenic acid, A., ii, 117.

Mendel, *Lafayette B.* See also *Russell H.* **Chittenden.**

Menegazzi, *G. P.*, toxicology of phenol, A., ii, 317.

Mengarini. See **Cecchi-Mengarini.**

Mengel, *P.*, separation of cerium from lanthanum and didymium and its estimation in the presence of the latter, A., ii, 223.

Menke, *Albert E.*, specific gravity of cæsium, A., ii, 483.

Menke, *Albert E.* See also *Hugo* **Erdmann.**

Menozzi, *Angelo*, amount of pentosans in vegetable and other substances, A., ii, 682.

Menschutkin, *Boris N.*, formation of dimethylaniline by the action of bromo- or iodo-benzene and phenol on dimethylamine, A., i, 499.

—— salts of methylaniline and dimethylaniline with halogen acids, A., i, 499.

Menschutkin, *Boris N.* See also *Alesei A.* **Wolkoff.**

Menschutkin, *Nicolai A.*, action of phosphorus tribromide on isomeric monatomic saturated alcohols. Allylpiperidine and allyldipropylamine, A., i, 937.

Mer, *Émile*, the causes of the transformation of sap-wood into wood in oaks (*Quercus Robur* and *Q. pedunculata*) A., ii, 607.

Merck, [*Carl*] *Emanuel*, derivatives of morphine, A., i, 649.

—— [derivatives of ethoxyphenol], A., i, 802.

Merck, *Louis*, the hyoscine-scopolamine question, A., i, 91.

Merz, *Victor*, and *H.* **Strasser**, naphthylated benzidines, A., i, 917.

Messinger, *Carl.* See *Emerique C.* **Szarvasy.**

Methner, *Theodor*, influence of the quality of the ether on the estimation of fat in food-stuffs, A., ii, 821.

Metzke, *Hermann*, arsenates of iron, A., ii, 293.

Metzner, *René*, copper selenate: preparation of selenic acid, A., ii, 20.

—— selenium and tellurium compounds, A., ii, 364.

Meunier. See *Leo* **Vignon.**

Meunier, *Jean.* See *Camille* **Vincent.**

Meyer, *Arthur*, life-history of starch grains in the higher plants, A., ii, 321.

Meyer, *Hans*, cantharadin. II. Isomerides of cantharidin, A., i, 380.

—— constitution of phenolphthalein, A, i, 707.

—— anemonin, A., i, 930.

Meyer, *Richard E.*, and *Alfred* **Conzetti**, derivatives of diphenylmethane, A., i, 763.

Meyer, *Richard E.*, and *Leo* **Friedland**, derivatives of fluoran, A., i, 764.

Meyer, *Richard E.*, and *Rudolf* **Gross**, benzoflavines, A., i, 945.

Meyer, *Richard E.*, and *W.* **Sundmacher**, derivatives of metamidophenol, A., i, 755.

Meyer, *Richard Jos.*, separation and estimation of chlorine, bromine, and iodine in halogen salts, A., ii, 611.

Meyer, *Richard Jos.*, and *P.* **Bruger**, picrotoxin, A., i, 226.

Meyer, *Stefan*, magnetic properties of the elements, A., ii, 587.

Meyerhoffer, *Wilhelm*, change of volume at the transition point of boracite, A., ii, 729.

Meyerhoffer, *Wilhelm*, and *A. P.* **Saunders**, a new fixed point in thermometry. A proposal for a normal room temperature, A., ii, 7.

—— —— reciprocal salt pairs. II. Equilibrium phenomena in the presence of a double salt, A., ii, 410.

Michael, *Arthur*, substitution of alkyl radicles for sodium in ethylic phenylsulphonesodioacetate, A., i, 816.

Michaelis [*Carl Arnold*] *August*, and *W.* **Kerkhof**, salol-*o*-phosphinic acid, A., i, 53.

Michaelis, *August*, and *E.* **Köhler**, a new series of betaines, A., i, 596.

Michaelis, *August*, and *R.* **Pasternack**, 5-chloro-1-phenyl-3-methylpyrazole, A., i, 941.

Michaelis, *August*, and *M.* **Pitsch**, action of aqueous alcoholic alkalis on phosphorus, A., ii, 285.

Michaelis, *August*, and *Hans* **Röhmer**, isomeric chlorophenyldimethylpyrazoles, A., i, 233.

—— —— simple conversion of pyrazolones into pyrazoles, A., i, 233.

—— —— 3-hydroxy-1-phenyl-5-pyrazolone, A., i, 233.

Michailenko, *Jakov*, action of zinc on a mixture of ethylic bromisobutyrate and ethylic formate; synthesis of symmetrical β-hydroxytetramethylglutaric acid, A., i, 482.

Michel, *F.* See *Carl* **Liebermann**.

Michel, *Léopold*, bismuthiferous molybdenite, A., ii, 561.

Michel, *Léopold*. See also *Léon* **Garnier**.

Micko, *Karl*, capsaicin, A., i, 716.

Middleton, *R. E.* See *William McDonnell* **Mackey**.

Miers, *Henry Alexander* [and *Ernald G. J.* **Hartley**], blende and zinciferous galena, A., ii, 431.

Milch, *Ludwig*, granitic rocks of the Riesengebirge, A., ii, 112.

Millar, *James Hills*. See *Horace T.* **Brown**.

Miller, *W.*, ethylic azelate, A., i, 791.

Miller, *W.*, and *A.* **Tschitschkin**, azelaone, A., i, 789.

Miller, *Wilhelm von*, and *Josef* **Plöchl**, action of cinnamaldehyde on phenyltoluidoacetonitrile, A., i, 159.

Miller, *Wilhelm von*, and *Josef* **Plöchl** [with *Bruno* **Bruhn**, *Ludwig* **Gerngross**, *J.* **Hamburger**. *W.* **Kollegorsky**, *R.* **Luppe**, *P.* **Scheitz**, and *Wilhelm* **Sieber**], behaviour of substituted amidonitriles towards aromatic aldehydes in presence of alkali, A., i, 127.

Miller, *Willet G.*, nickeliferous magnetites, A., ii, 109.

Miller, *W. W.*, jun., emery from Virginia, A., ii, 759.

—— smithsonite from Arkansas, A., ii, 761.

—— sandstone from Augusta Co. Virginia, A., ii, 769.

Millosevich, *Frederico*, sulphur and other minerals from the Malfidano mines near Buggerru, Sardinia, A., ii., 492.

Mills, *W. H.*, and *Thomas Hill* **Easterfield**, derivatives of dibenzylmesitylene, P., **1899**, 22.

Milobendski, *Th.*, behaviour of isomeric alcohols with phosphorous trichloride, A., i, 659.

Minet, *Adolphe*, impurities in aluminium, A., ii, 487.

Mingaye, *John C. H.*, analyses of phosphates from New South Wales, A., ii, 670.

—— phosphatic deposits in the Jenolan caves, New South Wales, A., ii, 670.

Minguin, *Jules*, corrosion figures showing the enantiomorphous structure of benzylidenecamphors, A., i, 771.

Minkowski, *Oskar*, uric acid in mammals, A., ii, 778.

Minovici, *Stephen S.*, condensation of the cyanhydrins of benzaldehyde and anisaldehyde, A., i, 890.

Minozzi, *A.*, the affinity between acids and bases in methylic alcoholic solution, A., ii, 642.

—— modification of Sprengel's pyknometer, A., ii, 646.

Minssen, *H*, See *G.* **Schliebs**.

Miolati, *Arturo*, preparation of carbonatotetramminecobalt hydrogen carbonate, A., ii, 369.

Miolati, *Arturo*, and *Ugo* **Alvisi**, electrolytic behaviour of some complex fluorides and oxyfluorides, A., ii, 350.

Mitchell, *Charles Ainsworth*. See *Otto* **Hehner**.

Miura, *Rentaro*. See *Muneo* **Kumagawa**.

Mixter, *William Gilbert*, electrosynthesis, A., ii, 266.

Moebes, *A.* See *Emil* **Erlenmeyer**, *jun.*

Möhlau, *Richard*, new reactions for paraquinone and paraquinonoid compounds, A., i, 61.

Möhlau, *Richard*, and *Volkmar* **Klopfer**, products of the action of sulphur on dimethylaniline, A., i, 240.

—— —— condensation of benzhydrols with paraquinones and paraquinonoid compounds, A., i, 912.

Möslinger, a new principle for the testing of sugared (Gallisierter) wines, A., ii, 709.

Mogk, *W. A.* See *George B.* **Wallace**.

Mohr, *Ernst*, β-diazopyridine and β-diazoamidopyridine, A., i, 72.

Mohr, *Ernst*. See also *Theodor* **Curtius**.

Mohr, *E. C. J.*, equilibrium in the system—water, ammonium chloride, ferric chloride, A., ii, 15.

Moissan, *Henri*, action of acetylene on metal-ammoniums, A., i, 241.

—— lithium-methylammonium, A., i, 410.

—— calcium hydride, A., ii, 25.

—— preparation of lithium and calcium ammonias and the corresponding amides, A., ii, 152.

—— properties of calcium, A., ii, 153.

Moissan, *Henri,* preparation and properties of calcium nitride, A., ii, 155.

—— colour of calcium carbide, A., ii, 219.

—— heat of formation of calcium oxide, A., ii, 352.

—— preparation and properties of crystallised calcium phosphide, A., ii, 418.

—— applications of aluminium, A., ii, 425.

—— formation of carbides of the alkali and alkaline earth metals and of magnesium, A., ii, 554.

—— electrolytic preparation of fluorine in a copper vessel, A., ii, 593.

Moissan, *Henri,* and *Alexandre* [*Léon*] **Étard,** preparation and properties of thorium carbide, A., ii, 227.

Moitessier, *Joseph,* compounds of phenylhydrazine with haloid salts of the alkaline earth metals, A., i, 205.

—— compounds of phenylhydrazine with metallic thiosulphates, dithionates, and hypophosphites, A., i, 688.

—— combination of phenylhydrazine and other bases with metallic salts, A., i, 752.

—— compounds of phenylhydrazine with cuprous salts, A., i, 807.

Mokiewsky, *Wladimir,* isoprene, A., i, 726.

—— action of zinc dust on bromalcohols, A., i, 729.

—— action of hydrogen bromide on glycols, A., i, 729.

Moldenhauer, *Fr.,* estimation of lead in ores, A., ii, 57.

Molinié, *Marcel.* See *Félix* **Marboutin.**

Molz, *Wilhelm.* See *Franz* **Feist.**

Mondolfo, *G. H.,* valuation of persulphates, A., ii, 805.

Mondolfo, *G. H.* See also *Ubaldo* **Antony.**

Monnet, *Paul,* and *Louis* **Benda,** action of carbonic anhydride on the sodium derivatives of the nitrophenols, A., i, 585.

Monnet, *Paul,* and *J.* **Kœtschet,** sacchareins: a new class of colouring matters derived from orthobenzoic sulphinide, A., i, 212, 289.

Montecchi, *G.,* reactions of mercurioaniline, A., i, 429.

Montemartini, *Clemente,* action of chlorine on isobutylacetic acid, A., i, 330.

—— condensations with ethylic β-chlorisovalerate, A., i, 420.

Montemartini, *Clemente,* and *D.* **Trasciatti,** estimation of morphine in opium, A., ii, 619.

Moody, *Gerald Tattersall,* propylbenzenesulphonic acids, P., **1899,** 17.

Moore, *Benjamin,* and *Swale* **Vincent,** comparative chemistry of the suprarenal capsules, A., ii, 41.

Moraczewski, *Waclaw von,* excretion of the constituents of urine in fever, A., ii, 441.

More, *Andrew,* chemical examination of the oleo-resin of *Dacryodes hexandra,* T., 718; P., **1899,** 150.

Moreau. See *Paul* **Cazeneuve.**

Moreigne, *Henri,* modification of Mörner and Sjöqvist's method of estimating urea, A., ii, 72.

—— estimation of urea in urine by means of sodium hypobromite, A., ii, 73.

—— relation between the total nitrogen of urine and the nitrogen present as urea, A., ii, 73, 314.

—— presence of tyrosine and leucine in the urine from a case of cystinuria. Detection of tyrosine, A., ii, 317.

Morel, *Albert,* phenylic alkylic phosphates, A., i, 264, 492, 747, 875.

—— mixed guaiacylic alkylic carbonates, A., i, 586.

Morel, *Albert.* See *Étienne* **Barral,** *Paul* **Cazeneuve.**

Morgan, *Gilbert Thomas,* note on the interaction of formaldehyde with β-naphthylamine derivatives, P., **1899,** 9.

Morgan, *John Livingston Rutgers,* theory of the separation of barium, strontium, and calcium from the mixed sulphates, A., ii, 627.

Morgan, *J. Livingston R.,* and *A. H.* **Gotthelf,** theory of the formation of nickel sulphide, A., ii, 626.

Morgan, *William Conger.* See *John L.* **Bridge.**

Morishima, *Kurata,* alkaloids contained in *Lycoris radiata,* Herb., A., i, 92.

—— proteid of wheat gluten, A., i, 466.

Moritz, *B.,* practical utility of semipermeable membranes, A., ii, 721.

Moritz, *Carl,* and *Richard* **Wolffenstein,** action of potassium persulphate on aromatic hydrocarbons, A., i, 424.

—— —— action of potassium persulphate on alkyl groups, A., i, 910.

Moritz, *P.* See *Wilhelm* **Biedermann.**

Morozewicz, *Józef,* formation of minerals in magmas, A., ii, 762.

Morpurgo, *Giulo,* artificial coloration of coffee, A., ii, 134.

Morrell, *Robert Selby,* and *James Murray* **Crofts,** action of hydrogen peroxide on carbohydrates in the presence of foreign salts, T., 786; P., **1899,** 99; discussion, P., 100.

Morris, *George Harris*, analysis of brewing sugars, A., ii, 187.

Morrison, *J. L.* See *James Lewis* **Howe**.

Mosnier, *A.*, compounds of lead iodide with other iodides, metallic or organic, A., ii, 222.

Moszczenski, *John*, estimation of tartaric acid, A., ii, 69.

Mott, *Frederick Walker*, and *Wakelin* **Barratt**, chemistry of Wallerian degeneration, A., ii, 317.

Mott, *Frederick W.*, and *William D.* **Halliburton**, physiological action of choline and neurine, A., ii, 781.

Mott, *Frederick W.* See also *William D.* **Halliburton**.

Motta, *A.* See *Giuseppe* **Grassi-Cristaldi**.

Moufang, *Nicola*, and *Julius* **Tafel**, brucine, A., i, 309.

—— —— ethylstrychnine and benzylstrychnine, A., i, 310.

Mouneyrat, *Antoine*, bromination with aluminium bromide in the aliphatic series, A., i, 1.

—— action of bromine on propylic bromide in presence of aluminium bromide, A., i, 97.

—— action of chlorine on acetylenic tetrabromide in presence of aluminium chloride, A., i, 241.

—— action of chlorine on pentachlorethane in presence of aluminium chloride, A., i, 241.

—— action of bromine on chloral in presence of aluminium chloride, A., i, 247.

—— action of iodine chloride on chlorobenzene in presence of aluminium chloride, A., i, 341.

—— action of chlorine on chloroform and of bromine on bromoform in presence of the corresponding aluminium halogen salts, A., i, 397.

—— action of bromine on ethylic bromide in presence of aluminium bromide, A., i, 470.

—— action of aluminium chloride on acetylene tetrachloride, A., i, 470.

—— action of bromine on acetylene tetrachloride in presence of aluminium chloride, A., i, 470.

—— action of hexachlorethane on benzene in presence of aluminium chloride, A., i, 490.

—— action of pentachlorethane and of tetrachlorethylene on benzene in presence of aluminium chloride, A., i, 490.

—— action of bromine on αβ-propylenic bromide in presence of anhydrous aluminium bromide: preparation of ααβ-tribromopropane, A., i, 555.

Mouneyrat, *Antoine*, action of bromine on ααβ-tribromopropane and on tribromhydrin in presence of aluminium bromide: preparation of ααβγ-tetrabromopropane, A., i, 556.

—— action of chlorine on propylic chloride in presence of aluminium chloride, A., i, 725.

—— action of bromine on isobutylic bromide in presence of aluminium bromide and chloride, A., i, 786.

—— chlorination of carbon disulphide in presence of aluminium chloride, A., ii, 365.

Mouneyrat, *Antoine*, and *Ch.* **Pouret**, chlorination of benzene in presence of aluminium chloride, A., i, 263.

—— action of bromine on chlorobenzene in presence of anhydrous aluminium chloride: preparation of parabromochlorobenzene, A., i, 584.

Mourelo, *José Rodriguez*, phosphorescent strontium sulphides, A., ii, 97, 98, 366, 420.

—— action of manganese in producing phosphorescence of strontium sulphide, A., ii, 484.

Moureu, *Charles*, ethanedicatechol or glyoxaldicatechol [dicatechol acetylenic ether], A., i, 30, 679.

—— bromocamphor, A., i, 68.

—— hydrolysis of ethanedicatechol [dicatechol acetylenic ether], A., i, 125.

—— glyoxal catechol, A., i, 138.

—— aromatic allylic and propenylic ethers, A., i, 427.

—— orthohydroxyphenoxyacetone, A., i, 433.

—— ethanecatechol [catechol ethylenic ether], A., i, 493.

—— ethylenecatechol [catechol acetylenic ether], A., i, 494.

—— methylethylenecatechol [catechol methylacetylenic ether], A., i, 494.

—— synthesis of estragole, and of allylic compounds, A., i, 494.

—— orthohydroxyphenoxyacetic acid and orthophenylenedioxydiacetic acid, A., i, 700.

Mourlot, *A.*, anhydrous crystalline magnesium sulphide, A., ii, 27.

—— crystallisation of anhydrous calcium and strontium sulphides, A., ii, 97.

—— metallic sulphides, A., ii, 747.

Moyer, *J. Bird*, separations of metallic sulphides by means of hydrogen chloride, A., ii, 697.

Mrazec, *L.*, riebeckite and ægirine in granite from Turcoaia, Roumania, A., ii, 768.

Müller, *Erich*, pyrogenic decomposition of gas-oil, phenol, and cresol, A., i, 27.

Müller, *Erich*, electrolytic method of preparing alkali chlorates, bromates, and iodates, A., ii, 742.
Müller, *Fr.* See *Hugo von* **Soden.**
Müller, *Friedrich*, and *John* **Seemann**, sugar from albumin, A., i, 968.
Müller, *Friedrich.* See *Albert* **Hesse.**
Müller, *M.* See *Paul* **Jannasch.**
Müller, *O.*, experiments with ferric sulphate for killing the denitrifying organism in stable manure, and preventing erysipelas and swine fever, A., ii, 506.
Müller, *Paul*, separation of albumoses from peptone, A., ii, 136.
Müller, *Wilhelm.* See *Richard* **Willstätter.**
Müller, *Wolf.* See *Jacobus H. van't* **Hoff.**
Müller-Erzbach, *Wilhelm*, distance of action of molecular forces, A., ii, 412.
Müncker, *Heinrich.* See *Max* **Busch.**
Mulder, *Eduard*, silver peroxysulphate, A., ii, 483.
Muller, *Joseph Auguste*, theory of the action of carbonic oxide on a solution of potassium ferrocyanide, A., i, 728.
—— estimation of ferrocyanides and carbonylferrocyanides, and their separation, A., ii, 616.
Muller, *Paul Thiebaut*, velocity of limited reactions, A., ii, 358.
—— law of the dilution of electrolytes, A., ii, 396.
Muller, *Paul Thiebaut.* See also *Albin* **Haller.**
Mulliken, *S. P.*, and *E. R.* **Barker**, reactions for the detection of the nitro-group, A., ii, 382.
Mulliken, *S. P.*, and *H.* **Scudder**, colour reaction for methylic alcohol, A., ii, 388.
Murmann, *Ernst*, a new form of crucible: the tube crucible, A., ii, 122.
—— estimation of zinc and manganese as sulphides, A., ii, 126.
Murray, *John*, and *Robert* **Irvine**, chemical changes in oceanic deposits, A., ii, 437.
Murrill, *Paul*, picoline haloids and perhaloids, A., i, 934.
Muspratt, *Max*, and *E.* **Shrapnel-Smith**, high strength hypochlorite solutions, A., ii, 281, 553.
Muttelet, *Fernand*, dinitrophenyldiacetylmethane, A., i, 281.
—— iminoimines (amidines), A., i, 354.
—— action of aniline on dinitrodiphenyldiacetylmethane, A., i, 435.
—— amidoamidines. IV., A, i, 500.
Mylius, *Franz*, and *Rudolf* **Dietz**, pure platinum metals of commerce, A., ii, 160.

N.

Nabl, *Arnold*, colouring substances contained in amethyst, citrine, and burnt amethyst, A., ii, 561.
Nägeli, *Ernest*, preparation of diphenylmethyleneaniline, A., i, 910.
—— nitration at elevated temperatures, A., i, 916.
Nagornoff, *Nicolai N.*, action of amines on the bromonitrobenzenes, A., i, 425.
Nannes, *G.*, forms of phosphoric acid in peaty soil, A., ii, 798.
Nasini, *Raffaele*, *Francesco* **Anderlini**, and *Roberto* **Salvadori**, probable presence of coronium and new elements in the solfatara of Pozzuoli and Vesuvius, A., ii, 482.
Nasini, *Raffaele*, and *Roberto* **Salvadori**, water of Bagnoli, Tuscany, A., ii, 771.
Natcheff, *C.* See *Friedrich* **Kehrmann.**
Natterer, *Konrad*, chemical investigations in the Red Sea, A., ii, 501.
Naumann, *Alexander*, reactions in anhydrous solvents, A., ii, 423.
Naumoff, *S.* See *Nicolai D.* **Zelinsky.**
Naylor, *William Arthur Harnson*, alkaloidal constituents of Cascarilla bark, A., i, 179.
Nebelthau, *Eberhard*, hæmatoporphyrinuria, A., ii, 568.
Nef, *John Ulric*, formhydroxamic acid, A., i, 109.
Nencki, *Marcellus*, organic syntheses by means of ferric chloride, A., i, 879.
Nencki, *Marcellus*, and *J.* **Zaleski**, behaviour of benzoyl peroxide and calcium peroxide in the digestive canal in dogs and men, A., ii, 676.
Nerking, *Joseph*, estimation of fat in animal tissues and fluids, A., ii, 191.
Nerking, *Joseph.* See also *Eduard* **Pflüger.**
Nernst, *Walther*, and *Emil* **Bose**, osmotic theory of the galvanic cell, A., ii, 345.
Nesbitt, *Beattie*, choline and neurine in the intestine during its complete obstruction, A., ii, 310.
Neuberg, *Carl*, a compound of glycuronic acid with parabromophenylhydrazine, A., i, 933.
—— estimation of phenol in urine, A., ii, 454.
—— detection and estimation of formaldehyde, A., ii, 580.
Neuberg, *L.*, See *Alfred* **Wohl.**
Neuman, *Albert*, nucleins, A., i, 467.
—— estimation of phosphoric acid for physiological purposes, A., ii, 54.
Neumann, *B.*, electrolytic estimation of nickel in presence of iron, A., ii, 386.

Neumann, *Paul,* composition of the water chesnut (*Trapa natans*), A., ii, 794.

Newbury, *Frederick George.* See *Arthur George* **Perkin.**

Newman, *Frank H.* See *Johannes* **Wislicenus.**

Newmann, *J.* See *Karl* **Elbs.**

Newton, *Edwin Tulley,* and *J. J. Harris* **Teall,** rocks from Franz Josef Land, A., ii, 163.

Nicloux, *Maurice,* estimation of small quantities of methylic alcohol, formaldehyde, and formic acid, A., ii, 253.

—— estimation of traces of carbonic oxide in air, A., ii, 333.

Nicol, *B. A.* See *Marcus Seymour* **Pembery.**

Nicolaéeff, *Peter D.,* analysis of loranskite, A., ii, 669.

Niementowski, *Stefan von* (and in part *Stanislaus* **Kozakowski**), new types of anhydro-compounds, A., i, 643.

Nietzki, *Rudolph,* and *W.* **Geese,** oxidation products of diquinoyltetroxime, A., i, 347.

Nilson, *Lars Fredrik.* See *Carl Gustaf* **Eggertz.**

Noël-Paton, *Diarmid,* conversion of liver glycogen into glucose, A., ii, 312.

Noël-Paton, *Diarmid, James Crauford* **Dunlop,** and *Ivison* **Macadam,** modifications of metabolism produced by diphtheria toxin, A., ii, 602.

Noelting, *Emilio,* and **Bianchi,** azodyes derived from 2′ : 1-naphthylamidosulphonic acid, A., i, 374.

Noelting, *Emilio,* and *G.* **Forel,** influence of oxidising substances on the solubility of gold in alkali cyanides, A., ii, 755.

Noelting, *Emilio,* and **Kuntz,** a new class of dyes, the diamidodiphenylbenzenylamidines, A., i, 354.

Noelting, *Emilio,* and **Paira,** isomerides of the rhodamines and the pararhodamines, A., i, 371.

Noetzel, *Max.* See *Hans* **Stobbe.**

Noll, *Alfred,* quantitative relations of protagon to the medulla of nerves, A., ii, 568.

Nordenström, *Gustaf,* inflammable gas in metalliferous mines, A., ii, 370.

Norris, *James F.,* and *Arthur I.* **Franklin,** composition of nitrogen iodide and the action of iodine on fatty amines, A., i, 663.

Norton, *John T.,* jun., influence of hydrochloric acid on titration with sodium thiosulphate, with especial reference to the estimation of selenious acid, A., ii, 518.

—— estimation of iron in the ferric state by reduction with sodium thiosulphate and titration with iodine, A., ii, 613.

Noyes, *Arthur Amos,* solubility of mixed electrolytes of two ions containing no common ion, A., ii, 9.

—— relation between osmotic work and osmotic pressure, A., ii, 357.

—— thermodynamical expressions for the heats of dissolution and dissociation of electrolytes, A., ii, 401.

Noyes, *Arthur A.,* and *Edward S.* **Chapin,** solubility of acids in solutions of the salts of other acids, A., ii, 274.

—— —— influence of an electrolyte of two ions on the solubility of an electrolyte with three ions, A., ii, 405.

Noyes, *Arthur Amos,* and *George J.* **Cottle,** reaction between silver acetate and sodium formate, a reaction of the third order, A., ii, 205.

Noyes, *Arthur Amos,* and *David* **Schwartz,** solubility of salts of a weak acid in a strong acid, A., ii, 10.

Noyes, *Arthur Amos,* and *J.* **Seidenstick-er,** solubility of iodine in dilute solutions of potassium iodide, A., ii, 11.

Noyes, *William Albert,* camphoric acid. V. [Derivatives of xylene], A., i, 284.

—— camphoric acid. VI., A., i, 759.

Noyes, *William Albert* [and *J. W.* **Shepherd**], constitution of camphoric acid; synthesis of ethylic cyanodimethylcyclopentanonecarboxylate, A., i, 928.

Nyssens, detection of perchlorate in Chili saltpetre, A., ii, 327.

O.

Oberländer, *Eugen.* See *Ludwig* **Gattermann.**

Obermayer, *Fritz,* estimation of urinary indican, A., ii, 263.

—— estimation of indoxylsulphuric acid (indican) in urine, A., ii, 458.

cuprite and malachite, A., ii, 760.

Ochsenius, *Carl,* occurrence of iodine in cuprite and malachite, A., ii, 760.

Oderfeld, *E.* See *Stainslaus von* **Kostanecki.**

Oechsner de Coninck, *William,* action of oxidising agents on nitrogenous compounds, A., i, 243.

—— oxidation of some carbamides, A., i, 420.

—— oxidation of secondary and tertiary amines A., i, 472.

Oechsner de Coninck, *William*, action of oxidising agents on some amides, A., i, 508.
—— study of an oxyptomaine, A., i, 830.
—— elimination of chlorides in rachitis, A., ii, 42.
—— elimination of nitrogen and phosphorus during assimilation, A., ii, 678.
Oechsner de Coninck, *William*, and *A.* **Combe**, action of oxidising agents on fatty and aromatic amines, A., i, 244.
—— oxidation of aromatic compounds, A., i, 347.
Oehler, *Eugen*, chemistry of lignite tar, A., i, 816.
Oehmichen, *Carl G.* See *Ludwig* **Gattermann.**
Oertel, *Horst*, organic phosphorus in urine, A., ii, 116.
Oesterle, *O. A.*, aloin, A., i, 538.
Oesterreich, *Paul R.* See *Johannes* **Pinnow.**
Oettel, *Felix*, electrolysis of solutions of calcium chloride, A., ii, 219.
Œttinger, *G.* See *Constantin I.* **Istrati.**
Offret, A., and *Henri* **Vittenet**, three crystalline forms of dimetanitrodiphenylcarbamide, A., i, 886.
Ogawa, *Masataka.* See *Edward* **Divers.**
Ogg, *A.*, chemical equilibrium between amalgams and solutions, A., ii, 14.
Ohligmacher, *C.* See *Otto* **Wallach.**
Ohly, *Julius*, chromylamide, A., ii, 754.
Okerblom, *Johann*, xanthine bases in the suprarenals, A., ii, 778.
O'Neal, *E. A.* See *James Lewis* **Howe.**
Onfroy, *P.*, gelatin in chocolate, A., ii, 76.
Oppenheimer, *Carl*, precipitation of acetone with mercuric sulphate, A., i, 475.
Oppenheimer, *S.*, magnetic rotation in salt solutions, A., ii, 139.
O'Reilly, *Joseph P.*, anatase and brookite from near Dublin, A., ii, 497.
Orloff, *E.*, analysis of nitrites, A., ii, 693.
Orloff, *N. A.*, betaine contained in the root of *Altheœa officinalis*, A., i, 44.
Orloff, *P.*, influence of various subtances in solution on the crystalline form of sodium chloride, A., ii, 654.
Orndorff, *William Ridgely*, and *H. A.* **Megraw**, dimethyldianthracene, a polymeride of β-methylanthracene, A., i, 819.
Orr, *Thomas Workman.* See *George Gerald* **Henderson.**
Ortmann, *Alfred*, detection of arsenic in coal-tar colours, A., ii, 181.
Ortoleva, *Giovanni*, action of iodine on cinnamic acid in pyridine solution, A., i, 894.
Orton, *Kennedy Joseph Previte.* See *Frederick D.* **Chattaway.**
Osborne, *Thomas Burr*, definite compounds of proteids with mineral acids, A., i, 836.
—— egg-albumin, A., i, 837.
Osborne, *W. A.*, invertin, A., i, 967.
Osborne, *Wilhelm.* See *Johannes* **Thiele.**
O'Shaughnessy, *F. R.* See *Henry Droop* **Richmond.**
Osius, *F. W.* See *Stanislaus von* **Kostanecki.**
Osmond, *Floris*, alloys of iron and nickel, A., ii, 351.
—— effect of low temperatures on steel, A., ii, 630.
Ossenbeck, *A.* See *Theodor* **Zincke.**
Osswald, *G.* See *Arthur* **Hantzsch.**
Ostrogovich, *Adriano.* See *Constantin I.* **Istrati.**
Ostwald, *Wilhelm.* See *Hans* **Landolt.**
Oswald, *Ad.*, the proteids of the thyroid gland, A., ii, 439.
Ota, *Kenjiro.* See *Harry C.* **Jones.**
Otto, *Marius*, ozone, A., ii, 282.
Otto, *Richard*, fermentation of bilberry must, A., ii, 505.
Otto, *Robert*, and *Julius* **Troeger**, the Crodo spring at the Juliushall bath, Harzburg, Harz mountains, A., ii, 437.

P.

Paal, *Carl*, and *H.* **Apitzsch**, nitrosacylamines, A., i, 268.
Paal, *Carl*, and *C.* **Benker**, retardation of chemical reactions due to stereochemical influences. I. Paranitrobenzylic bases, A., i, 587.
Paal, *Carl*, and *Friedr.* **Härtel**, retardation of chemical reactions due to stereochemical influences. II. Hydroxybenzylic bases, A., i, 748.
Paal, *Carl*, and *Hermann* **Stern**, two isomeric chlorodiphenacyls, A., i, 367.
—— —— iododiphenacyls, A., i, 367.
Päpke. See *Carl Adam* **Bischoff.**
Paessler and **Spanjer**, estimation of the acidity of tanning liquors, A., ii, 618.
Pagel. See *Charles Frédéric* **Schlagdenhauffen.**
Pagés, *J.* See *Henri* **Imbert.**
Pagnoul, *Aimé*, effect of perchlorate present in potassium nitrate, on vegetation, A., ii, 243.
—— influence of light on the growth of clover, A., ii, 788.
Pailhade. See **Rey-Pailhade.**
Paira. See *Emilio* **Noelting.**
Pakis. See *Carl Adam* **Bischoff.**
Palacre, *Charles*, powellite crystals from Michigan, A., ii, 495.

Palas, *A.*, detection of rape oil, A., ii, 72.

Palladin, *Wladimir*, modifications of plant respiration resulting from variations of temperature, A., ii, 686.

Palmaer, *Wilhelm*, chemical proof of concentration change with drop electrodes, A., ii, 347.

—— apparatus for the purification of mercury, A., ii, 485.

Panormoff, *Alexei A.*, globulin of white of egg, A., i, 654.

—— albumins of white of egg, A., i, 655.

Panzer, *Theodor*. See *Ernst* **Ludwig**.

Papasogli, *G.*, some characteristic reactions of nickel and cobalt, A., ii, 335.

Paradeis. See *Ludwig* **Gattermann**.

Paris, *Giulio*, detection of fluorine in wine, A., ii, 804.

Paris, *Giulio*. See also *Arthur* **Bornträger**.

Park, *James*, and *Frank* **Rutley**, rhyolites of the Hauraki goldfields, New Zealand, A., ii, 769.

Parker, *F. H.*, and *Graham* **Lusk**, maximum production of hippuric acid in rabbits, A., ii, 312.

Parker, *J. Gordon*. See *Henry Richardson* **Procter**.

Parkin, *John*, formation, storage, and depletion of carbohydrates in monocotyledons, A., ii, 790.

Parmentier, *F.*, alleged existence of fluorine in certain mineral waters, A., ii, 501, 675.

—— mineral waters of Mont Dore, A., ii, 675.

Partheil, *Alfred*, and *E.* **Amort**, arsenic compounds, A., ii, 417.

Partheil, *Alfred*, *E.* **Amort**, and *A.* **Gronover**, hexalkylated diarsonium compounds, A., i, 474.

Passon, *Max*, composition of the insoluble portion of basic slag, A., ii, 514.

Passy, *Jacques*, oil of petit grain, A., i, 65.

Pasternack, *R.* See *August* **Michaelis**.

Pastor, *J.* See *Alfred* **Werner**.

Pastureau, combination of phenylhydrazine with metallic salts, A., i, 205.

—— combination of phenylhydrazine with sodium hydrogen sulphite, A., i, 807.

Patein, *Gustave*, estimation of proteids in blood serum, A., ii, 827.

Patein, *Gustave*, and *E.* **Dufau**, the sugar in diabetic urine, A., ii, 375.

Paternò, *Emmanuele*, and *Ugo* **Alvisi**, reactions of metallic fluorides, A., ii, 17.

—— reactions of fluoro- and fluoroxysalts, A., ii, 18.

Pattinson, *Hugh Salvin*. See *John* **Pattinson**.

Pattinson, *John*, and *Hugh Salvin* **Pattinson**, separation and estimation of arsenic, A., ii, 56.

—— estimation of tin in commercial antimony, A., ii, 62.

Paul, *Victor*, 1-ethylphthalazine and some derivatives of phthalazone, A., i, 776.

Pauly, *Hermann*, condensation of cyclic acetone bases with mercaptans; exceptions to the rule of mercaptole formation, A., i, 228.

—— cyclic acetone bases, A., i, 872.

Pauly, *Hermann*, and *Joseph* **Rossbach**, formation of pyrroline and pyrrolidone derivatives from triacetonamine. I., A., i, 773.

Pavy, *Frederick William*, effects on blood and urine of the intravenous and subcutaneous injection of various carbohydrates, A., ii, 677.

Paweck, *Heinrich*, electrolytic estimation of zinc, A., ii, 250.

Pawlewski, *Bronislaw*, conversion of phenylcarbamine and phenylthiocarbimide into acetanilide, A., i, 594.

—— determinations of solubility at different temperatures, A., ii, 405.

Peachey, *Stanley John*. See *William J.* **Pope**.

Péchard, *E.*, oxidising action of alkali periodates, A., ii, 477.

—— action of iodine on alkalis, A., ii, 593.

Pechmann, *Hans von*, diazomethane and nitroso-acidamides, A., i, 134.

—— pyrazole from acetylene and diazomethane, A., i, 232.

—— condensation of glutaconic acid, A., i, 869.

Pechmann, *Hans von*, and *Eugen* **Seel**, condensation of diazomethane with quinones, A., i, 947.

Peckham, *Stephen Farnum*, technical analysis of asphaltum and asphalts, A., ii, 63.

Pécoul, *Adrien*. See *Félix* **Marboutin**.

Pélabon, *H.*, action of hydrogen on silver sulphide, A., ii, 24.

—— dissociation of mercuric oxide, A., ii, 423.

Pellizzari, *Guido*, preparation of hydrazides and their transformation products, A., i, 858.

Pellizzari, *Guido*, and *A. A.* **Ferro**, action of phosphorus pentasulphide on phenylurazole and paratolylurazole, A., i, 550.

Pembrey, *Marcus Seymour*, temperature of the mouth after exercise, A., ii, 309.

Pembrey, *Marcus Seymour*, and *B. A.* **Nicol**, temperature of the human body, A., ii, 163.

Pemsel, *Wilhelm*. See *Karl* **Spiro**.

Penfield, *Samuel L.*, and *H. W.* **Foote**, composition of tourmaline, A., ii, 304.

Penfield, *Samuel Lewis*, and *Charles H.* **Warren**, composition of parisite from Montana, A., ii, 600.

Peratoner, *Alberto*, and *G.* **Leonardi**, pyrone group. V. Action of iodic acid on pyromeconic acid, A., i, 421.

Perkin, *Arthur George*, a reaction of some phenolic colouring matters, T., 433; P., **1899**, 65.

—— the colouring matter of cotton flowers, *Gossypium herbaceum*. Note on rottlerin, T., 825; P., **1899**, 161.

—— scoparin, P., **1899**, 123.

Perkin, *Arthur George*, and *Frederick George* **Newbury**, the colouring matter contained in dyer's broom (*Genista tinctoria*) and heather (*Calluna vulgaris*), T., 830; P., **1899**, 179.

Perkin, *William Henry*, jun., oxidation of sulphocamphylic acid, T., 175.

Perkin, *William Henry*, jun., and *Charles H. G.* **Sprankling**, β-aldehydopropionic acid, $CHO{\cdot}CH_2{\cdot}CH_2{\cdot}COOH$, and β-aldehydoisobutyric acid, $CHO{\cdot}CH_2{\cdot}CH(CH_3){\cdot}COOH$, T., 11; P., **1898**, 112.

Perkin, *William Henry*, jun., and *Jocelyn Field* **Thorpe**, ββ-dimethylglutaric acid and its derivatives; synthesis of *cis*- and *trans*-caronic acids, T., 48; P., **1898**, 107.

—— —— synthesis of αββ-trimethylglutaric acid, $COOH{\cdot}CH(CH_3){\cdot}C(CH_3)_2{\cdot}CH_2{\cdot}COOH$, T., 61; P., **1898**, 250.

—— —— experiments on the constitution of isocamphoronic acid, T., 897; P., **1899**, 184.

Perkin, *William Henry*, jun. See *Harold Allden* **Auden**, *H. C. H.* **Carpenter**, *William* **Gilbody**, and *Frederick H.* **Lees**.

Perot, *A.* See *Ch.* **Fabry**.

Perraud, *J.* See *Léo* **Vignon**

Pesci, *Leone*, compounds of mercury with organic bases, A., i, 430.

—— mercuriphenyl sulphide and thiosulphate, A., i, 816.

—— replacement of several hydrogen atoms in benzene by means of mercury, A., i, 908.

—— action of acetanilide on mercury acetate, A., i, 908.

—— mercury derivatives of nitrogen compounds, A., ii, 750.

Peter, *Arnold H.*, preparation of mixed ethers, A., i, 558.

Peterkin, *James Dysart*. See *Harold Baily* **Dixon**.

Petermann, *E.* See *Theodor* **Zincke**.

Peters, *Franz*, the ferric chloride test for phenol, A., ii, 340.

Petersen, *Emil*, modifications of common galvanic cells, A., ii, 346.

Petersen, *Johannes*, marekanite-obsidian from Nicaragua, A., ii, 38.

Peterson, *Heinrich*, volumetric estimation of gold and platinum, A., ii, 253.

Petit, *Paul*, dextrins of saccharification, A., i, 559.

Petkow, *Nicolaus*. See *Rudolph* **Fittig**.

Petrén, *Jakob*, the so-called valleriite, A., ii, 759.

Petrenko-Kritschenko, *Pavel Iw.*, tetrahydropyrone compounds, A., i, 440.

Petrenko-Kritschenko, *Pavel Iw.*, and *S.* **Rosenzweig**, hydroxylamine derivatives of tetrahydropyrone compounds, A., i, 706.

Petry, *Eugen*, chemistry of malignant tumours, A., ii, 568.

Pettit, *J. H.*, minimum boiling points and vapour compositions, A., ii, 632.

Pfeiffer, *Otto*, preparation of pure silver, A., ii, 366.

Pfeiffer, [*Franz Wilhelm*] *Theodor* [*Christian*], explanation of denitrification and of the diminution of crops after the application of fresh farmyard manure, A., ii, 450.

—— adulteration of butter, A., ii, 823.

Pfeiffer, *Theodor*, *E.* **Franke**, *Otto* **Lemmermann**, and *H.* **Schillbach**, action of organic nitrogen, especially in farmyard manure, A., ii, 378.

Pflüger, *Eduard* [*Friedrich Wilhelm*], estimation of glycogen, A., ii, 529, 819.

—— influence of inanition on the glycogen of the animal body, A., ii, 604.

Pflüger, *Eduard*, and *Joseph* **Nerking**, estimation of glycogen, A., ii, 819.

Phelps, *Isaac K.* See *Henry Barker* **Hill**.

Philippe, *E.* See *Emil* **Fromm**.

Philippi, *E.*, formation of dolomite in the Alps, A., ii, 306.

Phillips, *Francis C.*, lubricants for glass stopcocks, A., ii, 16.

—— occurrence of hydrogen sulphide in the natural gas of Point Abino, Canada. Estimation of sulphur in gas mixtures, A., ii, 35.

Phillips, *Percy Phillip*. See *Raphael* **Meldola**.

Phinney, *J. I.* See *Charles Loring* **Jackson**.

Phisalix, *C.*, echidnase, A., ii, 782.

Piccini, *Augusto*, vanadium compounds of the type VX_2, A., ii, 297.
—— cæsium manganese alum, A., ii, 367.
—— Mendeléeff's periodic system of the elements and the new constituents of the atmosphere, A., ii, 645.
Piccini, *Augusto*, and *N.* **Brizzi**, vanadium compounds corresponding with the sesquioxide, A., ii, 297.
Piccinini, *Antonio*, action of alkylic iodides on α-methylindole in alkaline media, A., i, 74.
—— preparation and properties of pentamethyldihydroquinoline from indoles, A., i, 76.
—— constitution of hydroquinolines from indoles, A., i, 76.
—— action of ethylic diazoacetate on pyrroline, 1-methylpyrroline, and some indoles, A., i, 823.
—— constitution of the alkaloids of the pomegranate, A., i, 829, 964.
Piccinini, *Antonio*, and *G.* **Camozzi**, behaviour of dihydro-α-methylindole on reduction with methylic iodide, A., i, 74.
Piccinini, *Antonio*, and *A.* **Quartaroli**, methylgranatylamines, A., i, 965.
Pichard, *P.*, presence of manganese in minerals, plants, and animals, A., ii, 40.
—— forms and conditions under which chlorine is usually taken up by plants, A., ii, 788.
Pictet, *Amé*, and *G.* **Sussdorff**, derivatives of nicotinic acid, A., i, 164.
Pierron, *Paul*, electrolytic reduction of aliphatic nitro-derivatives, A., i, 844.
—— electrolysis of ammonium thiosulphate, A., ii, 587.
Pierron, *Paul*. See also *A.* **Daniel**.
Pieverling, *von*, distinctions between mercuric cyanide and oxycyanide, A., ii, 698.
—— mercuric oxycyanide, A., ii, 698.
Pillet, *Louis*. See *Eugène* **Charabot**.
Pinner, *Adolf*, chemistry of the atropine alkaloids, A., i, 177.
Pinnow, *Johannes*, nitrations with nitrous acid, A., i, 203.
—— preparation of pure tertiary anilines and tetralkylated aromatic diamines, A., i, 588.
—— preparation of α-dinitrodimethylaniline, A., i, 684.
Pinnow, *Johannes*, and *A.* **Matcovitch**, regularities of substitution in the formation of azo-colouring matters, A., i, 49.
Pinnow, *Johannes*, and *Paul R.* **Oesterreich**, action of ammonium sulphide on nitrated aromatic nitramines and nitrosamines, A., i, 202.
Pinnow, *Johannes*, and *Carl* **Sämann**, oxidation of alkyl haloids of benzimidazoles, A., i, 943.
Pinnow, *Johannes*, and *F.* **Wiskott**, substantive azo-dyes of the benzimidazole series, A., i, 500.
Pissarjewsky, *L.* See *Petr G.* **Melikoff**.
Pitkeathly, *William*. See *Thomas* **Purdie**.
Pitsch, *M.* See *August* **Michaelis**.
Pitt, *Arthur Ernest*. See *John Theodore* **Hewitt**.
Piutti, *Arnaldo*, a colour reaction of wood, A., ii, 340.
Plancher, *Giuseppe*, action of alkylic iodide on indoles: action of ethylic iodide on 2′-methylindole (methylketole), A., i, 450.
—— action of alkylic iodides on indoles: 1′:3′-dimethyl-3′-ethyl-2′-methylenindoline, A., i, 452.
—— action of alkylic iodides on indoles: action of methylic iodide on 2′-phenylindole, A., i, 453.
—— action of alkylic iodide on indoles: action of nitrous acid on 2′-methyl-3′:3′-diethylindolenine, A., i, 453.
—— synthesis of the bases formed by the methylation of indole, A., i, 454.
Plancher, *Giuseppe*, and *D.* **Bettinelli**, constitution of bases formed by the action of alkylic iodides on indoles, A., i, 455.
—— —— action of alkylic iodides on indoles: 2′:3′:3′-trimethylindolenine, A., i, 543.
Plathan, *A.*, isomorphous forms of calcium, strontium, barium, and lead formates, A., i, 253.
Platner, *Gustav*, neutralisation, solution, and electrolysis, A., ii, 628.
Platsch, *Max*. See *Arthur* **Rosenheim**.
Plöchl, *Josef*. See *Wilhelm von* **Miller**.

Rupe, *Hans*, cineolic acid, A., i, 340.

Rupe, *Hans*, and *Hans* **Labhardt**, unsymmetrical phenylhydrazine derivatives. V. Ethylic phenylhydrazidoformate, A., i, 356.

Rupe, *Hans*, and *J.* **Leontéeff**, condensation of nitrobenzaldehyde with gallacetophenone, A., i, 371.

Ruppel, *W. G.*, chemistry of tubercle bacilli, A., ii, 237.

Ruppel, *W. G.*, and *F.* **Ransom**, molecular relations of solutions of tetanus poison, A., ii, 443.

Russell, *Edward John*. See *Harold Baily* **Dixon**.

Russell, *William James*, hydrogen peroxide as the active agent in producing pictures on a photographic plate in the dark, A., ii, 720.

Russwurm, *Karl*. See *Hans* **Stobbe**.

Rutley, *Frank*. See *James* **Park**.

Ryan, *Hugh*, synthetical preparation of glucosides, T., 1054 ; P., **1899**, 196.

Rydlewski, *N.*, behaviour of raw sugar when stored, A., ii, 48.

S.

Sabanéeff, *Alexander* [and in part *E.* **Dengin** and *A.* **Speransky**], inorganic hydrazine salts and the preparation of hydrogen nitride, A., ii, 364.

Sabatier, *Paul*, basic silver-copper salts, A., ii, 654.

Sabatier, *Paul*, and *Jean Baptiste* **Senderens**, hydrogenation of acetylene in presence of nickel, A., i, 555.

Sabbatani, *Luigi*. See *B.* **Bergesio**.

Sablon. See **Leclerc du Sablon**.

Sacerdote, *Paul*. See *Daniel* **Berthelot**.

Sacharoff, *N.* action of enzymes and substances which kill bacteria, A., ii, 786.

Sachs, *A.*, pyridine derivatives from ethylic methylacetoacetate, A., i, 302.

Sachs, *Franz*, condensation products from flavinduline and deoxybenzoin, A., i, 239.

—— condensation of phthalimide with formaldehyde, A., i, 280.

Sachs, *Franz*. See also *Paul* **Ehrlich**.

Sämann, *Carl*. See *Johannes* **Pinnow**.

Sagrebin, *W.*, velocity constants in the formation of simple ethers, A., ii, 735.

Saillet, detection of urobilin in urine, A., ii, 459.

Saint-Hilare, *Constantin*, microchemical reactions, A., ii, 133.

Salaskin, *Sergei*, and *J.* **Zaleski**, estimation of urea, A., ii, 825.

Salcher, *Richard M.* See *Heinrich* **Goldschmidt**.

Salis, *R. von*. See *Stanislaus von* **Kostanecki**.

Salkind, *J.*, action of alkalis on chloroketones and chloralcohols, A., i, 733.

Salkowski, *Ernst* [*Leopold*], a slow proteid decomposition, A., i, 724.

—— influence of carbohydrates on the putrefaction of proteids, A., i, 724.

—— influence of hydrogen sulphide on carbonic oxide blood, A., i, 784.

—— action of superheated water on proteids, A., ii, 374.

—— formation of scatoleacetic acid during the putrefaction of proteids, A., ii, 567.

—— the first product of the gastric digestion of casein, A., ii, 567.

—— pentoses in the urine, A., ii, 679.

—— estimation of oxalic acid in urine, A., ii, 705.

—— antiseptic action of salicylaldehyde and benzoic anhydride, A., ii, 786.

Salkowski, *Heinrich* [*Hermann*]. See *Wilhelm* **Hittorf**.

Salomon, *Georg* [*Anton*]. See *Martin* **Krüger**.

Salvadori, *Roberto*, electromotive force of some concentration batteries and of a copper zinc battery with organic solvents, A., ii, 721.

Salvadori, *Roberto*. See also *Raffaele* **Nasini**.

Samson, *E.* See *Rubin* **Blank**.

Samtleben, *A.*, perbromides of some cyclic acetone bases, A., i, 542.

Samuel, *Ernst*. See *Otto* **Manasse**.

Sandsten, *Emil P.*, influence of gases and vapours on the growth of plants, A., ii, 320.

Saposchnikoff, *L.*, synthesis of parisopropylphenylhydroxypivalic acid, A., i, 896.

Sargent, *George William*, and *John Kirk* **Faust**, a new filtering medium, A., ii, 516.

Sasserath, *Edward A.* See *Arthur* **Rosenheim**.

Saunders, *A. P.*, preparation of hydrogen arsenide, A., ii, 286.

Saunders, *A. P.* See also *Wilhelm* **Meyerhoffer**.

Saurel, *Paul*, demonstration of the phase rule, A., ii, 406.

Scala, *Alberto*, rancidity of fats, A., i, 478.

Scarpitti, *Nino*, Piutti's reagent for alkaloids, A., ii, 344.

Schaar-Rosenberg, *F.* See *Armin* **Fischer**, *Ludwig* **Gattermann**.

Schäfer, *Edward Albert*, and *Swale* **Vincent**, physiological effects of intravenous injection of extracts of the pituitary body, A., ii, 441, 782.

Schaefer, *George L.*, a new test for cocaine, A., ii, 715.

Schäfer, *Joh.*, analysis of raw materials containing tartaric acid, A., ii, 70.

Schaer, *Eduard*, guaiacol test for blood, A., ii, 195.

Schall, [*Joh. Friedrich*] *Carl*, Weith's polymeric carbodiphenylimide, A., i, 280.

—— electrolytic decomposition of orthonitrobenzoic acid, A., i, 364.

—— constitution of brazilin, A., i, 539.

—— internal friction of solutions of ethereal salts in superfused thymol, A., ii, 640.

Schall, *Carl*, and *R.* **Klein**, electrolytic formation of nitrobenzene from orthonitrobenzoic acid, A., i, 425.

Schall, *Carl*, and *S.* **Kraszler**, electrolytic preparation of dithionbisulphides, A., i, 414.

Schaposchnikoff, *W. G.*, azonium chromogens. II., A., i, 431.

—— azonium chromogens. III. Ethylnaphthaphenazonium and its derivatives, A., i, 505.

Scharizer, *Rudolf*, constitution and genesis of iron sulphates, A., ii, 30.

Schatz. See *Carl Adam* **Bischoff**.

Schaum, *Karl*, hylotropic isomeric forms, A., ii, 733.

Schéele, *Carl von*, praseodymium, A., ii, 99.

—— separation of the cerite metals, A., ii, 291.

Scheffler, *W.* See *Walther* **Hempel**.

Scheij, *L. T. C.* [synthesis of normal ethereal salts of glycerol and fatty acids], A., i, 667.

Scheitz, *P.* See *Wilhelm von* **Miller**.

Schenck, *Rudolf*, crystalline liquids, A., ii, 360.

Schenck, *Rudolf*, and *Fr.* **Schneider**, crystalline liquids, A., ii, 637.

Schenke, *V.*, two simple methods for estimating carbonic anhydride in quicklime, limestone, animal charcoal, marls and soils, A., ii, 809.

Schepper, *D. W. Yssel de.* See *Augustin* **Bistrzycki**.

Schestakoff, *P. J.* See *Al. A.* **Shukoff**.

Schidrowitz, *Philip.* See *Otto* **Rosenheim**.

Schieffer, *Heinrich.* See *Friedrich* **Heusler**.

Schiff, *Hugo*, polyaspartic acids, A., i, 195.

—— methyleneasparagine, A., i, 870.

Schiff, *Hugo* [and in part *Giulio* **Marzichi** and *Vieri* **Sevieri**], polyaspartic acids, A., i, 674.

Schiff, *Robert*, isomeric forms of ethylic benzylidenebisacetoacetate, A., i, 366.

Schillbach, *H.* See *Theodor* **Pfeiffer**.

Schiller, *Nicolai N.*, significance of osmotic pressure in the thermodynamics of solutions, A., ii, 357.

Schilling, *Rudolf von*, and *Daniel* **Vorländer**, electrolytic conductivity of hydroresorcinols and δ-ketonic acids, A., i, 878.

Schilling, *Rudolf von.* See also *Daniel* **Vorländer**.

Schiloff, *Nikolai*, catalytic action in the oxidation of hydrogen iodide by bromic acid, A., ii, 147.

Schimmel and Co., ethereal oils, A., i, 63, 298, 923.

Schirmacher, *Carl.* See *Rudolph* **Fittig**.

Schlagdenhauffen, *Charles Frédéric*, and **Pagel**, estimation of carbonic oxide, A., ii, 384.

—— —— the flame of hydrogen, A., ii, 475.

Schleussner, *Karl.* See *Johannes* **Thiele**.

Schliebs, *G.*, and *H.* **Minssen**, changes in the surface and sub-soil of peat-land under the influence of cultivation and manure, A., ii, 571.

Schlinck, *Julius*, pyrrolidine, A., i, 539.

Schloesing, *Th.*, *jun.*, phosphoric acid dissolved by the water in soils, A., A., ii, 119.

—— nitrification in soils, A., ii, 175.

—— utilisation by plants of the phosphoric acid dissolved by the water of the soil, A., ii, 243.

—— action of very dilute acids on phosphates in soil, A., ii, 449.

Schlossberg, *S.* See *Carl* **Liebermann**.

Schlosser, *W.*, estimation of sugar in urine, A., ii, 185.

Schlumberger, *Ernest*, "condensed" metallic hydroxides, A., ii, 596.

Schmidt, *Ernst* [*Albert*], ketonic bases, A., i, 4.

—— ψ-carbamides, A., i, 16.

—— gelsemic acid, A., i, 72.

Schmidt, *Ernst*, and *Wilhelm* **Goehlich**, action of chloracetone on quinoline and allied bases, A., i, 232.

Schmidt, *Ernst*, *Augusta* **Jassoy**, and *P.* **Haensel**, peucedanin and oreoselone, A., i, 377.

Schmidt, *Ernst*, and *Daniel* **Knuttel**, pyridylacetonyl chloride and acetonylpiperidine, A., i, 228.

Schmidt, *Gerhard Carl.* See *Eilhard* **Wiedemann**.

Schmidt, *Julius*, isomeric benzoylacetoximes, A., i, 206.

Schneider, *Felix*, paradihydroxydiphenylamine, A., i, 499.

Schneider, *Fr.* See *Rudolf* **Schenck**.

Schneider, *Leopold*, estimation of lead in lead ores, A., ii, 250.

Schneider, *Max*, action of chlorine on homologues of phloroglucinol, A., i, 679.

Schneider, *R.*, bismuth suboxide, A., ii, 227.

Schneidewind, *W.*, assimilation of nitrates and the effect of different nitrates, A., ii, 49.

Schneidewind, *W.* See also *W.* **Krüger**.

Schoeller, *August*, potential difference between amalgams and solutions, A., ii, 346.

Schöndorff, *Bernhard*, urea in the animal organism and in normal mammalian muscle. Urea in various animal fluids. Formation of urea in the liver, A., ii, 373.

Scholl, *Hermann*, changes of silver iodide in light and the Daguerreotype process, A., ii, 621.

Scholl, *Roland.* See *Eugen* **Bamberger**.

Scholtz, *Max*, bebeerine and buxine, A., i, 92.

—— reaction of alkaloids with orthoxylylenic bromide, A., i, 648.

—— pelosine, A., i, 651.

—— conversion of unsaturated ketoximes into pyridine derivatives. II., A., i, 717.

—— retardation of chemical reactions due to stereochemical causes, A., i, 881.

—— estimation of alkaloids by means of standard iodine solution, A., ii, 390.

—— estimation of alkaloids by iodine solution, A., ii, 584.

Scholtz, *Max*, and *P.* **Friemehlt**, action of αδ-dibromopentane on primary and secondary bases, A., i, 541.

Schoorl, *N.*, iodometric estimation of sugar by means of Fehling's solution, A., ii, 617.

Schou, *C. V.* See *C. C. L. G.* **Budde**.

Schramm, *Julian.* See *Cornelius* **Radziewanowski.**

Schreber, *K.*, the theory of osmotic pressure, A., ii, 273.

Schreiber and **Waldvogel**, excretion of uric acid, A., ii, 780.

Schreiber, *C.*, and *F.* **Zetsche**, testing oil of turpentine for mineral oils, A., ii, 815.

Schreinemakers, *Frans Antoon Hubert*, equilibrium in the system, water–phenol–aniline, A., ii, 739.

Schreiner, *Oswald.* See *Louis* **Kahlenberg**, *Louis* **Kremers**.

Schröder, *K.*, potassium ferrocyanide as a source of iron in the volumetric analysis of iron, A., ii, 814.

Schröder. See also **Stahl-Schröder**.

Schröder van der Kolk, *J. L. C.*, microscopic examination of crystals, A., ii, 16.

Schroeter, *Georg*, chemistry of acetylene, A., i, 119.

Schrötter, *Hugo*, the albumoses of Witte's peptone, A., i, 316.

Schryver, *Samuel Barnett*, preparation of acid phenylic salts of dibasic acids, T., 661; P., **1899**, 121; discussion, P., 122.

—— new method for the analysis of commercial phenols, A., ii, 700.

Schükareff, *A.*, electrolytic potential, A., ii, 722.

Schüle, *Adolf*, composition of normal gastric juice, A., ii, 40.

Schüler, *Georg*, occurrence of chromic oxide in Algerian phosphates, A., ii, 335.

Schümann, *M.* See *Arthur* **Hantzsch**.

Schürenberg, *Alfred.* See *Emil* **Knoevenagel**.

Schützenberger, *Paul*, and *Octave* **Boudouard**, yttria earths contained in monazite sands, A., ii, 367.

Schulle, *B.*, employment of maize cake for feeding cows, A., ii, 609.

Schulten, *August* [*Benjamin* (*Baron*)] *de*, artificial production of lautarite, A., ii, 161.

—— artificial formation of lanarkite, A., ii, 161.

Schultze, *Herman S.*, conductivity of fused zinc chloride, A., ii, 623.

—— electrolysis of fused zinc chloride, A., ii, 657.

Schulz, *Friedrich N.*, metabolism in inanition, A., ii, 773.

Schulz, *Friedrich N.*, and *O.* **Falk**, excretion of phosphoric acid after castration, A., ii, 504.

Schulz, *Julius.* See *Hans* **Stobbe**.

Schulze, *Bernhard*, maize oilcake for milch cows, A., ii, 448.

—— digestibility of various new foods and the changes produced in them when superheated, A., ii, 509.

—— investigations of soils, A., ii, 510.

Schulze, *Ernst*, decomposition of proteid in plants, A. ii, 240.

—— influence of carbohydrates on the formation of proteid in plants, A., ii, 322.

—— distribution and functions of cane sugar in plants, A., ii, 570.

Schulze, *Ernst*, and *N.* **Rongger**, constituents of the seeds of *Pinus cembra*, A., ii, 242.

Schulze, *Ernst*, and *Ernst* **Winterstein**, constitution of ornithine and arginine, A., i, 107

Schunck, *C. A.*, a photographic investigation of the absorption spectra of chlorophyll and its derivatives in the violet and ultra-violet regions of the spectrum, A., ii, 540.

Schurig, fate of hæmoglobin in the organism, A., ii, 167.

Schuyten, *M. C.*, double sulphates of metals and antipyrine, A,, i, 306.

Schwartz, *David.* See *Arthur A.* **Noyes**.

Schwartz, *Rudolf*, weighing corrosive or fuming liquids, A., ii, 802.

—— estimation of boric anhydride in boracite, A., ii, 808.

Schwarz, *B.* See *Karl* **Elbs**.

Schwarz, *Heinrich P.* See *Martin* **Freund.**

Schwarz, *Leo*, oxidation of acetone and homologous fatty ketones [in the organism], A., ii, 40.

—— formation of urea from oxamic acid in the organism, A., ii, 165.

Schwarz, *Ph.* See *Theodor* **Zincke**.

Schweitzer, *C.*, glucoside containing caffeine and theobromine obtained from plants, A., i, 300.

Schwinge, *Wilhelm*, the number of red and colourless corpuscles, and amount of hæmoglobin at different ages in man, A., ii, 166.

Scott, *A. P.* See *H. T.* **Barnes**.

Scudder, *H.* See *S. P.* **Mulliken**.

Spielfogel, *M.* See *Paul* **Friedländer.**

Spiller, *Edward.* See *Erastus* **Hopkins.**

Spindler, *O.*, estimation of iodine in bismuth iodides, A., ii, 245.

—— volumetric estimation of bismuth, A., ii, 252.

Spiro, *Karl*, glycocine, A., ii, 777.

Spiro, *Karl*, and *Wilhelm* **Pemsel,** the basic and acid capacity of the blood and of proteids, A., ii, 230.

Spitzer, *Wilhelm*, conversion of nuclein bases into uric acid by the action of oxygen on tissue extracts, A., ii, 604.

Spivey, *W. T. Newton.* See *Thomas Barlow* **Wood.**

Sprankling, *Charles H. G.* See *William Arthur* **Bone**; *William H.* **Perkin,** *jun.*

Spring, *Walthère*, cause of the absence of colour in certain limpid natural waters, A., ii, 228.

—— the blue colour of water, A., ii, 475.

—— optically transparent liquids, A., ii, 537.

—— *rôle* of iron compounds, and of humic substances in the coloration of water: separation of these substances under the influence of sunlight, A., ii, 570.

—— diffusion of light by solutions, A., ii, 585.

Spruck, *W.* See *Alfred* **Werner.**

Spüller, *Josef*, a rapid Eggertz process, A., ii, 809.

Squibb, *Edward R.*, assay of nux vomica, A., ii, 535.

Staedel, *Wilhelm*, density and molecular weight of ozone, A., ii, 150.

Stahl-Schröder, *M.*, the *rôle* of sodium in plants, A., ii, 789.

Stapleton, *H. E.* See *Siegfried* **Ruhemann.**

Starck, *Wilhelm*, the ions of dilute sulphuric acid, A., ii, 625.

Stark, *J.*, coagulation of colloidal solutions, A., ii, 644.

Starke, *Paul*, orthazoxyanisoil, orthazoanisoil and orthohydrazoanisoil, and dianisidines, A., i, 589.

Starkweather, *G. P.*, specific volumes and thermodynamic relations of steam: Regnault's calorie, A., ii, 270.

Staüdenmaier, *Ludwig*, preparation of graphitic acid. II., A., ii, 481.

Stavenhagen, *Alfred*, tungsten, A., ii, 489.

Stead, *John Edward*, lead-antimony, tin-antimony, tin-arsenic, and tin-phosphorus alloys, A., ii, 32.

Stebbins, *James H.*, action of sulphuric acid on thymol, A., i, 604.

—— action of diazonium salts on thymolsulphonic acid, A., i, 916.

Steel, *Thomas*, red rain dust, A., ii, 674.

Steele, *D. B.* See *David Orme* **Masson.**

Steele, *L. T.* See *H. F.* **Hunt.**

Stefanowski. See *Carl Adam* **Bischoff.**

Steffeck, *H.*, and *Max* **Maercker,** efficacy of various manures, A., ii, 177.

Steger, *Alphonse*, velocity of substitution of a nitro-group in ortho- and paradinitrobenzene by alcohol, A., i, 745.

Steger, *Alphonse*. See also *Cornelis A. Lobry de* **Bruyn**.

Steiger, *George*, solubility of natural silicates in water, A., ii, 496.

Steinbrenk, *Adolf*. See *Paul* **Jacobson**.

Steindler, *Leo*, estimation of organic acids in urine, A., ii, 704.

Steiner, *Ernst*. See *Rudolf* **Hefelmann**.

Steinfels, *Wilhelm*, protection of standard solutions, A., ii, 380.

Steinitz, *Franz*. See *Franz* **Röhmann**.

Steinitzer, *Fritz*. See *Alfred* **Werner**.

Steinwehr, *H. von*. See *Friedrich Wilhelm* **Küster**.

Stelzner, *Alfred Wilhelm*, origin of the Freiberg mineral veins, A., ii, 107.

Stephan, *Karl*, conversion of linalool into terpineol (m.p. 35°), A., i, 68.

—— conversion of geraniol into terpineol (m.p. 35°), A., i, 920.

Stern, *Alfred*. See *Max* **Busch**.

Stern, *Arthur Landauer*, the nutrition of yeast. Part I., T., 201; P., **1898**, 182.

Stern, *Hermann*. See *Carl* **Paal**.

Sternberg, *Wilhelm*, taste in relation to chemical composition, A., ii, 772.

Stevens, *Henry Potter*. See *William D.* **Chattaway**.

Stewart *George Neil*, relative volume, or weight, of blood corpuscles and plasma, A., ii, 603.

—— effect of removal of the proteid on the molecular concentration and electrical conductivity of muscle extracts, A., ii, 680.

Stewart, *George N.*, and *Torald* **Sollman**, proteids of muscle, A., ii, 680.

Stieglitz, *Julius*, constitution of salts of imido-ethers and other carbimide derivatives, A., i, 359.

Stieglitz, *Julius*, and *Ralph H.* **McKee**, preparation of alkylisocarbamides from cyanamides, A., i, 594.

Stiehl, *Wilhelm*, lemon-grass oil, A., i, 66.

—— the three aldehydes of oil of lemon-grass, A., i, 711.

Stiehl, *Wilhelm*. See also *Otto* **Wallach**.

Stiepel, *Julius*. See *Richard* **Anschütz**.

Stift, *Anton*, *rôle* of pentosans in the manufacture of crude sugar, A., i, 185.

—— effect of formaldehyde on the germination of sugar beet seed, A., ii, 44.

Stift, *Anton*. See also *K.* **Komers**.

Stillmann, *John Mason*, and *R. E.* **Swain**, cryoscopic depression and latent heat of fusion of naphthylamine and diphenylamine, A., ii, 728.

Stobbe, *Hans*, synthesis of unsaturated dicarboxylic acids from ketones and diethylic succinate, A., i, 900.

Stobbe, *Hans* [and in part *Georg* **Heun**], condensation of acetophenone with diethylic succinate, A., i, 901.

Stobbe, *Hans* [and in part *Paul* **Kohlmann** and *Max* **Noetzel**], condensation of benzophenone with diethylic succinate, A., i, 900.

Stobbe, *Hans*, and *Karl* **Russwurm**, condensation of deoxybenzoin with diethylic succinate, A., i, 902.

Stobbe, *Hans*, *Karl* **Russwurm**, and *Julius* **Schulz**, condensation of dibenzyl ketone with diethylic succinate, A., i, 903.

Stockman, *Ralph*, and *E. D. W.* **Greig**, action of arsenic on bone marrow and blood, A., ii, 167.

Stöber, *F.*, burettes and separating funnels, A., ii, 552.

Stoeder, *Willem*, separation of brucine from strychnine, A., ii, 715.

Stoermer, *Richard*, formation of condensed nuclei with para-linkings, A., i, 73.

Stoermer, *Richard* [with *Kurt* **Dragendorff**, and *Paul* **Hoffmann**], action of nitrous acid on secondary aromatic amines, A., i, 42.

Stokes, *Alfred Walter*, automatic burettes, A., ii, 450.

Stokes, *Henry N.*, metaphosphimic acids. III., A., ii, 93.

Stokes, *Henry N.* See also *Henry W.* **Turner**.

Stoklasa, *Julius*, physiological meaning of phosphoric acid in the organism of the sugar beet, A., ii, 45.

—— physiological importance of arsenic in vegetation, A., ii, 323.

—— physiological importance of furfuroids in sugar beet, A., ii, 792.

Stollé, *Robert*, acetyl derivatives of hydrazine, A., i, 413.

—— salts of benzylidenehydrazinesulphonic acid, A., i, 430.

—— conversion of secondary acid hydrazides into derivatives of furodiazole, pyrrodiazole and thiodiazole, A., i, 456.

—— diphenylcarbamideoxime, A., i, 885.

Stone, *Winthrop E.*, and *H. E.* **Wright**, taka-diastase, A., i, 95.

Stoney, *Gerald*, quantity of oxygen in the atmosphere compared with that in the earth's crust, A., ii, 593.

Storch, *V.*, chemical method of ascertaining whether milk or cream has been heated to at least 80°, A., ii, 75.

Stortenbeker, *Willem*, electrolytic separation of cadmium and iron, A., ii, 126.

Stramer, *W.* See *Max* **Busch**.

Strasser, *H.* See *Victor* **Merz.**
Straub, *Walther*, influence of sodium chloride on proteid metabolism, A., ii, 372.
Stritar, *Milan Josef*, condensation product from isobutaldehyde and benzaldehyde, A., i, 889.
Strübe, *Hermann.* See *Paul* **Jacobson.**
Strzyzowski, *Casimir*, persulphate as a reagent for the detection of albumin in urine, A., ii, 459.
Stubenrauch, *Ludwig von*, chemical behaviour of iodoform and its detection in aqueous solutions, A., i, 398.
Stuber, *Emil.* See *Rudolph* **Fittig.**
Studer, *Arthur.* See *Adolf* **Liebmann.**
Studer, *B.*, detection of acetone in urine, A., ii, 190.
Stutzer, *Albert*, and *R.* **Hartleb**, decomposition of cement by bacteria, A., ii, 505.
—— —— estimation of combined carbonic acid or calcium carbonate in soils, A., ii, 521.
Suais, action of tetramethyldiamidobenzhydrol on para- and meta-sulphanilic acids, A., i, 58.
—— malachite-green-orthosulphonic acid, A., i, 439.
Sudborough, *John Joseph*, apparatus for heating sealed tubes at a constant temperature, A., ii, 552.
Sudborough, *John Joseph*, and *Lorenzo L.* **Lloyd**, etherification constants of substituted acetic acids, T., 467; P., **1899**, 2.
Sudborough, *John Joseph.* See also *Lorenzo L.* **Lloyd.**
Sulc, *Ottokar*, catalytic action of metals on solutions of oxalic acid, A., i, 569.
—— volatilisation of osmium as tetroxide in a current of air or oxygen, A., ii, 299.
Šulc, *Ottokar.* See also *Bohuslav* **Rayman.**
Sullivan, *Eugene C.*, some iodine compounds, A., ii, 398.
Sundmacher, *W.* See *Richard E.* **Meyer.**
Sundvik, *Ernst Edvard*, wax of the humble bee, A., i, 112.
—— xanthine bases from uric acid, A., i, 174.
Sussdorff, *G.* See *Amé* **Pictet.**
Sutherland, *William*, latent heat of evaporation of zinc and cadmium, A., ii, 7.
Sutherst, *W. F.* See *Friedrich* **Kehrmann.**
Suzuki, *U.*, formation of proteids and the assimilation of nitrates by phænogams in the absence of light, A., ii, 323.
Suzuki, *U.*, a proteid compound of arginine, A., ii, 793.
Swain, *R. E.* See *John Mason* **Stillmann.**
Swan, *J. N.*, some double halogen salts of mercury, A., i, 38.
Swarts, *Frédéric*, fluorine derivatives of toluene, A., i, 197.
—— fluorodibromacetic acid, A., i, 254.
—— chlorobromo-derivatives containing two atoms of carbon, A., i, 725.
—— oxidation of halogen-substituted derivatives of ethylene, A., i, 734.
Swaving, *A. J.*, injurious effect of sea water on soil, A., ii, 510.
Swinton, *Ralph S.*, quantitative separation of halogens, A., ii, 122.
Swirski, *G.*, absorption and excretion of iron in the guinea pig, A., ii, 373.
Sykes, *Walter John*, and *H. Neville* **Hussey**, diastase, A., i, 313.
Szádeczky, *Julius*, chloritoid from Hungary, A., ii, 497.
Szarvasy, *Emerique C.*, and *Carl* **Messinger**, a new compound of arsenic and tellurium, T., 597, P. **1899**, 123.
Szolayski, *B.* See *Eugen* **Bamberger.**
Sztankay, *Aba von*, composition of diuretin, A., i, 240.

T.

Tacke, *Bruno*, action of Bremen poudrette on sandy soil, A., ii, 690.
Täuber, *Ernst.* See *Ludwig* **Hantower.**
Tafel, *Julius.* See *Thomas B.* **Baillie**, *Wolfgang* **Brendler**, and *Nicola* **Moufgang.**
Taff, *Joseph A.*, albertite-like asphalt from Indian territory, U.S.A., A., ii, 756.
Tambor, *Josef.* See *T.* **Emilewicz**; *Stanislaus von* **Kostanecki.**
Tammann, *Gustav*, vapour pressure of hydrated crystals, A., ii, 8.
—— viscosity of undercooled liquids, A., ii, 272.
—— velocity of crystallisation. II. and III., A., ii, 272, 548.
—— pressure variation of the latent heat of fusion, A., ii, 399.
—— limits of the solid state. III. A., ii, 635.
Tammann, *Gustav.* See also *A.* **Bogojawlensky.**
Tanatar, *Simeon M.*, conversion of trimethylene into propylene, A., i, 422, 657.
—— hydroxylamine, A., ii, 285, 415.
—— action of hydrogen peroxide on halogen oxy-acids, A., ii, 414.
—— metaphosphoric acids, A., ii, 416.

Tanatar, *Simeon M.*, formation of azoimide, A., ii, 479.

—— percarbonates, A., ii, 482.

—— perborates, A., ii, 553.

Tanret, *Charles*, glucosamine [chitosamine] hydrochloride, A., i, 246.

—— glucosines, A., i, 246.

—— action of dilute nitric, sulphuric, hydrochloric, and phosphoric acids on nitrates in the presence of ether, A., ii, 21.

—— action of ammonium salts on *Aspergillus niger*, A., ii, 170.

—— fungi, A., ii, 171.

Tapia, *F. J.*, essential oil of caparrapi, A., i, 533.

Taraschtschansky. See *Carl Adam* **Bischoff**.

Tarugi, *N.*, calcium carbide as a reducing agent in analysis in the dry way, A., ii, 749.

Tassilly, *Eugène*, some properties of caffeine, A., i, 174.

—— estimation of caffeine in coffee, A., ii, 134.

—— basic and ammoniacal metallic halogen salts, A., ii, 747.

Taylor, *W. W.*, freezing points of aqueous solutions of sodium mellitate, A., ii, 7.

Teall, *Jethro Justinian Harris*, differentiation in igneous magmas as a result of progressive crystallisation, A., ii, 162.

Teall, *J. J. Harris*. See also *Edwin Tulley* **Newton**.

Tebb, *M. Christine*, chemistry of reticular fibre, A., ii, 312.

Teclu, *Nicolae*, magnet-radiometer, A., ii, 77.

Teodoresco, *E. C.*, and *Henri* **Coupin**, influence of anæsthetics on the formation of chlorophyll in plants, A., ii, 239.

Termier, *Pierre*, zoisite from the Alps, A., ii, 303.

—— tachylyte from the floor of the North Atlantic, A., ii, 436, 501.

Tétry, *Léon* [*Alexandre*], diphenylanthranone derivatives, A., i, 818.

Tetzlaff. See *Ludwig* **Gattermann**.

Thaddéeff, *Konstantin*. See *Andreas* **Arzruni**.

Thal, *R.*, clay from Russia, A., ii, 769.

Thayer, *E. F.*, boiling point curve for benzene and alcohol, A., ii, 140.

—— boiling point curves, A., ii, 402.

Theodor. See *Albert* **Ladenburg**.

Thiel, *A.* See *Friedrich Wilhelm* **Küster**.

Thiele, *Johannes*, silver derivatives of guanidine, A., i, 7.

Thiele, *Johannes*, preparation of amidoguanidine, A., i, 7.

—— azo- and hydrazo-compounds of tetrazole, A., i, 170.

—— condensation products of phenylisocrotonic acid: isomeric lactones of γ-ketonic acids, A., i, 216.

—— theory of unsaturated and of aromatic compounds, A., i, 554.

—— condensation of nitromethane with aromatic aldehydes, A., i, 584.

—— condensation of phenylisocrotonic acid with pyrocinchonic anhydride, A., i, 601.

—— reduction of benzil, A., i, 609.

—— dibenzylidenepropionic acid and phenacylcinnamic acid, A., i, 609.

—— isomeric diphenylcrotonolactones, A., i, 612.

—— hydrocinnamoin, A., i, 616.

—— constitution of benzene, A., i, 873.

Thiele, *Johannes*, and *James* **Bailey**, action of semicarbazide on formaldehyde, A., i, 109.

—— —— hydrazine derivatives of propionic acid, A., i, 169.

Thiele, *Johannes*, and *Willy* **Barlow**, condensation of amidoguanidine and of semicarbazide with quinones, A., i, 47.

Thiele, *Johannes*, and *Richard* **Bihan**, condensation of amidoguanidines with aromatic aldehydes and ketones, A., i, 46.

Thiele, *Johannes*, and *Frankland* **Dent**, action of chloroform on aqueous alkalis, A., i, 1.

—— —— urethanes, A., i, 14.

Thiele, *Johannes*, and *Otto* **Dimroth**, orthonitrobenzylic chloride and paranitrobenzylic chloride, A., i, 426.

Thiele, *Johannes*, and *Eduard* **Dralle**, condensation of amidoguanidine with aliphatic aldehydes and ketones, A., i, 7.

Thiele, *Johannes*, and *Otto* **Holzinger**, orthodiamidodibenzyl, A., i, 438.

Thiele, *Johannes*, and *Wilhelm* **Manchot**, derivatives of triazole, A., i, 167.

Thiele, *Johannes*, and *Ernst* **Mayr**, phenacylbromocinnamic acid, A., i, 610.

—— —— phenacylhydrocinnamic acid and the dibromide of dibenzylidenepropionic acid, A., i, 611.

Thiele, *Johannes*, and *Jakob* **Meisenheimer**, addition of hydrogen cyanide to ethylic cinnamylidenemalonate, A., i, 603.

—— —— reduction of dibenzylidenepropionic acid and of phenylcinnamenylacrylic acid, A., i, 614.

Thiele, *Johannes*, and *Wilhelm* **Osborne**, diazoamido-compounds of the fatty series, A., i, 412.

—— —— derivatives of triazan (prozan), A., i, 413.

Thiele, *Johannes*, and *Heinrich* **Rössner**, the dibromide of phenylcinnamenylacrylic acid, A., i, 612.

Thiele, *Johannes*, and *Karl* **Schleussner**, preparation of phenylcinnamenylacrylic acid and of diphenylbutadiene, A., i, 612.

Thiele, *Johannes*, and *Emil* **Uhlfelder**, nitrobiuret and amidobiuret, A., i, 118.

—— —— nitrodicyanodiamidine and amidodicyanodiamidine, A., i, 119.

Thiemich, *Martin*, fat in the liver of infants suffering from gastro-enteritis, A., ii, 234.

—— the source of fœtal fat. I. A., ii, 775.

Thierry, *Maurice de*, carbonic anhydride on Mont Blanc, A., ii, 653.

Thill, *J.*, volumetric estimation of sulphur in cast iron, steel, &c., by arsenious acid, A., ii, 693.

Thörner, *Wilhelm*, products of combustion of boiler fuel, A., ii, 746.

Thomas, *George Edward*, atomic weight of tungsten, and preparation of sodium pertungstate by means of the electric current, A., ii, 489.

Thomas, *Victor*, interchange of halogens in the aromatic series, A., i, 26.

—— chlorination by means of ferric chloride: general method for the preparation of chloriodo-derivatives, A., i, 676.

—— action of ferric chloride and bromide on aromatic hydrocarbons and their haloid substitution derivatives, A., i, 743.

—— metallic halogen salts, A., ii, 278.

—— absorption of nitric oxide by ferrous salts, A., ii, 368, 426.

—— mixed halogen lead salts, A., ii, 420, 484, 597.

Thompson, *William H.*, physiological effects of "peptone" when injected into the circulation, A., ii, 604, 677.

—— cinnamein or oil of Peru balsam, A., i, 715.

—— estimation of morphine in opium, A., ii, 194.

—— chemical constituents of cork, A., ii, 324.

Thomsen, [*Hans Peter Jürgen*] *Julius*, stability of solutions of hypochlorous acid in presence of alkalis, A., ii, 476.

Thorne, *Leonard Temple*, and *E. Haynes* **Jeffers**, estimation of moisture in invert sugar, A., ii, 51.

Thorpe, *Jocelyn Field*, and *William* **Udall**, the *cis*- and *trans*-β-phenylbutane-$\alpha\alpha_1\alpha_2$-tricarboxylic acids, T., 904; P., **1899**, 184.

Thorpe, *Jocelyn Field*. See *F. H.* **Howles**, *William Henry* **Perkin**, jun.

Thron, *Heinrich*. See *Rudolph* **Fittig**.

Thurnlackh. See **Garzarolli-Thurnlackh**.

Tichvinsky, *Mich.* See *Friedrich* **Kehrmann**.

Tickle, *Thomas*. See *John Norman* **Collie**.

Tiemann, [*Johann Carl Wilhelm*] *Ferdinand*, conversion of geraniol into methylheptenol, A., i, 184.

—— conversion of geranic acid in citronellic acid, A., i, 190.

—— history of citral, A., i, 247.

—— detection and estimation of citral, A., i, 249.

—— action of alkaline and acid reagents on citral, A., i, 250.

—— action of semicarbazide on samples of citral purified by different methods, A., i, 250.

—— occurrence of isopulegol in commercial citronellal, A., i, 622.

—— separation of citral from citronellal and methylheptenone, A., i, 622.

—— natural citral and the composition of oil of lemon-grass, A., i, 623.

—— Stiehl's three lemon-grass aldehydes, A., i, 623.

—— citronellylidenecyanacetic acid, A., i, 624.

Tiemann, *Ferdinand* [with *Paul* **Krüger**, and *Georg* **Lemme**], hydrosulphonic acid derivatives of cinnamaldehyde, A., i, 247.

Tiemann, *Ferdinand*, and *Friedrich Wilhelm* **Semmler**, carvenone, A., i, 224.

Tigges, *Hermann*. See *Paul* **Jacobson**.

Timpe, *H.*, aërometric estimation of fat in milk, A., ii, 822.

Tingle, *Alfred*. See *John Bishop* **Tingle**.

Tingle, *John* **Bishop**, and *Alfred* **Tingle**, action of ethylic oxalate on camphor. IV., A., i, 444.

Tistschenko, *Wetschiaslaw E.*, action of aluminium amalgam on alcohols, A., i, 408.

Todeschini, *Giustiniano*, distinctive reactions of tannic and gallic acids, A., ii, 341.

Tollens, *Bernhard*, carbohydrates of barley and malt, with special reference to the pentosans, A., ii, 174.

Tollens, *Bernhard*. See also *O. von* **Faber**.

Tolloczko, *Stanislaw*, structure of terpenes and allied compounds, A., i, 440.

Tommasi, *Donato,* thermal equilibrium in electrolysis, A., ii, 138.

—— thermochemical theory of the carbon cell, A., ii, 199.

—— principal of maximum work, A., ii, 412.

—— luminous phenomenon produced by ammonium salts and fused potassium nitrite, A., ii, 483.

Torrey, *Henry A.,* allocaffeine, A., i, 86.

Torrey, *Joseph, jun.* See *Henry Barker* **Hill.**

Toso, *P.,* phosphorus and arsenic in minerals of the island of Elba, A., ii, 600.

Tower, *Olin Freeman,* estimation of carbon and hydrogen in organic substances containing nitrogen, A., ii, 694.

Tower, *Olin F.* See *Francis Gano* **Benedict.**

Townsend, *C. O.,* influence of ether on germination, A., ii, 684.

Townsend, *John S.,* diffusion of ions into gases, A., ii, 729.

Trantom, *William.* See *Charles A.* **Kohn.**

Traphagen, *Frank W.,* and *W. M.* **Cobleigh,** estimation of carbohydrates, A., ii, 529.

Trasciatti, *D.,* a new amylamine, A., i, 855.

Trasciatti, *D.* See also *Clemente* **Montemartini.**

Traube, *Hermann,* composition and crystalline form of malates, A., i, 484.

Traube, *Wilhelm,* action of cyanogen on ethylic acetoacetate and acetylacetone, A., i, 192.

Traube, *Wilhelm,* and *E.* **Lehmann,** a new additive action of alkylenic oxides, A., i, 417.

Travers, *Morris W.,* origin of the gases evolved on heating mineral substances, meteorites, &c., A., ii, 769.

Travers, *Morris W.* See also *William* **Ramsay.**

Traverso, *G. P.,* minerals of Sarrabus, Sardinia, A., ii, 759.

Treadwell, *Frederick Pearson,* calcium and magnesium hydrogen carbonates, A., ii, 220.

Treubert, *F.* See *Ludwig* **Vanino.**

Trevor, *Joseph E.,* electromotive force of concentration cells, A., ii, 395.

Trey, *Heinrich,* detection of cadmium in presence of copper by adsorption, A., ii, 182.

Trillat, *Auguste,* unsymmetrical tetramethyldiamidodiphenylethane and its derivatives, A., i, 615.

Trillat, *Auguste,* detection and estimation of methylic alcohol in ethylic alcohol, A., ii, 130.

—— estimation of gelatin in gums and food materials, A., ii, 196.

—— detection of methylic alcohol in spirits: presence of this alcohol in brandy from marc, A., ii, 387.

Trillat, *Auguste.* See also *L. Alphonse* **Adrian.**

Troeger, *Julius,* and *Erich* **Ewers,** electrolysis of the sodium salts of halogen-substituted fatty acids, A., i, 12.

—— electrolysis of $\alpha\alpha\beta$-trichlorobutyric acid, A., i, 667.

Troeger, *Julius,* and *P.* **Feldmann,** *Oleum cadi,* A., i, 376.

Troeger, *Julius,* and *Victor* **Hornung,** action of sulphur monochloride and dichloride on sulphonates, thiosulphonates, and mercaptans, A., i, 905.

Troeger, *Julius,* and *Robert* **Uhde,** sulphonated butyric acids, A., i, 606.

Troeger, *Julius.* See also *Heinrich* **Beckurts,** *Robert* **Otto.**

Trowbridge, *Perry F.,* quinoline perhaloids, A., i, 636.

Truffaut, *Georges.* See *Alexandre* **Hebert.**

Tschirch, [*Wilhelm Oswald*] *Alexander,* and *A.* **Farner,** stick-lac, A., i, 446.

Tschirch, [*Wilhelm Oswald*] *Alexander,* and **Halbey,** olibanum, A., i, 69.

Tschirch, [*Wilhelm Oswald*] *Alexander,* and *A.* **Knitl,** opopanax from *Umbelliferæ,* A., i, 713.

Tschirner, *Fred.* See *Eugen* **Bamberger.**

Tschernik, *G.,* a new cerium mineral from the Caucasus, A., ii, 668.

—— argon and helium in cerium minerals from the Caucasus, A., ii, 669.

Tschitschkin, *A.* See *W.* **Miller.**

Tschugaeff, *L.,* influence of association of liquids on their optical activity, A., ii, 3.

Tschunkew. See *Carl Adam* **Bischoff.**

Tucker, *George M.* See *Homer J.* **Wheeler.**

Tucker, *M.,* and *Conrad von* **Seelhorst,** effect of the amount of water and the richness of soil on the development of the roots and above-ground growth of oats, A., ii, 508.

Tuckett, *Ivor Ll.,* pancreatic diabetes, A., ii, 676.

Tunnell, *Raymond W.,* and *Edgar F.* **Smith,** action of hydrogen chloride on sulphates, selenates, tellurates, and phosphates, A., ii, 744.

Turner, *Henry W.,* [mariposite], A., ii, 37.

Turner, *Henry W.*, *William F.* **Hillebrand**, *Henry N.* **Stokes**, and *William* **Valentine**, rock-forming biotites and amphiboles, A., ii, 498.

Turner, *Henry W.* See also *William F.* **Hillebrand.**

Tust. See *Ludwig* **Gattermann.**

Tutton, *Alfred Edwin,* thermal deformation of crystallised sulphates of potassium, rubidium, and cæsium, A., ii, 630.

Twitchell, *Ernst*, sulphuric acid as a reagent in the analysis of fatty acids, A., ii, 69.

U.

Udall, *William.* See *Jocelyn Field* **Thorpe**.

Uedinck, *August*, derivatives of β-bromopropylamine, A., i, 497.

Uhde, *Robert.* See *Julius* **Troeger**.

Uhlenhuth, *Rudolf*, hydroxylamine compounds of nickel sulphate, A., ii, 661.

Uhlfelder, *Emil.* See *Johannes* **Thiele.**

Ullfers, *Fritz.* See *Augustin* **Bistrzycki.**

Ulpiani, *C.* See *G.* **Ampola**.

Ulsch, *Karl*, action of tartaric acid and citric acid on metallic iron, A., i, 868.

—— estimation of some inorganic and organic acids by means of the volume of hydrogen evolved on treatment with a metal, A., ii, 802.

Umbgrove, *Herm.*, and *Antoine Paul Nicholas* **Franchimont**, propylnitramine and its alkylic derivatives: probable existence of a new class of neutral nitramines, A., i, 105.

Umbgrove, *Herm.* See *Antoine P. N.* **Franchimont**, *Albin* **Haller**.

Urbain, *G.*, yttrium earths in monazite sands, A., ii, 28.

—— nature of the didymium accompanying yttrium in monazite sands, A., ii, 424.

Urbain, *G.*, and *A.* **Debierne**, acetylacetonates [metallic compounds of acetylacetone], A., i, 789.

V.

Vadam, *Ph.*, volumetric estimation of boric acid, A., ii, 56.

—— oxidising enzymes from hellebore, A., ii, 683.

Vaillant, *Victor*, action of ammonia on dithioacetylacetone, A., i, 415.

—— action of aniline on dithioacetylacetone, A., i, 594.

Vaillant, *Victor*, action of sulphur chloride on the copper derivative of benzoylacetone, A., i, 599.

Valentine, *William.* See *Henry W.* **Turner.**

Vandenberghe, *Ad.*, preparation of hydrogen chloride, bromide, and iodide for laboratory purposes, A., ii, 150.

Vandevelde, *Alb. J. J.*, phenoxyacetic acid: phenylic phenoxyacetate and its bromine derivatives, A., i, 209.

Vanino, *Ludwig*, action of an alkaline solution of formaldehyde on silver haloids and thiocyanate, A., ii, 249.

—— preparation of fuming nitric acid, A., ii, 479.

—— detection of formaldehyde by means of phloroglucinol, A., ii, 703.

Vanino, *Ludwig*, and *L.* **Seemann**, estimation of gold and its separation from platinum and iridium, A., ii, 578.

Vanino, *Ludwig*, and *F.* **Treubert**, bismuth suboxide, A., ii, 428.

Varet, *Raoul*, action of ammonia on zinc and mercuric cyanides, and on haloid double salts of the latter, A., i, 98.

Vast, *A.* See *Louis* **Lapicque.**

Vater, *Heinrich*, interaction of calcium hydrogen carbonate and alkali sulphate: formation of alkali carbonates in nature, A., ii, 109.

Vaubel, *Wilhelm*, solubility of organic compounds in water, A., i, 317.

—— bromophenacetin, A., i, 700.

—— molecular weight of proteids, A., i, 839.

—— electrolytic production of chlorates, bromates, iodates, and hypochlorites, A., ii, 88.

—— molecular complexity of liquid hydrogen, A., ii, 475.

—— heat of neutralisation and electrolytic dissociation, A., ii, 727.

Vedrödi, *Victor*, estimation of copper in vegetables, A., ii, 59.

Veit, *A.* See *Arthur* **Hantzsch.**

Ven, *A. J. van der*, occurrence of hydrocyanic acid in the *Prunaceæ*, A., ii, 240.

Venable, *Francis Preston*, nature of valence, A., ii, 470.

Verley, *Albert*, modification of Friedel and Craft's method of synthesis by aid of aluminium chloride, A., i, 207.

—— extraction and synthesis of the odoriferous principle of jasmine, A., i, 376.

—— tertiary parabutyltoluene and its derivatives, A., i, 424.

Verley, *Albert,* action of acetic chloride on phenylic acetate in presence of aluminium chloride. Preparation of paracetophenylic acetate, A., i, 426.

—— application of Friedel and Craft's method of synthesis in the preparation of aromatic aldehydes and ketones under reduced pressure, A., i, 434.

—— formation of acetals of glycol, A., i, 665.

—— tuberone, the aromatic principle of the tuberose flower, A., i, 713.

—— action of acids on citrals, A., i, 768.

—— condensation of citral with cyanacetic acid, A., i, 768.

—— condensation of citral with malonic acid, A., i, 768.

Verneuil, *Auguste* [*Victor Louis*]. See *Grégoire N.* **Wyrouboff.**

Vernon, *Horace Middleton,* heat rigor in cold-blooded animals, A., ii, 567.

Verwer, *Hans,* and *Friedrich* **Groll,** the amount of carbon in electrolytically deposited iron, A., ii, 386.

Vèzes, *Maurice,* complex platinum salts: oxalates and chlorides, A., i, 572.

—— complex platinum salts: oxalates and nitrites, A., i, 671, 741.

—— complex palladium salts: palladoxalates, A., i, 672.

—— preparation of potassium platosochloride, A., ii, 492.

—— volatilisation of osmium in a current of air or oxygen, A., ii, 492.

Viard, *Georges,* decomposition of barium and calcium dihydrogen phosphates by water at 100°, A., ii, 26.

—— decomposition of monomanganous phosphate by water at 0° and at 100°, A., ii, 752.

Vieille, *Paul.* See *Marcellin* **Berthelot.**

Vierth, *M.,* detection of arachis oil in olive oil, A., ii, 583.

Vieth, *Paul,* curdling of milk after addition of soluble calcium salts, A., ii, 570.

Vignon, *Léo,* action of potash on oxynitrocellulose, A., i, 242.

—— oxycellulose osazones, A., i, 560.

—— estimation of phosphoric acid, A., ii, 54.

—— estimation of tannin, A., ii, 135.

Vignon, *Léo,* and **Barrillot,** estimation of copper and mercury in grapes, wines, lees and marcs, A., ii, 452.

Vignon, *Léo,* and **Meunier,** estimation of the amount of softening agent required for hard water, A., ii, 452.

Vignon, *Léo,* and *J.* **Perraud,** mercury in the products from vines treated with mercurial dressings, A., ii, 446.

Vigouroux, *Émile,* tungsten silicide, A., ii, 104.

—— silicon and metallic silicides, A., ii, 211.

—— action of chlorine on a mixture of silicon, silica, and alumina, A., ii, 746.

Villard, *P.,* solution of solids and liquids in gases, A., ii, 143.

—— hydrates of gases, A., ii, 151.

—— chemical effect of X-rays, A. ii, 266.

Villiers, *Antoine,* separation of oxide of manganese, magnesia, and the alkaline earths, A., ii, 523.

Villiger, *Victor.* See *Adolf von* **Baeyer.**

Vilmos, *A.* See *Alfred* **Werner.**

Vincent, *Camille,* and *Jean* **Meunier,** a new sugar accompanying sorbitol, A., i, 185.

Vincent, *Swale.* See *Benjamin* **Moore,** *Edward A.* **Schäfer.**

Vinci, *Gaetano,* physiological action of eucaine-B and analogous substances, A., ii, 316.

Visser, *L. E. O. de,* solidifying points of mixtures of stearic and palmitic acids, A., i, 255.

Vitali, *Dioscoride,* preparation of zinc valerate, A., i, 112.

—— uric acid and the murexide reaction, A., i, 117.

—— presence of organic chlorine in normal urine, A., ii, 41.

—— supposed existence of iodine in organic combination in the urine after administration of potassium iodide, A., ii, 116.

—— detection of manganese, A., ii, 251.

—— some reactions of biliary acids and their detection in urine, A., ii, 263, 342.

—— toxicological detection of acetylene, A., ii, 338.

—— detection of chlorates, bromates, and iodates in presence of each other, A., ii, 803.

Vittenet, *Henri,* oxidising action of α-chlorocamphor, A., i, 225.

—— formation of cuprous cyanide, A., i, 658.

—— symmetrical dinitrodiphenylcarbamides, A., i, 692.

—— symmetrical chloro-, bromo-, and iodo-diphenylcarbamides, A., i, 693.

—— aromatic carbimides, A., i, 756.

—— symmetrical dinitroditolylcarbamides, A., i, 810.

Vittenet, *Henri.* See also *A.* **Offret.**

Vogl, *Walther,* nitrovanillin, A., i, 697.

Vogt, *J. H. L.,* artificial cassiterite, A., ii, 562.

Volney, *C. W.*, barytocelestines, A., ii, 495.

Vongerichten, *Eduard*, non-nitrogenous decomposition products of morphine. III., IV., and V., A., i, 307, 649.

—— hydromethylmorphimethine, A., i, 551.

—— β-morphimethine, A., i, 965.

Vorländer, *Daniel*, mesityl oxide and ethylic malonate, A., i, 345.

—— alkyl, alphyl, and arryl, A., i, 553.

—— influence of carbonyl on adjacent groups, A., i, 812.

Vorländer, *Daniel*, and *A. S.* **Gärtner**, action of ethylic malonate on unsaturated ketones, A., i, 259.

Vorländer, *Daniel*, and *M.* **Kohlmann**, conversion of hydroresorcinol iuto glutaric acid, A., i, 679.

Vorländer, *Daniel*, and *Rudolf von* **Schilling**, determinations of the molecular weight of ethylic sodiomalonate and sodacetoacetate, A., i, 672.

Vorländer, *Daniel*. See also *Paul* **Herrmann**, *Rudolf von* **Schilling**.

Voswinckel, *Hugo*, triazan derivatives, A., i, 958.

Votoček, *Emil*, estimation of methylated pentoses, A., ii, 701.

Votoček, *Emil*. See also *Karl* **Andrlík**.

Vulpius, *Gustave*, discrimination of eucaine and cocaine, A., ii, 392.

W.

Wachholtz, *F.*, fate of carbonic oxide in the animal organism, A., ii, 372, 503.

Waddell, *John*, indicators, A., ii, 83.

—— benzene, acetic acid, and water, A., ii, 144.

—— reversible reactions, A., ii, 402.

—— freezing point in ternary mixtures, A., ii, 403.

—— the conversion of ammonium thiocyanate into thiocarbamide, and of thiocarbamide into thiocyanate, A., ii, 410.

Wade, *Edward Bruce Herschel*, the changes of volume due to dilution of aqueous solutions, T., 254; P., **1899**, 7.

—— new method of determining the vapour pressures of solutions, A., ii, 8.

Wagner, *E.*, hydroxylamine, A., ii, 650.

Wagner, *E.* See also *Alexander* **Ginzberg**, *M.* **Idzkowska**.

Wagner, *Georg*, and *Kazimir* **Slawinski**, constitution of pinene, A., i, 766.

Wagner, *Georg*. See *J.* **Godlewsky**, *J.* **Majewski**.

Wagner, *Julius*, reaction between potassium permanganate and hydrochloric acid under the influence of catalysors, A., ii, 275.

—— iodometry, A., ii, 326.

—— measuring the volume of liquids: preparation of normal solutions, A., ii, 379.

Wagner, *Paul*, ammonium salts and Chili saltpetre as manures, A., ii, 572.

—— how much basic slag should be applied to meadows? A., ii, 690.

Wahl, *H.*, camphopyrazolones, A., i, 778.

Walbaum, *Heinrich*, oil of neroli, A., i, 620, 621.

Wald, *F.*, what is a chemical individual? A., ii, 276.

Walden, *E. C.*, effect of inorganic solutions and solutions containing serum albumin on the frog's heart, A., ii, 781.

Walden, *Paul*, supposed identity o tannin and digallic acid, A., i, 212.

—— optical isomerism, A., ii, 393, 621.

—— influence of elements on the optical activity of the amyl radicle, A., ii, 537.

—— interconversion of optical antipodes. IV. and V., A., ii, 538.

Waldeyer, *O.* See *Conrad* **Willgerodt**.

Waldmann. See *Carl Adam* **Bischoff**.

Waldvogel. See **Schreiber**.

Walker, *A. J.* See *Karl* **Auwers**.

Walker, *Claude F.*, and *David H. N.* **Gillespie**, iodometric estimation of acids and alkalis, A., ii, 326.

Wallace, *George B.*, and *W. A.* **Mogk**, action of suprarenal extract on the mammalian heart, A., ii, 310.

Wallach, *Otto*, substituted cyanamides and thiocarbamides, A., i, 658.

Wallach, *Otto* [with *Milo C.* **Burt**], terpenes and ethereal oils. Condensation of benzaldehyde with ketones of the terpene series, A., i, 532.

Wallach, *Otto* [and *M.* **Hertz**], terpenes and ethereal oils: fenchone, A., i, 65.

Wallach, *Otto* [with *E.* **Lipczynski**, *H.* **Löhr**, and *C.* **Ohligmacher**], terpenes and ethereal oils: the carvone series, A., i, 530.

Wallach, *Otto* [*Wilhelm* **Stiehl**, *Adolf* **Sieverts**, and *R.* **Sieverts**], terpenes and ethereal oils: pinole, A., i, 709.

Walther, *J.*, action of zinc chloride on amylic alcohol, A., i, 323.

Walther, *Reinhold*, and *Th. von* **Pulawski**, benzimidazoles, A., i, 639.

Walther, *Reinhold*, and *St.* **Wlodkowski**, preparation of acyl- and nitroso-derivatives of aromatic alkylcarbamides, A., i, 590.

Wang, *Eyvin*, estimation of urinary indican, A., ii, 458.

—— results of administration of indole, A., ii, 678.

Warington, *Robert*, denitrification and farmyard manure, A., ii, 800.

Warnier, *L. A.*, estimation of pentosans, A., ii, 339.

—— coffee, A., ii, 794.

Warren, *Charles H.* See *Samuel Lewis* **Penfield**.

Warren, *Henry Nepean*, preparation of tungsten, molybdenum, chromium and manganese silicides, A., ii, 158.

Wasowicz. See **Dunin-Wasowicz**.

Wassiléeff, *A.*, hydrocarbon, $C_{10}H_{18}$, prepared from active amylic alcohol and its derivatives, A., i, 785.

Watschjanz. See *Carl Adam* **Bischoff**.

Wood, *Frank*, synthesis of ethylic alcohol, A., i, 182.
Wood, *Horatio C.* See *Léon* **Asher**.
Wood, *Thomas Barlow*, *W. T. Newton* **Spivey** and *Thomas Hill* **Easterfield**, cannabinol. Part I., T., 20; P., **1898**, 184.

Woodhead, *German Sims*, temperature of the horse, A., ii, 309.

Woodman, *A. G.*, estimation of added water in milk, A., ii, 618.

Woolcott, *G. H.* See *Charles George* **Matthews.**

Worms, *Wladimir*, action of dilute solutions of pyrophosphoric acid on the crystalline albumin of white of egg, A., i, 655.

Worobéeff, *V. von*, garnet from the urals, A., ii, 671.

Worobéeff, *W.*, preparation of zinc methyl, A., i, 871.

Worstall, *Robert A.*, sulphonation of the paraffins, A., i, 18.

—— direct nitration of paraffins: higher primary nitro-paraffins, A., i, 399.

—— action of sulphuric acid on nitroheptane, A., i, 787.

—— absorption of methane and ethane by fuming sulphuric acid, A., ii, 527.

Woulfson, *W.* See *Friedrich* **Kehrmann.**

Woy, *Rudolf*, estimation of sugar in chocolate, A., ii, 187.

Wright, *A. W.*, and *D. Albert* **Kreider**, relation between structural and magneto-optic rotation, A., ii, 265.

Wright, *H. E.* See *Winthrop E.* **Stone.**

Wróblewski, *Augustin*, properties of soluble starch and a simple method for its preparation, A., i, 324.

—— composition of Buchner's yeast extract, A., ii, 170.

—— a new proteid constituent of milk, A., ii, 232.

Wyrouboff, *Grégoire N.*, and *Auguste* **Verneuil**, extraction of thorium on a large scale, A., ii, 105.

—— —— constitution of the oxides of the rare earths, A., ii, 224, 423, 598.

—— —— quantitative separation of cerium, A., ii, 613.

Y.

Yardley, *H. B.*, ash of cardamoms, A., ii, 793.

Young, *George*, preparation and properties of naphthylcarbamides, A., i, 917.

Young, *Sydney*, action of chlorosulphonic acid on the paraffins and other hydrocarbons as a means of purifying the normal paraffins, T., 172; P., **1899**, 22.

—— the relative efficiency and usefulness of various forms of still-head for fractional distillation, with a description of some new forms possessing special advantages, T., 679; P., **1899**, 147.

Young, *Sydney*, thermal properties of isopentane, A., ii, 633.

Young, *Sydney*, and *Emily C.* **Fortey**, the vapour pressures, specific volumes, and critical constants of hexamethylene, T., 873; P., **1899**, 182.

Young, *Sydney*. See also *J.* **Rose-Innes.**

Z.

Zadik, *H.*, metabolic experiments with proteids containing, and not containing, phosphorus, A., ii, 774.

Zaharia, *Al. J.*, occurrence of perchlorate in Chili saltpetre: injurious action on cereals and sugar-beet, A., ii, 799.

Zaharia, *Al. J.* See also *Constantin I.* **Istrati.**

Zaleski, *J.* See *Marcellus* **Nencki**, *J.* **Salaskin.**

Zanetti, *Carlo Umberto*, ovimucoid, and a new glucoproteid from blood serum, A., i, 180.

Zanotti, *Venturo*, groups of carbohydrates, A., i, 851.

Zega, *Alexander*, butter analysis, A., ii, 823.

Zega, *Alexander*, and *R.* **Majstorović**, iodine number of fatty acids, A., ii, 820.

Zelinsky, *Nicolai D.*, reductions in the presence of palladium, A., i, 181.

Zelinsky, *Nicolai D.*, and *S.* **Naumoff**, 1:4-dimethylhexamethylene, A., i, 196.

Zemjatschensky, *Petr A.*, kaolinite deposits of South Russia, A., ii, 110.

Zenneck, *G.*, chemical stimulation of nerve-containing, and nerve-less (curarised), skeletal muscles, A., ii, 604.

Zetsche, *F.* See *C.* **Schreiber.**

Ziegele, *E.* See *Max* **Busch.**

Zilliacus, *A.* See *Wilhelm* **Ramsay.**

Zimmer. See *Ludwig* **Gattermann.**

Zimmerli, *Fritz.* See *Friedrich* **Kehrmann.**

Zincke, [*Ernst Carl*] *Theodor*, keto bromides and methylenequinones, A., i, 265.

—— methylenequinones of the dibenzyl and stilbene series, and the corresponding keto-chlorides, A., i, 616.

Zincke, *Theodor*, and *A.* **Ossenbeck**, isonaphthazarine, tetrahydroxynaphthalene, and tetraketohydronaphthalene, A., i, 765.

Zincke, *Theodor*, and *E.* **Petermann**, ketochlorides and orthodiketones of phenylazimidobenzene and phenyl-ψ-azimidobenzene, A., i, 135.

Zincke, *Theodor*, and *Ph.* **Schwarz**, orthodinitroso-derivatives of the benzene series, A., i, 751.

Zinkeisen, *Ed.* See *Theodor* **Curtius**.

Zinno, preparation of glyceric acid, A., i, 13.

Zoethout, *William D.*, analogies between the physiological effects of high temperatures, lack of oxygen, and certain poisons, A., ii, 235.

Zopf, *Wilhelm*, compounds from lichens, A., i, 716.

Zouboff, *B.*, determination of the heats of combustion of some organic compounds, A., ii, 589.

Zschimmer, *Eberhard*, alteration products of magnesia mica: variation of the optical characters with the composition, A., ii, 768.

Zuelzer, *G.*, lecithin and other "myelin substances" in brain and in egg yolk, A., ii, 504.

Zunino, *V.*, action of potash on epichlorhydrin, A., i, 410.

Zunz, *E.*, fractional precipitation of the products of peptic digestion by zinc sulphate, A., ii, 504.

—— the course of peptic proteolysis examined quantitatively, A., ii, 774.

INDEX OF SUBJECTS.

ABSTRACTS. 1899. Parts I & II.

(Marked A. i and A. ii respectively); and also to Transactions, 1899; (marked T.); and to Proceedings of the Session 1898—1899, Nos. 198 to 212, Nov., 1898—June, 1899 (marked P.).

INDEXERS.

J. Bruce, B.Sc.
M. O. Forster, Ph.D., B.Sc.
E. Goulding, B.Sc.
J. S. Haldane, M.A., M.D., F.R.S.
R. L. Jenks.
P. A. E. Richards.
L. J. Spencer, M.A.
J. F. Thorpe, Ph.D.

A.

Absinthin (Bourcet), A., i, 538.
Absorption, intestinal, causes of (Reid), A., ii, 775.
  intestinal, of proteids (Mendel), A., ii, 230; (Levene and Levin) A., ii, 309.
  of salts by the small intestine (Höber), A., ii, 372.
  of iodised fats (Rösel), A., ii, 775.
  of iodides by the skin (Gallard), A., ii, 503.
  of iron in the guinea-pig (Swirski), A., ii, 373.
  of liquids by muscle (Loeb), A., ii, 503.
  from the peritoneal cavity (Levene and Levin), A., ii, 309; (Mendel), A., ii, 440.
Acenaphthenepheno-*p*-diazine (*aa-naphthaquinoxaline*) and its *di*bromo-derivative (Ampola and Recchi), A., i, 918, 919.
Acenaphthenequinone, monurein, diurein, and dinitrodiurein (Ampola and Recchi), A., i, 919.
Acetal, specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  bromo-, action of, on ethylic sodiomalonate and sodiomethylmalonate (Perkin and Sprankling), T., 13; P., **1898**, 112.
Acetalazinetetrasulphonic acid (Schroeter), A., i, 119.
Acetaldehyde, occurrence of, in petroleum products (Robinson), A., i, 665.
  from the action of mercuric oxide on acetylene (Erdman and Köthner), A., i, 21.
  melting point of (Ladenburg and Krügel), A., ii, 545.
  influence of, on the hydration of calcium oxide (Rohland), A., ii, 596.
  action of ethylenediamine on (Kolda), A., i, 328.
  action of, on ethylenic glycol in presence of phosphoric acid (Verley), A., i, 665.
  action of mercuric sulphate on (Denigès), A., i, 414.
  action of fuming sulphuric acid on (Berthelot), A., i, 397.
  condensation of, with propionic acid (Kietreiber), A., i, 331.
  semicarbazone of (Thiele and Bailey), A., i, 169.
  estimation of (Rocques), A., ii, 189.
  preparation of a standard solution of (Rocques), A., ii, 531.
Acetaldehyde, *di*bromo- (Swarts), A., i, 735.
  thio- (Klinger), A., i, 859.
  Paraldehyde, action of fuming sulphuric acid on (Berthelot), A., i, 397.
Acetaldehyde-ammonia, heat developed by action of sulphuric acid on (de Forcrand), A., i, 109

Acetaldehyde-ammonia, equilibrium in dissociation of (Bancroft), A., ii, 411.
  action of sodium hypochlorite on (Delépine), A., i, 326.
Acetaldehydedisulphonic acid (Schroeter), A., i, 119.
  bromo- (Kohler), A., i, 489.
Acetaldehydephenylhydrazone, *p*-nitro- (Hyde), A., i, 689.
  α-nitro- (*phenylnitro-azoethane*) (Bamberger), A., i, 108.
Acetaldehydephenylhydrazonedisulphonic acid (Schroeter), A., i, 119.
Acetaldoxime, freezing point of (Carveth), A., ii, 81.
  stereoisomeric forms of, equilibrium of (Bancroft), A., ii, 145.
Acetaldoximedisulphonic acid (Schroeter), A., i, 119.
Acetalmalonic acid and its ethylic and silver salts (Perkin and Sprankling), T., 13; P., **1898**, 112.
Acetalmethylmalonic acid and its ethylic and silver salts (Perkin and Sprankling), T., 18.
Acetamide, preparation of (Aschan), A., i, 14.
  use of, as solvent in molecular weight determinations (Castoro), A., ii, 360.
  action of chromic acid on (Oechsner de Coninck), A., i, 243.
  action of methylic semiorthoxalate on (Anschütz and Stiepel), A., i, 573.
  action of fuming sulphuric acid on (Bagnall), T., 279.
  conversion of, into ethylamine by reduction (Guerbet), A., i, 795.
  oxidation of (Oechsner de Coninck), A., i, 509.
  mercury compound of (Kieseritzky), A., ii, 395.
  mercury compound of, estimation of (Ley and Kissel), A., ii, 485.
Acetamide, *di*chloro-, from action of ammonia on ethylic tetrachloracetonedicarboxylate (Dootson), T., 171; P., **1899**, 9.
  *tri*chloro-, *tri*bromo- and chloro*di*bromo- (Swarts), A., i, 735.
1′-Acetamido-2-acetoxy-1:4-naphthaquinone (Kehrmann and Haberkant), A., i, 62.
3-Acetamido-4-anilino-1:2- and -*β*-naphthaquinones (Kehrmann and Zimmerli), A., i, 80, 81.
3′-Acetamido-2-anilinophenyl*iso*naphthaphenazonium chloride, its anhydride and salts (Kehrmann and Aebi), A., i, 527.
2″-Acetamido-3-anilinophenyl*iso*naphthaphenazonium hydroxide and chloride (Kehrmann and Ravinson), A., i, 526.
Acetamidobenzaldehydine (Pinnow and Wiskott), A., i, 500.
o-**Acetamidobenzonitrile** (Friedländer), A., i, 350.
Acetamidocresol acetate, chloro- (Kehrmann and Tichvinsky), A., i, 129.
Acetamido-*m*-cresol acetate, bromo- (Kehrmann and Rüst), A., i, 130.
Acetamidodibenzylic disulphide, amino- (Thiele and Dimroth), A., i, 427.
3′-Acetamido-2-dimethylaminophenyl*iso*naphthaphenazonium salts (Kehrmann and Aebi), A., i, 527.
Acet-*o*-amidodimethylaniline (Pinnow), A., i, 684.
Acetamidodimethylbenzhydrol (Drawert), A., i, 643.
Acetamidodimethyl-*p*-toluidine, nitro- (Pinnow and Matcovitch), A., i, 50.
p-**Acetamidodiphenylamide**, *p*-amino-, dibenzylidene derivative and thiocarbimide (Jacobson and Kunz), A., i, 275.
  p-chloro- (Jacobson and Strübe), A., i, 273.
4-Acetamidoethenyl-1:2-naphthylenediamine, picrate, silver, and methyl derivatives (Meldola and Phillips), T., 1013; P., **1899**, 187.
p-**Acetamidoformazylbenzene** (Wedekind), A., i, 690.
p-**Acetamidohydrazobenzene**, transformation of (Jacobson and Kunz), A., i, 275.
3-Acetamido-2-hydroxy-1:4-naphthaquinone (Kehrmann and Zimmerli), A., i, 80.
2-Acetamidomesitylenonitrile (Bamberger and Weiler), A., i, 124.
3-Acetamido-4-methylamino-1:2-naphthaquinone (Kehrmann and Zimmerli), A., i, 80.
2-Acetamidomethylnaphthaphenazonium (Kehrmann and Jacob), A., i, 237.
Acetamidomethyltriazole (Thiele and Manchot), A., i, 167.
5-Acetamidonaphthaphenazine, and 6-chloro-derivative (Kehrmann and Zimmerli), A., i, 80.
4′-Acetamidonaphthaphenazine, 2-nitro- (Kehrmann and Jacob), A., i, 237.
3″-Acetamidonaphthaphenazine (Kehrmann and Mates), A., i, 81.
4′-Acetamidonaphthaphenazonium salts, 2-nitro- (Kehrmann and Jacob), A., i, 237.

3-**Acetamidonaphthaquinol** (Kehrmann and Zimmerli), A., i, 79.
3′-**Acetamido-β-naphthaquinone**, and oxime (Kehrmann and Mates), A., i, 81.
3-**Acetamido-1 : 2-naphthaquinone**, and 4-amino- and 4-chloro-derivatives (Kehrmann and Zimmerli), A., i, 79.
3-**Acetamido-β-naphthaquinonemalonic acid**, anhydride of ethylic salt (Liebermann), A., i, 373.
2-**Acetamido-1 : 4 : 2′-naphthaquinonesulphonic acid** and aniline salt (Gaess), A., i, 375.
Acetamidonitro-*o*-aminodiphenylamine (Kehrmann, Rademacher, and Feder), A., i, 236.
Acetamidophenetidine (Cohn), A., i, 944.
o- and *m*-**Acetamidophenetoil**, *p*-chloro- (Reverdin and Düring), A., i, 266, 267.
o-**Acetamidophenetoil**, *di*chloro- (Reverdin and Düring), A., i, 267.
2′-*p*-**Acetamidophenylbenzimidazole**, 2-amino- (Kym), A., i, 943.
2′-*o*-**Acetamidophenylbenzimidazole** (von Niementowski), A., i, 645.
Acetamidophenyldinaphthazonium chloride (Kehrmann and Sutherst), A., i, 527.
Acetamidophenylic ethylic carbonate (Hinsberg), A., i, 496.
  propylic ether (Hinsberg), A., i, 495.
2-**Acetamidophenylnaphthaphenazonium**, 4-amino-, and its chloride (Kehrmann, Rademacher, and Feder), A., i, 236.
o-**Acetamidophenylnaphthaphenazonium** chloride, 2-nitro-4′-amino- (Kehrmann, Rademacher, and Feder), A., i, 236.
2-**Acetamidophenyl*iso*naphthaphenazonium** salts (Kehrmann and Levy), A., i, 238.
2″-**Acetamidophenyl*iso*naphthaphenazonium** chloride and 3-amino-derivative (Kehrmann and Ravinson), A., i, 525.
Acetamidophenylrosinduline and chloride (Kehrmann and Locher), A., i, 82.
Acetamidophenyltolimidazole (von Niementowski), A., i, 645.
Acetamidoquinol and its chloro-derivative (Kehrmann and Bahatrian), A., i, 31.
Acetamidoquinone, formation of (Kehrmann and Gauhe), A., i, 28.
  chloro- and bromo- (Kehrmann and Bahatrian), A., i, 31.
Acetamido*iso*rosindone (Kehrmann and Levy), A., i, 238.
Acetamido-*p* tolyl-ψ-aziminobenzene (Willgerodt and Dauner), A., i, 825.
1- and 2-**Acetamido-3 : 1′ : 2′-trimethylbenzimidazoles** and picrates (Pinnow and Matcovitch), A., i, 50.
p-**Acetamidotriphenyltetrazolium** iodide (Wedekind), A., i, 690.
Acetamidovanillic acid (Vogl), A., i, 698.
Acetamidoxylylmethylnitrosamine (Pinnow and Oesterreich), A., i, 203.
Acetanilide, formation of (Pawlewski), A., i, 594.
  action of fuming nitric acid on; *p*-bromo-, preparation of (Kunz-Krause), A., i, 591, 592.
  action of sulphonating agents on (Armstrong), P., **1899**, 178.
  action of sulphuric acid on (Bagnall), T., 280; P., **1898**, 182.
  action of zinc chloride and hydrogen peroxide on (Bräutigam), A., i, 754.
  oxidation of (Oechsner de Coninck), A., i, 509.
  sodium compound of, action of phosgene on (Dixon), T., 384.
Acetanilide bromo- and *di*bromo-, action of sulphonating agents on (Armstrong), P., **1899**, 178.
  chloro-, *p*-chloro-, and 1 : 4-*di*chloro- (Castoro), A., i, 430.
  2 : 4-*di*chloro- and 2 : 4 : 6-*tri*chloro-, formation of (Chattaway and Orton), T., 1052; P., **1899**, 153.
  ω-*di*chloro- (Pawlewski), A., i, 594.
Acet-*o*-anisidide, *p*-nitro-, *p*-amino-, and *p*-iodo- (Meldola), P., **1898**, 226.
Acetethyl-*m*-amidophenol-saccharein (Monnet and Kœtschet), A., i, 213.
Acethydroxamic acid, isomeric benzoates of (Cameron), A., i, 206.
Acetic acid, presence of, in plants (Lieben), A., ii, 45.
  electric conductivity of solutions of, at high pressures (Bogojawlensky and Tammann), A., ii, 138.
  heat conductivity of (Aubel), A., ii, 354.
  heat developed in decomposition of potassium cyanide by (Berthelot), A., ii, 737.
  effect of pressure on melting point curve of (Tammann), A., ii, 636.
  freezing point of mixtures of water and (de Coppet), A., ii, 546.
  depression of freezing point of *o*-nitrophenol by (Ampola and Rimatori), A., ii, 353.

Acetic acid, vapour, dissociation of (Leduc), A., ii, 729.
influence of dissolved acetates on dissociation of (Bamberger), A., ii, 548.
diffusion velocity and association of (Hüfner), A., ii, 9.
surface tension of aqueous solutions of (Forch), A., ii, 641.
distribution ratio of, between benzene and water (Waddell), A., ii, 144.
action of, on liquid ammonia (Franklin and Kraus), A., ii, 202.
action of sulphuric acid on (Bagnall), T., 279.
deposition of anhydrous ferrous salts from (Thomas), A., ii, 426.
estimation of (Ulsch), A., ii, 802.
estimation of, in commercial acetates (Haberland), A., ii, 531.
estimation of formic acid in presence of (Leys), A., ii, 132.
separation of, from other fatty acids (Holzmann), A., ii, 68.
separation of propionic, butyric, and formic acids from (Haberland), A., ii, 531.
separation of, from *iso*valeric acid (Chapman), A., ii, 704.

Acetic acid, metallic salts, dissociation of, in solution (Calame), A., ii, 145.
ammonium salt, heat of dilution of (Dunnington and Hoggard), A., ii, 728.
copper salt, action of ammonia on (Vittenet), A., i, 658.
chromium salt, modifications of (Recoura), A., ii, 661, 662, 663.
ferric salt, decomposition of (Herz), A., i, 416.
mercury salts, dissociation and conductivity of (Ley and Kissel), A., A., ii, 486.
mercuric and mercurous salts, decomposition of, by action of light (Berthelot), A., ii, 2.
potassium salt, boiling point of alcoholic solutions of (Krafft), A., ii, 471.
praseodymium salt of (Scheele), A., ii, 100.
silver salt, solubility of (Arrhenius), A., ii, 360.
reaction between sodium formate and (Noyes and Cottle), A., ii, 205.
sodium salt, action of mercuric oxide and mercuric iodide on, in presence of alkali (Hofmann), A., i, 486.
solubility of benzoic acid in solutions of (Noyes and Chapin), A., ii, 274.

Acetic acid, *p*-acetophenylic salt of (Verley), A., i, 426.
β-amino*iso*propylic salt of (Uedinck), A., i, 498.
amylic salt, density, specific rotation and molecular volume of (Frankland), T., 358.
benzylic salt, preparation of, and *p*-bromo-; diphenylmethylic and benzylidenic salts (Bodroux), A., i, 678.
bornylic salt in oils of larch, fir, hemlock, spruce, and rosemary (Schimmel and Co.), A., i, 63.
*αβ-di*bromopropylic and *αγ-di*chlor*iso*propylic salts, action of potassium thiocyanate on (Engle), A., i, 3.
*di*bromoxylenolcarbinylic salt (Auwers), A., i, 343.
tert-p-butylbenzylic salt and 2 : 5-*di*nitro-derivative (Verley), A., i, 424.
*tri*chloroethylic, *tri*chloro*iso*propylic, phenyl*tri*chlorethylic, and phenyl*tri*bromethylic salts, action of zinc shavings on (Jocitsch and Faworsky), A., i, 786.
cyanobutylic salt (Henry), A., i, 567.
dibutylresorcinylic and diamylresorcinylic salts (Gurewitsch), A., i, 880.
ethylic salt, conductivity of salt solutions in (Kahlenberg and Lincoln), A., ii, 397.
melting point of (Ladenberg and Krügel), A., ii, 545.
viscosity of solutions of, in thymol (Schall), A., ii, 640.
reactions of metallic salts dissolved in (Naumann), A., ii, 423.
velocity of formation and hydrolysis of (Sudborough and Lloyd), T., 474; P., **1899**, 3.
hydrolysis of (Muller), A., ii, 359.
velocity of, hydrolysis in aqueous alcoholic solution (Kistiakowsky), A., ii, 13.
methylic salt, hydrolysis of, by diphenyliodonium hydroxide (Sullivan), A., ii, 398.
o-phenylbenzylic salt (Fanto), A., i, 367.
phenylic, and *o*-nitro-, guaiacylic and eugenylic salts (Freyss), A. i, 874.
p-toluoylcarbinylic salt (Collet), A., i, 55.
toluquinone-*m*-oxime salt (Bridge and Morgan), A., i, 130.

Acetic acid, amino-. See Glycocine.
bromo-, from action of hydrogen peroxide and of nitric acid on *di*bromodimethyl diketone (KELLER and MAAS), A., i, 11.
l-amylic salt, molecular rotation of (WALDEN), A., ii, 622.
ethylic salt, action of sodium alkyloxides on (BISCHOFF), A., i, 669.
ethylic salt, condensation of, with ethylic cyanodimethylglutarate (PERKIN and THORPE), T., 900; P., **1899**, 184.
condensation of, with ethylic α-cyano-β-phenylglutarate (THORPE and UDALL), T., 905; P., **1899**, 184.
bromothio-, barium salt, from action of barium manganate on bromhydroxyethanesulphonic acid (KOHLER), A., i, 489.
chloro-, influence of pressure on, melting point of (HULETT), A., ii, 469.
solutions, solid and liquid, of, in naphthalene (CADY), A., ii, 405.
mercury salts, dissociation and conductivity of (LEY and KISSEL), A., ii, 486.
potassium salt, action of mercuric oxide on (HOFMANN), A., i, 486.
ethylic salts, velocity of hydrolysis of, in aqueous alcoholic solution (KISTIAKOWSKY), A., ii, 13.
mono- and *di*-chloro-, sodium salts, electrolysis of (TROEGER and EWERS), A., i, 12.
mono-, *di*-, and *tri*-chloro-, electric conductivity of solutions of, at high pressures (BOGOJAWLENSKY and TAMMANN), A., ii, 138.
influence of, on dissociation of chlorine in water (JAKOWKIN), A., ii, 736.
and *mono*-, *di*- and *tri*-bromo- and iodo-derivatives, ethylic salts, velocity of formation and hydrolysis of (SUDBOROUGH and LLOYD), T., 476; P., **1899**, 3.
*di*chloro-, from action of potash on ethylic tetrachloracetonecarboxylate (DOOTSON), T., 171; P., **1899**, 9.
di- and *tri*-chloro-, and potassium salts, molecular refraction of solutions of (HALLWACHS), A., ii, 462.
cyano-, action of cuprous chloride on (RABAUT), A., i, 557.
amylic salt, action of ethylic and methylic orthoformate on, in presence of acetic anhydride (BOLLEMONT), A., i, 736.
Acetic acid, cyano-, ethylic salt, electrical dispersion of (LÖWE), A., ii, 201.
action of amylic formate on sodium derivative of (BOLLEMONT), A., i, 736.
action of ethylenic and trimethylenic bromides on sodium derivative of (CARPENTER and PERKIN), T., 921; P., **1899**, 133.
condensation of sodium derivative of, with ethylic α-brom*iso*amylacetate (LAWRENCE), P., **1899**, 163.
action of ethylic brom*iso*butyrate on sodium derivative of (BONE), P., **1899**, 5.
condensation of, with ethylic α-bromopropionate (BONE and SPRANKLING), T., 852.
action of, on ethylic cinnamate THORPE and UDALL), T., 906; P., **1899**, 184.
condensation of sodium derivative with ethylic dimethylacrylate (PERKIN and THORPE), T., 52.
condensation of sodium derivative with ethylic β-*iso*propylacrylate (HOWLES and THORPE), P., **1899**, 104.
condensation of, with quinones and with indones (LIEBERMANN), A., i, 522.
and methylic salt, action of *iso*valeric chloride on (KLOBB), A., i, 113.
fluoro*di*bromo-, formation of, salts, amide, and bromide (SWARTS), A., i, 254, 734.
Acetic acid bacteria (HOYER), A., ii, 784.
Acetic anhydride, action of, on the higher fatty acids (ALBITZKY), A., i, 862.
Acetic chloride, *tri*bromo-, *tri*chloro-, formation of (SWARTS), A., i, 254, 734.
Acetic fluoride, *tri*bromo-, fluorochlorobromo-, and fluoro*di*bromo- (SWARTS), A., i, 254.
Acetic series, chloro-derivatives, thermochemistry of (RIVALS), A., ii, 204.
Acetimidoacetylphenyltriazoline (BAMBERGER and VON GOLDBERGER), A., i, 547.
5-Acetimido-1:3-diphenylpyrazoline (SEIDEL), A., i, 138.
Acetimidodiphenyltriazoline (CUNEO), A., i, 549.
Acetimidoethylic ether, from action of alcohol on cyanoform (HANTZSCH and OSSWALD), A., i, 405.

Acetoacetic acid,
- ethylic salt, stability of, towards alkalis, relative to that of ethylic dimethylacetoacetate (Fischer), A., i, 262.
  - conductivity of salt solutions in (Kahlenberg and Lincoln), A., ii, 397.
  - compound obtained by action of, on carvone, desmotropic forms of (Rabe), A , i, 289.
  - trimethylenemercaptole of (Autenrieth and Wolff), A., i, 580.
  - action of aluminium amalgam on (Tistschenko), A., i, 408.
  - action of cyanogen on (Traube), A., i, 192.
  - action of ethylic thiocyanate on sodium derivative of (Kohler), A., i, 738.
  - action of *p*-phenetidine on (Foglino), A., i, 132.
  - condensation of, with anisamidine (Gabriel and Colman), A., i, 638.
  - condensation of, with benzidine (Heidrich), A., i, 366.
  - condensation of sodium derivative, with ethylic α-bromopropionate and α-brom*iso*butyrate (Bone and Sprankling), T., 847.
  - condensation of, with ethylic phenylpropionate (Ruhemann), T., 251; P., **1899**, 6.
  - condensation of, with ethylic *p*-nitrophenylpropiolate, and with ethylic acetylenedicarboxylate (Ruhemann and Cunnington), T., 782; P., **1899**, 169.
  - copper compound and basic copper methoxide of (Wislicenus), A., i, 192.
  - copper derivative, action of aliphatic thiocyanates on (Kohler), A., i, 737.
  - determination of the molecular weight of the sodium derivative of (Vorländer and Schilling), A., i, 672.
- cyano-, ethylic salt, from decomposition of ethylic dicyanacetoacetate (Traube), A., i, 192.
  - copper derivative (Kohler), A., i, 737.
- *di*cyano- (*α-acetyl-β-cyano-β-iminopropionic acid*), ethylic salt, and action of ethylic acetoacetate and ethylic malonate on (Traube), A., i, 192.

Acetoacetic benzidide and salts (Heidrich), A., i, 367.

Acetoacetoxybenzophenonephenylimine (Graebe and Keller), A., i, 703.

Acetoallylamide, and the action of bromine on it (Chiari), A., i, 325.

o-**Acetobenzylanisidide,** *p*-nitro- (Paal and Benker), A., i, 587.

Acetobenzylic cyanide (Beckh), A., i, 211.

Acetobenzyl-*m*- and **-*p*-nitranilides,** *p*-nitro- (Paal and Benker), A., i, 587.

Aceto-*m*-bromobenzhydrazide (Curtius and Portner), A., i, 136.

p-**Acetobromophenylhydrazide** hydrocyanide (Freer), A., i, 357.

Acetocarbamide, chloro-, action of alkylsulphinates on, and action of potassium hydrosulphide and thiocyanate on (Frerichs), A., i, 795, 796.
- thiocyano- (Frerichs), A., i, 796.

Acetocarbanilide, formation of (Dixon), T., 384.

Aceto-*p*-diacetoxydiphenylamide (Schneider), A., i, 499.

Acetodiphenylamidotriazine (Thiele and Bihan), A., i, 47.

Acetodiphenylcarbamide (Dixon), T., 395.
- formation of (Dains), A., i, 593.

Acetoethylbornylamide (Forster), T., 946.

Acetoethylnaphthaphenosaffranine (Schaposchnikoff), A., i, 506.

Acetoethyl*iso*rosinduline (Schaposchnikoff), A., i, 506.

Acetohydrazide, action of heat on (Pellizzari), A., i, 858.

Acetol. See Acetylcarbinol.

Acetomethylanilide, action of methylic iodide on (Wedekind), A., i, 352.
- *p*-nitro- (Stoermer and Hoffmann), A., i, 43.

Acetomethyl-*o*-toluidide (Gnehm and Blumer), A., i, 266.

Acetomethyl-*o*-toluidine-*p*-sulphonic acid (Gnehm and Blumer), A., i, 266.

2-Acetomethyl-*m*-xylidide (Friedländer and Brand), A., i, 351.

4-Acetomethyl-*m*-xylidide (Pinnow and Oesterreich), A., i, 203.

Aceto-α-naphthylamide, action of sulphuric acid on (Bagnall), T., 280; P., **1898**, 182.

Aceto-β-naphthylsulphonehydrazide (Curtius and Lorenzen), A., i, 149.

Acetone, from oxidation of dimethylacrylic acid, and its *p*-bromophenylhydrazine compound (Crossley and Le Sueur), T., 165; P., **1898**, 219.
- E.M.F. of, copper | zinc cell with hydrochloric or *tri*chloracetic acid in (Salvadori), A., ii, 721.

Acetone, conductivity of electrolytes in (Dutoit and Friderich), A., ii, 350.
boiling points of mixtures of, with alcohol or chloroform (Thayer), A., ii, 402.
boiling point curves of mixtures of, with methylic alcohol (Pettit), A., ii, 632.
boiling points of mixtures of, with chloroform or carbon tetrachloride (Haywood), A., ii, 632.
melting point of (Ladenburg and Krügel), A., ii, 545.
lowering of the freezing point of water by (Waddell), A., ii, 403.
composition of mixed vapours of water and (Carveth), A., ii, 467.
solubility of some metallic salts in (Rohland), A., ii, 144.
reactions of metallic salts dissolved in (Naumann), A., ii, 423.
aqueous, solutions of naphthalene in (Cady), A., ii, 82.
equilibrium between water, potassium chloride and; and between water, naphthalene and (Snell), A., ii, 407, 408.
oxidation of, by potassium permanganate (Cochenhausen), A., i, 251.
combination of, with mercuric sulphate (Denigès), A., i, 22, 256; (Oppenheimer), A., i, 475.
condensation of, with *iso*butaldehyde (Franke and Kohn), A., i, 11.
behaviour of the phenylhydrazone of, towards benzoic chloride, benzoic anhydride, benzaldehyde, and phthalic anhydride (Freer), A., i, 357.
origin of, in the living body (Cotton), A., ii, 780.
oxidation of, in the organism (Schwarz), A., ii, 40.
detection of (Malerba), A., ii, 132.
detection of, in formaldehyde (Smith), A., ii, 188.
detection of, in urine (Studer), A., ii, 190.
estimation of (Denigès), A., ii, 256.
Acetone, bromo-, action of, on trimethylamine (Brendler and Tafel), A., i, 104.
*penta*bromo- (Keller and Maas), A., i, 11; (Bergesio and Sabbatani), A., i, 733.
chloro-, action of primary, secondary, and tertiary bases on (Schmidt), A., i, 4.
condensation of, with ethylic acetonedicarboxylate in presence of ammonia (Feist and Molz), A., i, 675.
Acetone, ψ-*di*chloro- (Posner), A., i, 605.
*pent*iodo- (Peratoner and Leonardi), A., i, 421.
nitro- (Henry), A., i, 251; (Lucas), A., i, 433.
and the action of sodium ethoxide, piperidinomethylic alcohol and phenylhydrazine on it (Henry), A., i, 475.
*iso*nitro- (Hantzsch and Veit), A., i, 403; (Lucas), A., i, 433.
Acetoneaminodicyanodiamidine, hydrochloride of (Thiele and Uhlfelder), A., i, 119.
Acetonebenzil, condensation of, with benzaldehyde (Japp and Findlay), T., 1026; P., **1899**, 164.
Acetonechloroform (Cameron and Holly), A., i, 323.
reduction of, by zinc dust (Jocitsch), A., i, 748.
acetate, action of zinc shavings on (Jocitsch and Faworsky), A., i, 786.
Acetonecyanhydrin. See α-Hydroxy*iso*butyronitrile.
Acetonedicarboxylic acid, action of bromine on (Bergesio and Sabbatani), A., i, 733.
detection of (Denigès), A., ii, 454.
ethylic salt, action of chlorine and of bromine on (Dootson), T., 169; P., **1899**, 9.
condensation of, by sodium ethoxide, hydrogen chloride, ethylic chlor- or brom-acetate, or magnesium (Jerdan), T., 808; P., **1899**, 151.
condensation of, with chloracetone, in presence of ammonia (Feist and Molz), A., i, 675.
Acetonedicarboxylic acid, *tetra*chloro-, ethylic salt, and action of potash and of ammonia on it (Dootson), T., 169; P., **1899**, 9.
Acetone-ethylmercaptole, nitroso- (Posner), A., i, 605.
Acetone-oils (Buisine and Buisine), A., i, 475 (Duchemin), A., i, 859.
Acetoneoxalic acid, ethylic salt, electrical dispersion of (Löwe), A., ii, 201.
Acetonetricarboxylic acid, ethylic salt, and action of ethylic malonate on, in presence of sodium ethoxide (Willstätter), A., i, 576.
Acetonitrile, conductivity of electrolytes in (Dutoit and Friderich), A., ii, 350.
specific heat, and heat of vaporisation of (Luginin), A., ii, 354.
action of cuprous chloride on (Rabaut), A., i, 557.

- **Acetonitrile**, chloro-, from action of phosphorus pentachloride on dimethylglycollonitrile (Henry), A., i, 256.
- β-**Aceto-*p*-nitrophenyldimethylhydrazide** (Hyde), A., i, 689.
- β-**Aceto-*p*-nitrophenylhydrazide** (Hyde), A., i, 688.
- **Acetonuria** in phloridzin poisoning (Geelmuyden), A., ii, 235.
- **Acetonylacetonebisaminoguanidine** (Thiele and Dralle), A., i, 8.
- **Acetonylmethylpyridine** chloride (Schmidt), A., i, 5.
- **Acetonylpiperidine** (Schmidt and Knuttel), A., i, 229.
  - hydrochloride (Schmidt), A., i, 5.
- **Acetophenone**, conductivity of electrolytes in (Dutoit and Friderich), A., ii, 350.
  - arsenic acid compound of (Klages and Lickroth), A., i, 599.
  - action of, on stannic bromide (Garelli), A., ii, 271.
  - action of phenanthraquinone on, in presence of ammonia (Japp and Meldrum), T., 1032 ; P., **1899**, 166.
  - condensation of, with benzil (Wislicenus and Lehmann), A., i, 59.
- **Acetophenone**, bromo-, action of primary, secondary, and tertiary bases on (Schmidt), A., i, 4.
  - ω-chloro- (Collet), A., i, 55.
  - cyano-, preparation of (Seidel), A., i, 138.
  - ω-iodo- (Paal and Stern), A., i, 367.
  - α-iodo-, and α-*iso*nitro- and salts (Lucas), A., i, 433.
  - *iso*nitro-, electrolytic conductivity and dissociation constant of, (Hantzsch and Veit), A., i, 402.
- **Acetophenoneaminoguanidine** (Wedekind and Bronstein), A., i, 829.
- **Acetophenonediphenylhydrazone**, cyano- (Seidel), A., i, 139.
- **Acetophenonephenanthraquinone**. See 9-Hydroxy-9-phenacylphenanthrone.
- **Acetophenonephenylhydrazone**, cyano- (Seidel), A., i, 138.
  - *m*-nitro- (Rougy), A., i, 753.
  - *p*-nitro- (Hyde), A., i, 689.
- **Acetophenone-*o*-sulphophenylhydrazone**, *m*-nitro- (Rougy), A., i, 753.
- **Acetophenylamidobenzimidazole** (Pinnow and Wiskott), A., i, 501.
- **Acetophenylcarbamide** (Walther and Wlodkowski), A., i, 590.
  - chloro- and thiocyano- (Frerichs), A., i, 797.
- **Acetophenylfurfurylamine** (Marquis), A., i, 798.
- β-**Acetophenylhydrazide** (Leighton), A., i, 51 ; (Bamberger), A., i, 108.
- **Acetophenylhydrazidoformic acid**, ethylic salt (Rupe and Labhardt), A., i, 356.
- **Acetophenylhydrazonecarbodiphenylamine**, and *tri*bromo- (Schall), A. i, 281.
- **Acetophenylpiperidine**, hydrobromide (Schmidt), A., i, 5.
- **Acetophenylsemicarbazide** (Curtius and Burckhardt), A., i, 137.
- **Acetopropylamide**, βγ-*di*bromo-, and the action of water on it (Chiari), A., i, 325.
- **Aceto-*o*-propylanilide** (Piccinini and Camozzi), A., i, 74.
- **Aceto-β-propylidenebenzenesulphonehydrazide** (Curtius and Lorenzen), A., i, 149.
- **Acetotetrethyl-*m*-aminophenolsaccharein** (Monnet and Kœtschet), A., i, 213.
- **Aceto-*m*-toluidide**, ω-*tri*fluoro- (Swarts), A., i, 197.
- *o*- and *p*-**Acetotoluidides**, action of sulphonating agents on (Armstrong), P., **1899**, 178.
- **Aceto-*o*- and *p*-tolylcarbamides** (Walther and Wlodkowski), A., i, 590.
- **Acetotrimethyl-*m*-phenylenediamide** hydriodide (Jaubert), A., i, 684.
- **Acetoxime**, union of, with *p*-nitrodiazobenzene (Bamberger), A., i, 590.
  - chloro-, derivatives of (Matthaiopoulos), A., i, 10.
- **Acetoximephenylcarbamide**, chloro- (Matthaiopoulos), A., i, 10.
- *p*-**Acetoxy-α-benzamidocinnamic acid lactimide** (Erlenmeyer and Halsey), A., i, 760.
- **Acetoxybenzeneazo-3-hydroxy-2′-phenyl-1-methylbenzoxazole** (Heinrich), A., i, 172.
- **Acetoxybenzodiphenylfurfuran** (Japp and Meldrum), T., 1041 ; P., **1899**, 167.
- *o*-**Acetoxybenzylacetanilide** (Paal and Härtel), A., i, 749.
- **2-Acetoxybenzylideneacetophenone**, 5-bromo- and *di*bromide (von Kostanecki and Ludwig), A., i, 220.
- *o*-**Acetoxybenzyl-*m*- and -*p*-nitracetanilides** (Paal and Härtel), A., i, 749.
- *o*-**Acetoxybenzyl-*o*-nitraniline** (Paal and Härtel), A., i, 748.
- **Acetoxychalkones** (von Kostanecki and Tambor), A., i, 704.
- **Acetoxydecanaphthene** (Markownikoff and Rudewitsch), A., i, 582.
- **4-Acetoxydiacet-*o*-phenylenediamide** (Kehrmann and Gauhe), A., i, 28.

2′-Acetoxy-4′ : 6′-diethoxychalkone and bromo-*di*bromide (von Kostanecki, Tambor, and Bednarski), A., i, 892.

γ-Acetoxydiethylacetoacetic acid, ethylic salt, and *mono*bromo-derivative; also decomposition and hydrolysis (Conrad and Gast), A., i, 193.

2′-Acetoxy-4′ : 6′-dimethoxychalkone and bromo-*di*bromide (von Kostanecki, Tambor, and Emilewicz), A., i, 892.

2′-Acetoxy-3 : 4-dimethoxy-4′-ethoxychalkone (von Kostanecki and Różycki), A., i, 911.

2′-Acetoxy-4′ : 6′-dimethoxy-3 : 4-methylenedioxychalkone, *di*bromo- (von Kostanecki, Tambor, and Herstein), A., i, 893.

γ-Acetoxydimethylacetoacetic acid, methylic salt, decomposition of (Conrad and Gast), A., i, 114.

3-Acetoxy-1 : 2-dimethylbenzoxazole (Henrich), A., i, 172.

Acetoxy-αα-dimethylglutaconic acid and its anhydride and *p*-toluidide (Reformatsky), A., i, 482.

β-Acetoxy-$\alpha\alpha_1$-dimethylglutaric acid and its anhydride and monotoluidide (Reformatsky), A., i, 482.

Acetoxydiphenylene ketone (Heyl), A., i, 216.

β-Acetoxyethanesulphonic acid, α-bromo- (Kohler), A., i, 488.

Acetoxyethylenesulphonic acid (*acetylisethionic acid*), action of heat on (Kohler), A., i, 19.

2-Acetoxyflavone (von Kostanecki, Levi, and Tambor), A., i, 371.

p-Acetoxyhydrazobenzene, transformation of (Jacobson and Tigges), A., i, 274.

Acetoxyhydroxydiketonaphthadihydropyrazole (von Pechmann and Seel), A., i, 948.

Acetoxyhydroxydimethylglutaric acid, lactone of, and its aniline salt (Lawrence), T., 421.

Aceto-*m*-xylylcarbamide (Walther and Wlodkowski), A., i, 591.

4-Acetoxy-3-methoxybenzonitrile, 5-nitro- (Vogel), A., i, 698.

2′-Acetoxy-3-methoxy-4 : 4′-diethoxychalkone (von Kostanecki and Różycki), A., i, 912.

2-Acetoxy-4-methylanthraquinone (Bistrzycki and de Shepper), A., i, 151.

4′-Acetoxy-α-naphthaflavone (Keller and von Kostanecki), A., i, 524.

α-Acetoxyphenylcrotonic acid, *di*bromo- (Thiele and Mayr), A., i, 612.

β-Acetoxytetramethylglutaric acid and its anhydride and paratoluidide, and its dissociation constant (Michailenko), A., i, 482.

Acetoxytrimethylsuccinic anhydride (Komppa), A., i, 420.

m-Acetoxy-*p*-xylic acid (Perkin), T., 189.

Acetylacetone, metallic derivatives of (Urbain and Debierne), A., i, 789.
  action of cyanogen on (Traube), A., i, 192.
  condensation of, with anisamidine (Gabriel and Colman), A., i, 639.
  condensation of, with ethylic phenylpropiolate (Ruhemann,) T., 415; P., **1899**, 15; (Ruhemann and Cunnington), T., 780; P., **1899**, 169.

Acetylacetone, cyano-, from the decomposition of *di*cyanacetylacetone (Traube), A., i, 192.
  *di*cyano- (*cyaniminomethylacetylacetone*), and the action of acetylacetone, ethylic acetoacetate, and alcohol on it (Traube), A., i, 192.
  *di*thio-, compounds of, with ammonia and methylamine (Vaillant), A., i, 415.

Acetylacetonebisaminoguanidine, nitrate of (Thiele and Dralle), A., i, 8.

Acetylacetonechloral (Gigli), A., i, 12.

Acetylacetonephenylimide, *di*thio-, and its *di*hydrochloride, and condensation product with benzidine (Vaillant), A., i, 595.

Acetylalizarin (Perkin), T., 447; P., **1899**, 66.

Acetylalochrysin (Oesterle), A., i, 538.

Acetyl*iso*amylacetyl. See Methyl *iso*hexyl ketone.

Acetylamylurethane, chloro- and thiocyano- (Frerichs), A., i, 795, 796.

α-2 and **β-2-Acetylangelicalactones** (Knorr and Caspari), A., i, 194.

Acetylanhydroindoneresorcinol ether and **Acetylanhydronaphthaquinoneresorcinol** (Liebermann), A., i, 523.

p-Acetylanisoil, compound of, with phosphoric acid (Klages and Lickroth), A., i, 599.

Acetyl-2-anisylideneacetyl-1-naphthol (Keller and von Kostanecki), A., i, 524.

Acetylanisylidene-4-ethoxy-2-hydroxyacetophenone (von Kostanecki and Osius), A., i, 370.

Acetylanisylidene-2-hydroxyacetophenone (Herstein and von Kostanecki), A., i, 369.

Acetylanisylidenepaeonol (von Kostanecki and Osius), A., i, 370.

Acetyl-*o*-anisylpentahydro-1 : 3 : 5-dithiodiazine (Busch and Best), A., i, 955.

Acetylation, with the help of sulphuric acid (Skraup), A., i, 112.

Acetylbenzoin-yellow (Graebe), A., i, 220.

Acetylbenzoylfurfuranoxime(Marquis), A., i, 798.

Acetylbenzylidenepaeonol (Emilewicz and von Kostanecki), A., i, 368.

Acetylbrazilein (Herzig), A., i, 381.

***p*-Acetyl*tert.*butylbenzene** (Verley), A., i, 425.

Acetyl*iso*butylurethane, chloro- (Frerichs), A., i, 795.

γ-Acetylbutyric acid, electrical conductivity of (von Schilling and Vorländer), A., i, 879.

Acetylcalycin (Hesse), A., i, 385.

Acetylcamphoroxime (Frankforter and Mayo), A., i, 713.

Acetylcannabinol (Wood, Spivey, and Easterfield), T., 25.

Acetylcarbinol (*acetol*), formation of, by the action of bromine water on propylenic glycol (Kling), A., i, 787.

Acetylcerin (Thoms), A., ii, 324.

Acetylbischlorindonephloroglucinol (Liebermann), A., i, 523.

Acetylchlorindoneresorcinol ether(Liebermann), A., i, 523.

Acetylchlorodextrose, preparation of, and action on β-naphthol, *o*- and *p*-cresol and carvacrol (Ryan), T., 1055 ; P., **1889**, 196.

Acetylchlorogalactose, preparation of, and its action on β-naphthol (Ryan), T., 1057 ; P., **1899**, 196.

Acetylcitryltriphenylhydrazide, triacetyl derivative (Manuelli and de Righi), A., i, 885.

Acetyldehydrotetramethylhæmatoxylone (Gilbody and Perkin), P., **1899**, 28.

Acetodehydrotrimethylbrazilone (Gilboby and Perkin), P., **1889**, 28.

Acetyldesmotroposantonins, *d*- and *l*-, combination of, to form a lævorotatory compound (Andreocci), A., i, 931.

Acetyldesmotroposantonins, *r*- and *l*- (Andreocci and Bertolo), A., i, 301.

Acetyldesylthymol (Japp and Meldrum), T., 1037 ; P., **1899**, 167.

γ-Acetyldiethylacetoacetic acid (2 : 2-*diethyl*-3 : 5-*hexanedionoic acid*), ethylic salt, and copper derivative (Conrad and Gast), A., i, 194.

Acetyldiethylindolenineformoxime (Plancher), A., i, 453.

γ-Acetyl-ββ-dimethylbutyric acid, rom action of phorone on ethylic sodiomalonate, and its methylic salt and semicarbazone (Vorländer and Gärtner), A., i, 259.

γ-Acetyl-γγ-dimethylbutyric acid. See γ-Dimethylhexan-δ-onoic acid.

ε-Acetyl-δ-dimethylheptoic acid, and its oxime and semicarbazone (Leser), A., i, 743.

2-Acetyl-1 : 1-dimethyl*cyclo*hexanone-3, and its semicarbazone (Leser), A., i, 743.

Acetyldimethyl*iso*indazole (Bamberger and Weiler), A., i, 124.

Acetyldimethylphloroglucinol (Schneider), A., i, 680.

Acetyldimethyltetrazoline, from action of heat on diacetylhydrazine (Pellizzari), A., i, 859.

Acetyldinaphthaprasindone(Kehrmann and Sutherst), A., i, 528.

Acetyldiphenyl, chloro- (Collet), A., i, 56.

α-Acetyl-ββ-diphenylacrylic acid, ethylic salt, oxime and pyrazolone of (Klages and Fanto), A., i, 615.

5-Acetyl-4 : 6-diphenylpyridone (Ruhemann and Cunnington), T., 782 ; P., **1899**, 169.

Acetylene, from calcium carbide, impurities in (Chuard), A., i, 155.
  purification of (Göttig), A., i, 657.
  boiling point of (Ladenburg and Krügel), A., ii, 545.
  explosibility of, at low temperatures (Claude), A., i, 397.
  explosibility of mixtures of, with hydrogen or coal gas (Berthelot and Vieille), A., ii, 412.
  pure, velocity of explosion of (Berthelot and Le Chatelier), A., ii, 734.
  hydration of (Berthelot), A., i, 841.
  hydrogenation of, in presence of nickel, iron, cobalt, and copper (Sabatier and Senderens), A., i, 555.
  antiseptic properties of (Vitali), A., ii, 339.
  action of, on copper (Alexander), A., i, 843.
  action of, on copper, rubidium, zinc, mercury, and iron, also on solutions of various metallic salts, and on cuprous oxide (Erdman and Köthner), A., i, 21.
  action of iodine on (Keiser), A., i, 398.
  action of, on a solution of mercuric and sodium chlorides (Hofmann), A., i, 486.

Acetylene, action of, on mercuric nitrate (Köthner), A., i, 21 ; (Hofmann), A., i, 97.
action of ozone on (Otto), A., ii, 282.
action of, on sodium, potassium, lithium, and calcium ammoniums (Moissan), A., i, 241.
action of sulphuric acid on (Schroetter), A., i, 119 ; (Berthelot), A., i, 397.
silver derivatives, and their heats of formation (Berthelot and Delépine), A., i, 841.
compound of, with cuprous oxychloride (Chavastelon), A., i, 22.
*di*bromide. See Ethylene, *di*bromo-.
*tetra*bromide. See Ethane, *tetra*bromo-.
*tetra*chloride. See Ethane, *tetra*chloro-.
*di*iodide. See Ethylene *di*iodo-.
detection of, in toxicology (Vitali), A., ii, 339.
Acetylene, *mono*bromo- (Moureu), A., i, 30.
Acetylenedicarboxylic acid, substance formed by action of phenylhydrazine on (Leighton), A., i, 51.
ethylic salt, action of piperidine and diethylamine on (Ruhemann and Cunnington), T., 956 ; P., **1899**, 185.
condensation of, with ethylic benzoylacetate, and with ethylic acetoacetate (Ruhemann and Cunnington), T., 785 ; P., **1899**, 169.
Acetylenetetracarboxylic acid. See Ethanetetracarboxylic acid.
Acetyl*is*ethionic acid. See Acetoxyethylsulphonic acid.
Acetyl-*o*-ethoxy-2-benzylideneacetyl-1-naphthol (Alperin and von Kostanecki), A., i, 524.
Acetyl-4-ethoxybenzylidene-2-hydroxyacetophenone (Herstein and von Kostanecki), A., i, 370.
Acetyl-2-ethoxybenzylideneresacetophenone, ethylic ether (von Kostanecki and Salis), A., i, 524.
Acetyl-*p*-ethoxyphenylmalamic acid (Campanaro), A., i, 350.
***p*-Acetylethylbenzene** (Klages and Lickroth), A., i, 599.
Acetoethylurethane, chloro- and thiocyano- (Frerichs), A., i, 795, 796.
Acetylfabianaresen (Kunz-Krause), A., i, 449.
2-Acetylfurfuran (Bouveault), A., i, 120.
1 : 2-Acetylfurfuranoxime and its acetyl derivative (Bouveault), A., i, 120.
Acetylfurfurylideneacetonaphthol (Keller and von Kostanecki), A., i, 525.
Acetyl*iso*heptyldioxime (*acetylisoamylacetyldioxime*), **Acetyl*iso*heptylosazone**, **βα-Acetyl*iso*heptylphenylhydrazoxime** (Ponzio and de Gaspari), A., i, 253.
Acetylhexoyl. See Methyl amyl diketone.
Acetyl*iso*hexoyl. See Methyl *iso*amyl diketone.
Acetyl*iso*hexyldioxime, **β-Acetyl*iso*hexyl-phenylhydrazone** and **-osazone**, **βα-Acetyl*iso*hexylphenylhydrazoxime** (Ponzio and de Gaspari), A., i, 252.
Acetyl-*p*-hydroxybenzoic acid (Verley), A., i, 426.
5-Acetyl-2-hydroxy-4 : 6-diphenylpyridine and its silver compound (Ruhemann and Cunnington), T., 781 ; P., **1899**, 169.
Acetylidene *di*iodo-, action of, as a poison (Loew), A., ii, 169.
Acetyllactic acid, ethereal salts, densities, specific rotations, and molecular volumes of (Frankland), T., 357.
Acetylleucoethylene-blue (Cohn), A., i, 809.
Acetylmalic acid, and bromo-, ethereal salts, specific rotations, and molecular volumes of (Frankland), T., 348, 351.
Acetylmesitylene (Noyes), A., i, 286.
Acetomethylcarbamide, chloro- and thiocyano- (Frerichs), A., i, 796, 797.
Acetyl-2′-methyl-3 : 3′-diethylindolenine (Plancher), A., i, 450.
Acetylmethylethylheptenone (Barbier and Léser), A., i, 111 ; (Léser), A., i, 190.
Acetylmethylheptenone (2-*methyl*-2-*nonene*-6 : 8-*dione*), formation of (Léser), A., i, 190.
and its copper derivative, oxazole and dioxime ; also the action of ethylic monochloracetate and of ethylic iodide on its sodium derivative (Barbier and Léser), A., i, 110.
action of sulphuric acid on (Léser), A., i, 479.
Acetyl-*p*-methylhydrazobenzene (Jacobson and Lischke), A., i, 276.
Acetylmethylmorpholquinone, oxidation of (Vongerichten), A., i, 307.
Acetylmethyl*cyclo*pentenedicarboxylic acid, *di*imino-, monethylic salt (Traube), A , i, 192.
Acetylmethyl*cyclo*pentenoneoxime (Bouveault), A., i, 120.
Acetylmethylphloroglucinol, *di*chloro- (Schneider), A., i, 679.
Acetylmorphine ethylic carbonate (Merck), A., i, 649.

2-**Acetyl-1-naphthol,** condensation of, with anisaldehyde and with furfuraldehyde (Keller and von Kostanecki), A., i, 524, 525.

Acetylnataloin (Léger), A., i, 821.

Acetylnitrorosinduline (Kehrmann, Rademacher, and Feder), A., i, 235.

Acetyl*iso*nitrosophenylindole (Spica and Angelico), A., i, 938.

Acetyloreoselone (Schmidt, Jassoy, and Haensel), A., i, 378.

Acetylpalmityldioxime (Ponzio and Gaspari), A., i, 861.

Acetyl*cyclo*pentanediol (Meiser), A., i, 742.

p-**Acetylphenetoil,** compound of, with phosphoric acid (Klages and Lickroth), A., i, 599.

Acetophenyl*di*thiobiuret (Fromm and Philippe), A., i, 485.

Acetylphenylmethane, *di*nitro- (Muttelet), A., i, 435.

Acetyl-3-phenyl-1-methyl*cyclo*hexanol-5 (Knoevenagel and Goldsmith), A., i, 290.

Acetyl-4′-phenyl-3-methyl-2′-ketotetrahydroquinazoline (Hanschke), A., i, 776.

Acetylphenylnitroethanol, *o*-nitro- (Thiele), A., i, 585.

2-**Acetyl-1-phenyltriazoline,** 3-imino- and acetyl derivative (Bamberger and von Goldberger), A., i, 547.

Acetylphenylurazole (Cuneo), A., i, 9.

Acetylphloroglucinol ethylic and **diethylic ethers,** and condensation products obtained on hydrolysis (Herzig), A., i, 32.

Acetylpicrotin (Meyer and Bruger), A., i, 227.

Acetylpiperonal-2-hydroxyacetophenone (Feuerstein and von Kostanecki), A., i, 369.

Acetylpiperonalpaeonol (Emilewicz and von Kostanecki), A., i, 369.

Acetyl*cyclo*propane (*acetyltrimethylene*), preparation and oxidation of (Idzkowska and Wagner), A., i, 489.

Acetyl*cyclo*propanetricarboxylic acid and its ethylic salt (Ruhemann and Cunnington), T., 785; P., **1899,** 169.

α-**Acetylpropionic acid,** β-cyano-β-imino-. See Acetoacetic acid, *di*cyano-.

β-**Acetylpropionic acid.** See Lævulic acid.

α-**Acetylpropylic alcohol,** αβ-*di*thiocyano- (*α-acetyl-αβ-dithiocyanhydrin*) from action of potassium thiocyanate on αβ-*di*bromopropylic acetate (Engle), A., i, 3.

Acetyl*iso*propylphenylmethyl*cyclo*hexanol (Knoevenagel, Wedemeyer, and Giese), A., i, 291.

αβ-**Acetyl*iso*propylpropane-αγγ-tricarboxylic acid,** ethylic salt (Barbier and Grignard), A., i, 113.

Acetylpyridylacetonylchloride oxime (Schmidt and Knuttel), A., i, 229.

Acetylquinoneoxime, *m*-chloro-, stable and labile forms of, *p*-*di*chloro- (Kehrmann and Grab), A., i, 129.

Acetylresorcinolsaccharein (Monnet and Kœtschet), A., i, 213.

Acetylrhizocarpic acid (Hesse), A., i, 384.

Acetyl*apo*saffranine carbonate (Schaposchnikoff), A., i, 431.

Acetylsalicylaldehyde (Reychler), A., i, 56.

Acetylsalicylic acid (*aspirin*), physiological action of (Dreser), A., ii, 605.

Acetylstearyldioxime (Ponzio and Gaspari), A., i, 861.

Acetylstilbenediol (Thiele), A., i, 609.

Acetylstrophanthin (Kohn and Kulisch), A., i, 159.

Acetylsuccinic acid, ethylic salt, action of methylic iodide on the sodium derivative of (Bone and Sprankling), T., 848.
  action of *p*-phenetidine on (Foglino), A., i, 132.

Acetylsuccinic acid, *di*bromo-, ethylic salt, action of potassium carbonate and potash on (Smenoff), A., i, 792.
  conversion of, into aconitic acid (Conrad), A., i, 481.

Acetylsulphanilic acid, action of bromine on (Armstrong), P., **1889,** 177.

Acetyltartaric acid, *tri*chloro-, ethereal salts of, densities, specific rotations and molecular volumes of (Frankland), T., 363.

Acetyltetramethylpyrroline-β-carboxylamide (Pauly and Rossbach), A., i, 773.

Acetylthiophenine (Rimini), A., i, 872.

Acetylthujetin, m. p. of (Perkin), T., 829.

Acetylthymylic methylic ether (Verley), A., i, 434.

o-, *m*-, and *p*-**Acetyltoluenes** (Klages and Lickroth), A., i, 599.

Acetyltoluquinoneoxime, 4-bromo- (two forms of) and 4-chloro- (Kehrmann and Rüst), A., i, 129.

Acetyl-*p*-tolyldithiodiazolonethiol (Busch and von Baur-Breitenfeld), A., i, 951.

Acetyltrimethylene. See Acetyl*cyclo*propane.

Acetylurazole (Cuneo), A., i, 9.

Acetylurethanes, chloro-, action of alkyl sulphinates and of potassium hydrosulphide on (Frerichs), A., i, 795, 796.

Acetylvaleraldehyde (Freyss), A., i, 874.

Acetylvaleryl. See Methyl butyl diketone.

4-Acetyl-*o*-xylene, from fenchone (Marsh), T., 1058 ; P., **1899**, 196.

Acetyl-*m*-xylene, 2-bromo- (Noyes), A., i, 285.

4-Acetyl-*m*-xylene, 5-bromo- and 5-iodo- (Noyes), A., i, 285.

Acid, $C_5H_5O_2Cl$, from action of potash on chloralacetone or on *tri*chlorethylideneacetone (Salkind), A., i, 734.

$C_7H_{10}O_2$, from carvenolic acid and potash, and the dibromide (Wallach), A., i, 532.

$C_7H_{12}O_3$, from camphoquinone (Manasse and Samuel), A., i, 300.

$C_7H_{12}O_5$, from action of baryta on *iso*terebic acid (Fittig and Petkow), A., i, 336.

$C_8H_8O_6$ from acid $C_{10}H_{10}O_9$ (Gilbody and Perkin), P., **1899**, 28.

$C_8H_{12}O_5$, from camphoric acid by oxidation ; strychnine salt (Balbiano), A., i, 537.

$C_8H_{12}O_5$, from oxidation of camphoric acid, reduction of (Balbiano), A., i, 867.

$C_8H_{14}O_5$, from action of alkalis on the salts of *iso*propyl*iso*paraconic acid (Fittig and Burwell), A., i, 337.

$C_9H_{16}O_2$, from camphoric anhydride and aluminium chloride (Lees and Perkin), P., **1899**, 24.

$C_{10}H_6O_5N_2$, from *ββ*-*di*nitroso-*α*-naphthaquinone (Zincke and Ossenbeck), A., i, 766.

$C_{10}H_8O_5$ (Zincke and Ossenbeck), A., i, 766.

$C_{10}H_{10}O_6$, from oxidation of *di*methylbrazilin (Gilbody and Perkin), P., **1899**, 75.

$C_{10}H_{10}O_9$ from acid $C_{12}H_{12}O_6$ from oxidation of trimethylbrazilin (Gilbody and Perkin), P., **1899**, 28.

$C_{10}H_{12}O_8$, and ethylic salt from condensation of ethylic glutaconate (Pechmann), A., i, 870.

$C_{10}H_{16}O_4$, from dipentamethenylpinacolin (Meiser), A., i, 742.

$C_{10}H_{18}O_2$, from Bourbon essence of geranium (Flatau and Labbé), A., i, 65.

$C_{10}H_{18}O_3$, from action of sulphuric acid on acetylmethylheptenone, and its ethylic salt, and oxime (Léser), A., i, 479.

Acid, $C_{11}H_{12}O_7$, from oxidation of tetramethylhæmatoxylone (Gilbody and Perkin), P., **1899**, 29.

$C_{11}H_{18}O_4$, from reduction of the acid $C_{11}H_{18}O_5$ (Fittig and Stuber), A., i, 417.

$C_{11}H_{18}O_5$, from action of soda on bromohexyl*iso*paraconic acid, and its reduction (Fittig and Stuber), A., i, 417.

$C_{12}H_{12}O_6$, from oxidation of trimethylbrazilin (Gilbody and Perkin), P., **1899**, 28.

$C_{12}H_{12}O_7$, from lactone obtained by oxidising trimethylbrazilin (Gilbody and Perkin), P., **1899**, 28.

$C_{13}H_{22}O_4$ or $C_{12}H_{20}O_4$, from action of alkalis on 2-bromo-3-dimethyl-4-methylpentane-2 : 5-olidoic acid (Balbiano), A., i, 868.

$C_{14}H_{28}O_2$, from Indian essence of geranium (Flatau and Labbé), A., i, 65.

$C_{15}H_{20}O_2$, from camphoric anhydride and benzene, behaviour of, towards hydriodic acid (Blanc), A., i, 444.

$C_{15}H_{24}O_4$, from citral and malonic acid (Verley), A., i, 769.

$C_{15}H_{26}O_3$, from oil of caparrapi (Tapia), A., i, 533.

$C_{16}H_{10}O_4$, obtained by reducing *di*thiodiphthalylic acid, tetramethylic derivative (Gabriel and Leupold), A., i, 122.

$C_{16}H_{16}N_2O_3$, from anilinoacetonitrile and benzaldehyde (Miller, Plöchl, and Luppe), A., i, 128.

$C_{16}H_{20}O_6$, from the action of sodium on ethylic *iso*propyl*iso*paraconate (Fittig and Thron), A., i, 338.

$C_{16}H_{24}O_4$, from hydrolysis of the product of interaction of ethylic sodiomalonate and mesityl oxide ; ethylic and silver salts, *di*bromo-derivative and *di*hydrobromide ; also oxidation (Crossley), P., **1898**, 247.

$C_{17}H_{18}O_3N_2$, from anhydroformaldehyde-*p*-toluidine and benzaldehyde (Miller, Plöchl, and Sieber), A., i, 128.

$C_{17}H_{18}O_3N_2$, from benzylidenemethylamine and benzaldehyde (Miller, Plöchl, and Kollegorsky), A., i, 128.

$C_{17}H_{18}O_3N_2$, from ethylideneaniline and benzaldehyde (Miller, Plöchl, and Hamburger), A., i, 128.

$C_{18}H_{14}O_4$ and $C_{18}H_{16}O_5$, from diphenylbromobutyrolactoneacetic acid (Stobbe and Russwurm), A. i, 903.

Acid, $C_{18}C_{14}O_5$, from γ-phenyl-γ-benzylidene pyrotartaric acid (STOBBE and RUSSWURM), A., i, 903.
$C_{18}H_{34}O_3$, from quince-seed oil, and ethylic salt, and acetyl and *di*bromo-derivatives (HERMANN), A., i, 822.
$C_{20}H_{14}O_7$, obtained by condensation of oxalic acid and resorcinol, and its salts, and triacetyl, benzoyl, *di*nitro-, and *tetra*bromo-derivatives (HEWITT and PITT), T., 518 ; P., **1899**, 100.
$C_{23}H_{22}N_2O_4$, from benzaldehyde and phenyl-*p*-anisidoacetonitrile (MILLER, PLÖCHL, and SCHEITZ), A., i, 128.
$C_{25}H_{26}O_3N_2$, from cuminaldehyde and benzylideneaniline (MILLER, PLÖCHL, and GERNGROSS), A., i, 127.
from *Endocarpon miniatum* (HESSE), A., i, 382.
m. p. 42°, from quince-seed oil (HERMANN), A., i, 822.
m. p. 85°, from oxidation of yohimbine (SPIEGEL), A., i, 966.
m. p. 163°, from *Umbilicaria pustulata* (HESSE), A., i, 382.
m. p. 180°, from *Bœomyces roseus* (HESSE), A., i, 384.
nitrogenous, obtained by reducing ω-2-*di*nitromesitylene (BAMBERGER and WEILER), A., i, 124.
sulphonic, barium salt, $(C_2H_2O_{10}BrS_3)Ba_3,4H_2O$, from action of sulphuric acid on barium bromethylenesulphonate, and its decomposition (KOHLER), A., i, 489.
Acid-cellulose and lactone ; also action of nitric acid on (BUMCKE and WOLFFENSTEIN), A., i, 853.
Acidimetry, iodometric (FESSEL), A., ii, 802.
standard solutions for (PUCKNER), A., ii, 610.
Acids, electrolysis of (BOSE), A., ii, 349.
volume changes on mixing equivalent quantities of bases with, in methylic alcohol (MINOZZI), A., ii, 642.
demonstration of the relative strength of, by means of Congo red paper (BRUYN), A., i, 861.
physiological action of (LOEB), A., ii, 167 ; (ZOETHOUT), A., ii, 235.
estimation of, by iodine (WALKER and GILLESPIE), A., ii, 327.
Acids, monobasic, of the sugar group, preparation of (RUFF), A., i, 869.
Acids, dibasic, formed by the oxidation of fats, separation of (BOUVEAULT), A., i, 480.
monethylic salts, preparation of the chlorides of (BLAISE), A., i, 331.
Acids, fatty, determination of the constitution of (CROSSLEY and LE SUEUR), T., 161 ; P., **1898**, 219.
surface tension of aqueous solutions of (FORCH), A., ii, 641.
ethereal salts of, electrical absorption and dispersion of (LÖWE), A., ii, 200.
saturated, melting points of (SOLONINA), A., ii, 633.
higher, interval between melting point and boiling point of, under diminished pressure (KRAFFT), A., ii, 465.
normal, chlorides of, alternation in volatility in the series of (HENRY), A., i, 735.
detection and separation of, by means of *tetra*chloroquinol (BOUVEAULT), A., i, 790.
estimation of, in butter (HENRIQUES), A., ii, 258.
iodine number of (ZEGA and MAJSTOROVIĆ), A., ii, 820.
Acids of the **oxalic series**, relations between the melting points and molecular weights of (MASSOL), A., i, 738.
normal solubility of (LAMOUROUX), A., i, 479.
Acids, pseudo-, and tests for their existence (HANTZSCH), A., i, 399.

Phenyl-α′-phenylpyronecarboxylic acid.
Phenylphosphoric acid.
Phenylpropanetricarboxylic acid.
Phenylpropenylmalonic acid.
Phenylpropiolic acid.
Phenylpropiolohydroxamic acid.
α-Phenylpropionic acid.
Phenyl*iso*propoxyacetic acid.
Phenylpropylenetricarboxylic acid.
Phenyl*iso*propylethylenelactic acid.

Acids. See :—
Phenylpropylidenemalonic acid.
Phenylpropyloxyacetic acid.
Phenylpyrazolonecarboxylic acid.
γ-Phenyl-α-pyrone-α′β′-dicarboxylic acid.
Phenylquinolinecarboxylic acid.
o-Phenylsalicylic acid.
Phenylsarcosine.
Phenylsemicarbazideacetoacetic acid.
Phenylsemicarbazidecarboxylic acid.
Phenylstibic acid.
Phenylsulphone-*n*- and -*iso*-butyric acids.
Phenylsulphonesodioacetic acid.
Phenyltartronic acid.
1-Phenyl-*ac*-tetrahydronaphthalene-3-carboxylic acid.
Phenylthiocarbazinic acid.
Phenylthiohydantoic acid.
α-Phenyl*di*thio-C-methylketuretcarboxylic acid.
Phenyltolyltoluic acid.
Phenyltrimethacetobutyric acid.
Phenylxylylketoximecarboxylic acid.
Phloroglucinoltricarboxylic acid.
Phoronediacetic acid.
Phthalamic acid.
Phthalamidobenzoic acid.
Phthalanilic acid.
Phthalic acids.
Phthalimidobutylmalonic acid.
Phthalophenylamic acid.
Phthalyloxybenzoic acids.
Phthalylphenyl*iso*crotonic acid.
Phthalylsalicylic acid.
Picramic acid.
Picrotoxic acid.
Pimelic acid.
Piperic acid.
Piperidinoacetic acid.
Piperidylacetic acid.
α-Piperidylbutyric acid.
γ-Piperidyldimethylacetoacetic acid.
Piperidylmaleic acid.
α-Piperidylopropionic acid.
α-Piperidyl*iso*valeric acid.
Piperonylidenediacetoacetic acid.
Piperonylidenemalonic acid.
Piperonylmethyl*cyclo*hexenonedicarboxylic acid.
Plumieridic acid.
Polystichic acid.
Prehnitolcarboxylic acid.
cyclo-Propanecarboxylic acid.
cyclo-Propanedicarboxylic acid.
Propanedicarboxylic acid.
Propanepentacarboxylic acid.
Propanetetracarboxylic acid.
Propanetricarboxylic acids.
Propionic acid.
Propionylformic acid.

Acids. See :—
Propionylhydroxypropionic acid.
Propionylmalic acid.
o-Propiophenonecarboxylic acid.
n- and *iso*-Propylacetoacetic acids.
β-*iso*-Propylacetobutyric acid.
Propylacrylic acids (*hexenoic acids*).
Propylbenzenesulphonic acids.
Propylbenzoic acid.
β-*iso*-Propylbutyric acid (*heptoic acid*).
Propylcacodylic acid (*dipropylarsinic acid*).
Propylcitraconic acids.
Propylenedicarboxylic acid.
iso-Propylenemalonic acid.
Propylenetetracarboxylic acid.
Propylenetricarboxylic acid.
iso-Propylglutaric acids.
Propylglyceric acids.
Propylidenedicarboxylic acid.
Propylidenetricarboxylic acid.
Propylitaconic acids.
Propylmalonic acid.
Propylmesaconic acids.
Propylnitrolic acid.
Propylparaconic acids.
Propylphenylmethyl*cyclo*hexenonedicarboxylic acid.
iso-Propylphenylpivalic acid.
n- and *iso*-Propylphosphinic acids.
n- and *iso*-Propylphosphinous acids.
n- and *iso*-Propylsuccinic acids.
Protocatechuic acid.
Protocetraric acid.
Pulegone, hydrosulphonic acids of.
Pulveraric acid.
Pyrazoledicarboxylic acid.
Pyridazine-3-carboxylic acid.
Pyrimidinecarboxylic acid.
Pyrocinchonic acid.
Pyromeconic acid.
Pyromucic acid.
Pyromucylacetic acid.
Pyrotartaric acid.
Pyruvic acid.
Quinic acid.
Quinoldicarboxylic acid.
Quinolinecarboxylic acid.
Quinonedicarboxylic acid.
Racemic acid.
Rhizocarpic acid.
Rhizocarpinic acid.
Rhizonic acid.
Rhizoninic acid.
Ricinoleic acid.
Roccellic acid.
Rosanilinesulphonic acid.
Saccharic acid.
iso-Saccharinic acid.
Salazinic acid.
Salicylic acid.
Salicyl-O-phosphinic acid.

Acids. See :—
Salol-O-phosphinic acid.
Santalylphthalic acid.
Santonic acid.
Santonous acids.
Scatoleacetic acid.
Sebacic acid.
Semiorthoxalic acid.
Semiphenylhydrazoneoxalic acid.
Semi-*p*-tolylimino-oxalic acid.
Sodiophenylacetoacetic acid.
Stearic acid.
Stereocaulic acid.
Strychnic acid.
Suberic acid.
Succinamic acid.
Succinanilic acid.
Succinic acids.
Succinobenzylamic acid.
Sulphacetic acid.
o-Sulphamidobenzoic acid.
Sulphanilic acid.
Sulphobenzoic acid.
Sulphocamphylic acid.
Sulphocarbanilic acid.
Sulphomethyltriazancarboxylic acid.
Sulphonalphthalamic acid.
Sulphophenylaminopyrazolonecarboxylic acid.
Tannic acid.
Tartaric acid.
Tartrazinogenic acid.
Taurocholic acid.
Tartaric acid.
Teraconic acid.
Terebic acids.
iso-Terebilenic acid.
Terephthalic acid.
Terpenylic acid.
Tetracetylmucic acid.
Tetraspartic acid.
Tetrazodiphenyldicarboxylic acid.
Tetrahydrodicampherylic acid.
Tetrahydro*iso*lauronic acid.
Δ^2-Tetrahydro-*o*-toluic acid.
Tetrahydrouvitic acid.
Tetrahydro-xylic acid.
Tetramethyl*di*aminodiphenylmethanedimethylaminohydroxyphenoxazonecarboxylic acid.
Tetramethylenecarboxylic acid (cyclo*butanecarboxylic acid*).
Tetramethylenedicarboxylic acid (cyclo*butanedicarboxylic acid*).
Tetramethylpyrroline-*β*-carboxylic acid.
Tetric acid.
Thamnolic acid.
Thiazyl*iso*butyric acid.
Thioallophanic acid.
Thiocarbonylphenylcarbazinic acid.
Thiodiazoledisulphonic acid.

Acids. See :—
  Thioglycollic acid.
  Thiophanic acid.
  Thiophaninic acid.
  Thymolglycuronic acid.
  Thymolsulphonic acids.
  Tiglic acid.
  Toluenesulphonacetic acid.
  Toluenesulphoneacetoacetic acid.
  Toluenesulphonomalonic acid.
  Toluic acid.
  p-Toluidido-oxalic acid.
  Toluidinesulphonic acids.
  Toluidinoacetic acid.
  Toluylmalic acid.
  Toluyltartaric acid.
  Tolylacetic acid.
  Tolylaminoacetic acid.
  Tolylcarbamic acid.
  Tolyldithiocarbazinic acid.
  p-Tolyldithiodiazolonesulphonic acid.
  Tolylglyoxylic acid.
  Tolylhydroxynaphthazinedisulphonic acid.
  Tolylimidotolycarbamic acid.
  Tolylnaphthindolinonequinonecarboxylic toluidide.
  p-Tolyloxybutyric acid.
  Tolylphosphinic acid.
  Tolylphosphinous acid.
  Tolylsuccinic acid.
  Tolylsulphonebutyric acids.
  Triacetyl*di*amidonaphtholsulphonic acid.
  Triazolecarboxylic acid.
  2 : 4 : 6-Triethylbenzoic acid.
  Triglycolamic acid.
  Trihydroxyglutaric acid.
  Trimellitic acid.
  Trimercuracetic acid.
  Trimesic acid.
  Trimethoxybenzoylbenzoic acid.
  Trimethoxydiphenylmethanecarboxylic acid.
  Trimethoxy-α-methylcinnamic acid.
  Trimethylacetic acid.
  Trimethylacetylsuccinic acid.
  Trimethylenecarboxylic acid (*cyclopropanecarboxylic acid*).
  Trimethylenedicarboxylic acid (*cyclopropanedicarboxylic acid*).
  Trimethylgallic acid.
  αββ-Trimethylglutaranilic acid.
  αββ-Trimethylglutaric acid.
  Trimethylphosphortolubetainecarboxylic acid.
  Trimethylpyruvic acid.
  Trimethylsuccinic acid.
  Trimethyluric acid.
  Triphenylacetic acid.
  Triphenylglutaric acid.
  Triphenylpyrazolecarboxylic acid.

Acids. See :—
  Triphenyltrimesic acid.
  Tropæolic acid.
  Tyrosine.
  Umbilicaric acid.
  Undecoic acid.
  Undecylcarbamic acid.
  Uric acid.
  Usnic acid.
  Uvitic acid.
  Valeric acids.
  iso-Valerylcyanoacetic acid.
  iso-Valerylmalic acid.
  Vanillic acid.
  Vanilloylcarboxylic acid.
  Veratric acid.
  Vinylacetic acid.
  Vinylglycollic acid.
  Violuric acid (*isonitrosobarbituric acid*).
  Vulpic acid.
  Xylenesulphinic acid.
  p-Xylic acid.
  Xylidinesulphonic acids.
  Xylylcarboxylic acid.
  Xylylglyoxylic acids.
  Xylylic acid.
  Yohimbic acid.
  Zeoric acid.

Aconic acid, reduction of, and its constitution (Reitter), A., i, 115.

Aconine, physiological action of (Cash and Dunstan), A., ii, 42.

Aconitic acid, formation of, from ethylic *di*bromacetylsuccinate (Conrad), A., i, 481; (Semenoff), A., i, 792.
  and sodium salt, action of phosphorus trisulphide on (Hanna and Smith), A., i, 577.
  triethylic salt, formation of (Hanna and Smith), A., i, 577.
    tautomeric forms of (Guthzeit), A., i, 115.

iso-**Aconitic acid** (ω_2-Δ-ω_1-*propenetricarboxylic acid*), triethylic salt, and its sodium, ethyl, and benzyl derivatives; also its hydrolysis and reduction, and the action of aniline, paratoluidine, ethylamine, and ammonia on it (Guthzeit and Laska), A., i, 260.

Aconitine, *hepta*- and *tri*-iodides (Prescott), A., i, 90.
  physiological action of (Cash and Dunstan), A., ii, 42.

Acraldehyde (*acrolein*), preparation of (Wohl and Neuberg), A., i, 565.
  *di*bromide. See Propaldehyde, *di*bromo-.

Acrylacetic acid. See Tetric acid.

Address, congratulatory, to Prof. Sir G. C. Stokes, P., **1899**, 145.

Address, Presidential (Dewar), T., 1167; P., **1899**, 77.

Adipic Acid, formation of, from Russian petroleum (Aschan), A., i, 672.

formation of, from hydrolysis of ethylic αδ-*di*cyanovalerate (Carpenter and Perkin), T., 929.

formation of, in the oxidation of fats, and its separation (Bouveault), A., i, 480.

Adonitol, condensation of benzaldehyde with (de Bruyn and Alberda van Ekenstein), A., i, 662.

Adsorption, employment of, in analytical separations (Goppelsroeder), A., ii, 572.

Ægirite from Roumania (Mrazec), A., ii, 768.

Ælosomin, properties of (Griffiths), A., ii, 115.

"**Æschynite**" from Hitterö, Norway (Prior), A., ii, 433.

Æsculetin, synthesis of (Gattermann and Köbner), A., i, 364.

Æsculin, action of moulds on (Puriewitsch), A., ii, 683.

Affinity, chemical:—

Association of liquids, and optical activity (Tschugáeff), A., ii, 3.

of solvents, and osmotic pressure (Reychler), A., ii, 357.

of formic, acetic, or butyric acids in aqueous solution (Hüfner), A., ii, 9.

Association, molecular, and rotatory power of optically active liquids (Pope and Peachey), T., 1112; P., **1899**, 201.

of water (Vaubel), A., ii, 727.

Affinity constants of acids in methyl alcoholic, or aqueous solution (Minozzi), A., ii, 643.

of diazonium hydroxide (Davidson and Hantzsch), A., ii, 7.

of methylic hydroxymethylenecyanacetate (Bollemont), A., i, 791.

of *l*-phenylmethoxyacetic acid (McKenzie), T., 767.

of *l*- and *r*-trihydroxyglutaric acid (Ruff), A., i, 324.

Dilution law, for dissociated compounds (Barmwater), A., ii, 274.

validity of (van Laar), A., ii, 11.

Chemical equilibrium in voltaic cells, application of phase rule to (Bancroft), A., ii, 394.

variation of, with temperature (Bodenstein), A., ii, 637.

between ferric sulphate, ferrous dithionate, and sulphur dioxide (Antony and Manasse), A., ii, 753.

Affinity, chemical:—

Chemical equilibrium between hydrocyanic acid and other acids, with potash or soda (Berthelot), A., ii, 737.

between hydrogen, oxygen, and water, and between oxygen and carbon monoxide (Hélier), A., ii, 85.

between hydrogen and the oxides of carbon (Berthelot), A., ii, 286.

false, of hydrogen sulphide (Duhem), A., ii, 739.

in formation or decomposition of hydrogen selenide (Bodenstein), A., ii, 639.

between manganous hydroxide and ammonium salts (Herz), A., ii, 752.

between mercury, mercurous and mercuric iodides (François), A., ii, 751.

in precipitated silver chloride and bromide (Küster), A., ii, 206.

between silver nitrate, silver amalgam, and mercurous nitrate; and between mercury, mercurous and mercuric nitrates (Ogg), A., ii, 14.

between silver potassium cyanide, hydrogen sulphide, and hydrogen cyanide (Berthelot), A., ii, 422.

Hydrolysis of amides and ethereal salts by alkalis, influence of formation of salts on (Fischer), A., i, 262.

Partition of chlorine between carbon tetrachloride and water (Jakowkin), A., ii, 736.

Velocity of action of sodium methoxide or ethoxide on dinitrobenzenes, and on methylic iodide (Steger), A., i, 745.

Velocity of conversion of diazoamino- into aminoazo-compounds (Goldschmidt and Salcher), A., ii, 551.

Velocity of decomposition of carbon monoxide in presence of metallic oxides, or of carbon (Boudouard), A., ii, 595, 596.

of chloro-, bromo-, or iodo-benzene by sodium amyloxide or ethoxide (Löwenherz), A., ii, 639.

of glycerophosphoric acid (Cavalier and Pouget), A., i, 660.

Velocity of diazotisation (Hantzsch and Schümann), A., ii, 549.

Velocity of explosion of gases (Chapman), A., ii, 591.

of pure acetylene (Berthelot and Le Chatelier), A., ii, 734.

Affinity, chemical :—
Velocity of formation of methylic, ethylic, and methylic ethylic ethers, influence of water on (de Bruyn and Steger), A., i, 849.
and decomposition of hydrogen iodide and selenide, and of formation of hydrogen sulphide (Bodenstein), A., ii, 638, 639.
and of hydrolysis of ethereal salts (Kistiakowsky), A., ii, 13.
and hydrolysis of ethereal salts of substituted acetic acids (Sudborough and Lloyd), T., 467; P., **1899**, 3.
Velocity of hydrolysis of alkylic phosphates (Cavalier), A., ii, 13, 14.
of diazonium hydroxide, and of *syn*-diazotates (Davidson and Hantzsch), A., ii, 7.
of methylic acetate by diphenyliodonium hydroxide (Sullivan), A., ii, 398.
Velocity of inversion of cane-sugar, and osmotic pressure (Arrhenius), A., ii, 359.
Velocity of isodynamic change of ethylic mesityloxidoxalate (Brühl), A., ii, 735.
Velocity of non-explosive combination of hydrogen and oxygen (Bodenstein), A., ii, 733.
Velocity of oxidation of formaldehyde by hydrogen peroxide (Kastle and Loevenhart), A., i, 565.
Velocity of reaction between alcohols and their benzenesulphonates (Sagrebin), A., ii, 735.
of ethylic bromide with triethylamine (Hemptinne and Bekaert), A., ii, 359.
in bimolecular reactions (Waddell), A., ii, 402.
limited (Muller), A., ii, 358.
Agoniadin, probable identity of plumieride with (Franchimont), A., i, 934.
Agricultural Chemistry—
Animals, dairy products, and feeding experiments :—
Animals, presence of manganese in (Pichard), A., ii, 40.
Cattle, feeding experiments on (Aitken and Schulz), A., ii, 448; (Dickson and Malpeaux), A., ii, 509; (Schulle), A., ii, 609; (Baumert and Falke), A., ii, 689; (Fallot), A., ii, 797.
Horse, molasses as food for (Dickson and Malpeaux), A., ii, 509.
temperature of the (Woodhead), A., ii, 309.

Agricultural Chemistry: Animals:
Sheep, feeding experiments on (Aitken), A., ii, 448; Brétignière and Dupont), A., ii, 608.
influence of food on production of tallow in (Aitken), A., ii, 448.
influence of nitrogenous foods on wool formation in (Aitken), A., ii, 448.
Dairy Products :—
Butter, effect of oil-foods on (Baumert and Falke), A., ii, 689.
rancidity of (Amthor), A., ii, 259; (Scala), A., i, 478.
methods of analysis. See main index.
Cheese, action of calcium salts in manufacture of (Vieth), A., ii, 570.
Cream, fresh and ripened, composition of, estimation of proteids in (Ladd), A., ii, 178.
methods of analysis. See main index.
Milk, composition of (Richmond), A., ii, 707.
freezing point of (Winter), A., ii, 232.
influence of calcium salts on the curdling of (Vieth), A., ii, 570.
presence of a new proteid in (Wróblewski), A., ii, 232.
production, effect of sour hay on (Knieriem), A., ii, 795.
relation of composition of, to growth of progeny (Abderhalden), A., ii, 232, 568.
cow's and goat's, conversion of, into laben (Georgiadès), A., i, 835.
digestion of the sugar of, in the small intestine (Weinland), A., ii, 604.
methods of analysis. See main index.
Laben, composition of (Georgiadès), A., i, 835.
Feeding Experiments :—
Barley, cotton cake linseed cake, or **meal**, or **maize**, as food for sheep and cattle (Aitken), A., ii, 448.
Maize cake, as food for cows (Schulle), A., ii, 448, 609.
Mangel wurzels, as food for cattle, and their composition (Brétignière and Dupont), A., ii, 608.
Molasses, as food for horses and cattle (Dickson and Malpeaux), A., ii, 509.
Oils, as food for cows, and their influence on butter (Baumert and Falke), A., ii, 689.
Rape cake, adulteration in (Jörgensen), A., ii, 46.

Agricultural Chemistry :—

Plants.

Plant Composition and Metabolism :—

Plants, presence of simple acids and alcohols in (Lieben), A., ii, 45.
  alcohol in (Mazé), A., ii, 606; (Berthelot), A., ii, 685; (Devaux), A., ii, 789.
  alkaloids in (Barth), A., ii, 46.
  barium in (Hornberger), A., ii, 506.
  function of calcium salts in, and action of strontium and magnesium compounds (Loew), A., ii, 789.
  metabolism of calcium oxalate in (Kraus), A., ii, 685.
  carbohydrates in (Zanotti), A., i, 851.
    assimilation of (Mazé), A., ii, 321.
    conversion of, into alcohol (Mazé), A., ii, 606.
    influence of, on formation of proteids (Schulze), A., ii, 322.
    production of humus from (Snyder), A., ii, 48.
  chlorine, phosphorus and sulphur in (Berthelot), A., ii, 323.
  assimilation of chlorides by (Pichard), A., ii, 788.
  occurrence of metallic copper in (Frankforter), A., ii, 323.
  influence of anæsthetics on chlorophyll-formation in (Téodoresco and Coupin), A., ii, 239.
  dextrin and starch as reserve materials in (du Sablon), A., ii, 444.
  dwarf, production of, by variations of temperature (Bonnier), A., ii, 686.
  antiseptic action of ethereal oils in (Bokorny), A., ii, 786.
  selective absorption of elements by (Demoussy), A., ii, 238.
  hydrocyanic acid in, and its relation to proteid formation (Hébert), A., ii, 377.
  manganese in (Pichard), A., ii, 40.
  assimilation of organic nitrogen by (Lyebyedyev), A., ii, 689.
  nitrogen assimilation of by, during germination (Mazé), A., ii, 237.
  influence of light on nitrogen assimilation by (Laurent, Marchal and Carpiaux), A., ii, 173.
  elaboration of nitrogen compounds by (Mazé), A., ii, 321.
  assimilation of nitrates in, without light (Suzuki), A., ii, 323.

Agricultural Chemistry : Plants :—

Plants, distribution of α-, β-, and γ-oxydase in (Grüss), A., i, 314.
  absorption of potassium salts by (Demoussy), A., ii, 172.
  metabolism, formation of proteids in (Hébert), A., ii, 47.
  decomposition of proteids in (Schulze), A., ii, 240.
  influence of carbohydrates on decomposition and regeneration of proteids in (Schulze), A., ii, 322; (Suzuki), A., ii, 323.
  proteid decomposition, asparagine formation and respiration in, relation between (Prianischnikoff), A., ii, 787.
  assimilation of sodium and potassium compounds by (Schröder), A., ii, 789.
  digestion of starch in (du Sablon) A., ii, 239.
  starch formation in, and relation to diastase (Meyer), A., ii, 321.
  function and distribution of sucrose and other sugars in (Schulze), A., ii, 570.
  tannin formation in (Mer), A., ii, 607.

Plants :—

Ash, the mineral bases in (Tanret), A., ii, 170.
Bud formation, loss of calcium oxalate during (Kraus), A., ii, 685.
Chlorophyll, extraction from lucerne (*Medicago sativa*), (Étard), A., i, 381.
  formation of, without light (Étard and Bouilhac), A., ii, 46.
  influence of anæsthetics on formation of, in plants (Téodoresco and Coupin), A., ii, 239.
  chemistry of (Marchlewski), A., i, 381, 822.
  function of (Étard), A., ii, 792.
  relation of, to nitrogen nutrition (Laurent, Marchal, and Carpiaux), A., ii, 173.
  assimilation of, in relation to colour of leaves (Griffon), A., ii, 320.
  presence of, in the livers of invertebrates (Dastre and Floresco), A., ii, 374.
  compounds (Kohl), A., i, 228.
  derivatives, absorption spectra of, (Schunck), A., ii, 540.
Leaves, growth and constituents of, at various periods (Berthelot and André), A., ii, 319.
  presence of simple acids and alcohols in (Lieben), A., ii, 45.

Agricultural Chemistry: Plants:—

Leaves, formation of aromatic substances by alcoholic fermentation in presence of (Jacquemin), A., ii, 377.

chlorophyll-assimilation by, in relation to colour (Griffon), A., ii, 320.

chlorophyll in, in relation to assimilation of nitrogen (Laurent, Marchal, and Carpiaux), A., ii, 173.

Protoplasm, living and dead. The albumin of (Loew), A., ii, 606.

Root nodules, of pea; amount of nitric nitrogen formed by (Beeson), A., ii, 175.

Roots, constituents and growth of, at various periods (Berthelot and André), A., ii, 319.

absorption of carbohydrates, and carbon-assimilation by (Laurent), A., ii, 173.

excretions (Kohn), A., ii, 791.

decomposition of felspars, by (Sestini), A., ii, 798.

Cell sap, solubility of calcium oxalate (Kraus), A., ii, 685.

Seedlings, growth of, in various gases and vapours (Sandsten), A., ii, 320.

action of acetic acid on (Fassbender and Grevillius), A., ii, 794.

action of sodium perchlorate in Chili saltpetre on (Zaharia), A., ii, 799.

Seeds, growth and constituents of, at various periods (Berthelot and André), A., ii, 319.

germinating, action of ether on (Townsend), A., ii, 684.

oily, changes in composition of, during germination (Maquenne), A., ii, 171.

growth of, in various gases and vapours (Sandsten), A., ii, 320.

presence of manganese in (Pichard), A., ii, 40.

distribution and function of sugars in (Schulze), A., ii, 570.

action of acetic acid on (Fassbender and Grevillius), A., ii, 794.

importance of changing (Dehérain), A., ii, 687.

Stems, growth and constituents of, at various periods (Berthelot and André), A., ii, 319.

Plant tissue, estimation of carbonic *di*oxide in (Berthelot), A., ii, 685.

Respiration and assimilation in, under alpine conditions (Bonnier), A., ii, 686; (Palladin), A., ii, 686.

Agricultural Chemistry: Plants:—

Respiration of yeast cells, influence of oxygen on (Buchner and Rapp), A., ii, 169.

Respiratory coefficient in plants (Berthelot), A., ii, 685.

under increased respiration (Devaux), A., ii, 789.

Plant growth, nature and amount of, at various periods (Berthelot and André), A., ii, 319.

influence of light on (Pagnoul), A., ii, 788.

without light (Mazé), A., ii, 321.

influence of temperature and moisture on (Bonnier), A., ii, 686.

in various gases and vapours (Sandsten), A., ii, 320.

influence of sucrose on (Golding), A., ii, 689.

Plant nutrition, function of calcium oxalate in (Kraus), A., ii, 685.

root absorption of carbohydrates as a source of carbon in (Laurent), A., ii, 173.

nitrogen absorption in (Richter), A., ii, 237.

assimilation of nitrates and of ammonia in (Laurent, Marchal, and Carpiaux), A., ii, 173.

the relative value of nitrates and ammonia salts, and absorption of ammonia in (Mazé), A., ii, 237.

absorption of potassium salts in (Demoussy), A., ii, 172.

Plants, damage caused by acetic acid vapour, and solution to (Fassbender and Grevillius), A., ii, 794.

damage done to, by copper salts (Coupin), A., ii, 118.

toxic action of arsenic on, and its introduction in manures (Stoklasa), A., ii, 323.

toxic action of perchlorate, in nitrates on (Pagnoul), A., ii, 243; (Krüger and Berju) A., ii, 325.

toxic action of iodine compounds on (Demoussy), A., ii, 172.

Plant-germination, assimilation of oxidised and amidic nitrogen in (Mazé), A., ii, 237.

metabolism in oily seeds during (Maquenne), A., ii, 171.

metabolism in peas, lupins, and vetches during (Prianischnikoff), A., ii, 787.

influence of acetic acid on (Fassbender and Grevillius), A., ii, 794.

action of ether on (Townsend), A., ii, 684.

Agricultural Chemistry: Plants :—
Forest fires, loss of nitrogen in soil by (Snyder), A., ii, 48.
Plants :—
Arachis seeds, metabolism of reserve material in, during germination (Maquenne), A., ii, 171.
Artichokes, action of *Bacillus coli* on (Roux), A., ii, 444.
Barley, manurial experiments with (Malpeaux), A., ii, 242; (Prianischnikoff and Kouznezoff), A., ii, 513; (Maercker), A., ii, 691; (Lyebyedyev), A., ii, 689; (Guffroy), A., ii, 795; (Zaharia), A., ii, 799.
the carbohydrates of (Tollens), A., ii, 174.
assimilation of nitrates in the dark by (Suzuki), A., ii, 323.
germinated, presence of pectinase in (Bourquelot), A., i, 652.
phosphoric acid in (Matthews and Woolcott), A., ii, 174.
brewery, the potash requirements of, and its application (Rémy), A., ii, 795.
Beans, action of double superphosphates on (Wohltmann), A., ii, 511.
germinating, assimilation of nitrogen by (Mazé), A., ii, 237.
Beetroot (sugar), manurial experiments with (Schneidewind), A., ii, 49; (Wohltmann), A., ii, 511; (Maercker), A., ii, 691.
furfuroids in (Stoklasa), A., ii, 792.
influence of sodium perchlorate on (Zaharia), A., ii, 799.
seeds, action of formaldehyde on (Jodin), A., ii, 44.
cause of darkening of (Gonnermann), A., ii, 790.
seed and leaves, presence of an enzyme in, and absence of saccharose and lævulose in (Gonnermann), A., ii, 791.
amounts of lecithin and distribution of phosphoric acid in (Stoklasa), A., ii, 45.
juices, presence of peptones in (Rümpler), A., ii, 507.
Boletus edulis, yield of chitin from (Tanret), A., ii, 171.
amount of pentosans in (Menozzi), A., ii, 683.
Brassica juncea, *B. glauca*, *B. napus*, *B. rapa*, and *B. dichotoma* seeds, composition of oil of (Jörgensen), A., ii, 46.

Agricultural Chemistry: Plants :—
Broad bean, colouring principles of the, and other constituents (Bourquelot and Hérissey), A., ii, 325.
Buckwheat, nitrogenous nutrition of (Richter), A., ii, 237.
selective absorption by (Demoussy), A., ii, 238.
etiolated, action of anæsthetics on (Téodoresco and Coupin), A., ii, 239.
Carnations, growth of, in artificial soil with various manures (Jenkins and Britton), A., ii, 511.
Cereals, action of various manures on (Wohltmann), A., ii, 511.
action of basic slag on (Guffroy), A., ii, 795.
action of sodium perchlorate in Chili saltpetre on (Zaharia), A., ii, 799.
Chaff, nitrogen contents of (Holdefleiss), A., ii, 47.
Clover, grey, nitragin experiments with (Feilitzen), A., ii, 684.
influence of light on (Pagnoul), A., ii, 788.
white, red, and bastard, the digestive value of (Kineriem), A., ii, 795.
Colza, selective absorption by (Demoussy), A., ii, 238.
Conifers, variation in amount of lignin in wood of (Cieslar), A., ii, 447.
Conifer seeds, distribution and function of sugars in (Schulze), A., ii, 570.
Copper-beech, occurrence of barium in ash of (Hornberger), A., ii, 506.
Cotton flowers, the colouring matter of (Perkin), T., 825; P., **1899**, 161.
seed, presence of gossypol in (Marchlewski), A., i, 821.
Cruciferæ seeds, presence and absence of volatile mustard oils in (Jörgensen), A., ii, 797.
Cucumbers, growth of, in artificial soils with various manures (Jenkins and Britton), A., ii, 511.
Currant-bushes, sterility of (Aitken), A., ii, 447.
Fescue, action of potassium perchlorate in potassium nitrate on (Pagnoul), A., ii, 243.
Figs, Barbary, constituents of, and yield of alcohol from (Rolants), A., ii, 784.
Flowers, growth and constituents of, at various periods (Berthelot and André), A., ii, 319.
Fungi, chemical constituents of, and presence of proteids in (Winterstein), A., ii, 240.

AGRICULTURAL CHEMISTRY : PLANTS :—
Fungi, respiratory quotient of, in nutrient media (PURIEWITSCH), A., ii, 785.
  presence of a proteolytic ferment in (BOURQUELOT and HÉRISSEY), A., i, 313.
  iodine in (GAUTIER), A., ii, 650.
  preparation of fungin, fungose, and chitin from (TANRET), A., ii, 171.
  composition of mycelium of (MARSCHALL), A., ii, 44.
  edible, amount of pentosans in (MENOZZI), A., ii, 683
  toxic influence of various ions on (CLARK), A., ii, 627.
  toxic action of ethereal oils on (BOKORNY), A., ii, 318, 786; (SALKOWSKI), A., ii, 786.
Gooseberry, pectin of (BOURQUELOT), A., i, 652; (BOURQUELOT and HÉRISSEY), A., i, 653.
Grass, couch, the digestive value of (KNIERIEM), A., ii 795.
Haricot beans, French, composition and nutritive value of (BALLAND), A., ii, 174.
Hay, amount of phosphoric acid in (WAGNER), A., ii, 690.
  the percentage digestion of, by rabbits, and effect of some hay on milk production (VON KNIERIEM), A., ii, 795.
Leguminosæ, experiments with nitragin on (AITKEN), A., ii, 512.
Lentils, selective absorption by (DEMOUSSY), A., ii, 238.
Linseed, composition of (HERZOG), A., ii, 796.
Lucerne (*Medicago sativa*), growth and constituents of, at various periods (BERTHELOT and ANDRÉ), A., ii, 320.
  extraction of chlorophylls from (ÉTARD), A., i, 381.
Lupin, white, etiolated, action of anæsthetics on (TÉODORESCO and COUPIN), A., ii, 239.
  growth and constituents of, at various periods (BERTHELOT and ANDRÉ), A., ii, 319.
Maize, absorption of phosphoric acid in soil-water by (SCHLŒSING, jun.), A., ii, 243.
  kernels, selection of, for seed, and relation of external characters to chemical composition (HOPKINS), A., ii, 687.
  residues, digestibility of (SCHULZE), A., ii, 509.

AGRICULTURAL CHEMISTRY: PLANTS :—
Maize, seedlings, assimilation of carbon by roots of (LAURENT), A., ii, 173.
  seeds, assimilation of nitrogen by germinating (MAZÉ), A., ii, 237.
    selective absorption by (DEMOUSSY), A., ii, 238.
  stalks, the sugars of (ISTRATI and ŒTTINGER), A., ii, 506, 507.
Maize-cake, composition and feeding value of (SCHULLE), A., ii, 609.
Malt, the carbohydrates of (TOLLENS), A., ii, 174.
  the nitrogen compounds in, and their separation (LASZCZYNSKI), A., ii, 793.
  the sugars of (LING), A., ii, 187.
  and barley, relation between acidity and soluble phosphates or total phosphoric acid; calcium and magnesium in; presence of organic acids in (MATTHEWS and WOOLCOTT), A., ii, 174.
Mangel-wurzel, manurial experiments at Rothamsted with (WARINGTON), A., ii, 800.
  manurial experiments with (DEHÉRAIN), A., ii, 687.
  composition and feeding value of (BRÉTIGNIÈRE and DUPONT), A., ii, 608.
Millet, composition and feeding value of varieties of (BALLAND), A., ii, 119.
  hay, presence of an active principle in (LADD), A., ii, 240.
Monocotyledons, the metabolism of carbohydrates and relative value of various sugars for starch-formation in (PARKIN), A., ii, 790.
Mulberry leaves, amount of cellulose and pentosans in (MENOZZI), A., ii, 683.
Mustard, manurial value of various phosphates for (JOFFRE), A., ii, 610.
  nitrogenous nutrition of (RICHTER), A., ii, 237.
  methods of analysis. See main index.
Nut-shells, composition of (ZANOTTI), A., i, 851.
Oak, conversion of sapwood into wood in (MER), A., ii, 607.
  occurrence of metallic copper in wood of (FRANKFORTER), A., ii, 323.
Oak-barks, amounts of tannin in, and influence of age thereon (BOREL and BLONAY), A., ii, 241.

Agricultural Chemistry : Plants :—

- **Oats**, manurial experiments with (Schneidewind), A., ii, 49; (Richter), A., ii, 237; (Malpeaux), A., ii, 242; (Dehérain), A, ii, 243; (Klopfer), A., ii, 512; (Liebscher and Edler), A., ii, 691; (Karpinski), A., ii, 787; (Schröder), A., ii, 789; (Zaharia), A., ii, 799.
  - influence of water supply and manure on growth of (Tucker and Seelhorst), A., ii, 508.
  - influence of pot or field growth on assimilation in (Karpinski), A., ii, 787.
- **Peas**, fixation of nitrogen by (Richter), A., ii, 237.
  - selective absorption by (Demoussy), A., ii, 238.
  - germination of (Jodin), A., ii, 44.
  - formation of alcohol in (Mazé), A., ii, 606.
  - production of nitric nitrogen by, and influence on associated crops (Beeson), A., ii, 175.
  - grey, nitragin experiments with (Feilitzen), A., ii, 684.
- *Phaseolus multiflorus*, assimilation of nitrates in the dark by (Suzuki), A., ii, 323.
- **Potatoes**, manurial experiments with (Dehérain), A., ii, 687.
  - assimilation of nitrates in the dark by (Suzuki), A., ii, 323.
  - amount of solanine in (Bauer), A., ii, 392.
  - poisonous action of calcium chloride on (Wheeler, Tucker, and Hartwell), A., ii, 51.
- *Quercus robur*, and *Q. pedunculata*, formation of duramen in, and the tannin starch in (Mer), A., ii, 607.
- **Quince**, pectin of (Bourquelot), A., i, 652; (Javillier), A., i, 822.
- **Radishes**, growth of, in artificial soil with various manures (Jenkins and Britton), A., ii, 511.
- **Rape**, manurial experiments with (Wohltmann), A., ii, 511; (Grashof), A., ii, 797.
  - Indian, influence of, in rape-cake (Jörgensen), A., ii, 46.
- **Rape-cakes**, volatile mustard oil in, and valuation of, for cattle food (Jörgensen) A., ii, 797.
- *Robinia*, growth and constituents of, at various periods (Berthelot and André), A., ii, 320.
- *Rosaceæ*, absence of hydrocyanic acid from cultivated (Hébert), A., 377.

Agricultural Chemistry : Plants :—

- **Roses**, the pectin of (Bourquelot), A., i, 652.
- **Rye**, selective absorption by (Demoussy), A., ii, 238.
  - action of perchlorate on (Sjollema), A., ii, 513; (Zaharia), A., ii, 799.
  - summer, action of various phosphates on (Kühn), A., ii, 50.
  - estimation of cellulose in (Lebbin), A., ii, 67.
- **Silver fir** and **Spruce fir**, amount of lignin in wood of (Cieslar), A., ii, 447.
- **Straw**, nitrogen contents of (Holdefleiss), A., ii, 47.
  - production of humus from (Snyder), A., ii, 48.
- **Sugar-cane**, presence of glycollic acid in (Shorey), A., ii, 507.
- **Tobacco**, assimilation of chlorides by (Pichard), A., ii, 788.
  - cigar, pipe and cigarette, amounts of nicotine in (Sinnhold), A., ii, 48.
  - leaves, composition of good and bad, and effect of soluble manures on (Behrens), A., ii, 795.
  - methods of analysis. See main index.
- **Tomatoes**, growth of, in artificial soil with various manures (Jenkins and Britton), A., ii, 511.
- **Vetch**, pot experiments with (Dehérain), A., ii, 610.
  - growth of, in the dark (Mazé), A., ii, 321.
  - etiolated, action of anæsthetics on (Téodoresco and Coupin), A., ii, 239.
  - germinating, assimilation of nitrogen by (Mazé), A., ii, 237.
  - the digestive value of (von Knieriem), A., ii, 795.
- *Vicia fabia*, action of temperature changes on growth of (Palladin), A., ii, 686.
- **Vine**, action of mercurial dressings on (Vignon and Perraud), A., ii, 446.
  - leaves, addition of extract of, to fermenting must (Jacquemin), A., ii, 377.
- **Walnut-cake**, composition of, and value for feeding cows (Fallot), A., ii, 797.
- **Wheat**, manurial experiments with (Malpeaux), A., ii, 242; (Dehérain), A., ii, 243; (Guffroy), A., ii, 795.
  - growth, and constituents of, at various periods (Berthelot and André), A., ii, 319.

Agricultural Chemistry: Plants:—
Wheat, relation of composition to quality of soil (Januszewski), A., ii, 325.
  selective absorption by (Demoussy), A., ii, 238.
  etiolated, action of anæsthetics on (Téodoresco and Coupin), A., ii, 239.
  toxic action of copper salts on (Coupin), A., ii, 118.
  toxic action of chromium compounds on (Coupin), A., ii, 242.
Yeast, assimilation of nitrogen by (Stern), T., 205; P., **1898**, 183.

Soils.

Soils, arable, loss of manures in (Schliebs and Minssen), A., ii, 571.
  quality and requirements of, shown by plant analysis (Januszewski), A., ii, 325; (Liebscher and Edler), A., ii, 691.
  influence of various crops on the moisture in (Maercker), A., ii, 689.
  influence of water in, on plant constituents (Wilms and Seelhorst), A., ii, 609.
  effect of sea-water on (Swaving), A., ii, 510.
  barium in (Hornberger), A., ii, 506.
  chlorides in (Pichard), A., ii, 788.
  humoid substances in (Snyder), A., ii, 48; (André), A., ii, 119, 120, 449; (Sestini), A., ii, 120; (Ladd), A., ii, 176.
  phosphates in (Schlœsing), A., ii, 119, 449; (Prianischnikoff), A., ii, 514; (Hanamann), A., ii, 515.
  artificial, growth of various plants in (Jenkins and Britton), A., ii, 511.
  calcareous, loss of nitrogen from ammoniacal manures on (Giustiniani), A., ii, 692.
  crop bearing, loss of constituents of by rainfall (Hanamann), A., ii, 515.
  cultivated (André), A., ii, 119, 449.
  heavy, action of manures on (Wohltmann), A., ii, 511; (Pfeiffer and others), A., ii, 378; (Klopfer), A., ii, 512.
  light, action of manures on (Pfeiffer, Franke, Lemmermann and Schillbach), A., ii, 378; (Wagner), A., ii, 572.
  meadow, amount of basic slag required for (Wagner), A., ii, 690.

Agricultural Chemistry: Soils:—
Soils, moorland, composition of (André), A., ii, 449.
  orchard, sterility of (Aitken), A., ii, 447.
  peaty, composition of (André), A., ii, 449.
    forms of phosphoric acid in (Nannes), A., ii, 798.
    action of manures on (Schliebs and Emmerling; Minssen), A., ii, 571; (Feilitzen), A., ii, 684.
  prairie, effect of cultivation on (Snyder), A., ii, 48.
  sandy action of poudrette on (Tacke), A., ii, 690.
  surface and sub-soil, phosphoric acid in, and its solubility (Seissl), A., ii, 798.
  vegetable mould, composition of (André), A., ii, 449.
  marly, from Asia Minor (Schulze), A., ii, 510.
  from Bad-Pyrmont (Kreusler) A., ii, 799.
  from Bulgaria (Schulze), A., ii, 510.
  from Franzenbad (Ludwig, Hödlmoser, and Panzer), A., ii, 798.
  of North Dakota (Ladd), A., ii, 176.
  Rothamstead (Goss and Snyder), A., ii, 688.
    effect of nitrates and farmyard manure on, as regards denitrification (Warington), A., ii, 800.
  methods of analysis. See main index.

Nitrification, Nitrogen, and Nitrogenous Compounds:—
Nitrification in soils (Schlœsing), A., ii, 175; (Pfeiffer, Franke, Lemmermann, and Schillbach), A., ii, 379; (Demoussy), A., ii, 443.
Nitrates, action of, on chlorides in soils (Pilchard), A., ii 788.
Nitrogen in soil, loss of, by forest fires (Snyder), A., ii, 48.
  atmospheric, fixation of, by symbiotic organisms (Bouilhac), A., ii, 238.
  nitric, amounts of, formed by nodule-bacteria on pea (Beeson), A., ii, 175.
Nitrogenous substances accompanying humic acid from soils (Sestini), A., ii, 120.
Nitrifying organisms, biology of (Dawson), A., ii, 785.
Micro-organisms in soils (Dehérain), A., ii, 609.

AGRICULTURAL CHEMISTRY : SOILS :—
Denitrification in soils, causes and importance of (KRÜGER and SCHNEIDEWIND), A., ii, 510.
in soils, and action of farmyard manure (KRÜGER and SCHNEIDEWIND), A., ii, 449 ; (PFEIFFER), A., ii, 50.
Denitrifying bacteria, classification of (AMPOLA and ULPIANI), A., ii, 444.
loss of nitrogen by (WARINGTON), A., ii, 800.

WATER.

Water in soils, solvent action of, on phosphoric acid, and action of carbonic anhydride (SCHLŒSING), A., ii, 119.

MANURES AND MANURING EXPERIMENTS.

Manures, action of various, on formation of furfuroids in sugar-beet (STOKLASA), A., ii, 792.
production of humus from (SNYDER), A., ii, 48.
loss of, in arable land and meadows (SCHLIEBS and MINSSEN), A., ii, 571.
artificial, action of, on various plants (JENKINS and BRITTON ; SEBELIEN), A., ii, 511.
ammonia in, fixation by various agents (EMMERLING), A., ii, 571.
methods of analysis. See main index.
Alinite, manurial effect of, on cereals (MALPEAUX), A., ii, 242.
Ammoniacal manures, loss of nitrogen from, in calcareous soils (GIUSTINIANI), A., ii, 692.
Ammonium salts, manurial value of (KLOEPFER), A., ii, 512 ; (WAGNER), A., ii, 572.
phosphate, as manure for barley and oats (STEFFECK and MAERCKER), A., ii, 177.
sulphate, manurial action of (WOHLTMANN), A., ii, 511.
assimilation of, by oats, in pots and in the field (KARPINSKI), A., ii, 787.
Arsenic in manures, and its toxic action (STOKLASA), A., ii, 323.
Blood-meal as manure (PFEIFFER, FRANKE, LEMMERMANN, and SCHILLBACH), A., ii, 378.
Bone-meal as manure (KÜHN), A., ii, 50 ; (STEFFECK and MAERCKER), A., ii, 177; (MEISSL and REITMAIR), A., ii, 379.

AGRICULTURAL CHEMISTRY: MANURES:–
Clover manure (green), production of humus from (SNYDER), A., ii, 48.
Dung, action of, on cereal crops (WOHLTMANN), A., ii, 511.
Farmyard manure, experiments with (PFEIFFER, FRANKE, LEMMERMANN, and SCHILLBACH), A., ii, 378.
production of humus from (SNYDER), A., ii, 48.
artificial, conservation of nitrogen in (ROGOVSKY), A., ii, 512.
action of, on potatoes and mangolds (DEHÉRAIN), A., ii, 687.
action of, on sterile orchard soil (AITKEN), A., ii, 447.
action of, on vetches (DEHÉRAIN), A., ii, 610.
Guano, experiments with new sorts of (STEFFECK and MAERCKER), A., ii, 178.
manurial action of, on barley (MAERCKER), A., ii, 691.
Norwegian fish-, manuring of barley and oats with (STEFFECK and MAERCKER), A., ii, 177.
Horn meal as manure (PFEIFFER, FRANKE, LEMMERMANN, and SCHILLBACH), A., ii, 378.
Kainite, manurial action of (WOHLTMANN), A., ii, 511 ; (MAERCKER), A., ii, 691.
Leather refuse as manure (STEFFECK and MAERCKER), A., ii, 178.
Lime as a manure for various crops (WOHLTMANN), A., ii, 511.
as a manure, in excessive dressing with ammonium sulphate (WHEELER, TUCKER, and HARTWELL), A., ii, 50.
Magnesia, as manure for grain crops (SCHNEIDEWIND), A., ii, 49.
Meat scrap manure, production of humus from (SNYDER), A., ii, 48.
Nitragin, experiments with (AITKEN), A., ii, 512; (FEILITZEN), A., ii, 684 ; (DAWSON), A., ii, 785.
Nitrates, exhaustion of world's supply of (DEHÉRAIN), A., ii, 243.
assimilation of, by oats (KARPINSKI), A., ii, 787.
various, as manure for sugar-beet and oats (SCHNEIDEWIND), A., ii, 49.
and soluble manures, action of, on tobacco (BEHRENS), A., ii, 795.
Nitrogen, organic, as manure for plants (LYEBYEDYEV), A., ii, 689 ; (PFEIFFER and others), A., ii, 378.

AGRICULTURAL CHEMISTRY: MANURES:–
- **Nitrogenous manures**, and their relative values (KÖNIG), A., ii, 49; (STEFFECK and MAERCKER), A., ii, 177; (LYEBYEDYEV), A., ii, 689.
  - action of, on flowering plants (SEBELIEN), A., ii, 511.
  - action of, on oats (LIEBSCHER and EDLER), A., ii, 691.
- **Oil cakes**, various, manurial value of (MALPEAUX), A., ii, 378.
- **Phosphates**, manurial value of, in relation to solubility (JOFFRE), A., ii, 610.
  - manuring of barley and oats with (STEFFECK and MAERCKER), A., ii, 177.
  - influence of, on yield of oil in rape (GRASHOF), A., ii, 797.
  - mineral, value of, for various crops (PRIANISCHNIKOFF), A., ii, 514.
- **Phosphoric acid**, citrate soluble, production of (KNOOP), A., ii, 801.
  - retention of, by soils (HANAMANN), A., ii, 515.
  - of basic slag and bone-meal, field experiments on the (MEISSL and REITMAIR), A., ii, 379.
  - as double superphosphate, action of, on beans (WOHLTMANN), A., ii, 511.
  - influence of, on growth of oats (TUCKER and SEELHORST), A., ii, 509.
  - in soil-water, utilisation of, by plants (SCHLŒSING, jun.), A., ii, 243.
  - methods of analysis. See main index.
- **Potash manures**, action of, on oats (LIEBSCHER and EDLER), A., ii, 691.
- **Potassium** phosphate as manure for barley and oats (STEFFECK and MAERCKER), A., ii, 177.
- **Poudrette** as manure, the nitrogenous value of (TACKE), A., ii, 690.
- **Slag, basic**, as manure for cereals (KÜHN), A., ii, 50; (MEISSL and REITMAIR), A., ii, 379; (GUFFROY), A., ii, 795.
  - amount of, required for meadow soils (WAGNER), A., ii, 690.
  - action of, on ammoniacal manure (GIUSTINIANI), A., ii, 692.
  - composition of insoluble portion of (PASSON), A., ii, 514.
  - methods of analysis. See main index.
- **Sodium nitrate** (*Chili saltpetre*), manurial action of (WOHLTMANN), A., ii, 511; (KLOEPFER), A., ii, 512; (PRIANISCHNIKOFF and KOUZNEZOFF), A., ii, 513.

AGRICULTURAL CHEMISTRY: MANURES:–
- **Sodium nitrate** (*Chili saltpetre*), as a top-dressing for sugar-beet (MAERCKER), A., ii, 691.
  - toxic action of perchlorate in (KRÜGER and BERJU), A., ii, 325; (SJOLLEMA), A., ii, 513; (ZAHARIA), A., ii, 799.
  - methods of analysis. See main index.
- **Stable Manure**, action of ferric sulphate on micro-organisms of (MÜLLER), A., ii, 506.
- **Starfish**, manurial value of (FIELD), A., ii, 690.
- **Stone-meal**, inutility of, as manure (STEFFECK and MAERCKER), A., ii, 177.
- **Sucrose** (*cane sugar*), manurial value of, and influence on nitrogen fixation (GOLDING), A., ii, 689.
- **Superphosphate**, conversion of, into tricalcium phosphate in soils (JOFFRE), A., ii, 420.
  - amount of arsenic in, and its toxic action (STOKLASA), A., ii, 324.
  - influence of, on summer rye (KÜHN), A., ii, 50.
  - manurial action of, on vetches (DEHÉRAIN), A., ii, 610.
- **Vetches**, as a manure for potatoes and mangolds (DEHÉRAIN), A., ii, 687.

MANURING EXPERIMENTS.
- **Manuring experiments** on maize, beans, and vetches (MAZÉ), A., ii, 237.
  - (nitrogenous) with peas, buckwheat, oats, and mustard (RICHTER), A., ii, 237.

Aikinite, from the Urals (GUILLEMAIN), A., ii, 757.

Air. See Atmospheric air.

α-Alanine (*α-aminopropionic acid*), heat of formation of (BERTHELOT and ANDRÉ), A., ii, 400.
- *d*- and *l*-, and hydrochlorides, specific rotations of (FISCHER), A., ii, 888.

Albamine, from egg-albumen (FRÄNKEL), A., i, 396.

Albertite, asphalt resembling, from U.S.A. (TAFF), A., ii, 756.

Albite from Russia (JEREMÉEFF), A., ii, 673.

Albumen of carob-seed, composition and hydrolysis of (BOURQUELOT and HÉRISSEY), A., i, 839.

Albumin, constitution of (KOSSEL), A., i, 833.
- from blood, crystallisation of (GRUZEWSKA), A., i, 838.
- in plants, formation of and chemical character (LOEW), A., ii, 606.

- **Albumin,** action of pepsin and pancreatic juice on (Harlay), A., i, 835.
  - decomposition products of (Cohn), A., i, 315.
  - mode of conversion of sugar into, in diabetes (Müller and Seemann), A., i, 968.
  - detection of (Gnezda), A., ii, 715.
  - detection of, in animal liquids (Riegler), A., ii, 264.

  action of sulphur on (Franck), A., ii, 28.
  action of, on tellurium dioxide (Lenher), A., ii, 479.
  amalgamated, oxidation of, in contact with mercury (Hunt and Steele), A., ii, 33.

Aluminium alloys with copper, chemical behaviour of (Ditte), A., ii, 425.

Aluminium amalgam, action of, on alcohols (Tistschenko), A., i, 408.

Aluminium salts, diffusion of light by solutions of (Spring), A., ii, 585.

Aluminium salts, inversion of sugar solutions by (Kahlenberg, Davis, and Fowler), A., ii, 470.

Aluminium bromide, heat of formation of (Beketoff), A., ii, 726.
  bromination with, in the aliphatic series (Mouneyrat), A., i, 1.
 chloride, influence of, on the hydration of calcium oxide (Rohland), A., ii, 596.
 sodium chloride, conductivity of aqueous solutions of (Jones and Ota), A., ii, 587.
 hydroxide, formation of (Hunt and Steele), A , ii, 33.
  colloidal solution of (Krafft), A., ii, 473.
 lead iodide (Mosnier), A., ii, 222.
 oxide (*alumina*), amount of, in Egyptian porcelain (Le Chatelier), A., ii, 751.
  solubility of, in fused silicates (Morozewicz), A., ii, 762.
  reduction of, by boron or silicon, in chlorine (Duboin and Gautier), A., ii, 653.
 phosphate from Moravia (Kovář), A., ii, 669.
  precipitation of, and detection of, in presence of ferric phospate (Caven and Hill), A., ii, 28.
 phosphides, and carbide (Franck), A., ii, 102.
 silicates, amorphous hydrated (Kasai), A., ii, 435.
 sulphate, influence of, on the reaction between potassium permanganate and hydrochloric acid (Wagner), A., ii, 275.

Aluminium, estimation and separation of:—
 estimation of, in phosphates (Blattner and Brasseur), A., ii, 128.
 separation of mercury from (Jannasch and Alffers), A., ii. 60.
 separation of phosphates from (Antony and Mondolfo), A., ii, 330.
 separation of zinc from (Jensch), A., ii, 522).

Amalgams. See Mercury alloys.

Amarine, action of formaldehyde on (Delépine), A., i, 234.
 hydrochloride, from action of ammonium chloride on benzaldehyde (Delépine), A., i, 187.
 conversion of silver derivative of, into lophine (Snape and Brooke), T., 211; P., **1899**, 22.
 isomeride of (Snape and Brooke), T., 208, 211; P., **1899**, 22.

Amber, discrimination of copal from (Rössler), A., ii, 530.

Amber-like resin from Canada (Klebs), A., ii, 34.

Amethyst, colouring matter of (Nabl), A., ii, 561.

Amides, preparation of (Aschan), A., i, 14.
 derived from aldehydes (Delépine), A., i, 664.
 of saturated mono- and di-basic fatty acid, melting points of (Solonina), A., ii, 633.
 separation of, from malt, wort, and beer (Laszczynski), A., ii, 793.
 substituted, hydrolysis of (Remsen), A., i, 507.

Amidic nitrogen, distinction between proteid nitrogen and (Mallet), A., ii, 576.

Amidines, amino- and *di*amino-, and β-naphthol-azo- and tetrazo-dyes obtained from (Muttelet), A., i, 355.

Amidulin, function of, in leaves, seeds, and roots (Gonnermann), A., ii, 791.

Amines derived from aldehydes (Delépine), A., i, 186, 664.
 taste of salts of (Höber and Kiesow), A., ii, 207.
 aromatic, maleic derivatives of (Giustiniani), A., i, 349.
 fatty, action of iodine on (Norris and Franklin), A., i, 664.
  action of nitrosyl chloride on (Solonina), A., i, 473, 561.
  and aromatic, action of oxidising agents on (Oechsner de Coninck and Combe), A., i, 244.
  primary, action of aqua regia on (Solonina), A., i, 663.
  secondary and tertiary, action of hydrogen peroxide on (Dunstan and Goulding), T., 1004; P., **1899**, 124.
 secondary and tertiary, oxidation of (Oechsner de Coninck), A., i, 472.

Ammelide (*melanurenic acid*), and *di*thio-, formation of (Diels), A., i, 406.

Ammonia, from action of sodium amalgam on sodium nitrite or nitrate (Divers), T., 87; P., **1898**, 222.
- electric conductivity of solutions of, at high pressures (Bogojawlensky and Tammann), A., ii, 138.
- melting point of (Ladenburg and Krügel), A., ii, 545.
- liquid, properties of (Franklin and Kraus), A., ii, 284.
  - heat of combination of, with water (Berthelot), A., ii, 727.
  - molecular rise in boiling point of, caused by dissolved substances (Franklin and Kraus), A., ii, 202.
  - cause of dissociative power of (Brühl), A., ii, 10.
  - as a solvent (Franklin and Kraus), A., ii, 208.
  - solubility of silver chloride and iodide in (Jarry), A., ii, 738.
- velocity of diffusion of, through water and through agar jelly (Hüfner), A., ii, 9.
- solubility of, in aqueous solutions of silver nitrate (Konowaloff), A., ii, 418.
- action of electric glow discharge on mixtures of, with oxygen (Mixter), A., ii, 267.
- action of methylic chloride, bromide, and iodide on (Dübowsky), A., i, 855.
- action of, on mercuric or cupric chlorides dissolved in organic solvents (Naumann), A., ii, 423.

Ammonia, compound of, with arsenic and sodium (Hugot), A., ii, 151.
- compounds of, with metallic salts (Matthews), A., ii, 295, 296; (Abegg and Bodländer), A., ii, 543.
- action of, on seeds, seedlings, and water-plants (Sandsten), A., ii, 320.
- conversion of, into nitrates and nitrites in soils (Demoussy), A., ii, 443.
- detection of (Riegler), A., ii, 180.
- estimation of, in urine (Camerer and Söldner), A., ii, 825.
- estimation of, in waters (Winkler), A., ii, 805.

Ammonio-metallic salts, constitution of (Reitzenstein), A., ii, 95.

Ammonio-potassium, -sodium, -lithium, and **-calcium** (Moissan), A., ii, 152.

Ammonio-silver chlorides and iodides, preparation and dissociation of (Jarry), A., ii, 738.
- iodate (Rosenheim and Liebknecht), A., ii, 743.
- nitrate, preparation and thermochemistry of (Berthelot and Delépine), A., ii, 748.

Ammonium amalgam (Pocklington), A., ii, 200.

Ammonium salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
- luminous phenomena produced by, and fused potassium nitrate (Tommasi), A., ii, 483.
- equilibrium between manganous hydroxide and (Herz), A., ii, 752.
- taste of (Höber and Kiesow), A., ii, 207.
- effect of, on growth of *Aspergillus niger* (Tanret), A., ii, 170.
- See also Agricultural chemistry.

Ammonium antimonate (Senderens), A., ii, 557.
- azoimide, molecular weight and spectrum of, and ammonium cobaltoazoimide (Curtius and Rissom), A., ii, 91, 92.
- *per*borate, decomposition of (Tanatar), A., ii, 553.
- bromide, fluidity and conductivity of, (Dennhardt), A., ii, 351.
- osmium bromide (Rosenheim and Sasserath), A., ii, 665.
- selenibromide (Lenher), A., ii, 19.
- *per*chlorate, use of, in explosives (Alvisi), A., ii, 414, 647, 748.
- chloride conductivities of, mixed solutions of, potassium chloride and (Jones and Knight), A., ii, 628.
  - fluidity and conductivity of (Dennhardt), A., ii, 351.

Ammonium chloride, heat of dilution of (Dunnington and Hoggard), A., ii, 728.
thermal change on diluting saturated solutions of (Pollok), P., **1899**, 8.
equilibrium in systems containing water, ferric chloride, and (Mohr), A., ii, 15.
action of chromic acid on (Oechsner de Coninck and Combe), A., i, 244.
double chlorides, dissociation of, change of entropy in (Matignon), A., ii, 273.
cerium *hexa*chloride (Koppel), A., ii, 98.
ferric chlorides (Mohr), A., ii, 15.
magnesium chloride, and zinc bromide, conductivities of, solutions of (Jones and Knight), A., ii, 628.
mercuric chloride, conductivity of, aqueous solutions of (Jones and Ota), A., ii, 587.
constitution of (Pesci), A., ii, 750.
palladium chloride, electrolysis of (Cowper-Coles), A., ii, 755.
dissociation of, change of entropy in (Matignon), A., ii, 273.
*di*fluoriodate (Weinland and Lauenstein), A., ii, 363.
fluoromolybdates, fluorosilicate, fluorouranate and fluorotitanate, dissociation and conductivity of (Miolati and Alvisi), A., ii, 350.
*mono*fluoroselenate (Weinland and Alfa), A., ii, 595.
manganic iodate (Berg), A., ii, 426.
lead iodide (Mosnier), A., ii, 222.
mercuric iodide, action of water on (François), A., ii, 597.
nitrate, fluidity, and conductivity of (Dennhardt), A., ii, 351.
melting point and transition curves of (Tammann), A., ii, 636.
heat of dilution of (Dunnington and Hoggard), A., ii, 728.
influence of, on the boiling point of liquid ammonia (Franklin and Kraus), A., ii, 202.
deliquescence of (Kortright), A., ii, 644.
reduction of, by sodium amalgam (Divers), T., 92.
explosives, use of potassium chlorate in (Le Chatelier), A., ii, 647.
double compound of, with mercuric chloride (Hofmann and Marburg), A., i, 487.
separation of, from sodium sulphate (Roca), A., ii, 358.
praseodymium nitrate and sulphate (Scheele), A., ii, 99.
Ammonium hydrogen hyponitrite (Divers), T., 121.
osmiamate (Brizard), A., ii, 559.
hydrazine hypophosphate (Sabanéeff), A., ii, 364.
phosphate. See Agricultural chemistry.
magnesium phosphate, composition of (Gooch and Austin), A., ii, 451.
pyrophosphate (Berthelot and André), A., ii, 156.
phosphiodate, molybdiodate, and tungstiodate (Chrétien), A., ii, 363.
selenite, hydrogen selenite, and trihydrogen diselenite (Divers and Haga), T., 539; P., **1899**, 102.
sulphate, galvanic polarisation in solutions of (Jahn), A., ii, 542.
thermal changes on diluting saturated solutions of (Pollok), P., **1899**, 8.
equilibrium between ethylic alcohol, water, and (de Bruyn), A., ii, 591.
See also Agricultural chemistry.
antimony sulphate (Gutman), A., ii, 34.
iron alum and chromium alum (Howe and O'Neal), A., ii, 103.
vanadium sulphate (Piccini), A., ii, 297.
magnesium sulphide (Franklin and Kraus), A., ii, 284.
sulphite, anhydrous, formation of (Divers and Ogawa), T., 534.
hyposulphite, and hydrogen sulphite (Prud'homme), A., ii, 554.
thiosulphate, electrolysis of (Pierron), A., ii, 587.
sodium *mono*tungstoperiodate (Rosenheim and Liebknecht), A., ii, 744.
*pyroper*vanadate (Melikoff and Pissarjewsky), A., ii, 298.
Ammonium organic compounds:—
Ammonium acetate, solubility of lead sulphate in aqueous (Long), A., ii, 812.
ethyl selenite (Divers and Haga), T., 537; P., **1899**, 101.
iso-nitracetone (Lucas), A., i, 433.
vanadium thiocyanate (Cioci), A., i, 321.
Ethyl ammoniumsulphite (Divers and Ogawa), T., 533; P., **1899**, 101.
Amphibole. See Hornblende.
Amygdalin, heats of combustion, formation and dissolution of (Berthelot), A., ii, 726.
action of cuprous chloride on (Rabaut), A., i, 557.
iso-**Amylacetic acid**. See Heptoic acid.

iso-**Amylacetoacetic acid,** ethylic salt, action of hydrocyanic acid on; reduction (Auden, Perkin, and Rose), T., 912; P., **1899,** 162.
ethylic salt, preparation of methyl *iso*amyl diketoxime from (Fileti and Ponzio), A., i, 111.
iso-**Amylacetone,** action of hydrocyanic acid on (Auden, Perkin, and Rose), T., 920; P., **1899,** 163.
sec-**Amylamine** (*β-aminopentane*) and its salts (Kursanoff), A., i, 474.
Amylamine (*αβ-dimethylpropylamine*), and its hydrochloride and oxalates (Trasciatti), A., i, 855.
Amylase (Bourquelot and Hérissey), A., i, 93.
action of, on starch and various worts (Petit), A., i, 559.
Amylbenzene, and its nitro-derivative (Konowaloff and Egoroff), A., i, 801.
iso-**Amylchlorophosphine** (Guichard), A., i, 563.
β-iso-**Amylcitraconic anhydride** (Lawrence), P., **1899,** 164.
α-iso-**Amylcrotonic acid,** and oxidation (Auden, Perkin, and Rose), T., 920; P., **1899,** 163.
α-iso-**Amylene**-(*isopropylethylene*), action of bromine on (Ipatieff), A., i, 470.
β-iso-**Amylene** (*trimethylethylene*), and its bromo- and *di*bromo-derivatives (Ipatieff), A., i, 470.
heat of combustion of (Zouboff), A., ii, 589.
action of hypobromous acid on (Mokiewsky), A., i, 729.
action of nitric anhydride on (Demjanoff), A., i, 845.
Amylene (*trimethylethylene*), *di*bromo-, action of ethylic sodiomalonate on (Ipatieff), A., i, 481.
chloro- (2-*methyl*-3-*chlorobutene*) (Brochet), A., i, 100.
Amylenic bromide, action of solution of aluminium bromide in carbon disulphide on (Konowaloff), A., i, 471.
γ-**Amylenic** (*α-methylethylethylenic*) bromide, *β*-bromo-derivative (Wassiléef), A., i, 786.
iso-**Amylenic glycol,** *di*bromo-, from oxidation of isoprene *di*bromide (Mokiewsky), A., i, 727.
β-iso-**Amylenic glycol** (*trimethylethylenic glycol*), action of hydrogen bromide on (Mokiewsky), A., i, 729.
iso-**Amylenic** *βγ*-nitrosate (Demjanoff), A., i, 845.
i-iso-**Amylic alcohol** and its benzenesulphonate, velocity of reaction between (Sagrebin), A., ii, 735.
iso-**Amylic alcohol** (*fermentation amylic alcohol*), specific rotation of (Brjuchonenko), A., ii, 265.
and its ethereal salts, optical activity of (Tschugáeff), A., ii, 3.
dielectric constant of, temperature coefficient of (Abegg and Seitz), A., ii, 623.
specific heat and heat of vaporisation of (Luginin), A., ii, 269.
heat of combustion of (Zouboff), A., ii, 589.
critical temperature of mixtures of, with ethane (Kuenen and Robson), A., ii, 356.
and water, mutual solubilities of (Herz), A., ii, 83.
action of hydrogen peroxide on, in presence and absence of iron (Fenton and Jackson), T., 2; P., **1898,** 240.
action of zinc chloride on (Walther), A., i, 323.
aluminium derivative of (Tistschenko), A., i, 408.
sodium derivative, action of on ethylic salts of *α*-bromo-fatty acids (Bischoff), A., i, 670.
examination of commercial (Richmond and O'Shaughnessy), A., ii, 579.
bromo-, and action of zinc dust on (Mokiewsky), A., i, 729.
Amylic alcohol (sec-*butylcarbinol, methylethylcarbincarbinol*), density, specific rotation and molecular volume of (Frankland), T., 358.
specific heat and heat of vaporisation of (Luginin), A., ii, 269.
Amylic alcohol (*diethylcarbinol*), amino-, and its platinochloride; also the action of phenylthiocarbimide, ethylthiocarbimide, or hydrobromic acid on it (Jänecke), A., i, 477.
Amylic alcohol (*methylpropylcarbinol*), action of aluminium amalgam on (Tistschenko), A., i, 408.
Amylic alcohol (*methyl*iso*propylcarbinol*), nitro-, action of formaldehyde on (Henry), A., i, 729.
tert.-**Amylic alcohol** (*dimethylethylcarbinol, amylene hydrate*), specific heat and heat of vaporisation of (Luginin), A., ii, 269.
heat of combustion of (Zouboff), A., ii, 589.
effect of pressure on melting point curves of (Tammann), A., ii, 636.
action of aluminium amalgam on (Tistschenko), A., i, 408.
action of chlorine on (Brochet), A., i, 100.

tert.-**Amylic alcohol** (*dimethylethylcarbinol, amylene hydrate*), action of phosphorus tribromide on (MENSCHUTKIN), A., i, 937.
  action of aluminium amalgam on (TISTSCHENKO), A., i, 408.
  phenylurethane (LAMBLING), A., i, 53.
Amylic cetylic ether, density, specific rotation, and molecular volume of (FRANKLAND), T., 360.
  hydrogen carbonate (HEMPEL and SEIDEL), A., ii, 152.
  nitrate, assay of (FISCHER and ANDERSON), A., ii, 618.
  selenide, specific rotation of (BRJUCHONENKO), A., ii, 265.
  sulphide, *di*sulphide, and iodide, bromide, and chloride, specific rotation of (BRJUCHONENKO), A., ii, 265.
  tetra- and *tri-*sulphides (TROEGER and HORNUNG), A., i, 906.
iso-**Amylic** *l*-amylic ether, specific rotation of (BRJUCHONENKO), A., ii, 265.
tert.-**Amylic** chloride (*2-methyl-2-chlorobutane*), from action of chlorine on *tert.*-amylic alcohol (BROCHET), A., i, 100.
iso-**Amylidenebismalonic acid** (*heptanetetracarboxylic acid*), ethylic salt (KNOEVENAGEL), A., i, 116.
Amylidenecyanhydrin. See *a*-Hydroxy-*iso*-hexonitrile.
Amylketo-ψ-nitrole, and its decomposition and hydrolysis (PONZIO), A., i, 667.
iso-**Amylmalonic acid**, thermochemistry of (MASSOL), A., ii, 143.
  l-amylic salt, molecular rotation of (WALDEN), A., ii, 622.
Amyl mercaptan, specific rotation of (BRJUCHONENKO), A., ii, 265.
Amylnicotinamide (PICTET and SUSSDORF), A., i, 164.
Amylodextrin, nitration and attempted recovery of; also its constitution (BROWN and MILLAR), T., 311; P., **1899**, 13.
Amyloid degeneration, chemistry of (KRAWKOW), A., ii, 42.
iso-**Amyloxychlorophosphine** (GUICHARD), A., i, 564.
p-**Amylphenol**, synthesis of (GUREWITSCH), A., i, 880.
p-*iso*-**Amylphenol**, synthesis of (MEISSEL), A., i, 880.
iso-**Amylphosphinic** and *iso*-**Amylphosphinous acids** (GUICHARD), A., i, 564, 565.
1-*iso*-**Amylpipecoline**, and its salts, rotation of (HOHENEMSER and WOLFFENSTEIN), A., i, 937.
iso-**Amylpiperidine oxide** and *iso*-**Amylpiperidinesulphonic anhydride** (AUERBACH and WOLFFENSTEIN), A., i, 936.
Amyl-radicle, optical activity of, influence of elements on (WALDEN), A., ii, 537.
iso-**Amylsuccinic acid** (*heptanedicarboxylic acid*) and salts (FITTIG and SCHIRMACHER), A., i, 338.
  and action of methylic iodide on, in presence of sodium ethoxide (LAWRENCE), P., **1899**, 163.
  β-cyano-, ethylic salt, and hydrolysis (LAWRENCE), P., **1899**, 163.
iso-**Amylthiochlorophosphine** and *iso*-**Amylthiophosphinic acid**, ethylic salt (GUICHARD), A., i, 564, 565.
iso-**Amylxanthic acid** potassium salt, electrolysis of solutions of (SCHALL and KRASZLER), A., i, 414.
Anabsinthin from *Artemisia absinthium* (TRILLAT), A., i, 377.
Anæmia, pernicious, action of arsenic in (STOCKMAN and GREIG), A., ii, 167.
Anagyrine, and *di*bromo-derivative (KLOSTERMANN), A., i, 960.
Analcite from Caucasus (GLINKA), A., ii, 672.
Analysis, organic, use of compressed oxygen and soda-lime in (BENEDICT and TOWER), A., ii, 520.
  estimation of traces of iodine in (BOURCET), A., ii, 516.
  estimation of nitrogen in (HOPKINS), A., ii, 611.
  estimation of nitrogen in electrolytically (BUDDE and SCHOU), A., ii, 693.
  estimation of sulphur, chlorine, bromine, and iodine (LONGHI), A., ii, 328.
Analysis, quantitative, without using hydrogen sulphide (RAWITSCH), A., ii, 578.
Anatase ("favas") from Brazil (HUSSAK), A., ii, 432.
  from Dublin (O'REILLY), A., ii, 497.
Andesite from Santorin, secondary minerals in (LACROIX), A., ii, 305.
Anemonin and **Anemonolic acid** (MEYER), A., i, 930.
Anethoil, action of ozone on (OTTO), A., ii, 282.
Anglesite from Sardinia (MILLOSEVICH), A., ii, 492.
Anhalamine, presence of, in *Anhalonium Lewinii* heads (KAUDER), A., i, 650.
Anhalonine, physiological action of (DIXON), A., ii, 681.
Anhydracetonebenzil, condensation of, with benzaldehyde, cuminaldehyde, cinnamaldehyde, and benzil (JAPP and FINDLAY), T., 1023; P., **1899**, 164.

- **Anhydracetonebenzil-β-carboxylic acid,** condensation of, with benzaldehyde (Japp and Findlay) T., 1025 ; P., **1899**, 65.
- **Anhydracetonedibenzil** (Japp and Findlay), T., 1025 ; P., **1899**, 164.
- **Anhydride,** $C_{11}H_{12}O_4$, from nitrosocorydaldine (Dobbie and Lauder), T., 674 ; P., **1899**, 129.
  - $C_{13}H_{18}O_4$, from action of ethylic sodiomalonate on pulegone (Vorländer and Gärtner), A., i, 259.
- **Anhydrides,** conductivity of salt solutions in (Kahlenberg and Lincoln), A., ii, 397.
  - of dibasic organic acids, condensation with sodium derivatives of phenols (Schryver), T., 661 ; P., **1899**, 121.
- *α*-**Anhydrobenzillævulic acid**, condensation of, with benzaldehyde, (Japp and Findlay), T., 1024 ; P., **1899**, 164.
- **Anhydrobisdiketohydrindene** (*bindone*) (Wislicenus), A., i, 219.
- **Anhydrobis-β-hydrindone** (Heusler and Schieffer), A., i, 365.
- **Anhydrocamphoronic acid,** sodium, silver, and methylic salts : constitution (Aschan), A., i, 69.
- **Anhydrodiacetylpicrotin** (Meyer and Bruger), A., i, 227.
- **Anhydrodigitoxigenin** (Kiliani), A., i, 71.
- **Anhydroecgonine,** constitution of (Willstätter and Müller), A., i, 178.
- **Anhydrohomocamphoronic acid** (Lapworth and Chapman), T., 998 ; P., **1899**, 160.
- **Anhydro-*p*-hydroxy-ψ-cumylic** bromide, bromo-, its acetate, and *di*bromo- (Auwers and Ercklentz), A., i, 35.
- **Anhydro-*p*-hydroxymesitylic alcohol,** *di*bromo-, bromide of (Auwers and Allendorff), A., i, 32.
- **Anhydro-*p*-hydroxy-*o*-xylylic** bromide, *tri*bromo- (Auwers and de Rovaart), A., i, 34.
- *p*-**Anhydrohydroxylaminobenzylic alcohol**, polymeride of (Löb), A., i, 122.
- **Anhydroindoneresorcinol ether** and its acetyl derivative (Liebermann), A., i, 523.
- **Anhydro-*α*-naphthaquinoneresorcinol** and its acetyl derivative (Liebermann), A., i, 523.
- **Anhydropicrotin,** nitro- (Meyer and Bruger), A., i, 227.
- **Anhydrosaligenin** bromide, bromo-, and *di*bromo- (Auwers and Büttner), A., i, 37.
- **Anilides,** action of fuming nitric acid on (Kunz-Krause), A., i, 591.
- **Aniline,** depression of freezing point of *o*-nitrophenol by (Ampola and Rimatori), A., ii, 353.
  - influence of, on the boiling point of liquid ammonia (Franklin and Kraus), A., ii, 202.
  - and water, mutual solubilities of (Herz), A., ii, 83.
  - equilibrium between water, phenol, and (Schreinemakers), A., ii, 739.
  - aminolytic constant of, in presence of various acids (Goldschmidt and Salcher), A., ii, 551.
  - absorption of argon by (Berthelot), A., ii, 653.
  - vapour, action of electric glow discharge on mixtures of, with oxygen (Mixter), A., ii, 267.
  - action of substituents on (Armstrong), P., **1899**, 176.
  - action of ozone on (Otto), A., ii, 282.
  - behaviour of, towards fused alkali nitrates (Nägeli), A., i, 916.
  - oxidation of (Bamberger and Tschirner), A., i, 347.
  - direct oxidation of, to phenylhydroxylamine (Bamberger and Tschirner), A., i, 687.
  - colouring matters obtained from, by action of titanium chloride (Kling), A., i, 429.
  - condensation of, with *αδ*-*di*bromopentane (Scholtz and Friemehlt), A., i, 541.
  - and *p*-bromo-, and *p*-nitro-, velocity of diazotisation of (Hantzsch and Schümann), A., ii, 550.
  - compounds of, with metallic salts (Matthews), A., ii, 296.
  - hydrochloride, action of chromic acid on (Oechsner de Coninck), A., i, 244.
  - mercurichlorides (Swan), A., i, 38.
  - phosphate (Klages and Lickroth), A., i, 599.
  - stannochlorides and stannichloride (Slagle), A., i, 39.
  - zincochlorides and zinco-bromide (Base), A., i, 40.
  - estimation of (Denigés), A., ii, 826.
  - estimation of, volumetrically (François), A., ii, 713.
- **Aniline,** *β*-*tri*bromo-, from action of bromine on hydrogen potassium anilinedisulphonate (Bagnall), T., 281.
  - *p*-chloro-, and 2 : 4-*di*chloro-, from *p*-nitrophenylhydrazine (Hyde), A., i, 689.
  - 2 : 4 : 6-*tri*chloro-, 2 : 4-*di*chloro-, *p*-chloro-, and *exo*-*di*chloro- (Bamberger, Büsdorf, and Szolayski), A., i, 341, 342.

Aniline, 2-chloro-6-iodo-4-nitro- (Willgerodt), A., i, 586.
 m-nitro-, electrolytic reduction of (Elbs and Kopp), A., i, 270.
  condensation of with *a*δ-*di*bromopentane (Scholtz and Friemehlt), A., i, 541.
  estimation of, in paranitraniline (Liebmann), A., ii, 66.

Anilinedisulphonic acid, hydrogen potassium salt, and action of bromine on (Bagnall), T., 281.

Aniline oils and **Aniline salt**, analysis of (Liebmann and Studer), A., ii, 583.

Aniline-Red, *p*-nitro- (Liebmann), A., ii, 65.

Anilinoacetamidoquinone (Kehrmann and Bahatrian), A., i, 31.

Anilinoacetic acid, nitroso-, and its phenylhydrazide (Fischer), A., i, 349.

γ-Anilinoacridine (Fischer and Demeler), A., i, 635.

3-Anilino-2-aminophenyl*iso*naphthaphenazonium chloride (Kehrmann and Levy), A., i, 238.

Anilinoaminoquinone (Kehrmann and Bahatrian), A., i, 31.

Anilinobenzoic acid. See Diphenylamine-*o*-carboxylic acid.

Anilinobenzylacetoacetic acid oxime and phenylhydrazone, ethylic salts (Bertini), A., i, 896, 897.

Anilinobenzylbenzylideneacetone (Bertini), A., i, 896.

β-Anilino-*a*-carboxyglutaric acid, triethylic salt (Guthzeit and Laska), A., i, 260.

Anilinochloropropionitrile (Eibner), A., i, 41.

Anilinodibenzyl ketone anilide (Francis), T., 870.

Anilinodimethylacetoacetic acid, ethylic salt (Conrad and Hock), A., i, 632.

γ-Anilinodimethylacetoacetic acid, methylic salt (Conrad and Gast), A., i, 258.

Anilinohydroxyquinone (Kehrmann and Bahatrian), A., i, 31.

Anilinohydroxyquinoneanilide. nitro-, [1 : 2 : 6 : 4 : 5] (Kehrmann and Idzkowska), A., i, 493.

Anilinonaphthaphenosaffranine, and its piperidine and *m*-tolylenediamine derivatives (Schaposchnikoff), A., i, 432.

Anilinonaphthaquinonesulphonic acid, aniline salt (Gaess), A., i, 375.

Anilinopentane, *a*δ-*di*-*o*-nitro- (Scholtz and Friemehlt), A., i, 541.

3′-Anilino-β-phenotriazone (König and Reissert), A., i, 457.

2′ : 4′-Anilino-3′-phenyldihydroquinazoline, and **2′-Anilino-3′-phenyl-4′-ketotetrahydroquinazoline** and its 1′-methyl derivative (McCoy), A., i, 360.

3-Anilinophenyl*iso*naphthaphenazonium chloride, 2″-amino- (Kehrmann and Ravinson) A., i, 526.

Anilinophenyl*apo*saffranine (Schaposchnikoff), A., i, 432.

a-Anilinopropionitrile, *p*-chloro- and *p*-nitro- (Eibner), A., i, 41.

2-Anilinopyridine, and methiodide, and methochloride (Fischer, Hoerger, and Jaeger), A., i, 634.

Animals, presence of manganese in (Pichard), A , ii, 40.

Animal charcoal, rate of filtration of water or alcohol through (Hausser), A., ii, 277.
 estimation of carbonic anhydride in (Schenke), A., ii, 809.

Animal tissues, estimation of fat in (Nerking), A., ii, 191; (Knopfelmacher), A., ii, 821.

Anisaldehyde (*o-methoxybenzaldehyde*), condensation of, with 2-acetyl-1-naphthol (Keller and von Kostanecki), A., i, 524.
 cyanhydrin, condensation product of, and its *di*bromo- and *di*nitro-derivatives (Minovici), A., i, 890.
 hydrazone (Bouveault), A., i, 288.

Anisaldime hydrochloride (Busch and Wolff), A., i, 951.

p-**Anisamide**, *o*-chloro-, and *o*-bromo-, (Gattermann and Rölofsen), A., i, 510.

Anisamidine, condensation of, with ethylic acetoacetate and acetylacetone (Gabriel and Colman), A., i, 639.

Anisic acid, formation of (Bouveault), A., i, 287.
 *di*chloro- (Bertozzi), A., i, 877.

o-**Anisidine**, *p*-nitro-, and its acetyl derivative (Meldola), P., **1898**, 226.

p-**Anisidine**, *o*-bromo-, preparation of, and salts (Benevento), A., i, 349.

Anisil-*a*-osazone, and **-β-osazone** (Biltz and Wienands), A., i, 910.

Anisoil, synthesis of (Moureu), A., i, 495.
 absorption of argon by (Berthelot), A., ii, 653.

o- and *p*-**Anisoilsulphinic acids** (Gattermann), A., i, 517.
 amides and anilides (Gattermann), A., i, 518.

ab-**Anisoylbenzylthiocarbamide**, *ab*-**Anisoylethylthiocarbamide**, *ab*-**Anisoylethylurea**, *ψn*-**Anisoylethylurea**, *ab*-**Anisoylmethylthiocarbamide**, *n*-**Anisoyl**-*v*-**phenylbenzylthiourea**, *ab*-**Anisoylphenylthiocarbamide**, **Anisoylthiocarbimide**, **Anisoylthiohydantoin**, **Anisoylthiourea**, **Anisoylthiourethane**, *ab*-**Anisoyl**-*o*- and -*p*-**tolylthiocarbamides** (Dixon), T., 385—388; P., **1899**, 53, 54.

o-**Anisyldithiocarbazinic acid** (Busch and Best), A., i, 955.

o-**Anisyldithiodiazolonethiol** and its disulphide (Busch and Münker), A., i, 953.

2-Anisylideneacetyl-1-naphthol and its acetyl derivative (Keller and von Kostanecki), A., i, 524.

p-**Anisylidenecoumaranone** (Herstein and von Kostanecki), A., i, 370.

Anisylidenediacetoacetic acid ethylic salt (Knoevenagel and Goecke), A., i, 215.

Anisylidene-4-ethoxy-2-hydroxyacetophenone and acetyl derivative and dibromide (von Kostanecki and Osius), A., i, 370.

Anisylidene-2-hydroxyacetophenone and acetyl derivative and dibromide (Herstein and von Kostanecki), A., i, 369.

Anisylidenemalonic acid, preparation of (Knoevenagel), A., i, 145.
  ethylic salt (Knoevenagel and Groos), A., i, 117.

Anisylidenepæonol, and its acetyl derivative (von Kostanecki and Osius), A., i, 370.

Anisyl methyl ketone (Reychler), A., i, 55.

o-**Anisylmethylthiodiazolinethiol** (Busch and Best), A., i, 955.

2-Anisylmethylthiosemicarbazide (Marckwald), A., i, 505.

o-**Anisylpentahydro-1 : 3 : 5-dithiodiazine**, and hydrochloride and acetyl derivative (Busch and Best), A., i, 955.

2-Anisylphenylthiosemicarbazide, (Marckwald), A., i, 505.

Annabergite from Sicily (La Valle), A., ii, 495.

Annual General Meeting, T., 1167; P., **1899**, 77.

Anorthoclase from the Transvaal (Henderson), A., ii, 111.

Anthracene, formation of (Kroczmař), A., i, 144; (Mouneyrat), A., i, 490.
  examination of, possible error in (Bassett), A., ii, 815.

Anthracite, origin of (Cohen), A., ii, 113.

Anthragallol (1 : 2 : 3-*Trihydroxyanthraquinone*) *mono*-potassium, sodium, barium, and calcium, salts of, and action of alcoholic potash on (Perkin), T., 435; P., **1899**, 65.
  ethylic ether (Perkin), T., 446; P., **1899**, 66.

Anthranilic acid (*o-aminobenzoic acid*), products of the action of acetonitrile on (Mathews), A., i, 57.
  methylic salt, in oil of Neroli (Walbaum), A., i, 620, 621; (E. and H. Erdmann), A., i, 621.
    ethylic salt, hydrochloride and benzoyl derivative of (E. and H. Erdmann), A., i, 621.

Anthraphenone (Lippmann and Fleissner), A., i, 918.

Anthrapurpurin, potassium derivative of (Perkin), P., **1899**, 65.

Anthraquinone group of colouring matters, salts of (Perkin), T., 435; P., **1899**, 65.

Anti-albumid, hydrolysis of, to form pigments (Chittenden and Albro), A., i, 468.

Antimony cathodes, pulverisation of, during electrolysis (Bredig and Haber), A., ii, 78.
  action of, on sulphuric acid (Adie), P., **1899**, 133.

Antimony alloys, with calcium (Moissan), A., ii, 153; (Tarugi), A., ii, 749.
  with lead and tin (Stead), A., ii, 32, 33.

Antimony salts, reduction of, by hypophosphorous acid and palladium (Engel), A., ii, 750.
  reduction of, with calcium carbide (Tarugi), A., ii, 749.

Antimony *tri*chloride, conductivity of solutions of, in various solvents, molecular weight of, in nitrobenzene (Kahlenberg and Lincoln), A., ii, 397.
  lead iodide (Mosnier), A., ii, 222.
  *tri*oxide, action of oxalic acid and alkali oxalates on (Rosenheim and Bierbrauer), A., i, 570.
    alkaline solution of, action of, on metallic salt solutions (Harding), A., ii, 490.
  Antimonic acids and *pent*oxide (Senderens), A., ii, 557.
  *tri*sulphide, analysis of (Kitzing), A., ii, 525.
    separation of lead sulphide from (Moyer), A., ii, 697.
  *penta*sulphide (Klenker), A., ii, 490, 557.

Antimony potassium, sodium, and ammonium sulphates (Gutman), A., ii, 33, 34.

Antimony organic compounds:—
  Antimonylcatechol acetate and fluoride (Causse), A., i, 362.
  Antimonylgallic acid hydroxide, and its salts (Causse), A., i, 362.
  Antimonylpyrogallol hydroxide, and its salts (Causse), A., i, 362.

Antimony, detection, estimation, and separation of:—
  detection of (Ducommun), A., ii, 338.
  estimation of, in alloy, with tin (Fraenkel), A., ii, 524.
  estimation of, in presence of copper, lead, and phosphorus (Fraenkel), A., ii, 524.
  estimation of arsenic in (Ducru), A., ii, 124.
  estimation of tin in (Pattinson and Pattinson), A., ii, 62.
  separation of bismuth, cadmium, copper, lead, and silver from (Atkinson), A., ii, 615.
  separation of copper from (Lucas), A., ii, 523.
  separation of mercury from (Jannasch and Devin), A., ii, 59.
  separation of tin from (Bornemann), A., ii, 615.

Antipeptone, constituents of (Kutscher), A., i, 179.
  properties and purification of (Siegfried), A., i, 784.

Antipyrine (1-*phenyldimethylpyrazolone*), velocity of crystallisation of (Bogojawlensky), A., ii, 206.
  action of iodine on (Bougault), A., ii, 193.
  double salicylates of metals and (Schuyten), A., i, 306.
  estimation of (Bougault), A., ii, 193.

Antipyrine chloropyrazole (Michaelis and Röhmer), A., i, 233.

Antitoxin of snake venom, mode of action of (Martin), A., ii, 782.

Antitoxins, mode of action of (Cobbett), A., ii, 680.
  cause of physiological antagonism of, to toxins (Martin and Cherry), A., ii, 234.

Apatite, solubility of, in water, and in water saturated with carbon dioxide (Joffre), A., ii, 420.

Apigenin, action of potassium acetate on (Perkin), T., 441; P., **1899**, 66.

Apiole, specific heat, heat of fusion, and velocity of crystallisation of (Tammann), A., ii, 549.

Aplysiopurpurin, separation from *Aplysia punctata*, and properties of (MacMunn), A., ii, 313.

Apophyllite, from Minnesota (Berkey), A., ii, 371.

Aquilegia vulgaris, distribution of hydrocyanic acid in (Hébert), A., ii, 378.

Arabic acid, from gum of opoponax (Tschirch and Knitl), A., i, 714.

Arabinose from the hydrolysis of gentian-root pectin (Bourquelot and Hérissey), A., i, 93.
  oxidation of, by hydrogen peroxide; also hydrazone and osazone (Morrell and Crofts), T., 790; P., **1899**, 99.
  oxidation of, by sorbose bacterium (Bertrand), A., ii, 170.
  estimation of mannose in presence of (Bourquelot and Hérissey), A., ii, 817.

d- and *r*-**Arabinose**, reduction and oxidation of (Ruff), A., i, 324.

Arabitol, condensation of benzaldehyde with (de Bruyn and Alberda van Ekenstein), A., i, 662.

d- and *r*-**Arabitol** and *d*- and *r*-**Arabonic acids** and their lactones (Ruff), A., i, 324.

Arachidic acid, amount of, in rape and mustard oils (Archbutt), A., ii, 340.
  metabolism of, in earth-nuts during germination (Maquenne), A., ii, 171.
  estimation of, in earth-nut oil (Archbutt), A., ii, 260.

Arachis, seeds of. See Agricultural chemistry.

Arachis oil, detection of, in olive oil (Vierth), A., ii, 583.

Arbacin, reactions of (Bang), A., i, 836.

Arbutin, action of moulds on (Puriewitsch), A., ii, 683.

Archil, use of, in alkalimetry (Glaser), A., ii, 573.

Argentite from Sardinia (Traverso), A., ii, 760.

Arginine, purification of, and its *di*-benzoyl and other derivatives (Gulewitsch), A., i, 833.
  hydrolysis of, and constitution (Schulze and Winterstein), A., i, 107.
  a proteid compound of (Susuki), A., ii, 793.

Argols, estimation of tartaric acid in (Eckstein; Schäfer), A., ii, 70.

Argon in a cerium mineral from the Caucasus (Tschernik), A., ii, 669.
  in helium from samarskite and cleveite (Ramsay and Travers), A., ii, 22.

Argon, nature of (Brauner), A., ii, 360.
  position of, in the periodic system (Brookes), A., ii, 552; (Piccini), A., ii, 645; (Howe), A., ii, 740.
  molecular weight of (Berthelot), A., ii, 207.
  preparation of (Ramsay), A., ii, 211.
  preparation, density and refraction of (Ramsay and Travers), A., ii, 746.
  density of (Ramsay), A., ii, 745.
  diffusion of, through caoutchouc membrane (Kistiakowski), A., ii, 730.
  mixture of, with carbon disulphide, effect of silent electric discharge on (Berthelot), A., ii, 648.
  absorption of, by organic compounds, under influence of silent electric discharge (Berthelot), A., ii, 653.
  action of, on mercury dimethyl and mercury diphenyl (Berthelot), A., i, 471.
Aroideæ, absence of hydrocyanic acid in (Hébert), A., ii, 377.
Aromatic allylic and propenylic ethers (Moureu), A., i, 427.
Arsenic, mirror and yellow, formation of (Linck), A., ii, 416.
  cathodes, pulverisation of, during electrolysis (Bredig and Haber), A., ii, 78.
  action of, on sulphuric acid (Adie), P., **1899**, 133.
  action of, on bone marrow and blood (Stockman and Greig), A., ii, 167.
  compound of, with calcium (Moissan), A., ii, 153.
Arsenic alloys, with tin (Stead), A., ii, 33.
Arsenic salts, reduction of, by calcium carbide (Tarugi), A., ii, 749.
Arsenic *tri*chloride, conductivity of salt solutions in; molecular weight of, in nitrobenzene (Kahlenberg and Lincoln), A., ii, 397.
  lead iodide (Mosnier), A., ii, 222.
  mercuride. See Mercury arsenide.
  *tri*hydride, preparation of (Saunders), A., ii, 286.
  *tri*oxide. See Agricultural chemistry.
  Arsenious acid, electrolytic oxidation of (Tommasi), A., ii, 138.
  Arsenic acid, action of, on algæ (Bouilhac), A., ii, 238.
  Thioxyarsenic acids, mono- and di-, preparation of (McCay), A., ii, 745.
  compounds of, with oxygen, sulphur, selenium, and tellurium (Szarvasy and Messinger), T., 597; P., **1899**, 123.
  compound of, with sodium and ammonia (Hugot), A., ii, 151.
Arsenic *tri*sulphide, colloidal solutions of, coagulation of, by zinc chloride (Stark), A., ii, 644.
  separation of lead sulphide from (Moyer), A., ii, 697.
  thallium sulphide (Loczka), A., ii, 100.
  Octarsenotritelluride (Szarvasy and Messinger), T., 598; P., **1899**, 123.
Arsenic, detection, estimation, and separation of:—
  detection of (Ducommun), A., ii, 338.
  detection of, in carpets (Rössler), A., ii, 530.
  detection of, in coal-tar colours (Ortmann), A., ii, 181.
  estimation of (Pattinson and Pattinson), A., ii, 56.
  estimation of, in antimony and other metals (Ducru), A., ii, 124.
  estimation of, in glycerol (Bennett), A., ii, 519.
  estimation of, in ores (Bennett), A., ii, 519.
  separation of copper from (Remy), A., ii, 127.
  separation of cadmium, cobalt, copper, lead, and silver from (Atkinson), A., ii, 615.
  separation of mercury from (Jannasch and Devin), A., ii, 59.
Arsenides, preparation of (Granger), A., ii, 211.
Artichokes. See Agricultural chemistry.
Artolin from wheat-gluten, and its hydrochloride (Morishima), A., i, 466.
Arzrunite from Chili (Arzruni, Thaddéeff and Dannenberg), A., ii, 562, 563.
Asarone. See 1 : 2 : 4 : 5-Trimethoxypropenylbenzene.
Asarylic aldehyde (Gattermann and Eggers), A., i, 347.
Asbestos from Canada and South Africa (Kersting), A., ii, 765.
  from Lombardy (Brugnatelli), A., ii, 372.
  filter (Goske), A., ii, 16; (Lohse), A., ii, 801.
Asbolane from Sicily (La Valle), A., ii, 495.
Asbolite from New South Wales (Jaquet), A., ii, 162.
Ashes, estimation of calcium and magnesium in (Haywood), A., ii, 612.
Asparagine, presence of, in the broad-bean (Bourquelot and Hérissey), A., ii, 325.
  formation of, in plants (Schulze), A., ii, 240.
  configuration of (Walden), A., ii, 539.

Asparagine, action of formaldehyde on (Schiff), A., i, 870.
  influence of, on the hydration of calcium oxide (Rohland), A., ii, 596.
  See also Agricultural chemistry.
Aspartic acid (*aminosuccinic acid*), presence of, in antipeptone (Kutscher), A., i, 179.
  configuration of (Walden), A., ii, 539.
Aspergillus niger, composition of (Marschall), A., ii, 44.
  the respiratory quotient of, in nutrient media (Puriewitsch), A., ii, 785.
  the fungose of, and yield of chitin (Tanret), A., ii, 171.
Asphalt from U.S.A. (Taff), A., ii, 756.
  artificial production of (Day), A., ii, 559.
  analysis of (Peckham), A., ii, 63.
  estimation of sulphur in (Herting), A., ii, 804.
Aspidiophylls, presence of, in *Aspidium filix fœmina* (Étard), A., ii, 792.
Aspidium filix mas, constituents of oil from rhizome of (Katz), A., ii, 324.
Aspirator, automatic glass valve for (Rosenheim), A., ii, 552.
Aspirin (*acetylsalicylic acid*), physiological action of (Dreser), A., ii, 605.
Association. See Affinity, chemical.
Asterium, spectrum of (Lockyer), A., ii, 4.
Asymmetry, product of, and maximum rotation of ethereal salts (Frankland), T., 351.
Atmospheric air, ionic charges produced in, by Röntgen rays (Townsend), A., ii, 730.
  depression of freezing point of water by dissolved (Raoult), A., ii, 203.
  viscosity of (Breitenbach), A., ii, 403.
  vapour pressure of, at the temperature of boiling hydrogen (Dewar), A., ii, 741.
  compressibility of (Berthelot and Sacerdote), A., ii, 404.
  compressed, pump for preparing (Bourcet and Berlemont), A., ii, 413.
    solution of bromine in (Villard), A., ii, 143.
  liquid, sp. gr. and composition of (Ladenburg and Krügel), A., ii, 208.
    manufacture of (Linde), A., ii, 414.
  chlorides and iodine in (Gautier), A., ii, 592, 593.
  carbon dioxide in, at different altitudes (De Thierry), A., ii, 653.
  carbon dioxide in, and the oxidation of organic matter contained in (Lévy and Henriet), A., ii, 94.
Atmospheric air, presence of hydrogen in (Gautier), A., ii, 149.
  estimation of traces of hydrogen sulphide in (Lehmann), A., ii, 53.
Atomic theory, origin of Dalton's (Debus), A., ii, 645; (Kahlbaum), A., ii, 740.
Atomic weight of argon (Berthelot), A., ii, 207.
  of carbon (Dewar), P., **1898**, 175; (Berthelot), A., ii, 207.
  of chlorine (Berthelot), A., ii, 207.
  of cobalt (Richards and Baxter), A., ii, 753.
  of hydrogen (Dewar), P., **1898**, 175; (Leduc), A., ii, 475, 729.
  of nickel (Richards and Cushman), A., ii, 488.
  of nitrogen (Dean; Dewar), P., **1898**, 174; (Berthelot), A., ii, 207.
  of oxygen (Dewar), P., **1898**, 175; (Keiser), A., ii, 88; (Leduc), A., ii, 475.
  of praseodymium and neodymium (Jones), A., ii, 292.
  of selenium (Lenher), A., ii, 18.
  of silver, and of sulphur (Berthelot), A., ii, 207.
  of tellurium (Wilde), A., ii, 148.
  of tungsten (Thomas), A., ii, 489.
  of victorium (Crookes), A., ii, 751.
Atomic weights, recalculation of, by the method of limiting density (Berthelot), A., ii, 207.
  table of (Landolt, Ostwald, and Seubert), A., ii, 86.
Atranoric acid from various lichens (Zopf), A., i, 717.
Atranorin, presence of, in various lichens (Hesse), A., i, 381—386.
Atropine, occurrence and chemistry of (Pinner), A., i, 178.
  action of *o*-xylylenic bromide on (Scholtz), A., i, 649.
  *ennea*iodide, and *mono*- and *di*-hydriodide mercuric iodides (Prescott), A., i, 89.
apo-**Atropine**, chemistry of (Pinner), A., i, 178.
Atropine alkaloids, absence of scopolamine from (Merck), A., i, 91.
Atroscine (*atrascine*, *i-scopolamine*, *inactive hyoscine*), occurrence and chemistry of (Pinner), A., i, 178.
  (Hesse), identity of, with *i*-scopolamine (Gadamer), A., i, 91; (Merck), A., i, 91.
Auerbachite from Russia (Jereméeff), A., ii, 673.
Augite, from Rhön Mountains (Seyfried), A., ii, 162.
  artificial (Morozewicz), A., ii, 763.

Augite and hornblende, intergrowth of, from Colorado (EAKINS), A., ii, 564.
Auramine, formation of (WEINMANN), A., i, 204.
  constitution of (GRAEBE), A., i, 702.
"**Auxochrome**" groups and derivatives (KAUFFMANN), A., ii, 464.
Azaurolic acid, from reduction of ethylnitrolic acid and its erythro-salts (GRAUL and HANTZSCH), A., i, 188.
Azelaic acid and potassium salts, thermochemistry of (MASSOL), A., ii, 353.
  action of soda-lime on (MILLER and TSCHITSCHKIN), A., i, 789.
  ethylic salt (MILLER), A., i, 791.
Azelaone (cyclo*octanone*) (MILLER and TSCHITSCHKIN), A., i, 789.
Azinecarbonic acid, methylic salt (THIELE), A., i, 171.
o-**Azoanisoil** (STARKE), A., i, 589.
Azobenzene, depression of freezing point of dibenzyl by; cryoscopic behaviour of, in benzylaniline solution (GARELLI and CALZOLARI), A., ii, 732.
  osmotic pressure of ethereal solutions of (GOODWIN and BURGERS), A., ii, 273.
  action of potassium dichromate and sulphuric acid on (OECHSNER DE CONINCK), A., i, 473.
  action of substituents on (ARMSTRONG), P., **1899**, 176.
  hydrobromide, *p*-amino- (BISCHOFF and PUREWITSCH), A., i, 231.
Azobenzene-*p*-carboxylic acid, methylic and ethylic salts (JACOBSON and STEINBRENK), A., i, 276.
Azo-compounds, rate of formation of, in presence of various acids (GOLDSCHMIDT and BÜRKLE), A., ii, 276.
Azo-compounds. See preceding entries, and also:—
  Acetalazinetetrasulphonic acid.
  Acetoxybenzeneazohydroxyphenylmethylbenzoxazole.
  Allophanazide.
  Allophanylazobutyronitrile.
  p-Aminoazobenzenehydrobromide.
  Azotriazole.
  p-Azoxyanisoil.
  Azoxybenzene.
  Azoxyphenetoil.
  Benzaldehydine-azophenol.
  Benzamidoazoresorcinol.
  Benzeneazoacetic acid.
  Benzeneazoacetoacetic acid.
  Benzeneazodimethylindazole.
  Benzeneazodiphenylimidocarbamide.
  Benzeneazo-*p*-ethoxybenzeneazophenol.
  Benzeneazohydroxydimethylbenzoxazole.

Azo-compounds. See:—
  Benzeneazohydroxymethylbenzoxazole.
  Benzeneazohydroxyphenylmethylbenzoxazole.
  3'-Benzeneazoindazole.
  Benzeneazo-*p*-methoxybenzeneazophenol.
  Benzeneazomethylphloroglucinolazobenzene.
  Benzeneazophenol.
  Benzeneazostyrene.
  Benzenylazoxime.
  Benzoylazobenzene.
  Benzoyloxybenzeneazohydroxyphenylmethylbenzoxazole.
  Bisethylicacetoacetateazodiphenyldicarboxylic acid.
  Bisphenolazodiphenyldicarboxylic acid.
  iso-Butaldazine.
  iso-Butylideneazine.
  Butyramidoazobenzene.
  Diazoacetic acid.
  Diazoacetonitrile.
  Diazoaminoindazole.
  Diazoaminopyridine.
  Diazobenzene.
  iso-Diazobenzene-sodium.
  Diazobenzenesulphonic acid.
  Diazobenzoic acid.
  Diazodimethylindazole hydroxide.
  Diazoethane.
  Diazoguanidine.
  Diazoindazole hydroxide.
  Diazomethane.
  Diazosulphanilic acid.
  Diazotates.
  Diazotolueneimide.
  Diazotriazolecarboxylic acid.
  Diazouracils.
  Diazourethanes.
  Diazo-xyleneimide.
  Dibenzenylazoxime.
  Diethylaminophenylcyanazomethinephenyl.
  Diethyl-*o*-phenetidineazobenzene.
  Digallacylosazone.
  Dimethylaminophenylcyanazomethinephenyl.
  Dimethylindazoleazo-β-naphthol.
  Dimethyltolueneazammonium silver iodide.
  Diphenyltriazine.
  Disazo-dyes.
  Guanazylmethane.
  Guanidinecarboxylazide.
  Hydrazobenzene.
  Hydroxyazobenzene.
  Hydroxybenzylideneazine.
  α-Hydroxy*iso*butyramidoazobenzene.
  Indazoleazo-β-naphthol.

Azo-compounds. See :—
  Indazolylazodimethylaniline.
  Indazolylazo-β-naphthol.
  Mesitylazodimethylindazole.
  Methoxybenzeneazophenol.
  p-Methoxybenzeneazophenylmethylbenzoxazole.
  β-Methyladipic acid, azide of.
  Methylazimino-xylene.
  Methylnitrosaminotolueneazonaphthylamine.
  Methylnitrosamino-*s*-xyleneazo-β-naphthylamine.
  Methyltriazoleazodimethylaniline.
  Methyltriazoleazo-β-naphthylamine.
  β-Naphtholazo-dyes.
  Naphthoylazomethylene.
  Phenantriazine.
  Phenylaziminobenzenes.
  Phenylazochromotropic acid.
  Phenylazoethane.
  Phenylazoglutaconic acid.
  Phenylazopentane.
  Phenylazopropane.
  Phenylazo-xylene.
  Phenylmethylbenzeneazo-5-pyrazolone.
  Picrylazo-α-xylene.
  Propionamidoazobenzene.
  Pyridineazoresorcinol.
  Saloloxyphosphazophenyl.
  Tetrazodianisyl.
  Tetrazodianisylsulphonic acid.
  Tetrazodiphenyldicarboxylic acid.
  3′-*o*-Tolueneazoindazole.
  Tolyl-ψ-aziminobenzene.
  Triazoleazodimethylaniline.
  Trimethylbenzimidazoleazonaphthylamine.
  iso-Valeramidoazobenzene.
  3′-*m*-Xylene-*p*-azo-3-methylindazole.
  Xylyl ψ-aziminobenzene.
  Xylylazobenzene.
Azodicarbonanilide (Curtius and Burkhardt), A., i, 137.
Azoimide, preparation of (Curtius and Rissom), A., ii, 90; (Sabanéeff and Dengin), A., ii, 365; (Tanatar), A., ii, 479.
Azonium bases, properties of (Schaposchnikoff), A., i, 431.
  compounds from benzil (Kehrmann and Natcheff), A., i, 81.
Azotetrazole, derivatives of (Thiele), A., i, 170.
p-**Azotoluene**, formation of (Löb), A., i, 123.
  m-*di*amino-, melting points of (Elbs and Schwarz), A., i, 270.
Azotriazole (Thiele and Manchot), A., i, 168.
o-**Azoxyanisoil** (Starke), A., i, 589.
p-**Azoxyanisoil**, specific inductive capacity of, in liquid and crystalline-liquid state (Abegg and Seitz), A., ii, 623.
  heat of transition of, from crystalline-liquid to isotropic form, and critical point of (Hulett), A., ii, 468.
  transition temperature of, and influence of benzophenone on; solutions of *p*-azoxyphenetoil in (Schenck and Schneider), A., ii, 637.
  transition point of (Schenck), A., ii, 360.
Azoxybenzene, formation of (Bamberger and Tschirner), A., i, 348; (Fischer), A., i, 349.
  constitution of (Lachmann), A., i, 588.
Azoxybenzene, *p*-*di*chloro- (Bamberger, Büsdorf, and Szolayski), A., i, 341.
  *di*nitro- (Steger), A., i, 745.
p-**Azoxyphenetoil**, heat of transition of, from crystalline-liquid to isotropic form, and critical point of (Hulett), A., ii, 468.
  solutions of, in azoxyanisoil, melting points of (Schenck and Schneider), A., ii, 637.

B.

Bacillus choleræ, *B. coli communis*, and Eberth's bacillus, action of, on dextrose and on biliverdin, bilirubin, and hæmoglobin (Hugounenq and Doyon), A., ii, 376, 377.
  coli communis, secretion of a colour-forming oxydase by (Roux), A., ii, 444.
  diphtheritidis and Löfler's bacillus, failure of Outchinsky's experiment with (Hugounenq and Doyon), A., ii, 377.
  Ellenbachensis preparation (alinite), manurial action of, on cereals (Malpeaux), A., ii, 242.
  lactis aërogenes, action of, on malic acid (Emmerling), A., ii, 569.
  tetanus solutions, molecular relations of (Ruppel and Ransom), A., ii, 443.
  tuberculosus, the chemistry of (Ruppel), A., ii, 237.
    and *B. typhosus* extracts, presence of a proteolytic enzyme in (Geret and Hahn), A., i, 95.
Bacteria, action of, on cement (Stutzer and Hartleb), A., ii, 505; (Barth), A., ii, 606.

Bacteria, action of ferric sulphate on (Müller), A., ii, 506.
  production of fluorescent pigments by (Jordan), A., ii, 318.
  solution of fibrin by, in presence of chloroform (Salkowski), A., i, 724.
  action of leucocytes on (Hardy), A., ii, 165.
  associated with algæ, fixation of nitrogen by (Bouilhac), A., ii, 238.
  denitrifying, classification of, and action on various classes of chemical compounds (Ampola and Ulpiani), A., ii, 444.
  nodule, physiology of (Dawson), A., ii, 785.
    influence of sucrose on (Golding), A., ii, 689.
  pathogenic, chemical activity of (Hugounenq and Doyon), A., ii, 376.
    in water, action of ozone on (Marmier and Abraham), A., ii, 506.
  sulphur (Hartley), A., ii, 437.
  toxic action of ethereal oils, aldehydes, and acids on (Bokorny), A., ii, 318, 786.
Bacterium aceti, *B. xylinum*, *B. rancens*, and *B. Pasteurianum*, inverting and reducing power of (Hoyer), A., ii, 784.
  denitrificans V., action of, on metallic and organic nitrites (Ampola and Ulpiani), A., ii, 444.
  of erysipelas and of swine fever, action of ferric sulphate on (Müller), A., ii, 506.
  sorbose-, action of, on xylose in yeast extract (Bertrand), A., ii, 44.
    oxidation of aldoses by (Bertrand), A., ii, 170.
    oxidative power of, and growth in beer (Emmerling), A., ii, 318.
Baddeleyite ("favas") from Brazil (Hussak), A., 432.
Baddeckite from Nova Scotia (Hoffmann), A., ii, 110.
Bæomyces roseus, constituents of (Hesse), A., i, 384.
Balance Sheet of the Chemical Society, March, **1899**, and of the Research Fund, March, **1899**. See Annual General Meeting, T., 1167.
Balm, oil of. See Melissa, oil of.
Balsam, Peru, composition of (Thoms), A., i, 715.
Barbaloin, number of hydroxyl groups in (Léger), A., i, 157.
  distinction of, from nataloins (Léger), A., i, 821.
Barbaloin, *tri*chloro-, and triacetyl- and tribenzoyl derivatives, and identity of *tri*bromobarbaloin with *tri*bromo*iso*barbaloin (Léger), A., i, 157.
iso-**Barbaloin**, and its *tri*bromo-, *tri*chloro-, triacetyl*tri*chloro-, and dibenzoyl derivatives (Léger), A., i, 157.
Barbarea præcox, glucoside and essential oil of (Gadamer), A., i, 930.
Barbatic acid from *Clectoria ochroleuca* (Zopf), A., i, 716.
Barbituric acid, nitroso- (*violuric acid*), (Hantzsch), A., i, 400; (Guichard), A., i, 781.
Barium, occurrence of, in plants and soils (Hornberger), A., ii, 506.
  solution of, in mercury (Schoeller), A., ii, 347.
  compounds in artesian well water (White), A., ii, 420.
Barium salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
Barium antimonate (Senderens), A., ii, 557.
  arsenide, preparation of (Lebeau), A., ii, 655.
  azoimide (Curtius and Rissom), A., ii, 92.
  carbonate, reduction of, by aluminium (Franck), A., ii, 103.
  chloride, electrolysis of aqueous solutions of (Bischoff and Foerster), A., ii, 89.
    thermal change on diluting saturated solutions (Pollok), P., **1899**, 8.
    dehydration of (Richards), A., ii, 8.
    absorption of water by, and hydrates of (Busnikoff), A., ii, 409.
    partition of water between sulphuric acid and (Busnikoff), A., ii, 361.
  uranium chloride and bromide (Aloy), A., ii, 556.
  hydroxide, electrolysis of aqueous solutions of (Glaser), A., ii, 79.
    transition temperature of (Richards and Briggs), A., ii, 355.
    removal of calcium and magnesium salts from natural waters by (Griffin), A., ii, 655.
  manganic iodate (Berg), A., ii, 426.
  iodide, action of, on silver nitrate dissolved in pyridine (Naumann), A., ii, 423.
  lead iodide (Mosnier), A., ii, 222.
  molybdiodate (Chrétien), A., ii, 363.
  copper thallium and nickel thallium nitrites (Przibylla), A., ii, 223.
  rhodium nitrite, and dodecarhodite (Joly and Leidié), A., ii, 34.
  hyponitrite, and hyponitrosoacetate (Divers), T., 117; P., **1898**, 224.

- **Barium** dihydrogen phosphate, decomposition of, by water at 100° (Viard), A., ii, 26.
  - sulphate in sandstones (Clowes), A., ii, 761.
  - sulphide, phosphorescence of (Mourelo), A., ii, 420.
  - *per*tantalate (Melikoff and Pissarjewsky), A., ii, 491.
  - *tetra*tungstate, reduction of (Granger), A., ii, 32.
  - *hexa*tungstoperiodate (Rosenheim and Liebknecht), A., ii, 744.
  - *per*uranate, action of carbonic anhydride on (Melikoff and Pissarjewsky), A., ii, 31.
- **Barium organic compounds :—**
  - *iso*butylic sulphate, decomposition of (Biron), A., i, 408.
  - platinocyanide, preparation of (Bergsöe), A., i, 320.
- **Barium, estimation and separation of :—**
  - estimation of, in presence of calcium and strontium (Knobloch), A., ii, 182.
  - separation of selenium from (Jannasch and Müller), A., ii, 60.
  - separation of, from strontium and calcium in mixed sulphates, theory of (Morgan), A., ii, 627.
- **Barley.** See Agricultural chemistry.
- **Barytes** from the Odenwald (Kraatz-Koschlau), A., ii, 302.
- **Barytocelestine** from Ontario (Volney), A., ii, 495.
- **Basalt** from Antarctic regions (Prior), A., ii, 436.
  - from Franz Josef Land (Newton and Teall), A., ii, 163.
- **Basalt-glass.** See Tachylyte.
- **Basanite, leucite-,** from Vesuvius (Becke), A., ii, 500.
- **Base,** $C_3H_6ON_4$, from reduction of aminoguanidineglyoxylic acid, and its nitrate (Thiele and Dralle), A., i, 7.
  - $C_7H_{12}N_4$, from the action of acetonylacetone on aminoguanidine hydrochloride, and its hydrochloride and nitrate (Thiele and Dralle), A., i, 8.
  - $(C_9H_{12}NO)_x$, from reduction of ω-2-*di*nitromesitylene (Bamberger and Weiler), A., i, 124.
  - $C_{10}H_{15}ON$, from carvone tribromide and ammonia (Wallach), A., i, 531.
  - $C_{10}H_{19}N$, from *iso*lauronyl methyl ketoxime, hydrochloride, platinochloride (Blanc), A., i, 925.
  - $C_{18}H_{23}NO_4$, isomeric with cocethyline, presence of, in cocaine (Skraup), A., i, 963.
- **Base obtained by reducing** ω-2-*di*nitromesitylene (Bamberger and Weiler), A., i, 124.
- **Bases,** energy of some (Carrara and Rossi), A., ii, 358.
  - volume changes on mixing equivalent quantities of acids with, in methylic alcohol (Minozzi), A., ii, 642.
  - excretion of, in the urine of fasting rabbits (Katsuyama), A., ii, 314.
  - organic, action of urethane on (Manuelli and Ricca-Rosellini), A., i, 887.
  - aromatic, behaviour of, towards ethereal salts of α-bromo-acids (Bischoff), A., i, 202.
  - pseudo- (Hantzsch), A., i, 400.
  - tertiary, action of hydrogen peroxide on (Wolffenstein ; Bamberger), A., i, 495.
- **Basic slag.** See Slag, basic, and also Agricultural Chemistry.
- **Basil,** oil of, composition of (Dupont and Guerlain), A., i, 440.
- **Bassorin,** amount of, in opoponax (Tschirch), A., i, 714.
- **Bastnäsite** from Colorado (Hillebrand), A., ii, 301.
- **Bauxite,** formation of (Bauer), A., ii, 565.
- **Beans.** See Agricultural chemistry.
- **Bebeerine** (*bebirine*), identity of pelosine with (Scholtz), A., i, 651.
  - decomposition products of, and action of *o*-xylylenic bromide (Scholtz), A., i, 92.
- **Beer,** influence of the mineral constituents of water on (Lott), A., ii, 683.
  - the nitrogen compounds in, and their separation (Laszczynski), A., ii, 793.
  - growth of sorbose bacterium in (Emmerling), A., ii, 318.
  - detection of salicylic acid in (Abraham), A., ii, 341.
- **Beeswax.** See Wax.
- **Beet-diastase** and **Beet invertase** (Gonnermann), A., ii, 792.
- **Beetroot.** See Agricultural chemistry.
- **Beetroot-resin acid** (Andrlík and Votoček), A., i, 157.
- *Beggiatoa*, iodine in (Gautier), A., ii, 649.
- **Belladonna,** root and leaves, the oxydase of (Lépinois), A., i, 653.
- **Belladonnine,** chemistry of (Pinner), A., i, 178.
- **Benzaconine,** physiological action of (Cash and Dunstan), A., ii, 42.
- **Benzaldehyde,** formation of (Moritz and Wolffenstein), A., i, 424.

Benzaldehyde, synthesis of (Meissel), A., i, 880.
  specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  absorption of argon by (Berthelot), A., ii, 653.
  action of sodium hydroxide, methoxide or benzyloxide on (Kohn and Trantom), T., 1155 ; P., **1899**, 194.
  behaviour of, towards fused alkali nitrates (Nägeli), A., i, 916.
  condensation of, with polyhydric alcohols (de Bruyn and Alberda van Ekenstein), A., i, 661.
  condensation of, with anhydracetone benzil, α-anhydrobenzillævulic acid, anhydracetonebenzil-β-carboxylic acid, and acetonebenzil (Japp and Findlay), T., 1023 ; P., **1899**, 164.
  condensation of, with benzylic cyanide (Henze), A., i, 218.
  condensation of, with *iso*butaldehyde (Stritar), A., i, 889.
  condensation of, with cinnamaldehyde, phenyl*iso*crotonic acid, phthalic anhydride, and pyrocinchonic anhydride (Thiele), A., i, 216.
  decomposition of ammonium chloride by (Delépine), A., i, 187.
  cyanhydrin, condensation product of, and bromo- and nitro-derivatives (Minovici), A., i, 890.
  and *p*-chloro-*m*-nitro- diacetates (Freyss), A., i, 875.
Benzaldehyde, nitro-, condensation of gallacetophenone (Rupe and Leontéeff), A., i, 371.
Benzaldehydephenylhydrazone, conversion of, into α-benzilosazone (Biltz), A., i, 502.
Benzaldehyde-*m*-nitrophenylhydrazone, *o*-nitro-, *m*-nitro-, and *p*-nitro- (Rougy), A., i, 752.
Benzaldehyde-*p*-nitrophenylhydrazone, and *m*-nitro- and *p*-nitro- (Hyde), A., i, 689.
Benzaldehydine, amino-, *di*amino-, and *tri*amino-, salts and acetyl derivatives (Pinnow and Wiskott), A., i, 500, 501.
  nitro-. See Phenylbenzylbenzimidazole, nitro-.
Benzaldehydineazophenol (Pinnow and Wiskott), A., i, 500.
Benzaldine, *m*-nitro-, hydrochloride of (Busch and Wolff), A., i, 951.
Benzaldoxime, stereoisomeric forms of (Bancroft), A., ii, 145, 411 ; (Cameron), A., ii, 411.
  o-chloro- (Werner and Bloch), A., i, 753.
Benzamide, preparation of, from benzimidoxydiphenylacetic acid and from triphenyloxazolone (Japp and Findlay), T., 1030 ; P., **1899**, 165.
  formation of, from benzimidoethylic ether (Wheeler and Johnson), A., i, 431.
  oxidation of (Oechsner de Coninck and Combe), A., i, 347 ; (Oechsner de Coninck), A., i, 244, 509.
  mercury compound of, constitution of (Kieseritzky), A., ii, 395.
  di-o-substituted, hydrolysis of (Lloyd and Sudborough), T., 581.
Benzamides, chloro-, bromo-, iodo-, nitro-, and amino-, hydrolysis of (Reid), A., i, 507, 508.
Benzamidine hydrochloride, action of, on ethylic phenylpropiolate (Ruhemann and Cunnington), T., 959 ; P., **1899**, 185.
Benzamidoacetic acid. See Hippuric acid.
Benzamidoazoresorcinol (Bamberger and von Goldberger), A., i, 170.
Benzamidobenzoic acids (Limpricht), A., i, 292.
o-**Benzamidodimethylaniline** (Bamberger and Tschirner), A., i, 683.
2-Benzamido-3 : 5-dimethylbenzaldoxime benzoate (Bamberger and Weiler), A., i, 123.
Benzamidodimethylbenzophenone (Drawert), A., i, 642.
4-Benzamidoethenyl-1 : 2-naphthylenediamine, hydrochloride, sulphate, picrate (Meldola and Phillips), T., 1015 ; P., **1899**, 187.
Benzamidoindazole (Bamberger and von Goldberger), A., i, 545.
Benzamidomethylbenzophenone (Hanschke), A., i, 775, 776.
3-Benzamidomethyl*cyclo*pentane (Markownikoff), A., i, 799.
Benzamidomethyltriazole (Thiele and Manchot), A., i, 167.
β-*o*-**Benzamidophenylbenzimidazole** (von Niementowski), A., i, 645.
β-**Benzamido-*p*-tolylbenzimidazole** (von Niementowski), A., i, 645.
Benzanilide, action of sulphonating agents on (Armstrong), P., **1899**, 178.
  thio- (Bamberger), A., i, 694.
Benzazide, *m*-bromo- and *p*-bromo- (Curtius and Portner), A., i, 136.
Benzazimide. See 4′-Hydroxy-β-phenotriazine.
Benzene, constitution of (Brühl ; Thiele), A., i, 873.
  physical constants of (Young and Fortey), T., 880.

Benzene, specific heat and heat of vaporisation of (Luginin), A., ii, 269.
latent heat of fusion of, influence of pressure on (Hulett), A., ii, 469.
boiling points of mixtures of, with alcohol (Thayer), A., ii, 140.
vapour pressures of solutions of, in carbon tetrachloride (Lehfeldt), A., ii, 633.
mixtures of, with toluene, carbon tetrachloride or alcohol, vapour pressures of (Lehfeldt), A., ii, 11.
and carbon disulphide, composition of mixed vapours of (Carveth), A., ii, 467.
mixtures of, with toluene, fractionation of (Young), T., 682.
diffusion coefficient of, across vulcanised caoutchouc (Flusin), A., ii, 205.
molecular weight of, in carbon tetrachloride or alcohol (Speyers), A., ii, 468.
molecular weight of alcohols in (Biltz), A., ii, 634.
equilibrium between naphthalene, diphenylamine and; between naphthalene, β-naphthol and; and between phenanthrene, carbazole and (Bruni), A., ii, 406.
and water, mutual solubilities of (Herz), A., ii, 83.
flash point of (Raikow), A., i, 847.
absorption of argon by (Berthelot), A., ii, 653.
action of chlorosulphonic acid on (Young), T., 174.
action of hydrogen sulphide on mercuric chloride dissolved in (Naumann), A., ii, 423.
action of hexachlorethane, pentachlorethane, and of tetrachlorethylene on (Mouneyrat), A., i, 490.
action of, on stannic bromide (Garelli), A., ii, 271.
condensation of, with phenyloxanthranol (Guyot), A., i, 295.
Benzene, amino-. See Aniline.
1 : 2 : 3 : 5-*tetr*amino- (Drost), A., i, 751.
bromo-, action of sodium alkyloxides on (Löwenherz), A., ii, 639.
*di*bromo-, *tetra*bromo-, and *hexa*bromo-, preparation of (Cohen and Dakin), T., 894; P., **1899**, 183.
1 : 4-*di*bromo- (Thomas), A., i, 26, 743.
1 : 3 : 5-*tri*bromo-, 2 : 4 : 6-*tri*iodo- (Istrati), A., i, 341.
o-, *m*-, and *p*-bromonitro-, action of amines on (Nagornoff), A., i, 425.
Benzene, *sym*-*tri*bromo*di*nitro- (Jackson and Koch), A., i, 677.
chloro-, action of sodium alkyloxides on (Löwenherz), A., ii, 639.
mono-, *di*-, *tri*-, *tetra*-, *penta*-, and *hexa*-chloro-, produced in presence of aluminium chloride (Mouneyrat and Pouret), A., i, 263.
*di*chloro- and *tri*chloro- (Mouneyrat), A., i, 341.
*tri*chloro- (Thomas), A., i, 743.
p-chlorobromo- (Cohen and Dakin), T., 894; P., **1899**, 183; (Mouneyrat and Pouret), A., i, 584; (Thomas), A., i, 743.
*penta*chlorobromo-, formation of (Thomas), A., i, 26.
1 : 3 : 5-*tri*chloro-2-bromo-, 1 : 3 : 5-*tri*chloro-2-bromo-4 : 6-*di*nitro-, 1 : 3 : 5-*tri*chloro-2-iodo-, 1 : 3 : 5-*tri*chloro-2 : 4-*di*nitro- (Jackson and Gazzolo) A., i, 744.
p-chloriodo- (Mouneyrat), A., i, 341; (Thomas), A., i, 676, 743.
1 : 3 : 6-chloro*di*nitro-, and 2 : 1 : 4-chloro*di*amino-, formation of (Kehrmann and Grab), A., i, 129.
iodo-, decomposition of, by sodium amyloxide or ethoxide (Löwenherz), A., ii, 639.
iododichloride, potential difference between chlorine and (Sullivan), A., ii, 398.
nitro-, formation of (Bamberger and Tschirner), A., i, 348; (Schall and Klein), A., i, 425.
conductivity of salt solutions in (Kahlenberg and Lincoln), A., ii, 397; (Euler), A., ii, 462.
diffusion coefficient of, across vulcanised caoutchouc (Flusin), A., ii, 205.
structure of (Lachmann), A., i, 588.
electrolytic reduction of (Löb), A., i, 122; (Elbs and Kopp), A., i, 270.
influence of, on the oxidation of iodide by bromic acid (Schiloff), A., ii, 147.
detection of (Mulliken and Barker), A., ii, 382.
o- and *p*-*di*nitro- (de Bruyn and Steger), A., i, 744.
and *p*-, influence of water on the action of sodium methoxide or ethoxide on (de Bruyn and Steger), A., i, 745.
velocity of action of sodium methoxide or ethoxide on (Steger), A., i, 745.
o-nitro-*o*-*di*nitroso-, *p*-nitro-*o*-*di*nitroso-, *m*-*di*nitro-*o*-*di*nitroso- (Drost), A., i, 751.

Benzene, nitroso-, formation of (Bamberger and Tschirner), A., i, 348.
  hylotropic-isomeric forms of (Schaum), A., ii, 733.
  behaviour of, towards *o*-aminophenol (Krause), A., i, 272.
  action of zinc ethyl on (Lachmann), A., i, 588.
  1 : 2 : 3 : 4-*tetra*nitroso- and nitro-*tetra*nitroso- (Nietzke and Geese), A., i, 347.
3′-Benzeneazo-1 : 3-dimethylindazole (Bamberger), A., i, 544.
Benzeneazodiphenylimidocarbamide (Schall), A., i, 281.
Benzeneazo-*p*-ethoxybenzeneazophenol (Krause), A., i, 272.
Benzeneazohydroxyanilide (Bamberger and Tschirner), A., i, 687.
Benzeneazo-3-hydroxy-1 : 2′-dimethylbenzoxazole, Benzeneazo-3-hydroxy-1-methylbenzoxazole, Benzeneazo-3-hydroxy-2′-phenyl-1-methylbenzoxazole (Heinrich), A., i, 172, 173.
Benzeneazohydroxy-*o*-toluidide and ***p*-toluidide** (Bamberger and Tschirner), A., i, 687.
3′-Benzeneazoindazole (Bamberger and von Goldberger), A., i, 545.
Benzeneazo-*p*-methoxybenzeneazophenol (Krause), A., i, 272.
Benzeneazomethylphloroglucinolazobenzene (Boehm), A., i, 32.
o-**Benzeneazophenol**, *p*-chloro- (Krause), A., i, 272.
Benzeneazostyrene, *p*-bromo- (Freer), A., i, 357.
Benzeneazo-*m*-xylene, 2 : 4-*di*nitro- (Willgerodt and Klein), A., i, 883.
Benzeneazo-. See also Phenylazo-.
Benzenesulphinic acid, *p*-chloro- and *p*-bromo- (Gattermann), A., i, 517.
Benzenesulphodimethylenimide (Howard and Marckwald), A., i, 749.
Benzenesulphonazide, Benzenesulphonehydrazide (Curtius and Lorenzen), A., i, 148, 149.
Benzenesulphonic acid, electric conductivity of solutions of, at high pressures (Bogojawlensky and Tammann), A., ii, 138.
  ethereal salts, velocity of reaction between alcohols and (Sagrebin), A., ii, 735.
  hydrazine salt of (Curtius and Lorenzen), A., i, 149.
Benzenesulphonic sulphide, *di*sulphide, *tri*sulphide, and *tetra*sulphide (Troeger and Hornung), A., i, 905.
Benzenesulphonylbenzoylphenylmethylhydrazine (Bamberger), A., i, 701.
Benzenesulphonylphenylethylhydrazine (Bamberger), A., i, 701.
Benzenesulphotrimethyleneimide (Howard and Marckwald), A., i, 749.
Benzenyl-3-amino-*p*-cresol and its benzoyl and dibenzoyl derivatives (Auwers and Czerny), A., i, 131.
Benzenyl-β-*o*-amino-phenyl-and-*p*-tolylbenzimidazole (von Niementowski), A., i, 646.
Benzenylaminophenyleneamidine. See Phenylaminobenzimidazole.
Benzenylaminoxime, Benzenylanilinoxime, and **Benzenylazoxime,** *o*-chloro- (Werner and Bloch), A., i, 753, 754.
Benzenyl-3-benzamido-*p*-cresol and its benzoate (Auwers and Czerny), A., i, 132.
Benzenylphenyleneamidine. See Phenylbenzimidazole.
Benzenylpiperidoxime, Benzenyltoluidoxime, *o*-chloro- (Werner and Bloch), A., i, 754.
Benzhydrazide, *m*-bromo-, hydrochloride: sodium, acetyl, benzaldehyde, *o*-hydroxybenzaldehyde, and acetone derivatives (Curtius and Portner), A., i, 136.
  p-bromo-, hydrochloride: benzaldehyde and acetone derivatives (Curtius and Portner), A., i, 136.
  m-*di*bromo- (Curtius and Portner), A., i, 136.
Benzhydrol, condensation of, with benzonitrile (Japp and Findlay), T., 1031; P., **1899**, 165.
  condensation of, with *p*-quinone and with *p*-quinonoid compounds (Möhlau and Klopfer), A., i, 914.
Benzhydroxamic acid, *m*-nitro- and *p*-nitro- (Werner and Skiba), A., i, 691.
Benzhydroximic chloride, *o*-chloro- (Werner and Bloch), A., i, 753.
Benzidine, condensation of, with ethylic acetoacetate (Heidrich), A., i, 366.
Benzidinedithiocarbimide, and its compounds with anisoil and phenetoil (Bamberger), A., i, 697.
Benzil, electrolysis of (James), A., i, 909.
  repeated crystallisation of (Bogojawlensky), A., ii, 206.
  condensation of, with acetophenone (Wislicenus and Lehmann), A., i, 59.
  condensation of, with anhydracetonebenzil (Japp and Findlay), T., 1025; P., **1899**, 164.
  condensation of, with *o*-aminodiphenylamine (Kehrmann and Woulfson), A., i, 506.

Benzil condensation of, with benzylideneacetone (JAPP and FINDLAY), T., 1026; P., **1899**, 164.
  condensation of, with resorcinol (VON LIEBIG), A., i, 915.
Benzil-*o*-carboxylic acid, the two modifications of (SOCH), A., i, 216.
Benzildioxime peroxide (WERNER and SKIBA), A., i, 690.
    *di*chloro- (WERNER and BLOCH), A., i, 754.
Benzil*anti*dioxime and **Benzil*syn*dioxime**, *o*-*di*chloro-, the diacetate and dipropionate (WERNER and BLOCH), A., i, 754.
Benzilic acid (*a-hydroxydiphenylacetic acid, diphenylglycollic acid*), condensation of, with benzonitrile (JAPP and FINDLAY), T., 1028; P., **1899**, 165.
Benzil-*p*-nitrophenylosazone (HYDE), A., i, 689.
a- and *β*-**Benzilosazone**, acetyl derivatives (BILTZ), A., i, 502.
Benzil-reaction, the so-called (BAMBERGER and SCHOLL), A., i, 701.
Benzimidazole alkyl haloids, oxidation of (PINNOW and SÄMANN), A., i, 943.
Benzimidazole-1 : 2-dicarboxylic acid, and dimethylic salt and anhydride (FISCHER), A., i, 641.
Benzimidobenzhydrylic oxide, formation and synthesis of (JAPP and FINDLAY), T., 1031; P., **1899**, 165.
Benzimidoxydiphenylacetic acid, and its silver salt, and its conversion into triphenyloxazolone; action of hydriodic acid on; action of caustic potash on (JAPP and FINDLAY), T., 1029; P., **1899**, 165.
Benzimidodiphenyltriazoline (CUNEO), A., i, 549.
Benzo-*o*-aminoanilide, *o*-amino-, and salts (VON NIEMENTOWSKI), A., i, 644.
Benzo-*m*-amino-*p*-toluidide, *o*-amino- (VON NIEMENTOWSKI), A., i, 644.
Benzobenzylamide, nitroso-, behaviour of, towards alcohol (VON PECHMANN), A., i, 134.
p-**Benzobromophenylhydrazide** (FREER), A., i, 357.
Benzodinitranilide (MUTTELET), A., i, 500.
  and *p*-nitro-derivative (KYM), A., i, 943.
Benzodiphenylcarbamide (DAINS), A., i, 594.
Benzoethylamide (WHEELER and JOHNSON), A., i, 354.
"**Benzoflavine 6B.F.O.**," constitution of (MEYER and GROSS), A., i, 945.
Benzopurpurin, molecular weight of, in aqueous solution (KRAFFT), A., ii, 473.
Benzohexaphenyltrifurfuran (JAPP and MELDRUM), T., 1043; P., **1899**, 167.
Benzoic acid, formation of (WEILER), A., i, 491.
  solubility of, in solutions of sodium acetate or formate (NOYES and CHAPIN), A., ii, 274.
  behaviour of, towards fused alkali nitrates (NÄGELI), A., i, 916.
  compound of, with sulphuric acid (HOOGEWERFF and DORP), A., i, 672.
  and methylic and ethylic salts, nitration of (HOLLEMAN), A., i, 747.
  detection of, in milk (BREUSTEDT), A., ii, 532.
Benzoic acid, silver salt, solubility of, in solutions of nitric acid and of chloracetic acid (NOYES and SCHWARTZ), A., ii, 10.
  ethereal salts of, electrical absorption and dispersion of (LÖWE), A., ii, 200.
  benzenyl-3-benzamido-*p*-cresol salt (AUWERS and CZERNY), A., i, 132.
  benzylic salt, action of caustic soda on (KOHN and TRANTOM), T., 1161; P., **1899**, 194.
  cholesterylic salt, heat of transition of, from crystalline-liquid to isotropic form (HULETT), A., ii, 469.
  ethoxyphenylic salt (MERCK), A., i, 802.
  o- and *p*-hydroxyphenylmercuric chloride salts (DIMROTH), A., i, 428.
  toluquinone-*o*- and *m*-oxime salts (BRIDGE and MORGAN), A., i, 130.
  triphenylvinylic salt (BILTZ), A., i, 439.
  trimethylammonium, tripropylammonium, and phenylammonium salts (LLOYD and SUDBOROUGH), T., 596; P., **1899**, 3.
Benzoic acid, *m*-amino-, and *p*-amino-, ethylic salts, and benzoyl derivatives of (LIMPRICHT), A., i, 292.
  p-amino-, preparation and methylation of (PINNOW), A., i, 588.
  o-, *m*-, and *p*-amino-, oxidation of, with chromic acid (DE CONINCK and COMBE), A., i, 347.
    and *o*-, *m*-, *p*-bromo-, amylic salts, densities and specific rotations of (GUYE and BABEL), A., ii, 718.
  2 : 4 : 6-*tri*bromo-, phenylammonium, *m*-bromophenylammonium, trimethylammonium, tripropylammonium, and tribenzylammonium salts (LLOYD and SUDBOROUGH), T., 592, 593; P., **1899**, 3.

Benzoic acid, 2 : 4 : 6-*tri*bromo-3-amino-, α- and β-naphthylammonium, phenylammonium, *m*-bromo- and *m*-nitro-phenylammonium, phenyldiethylammonium, 2:4:5- and 2 : 4 : 6-trimethylphenylammonium, trimethylammonium, tripropylammonium, and tribenzylammonium salts (Lloyd and Sudborough), T., 589—592 ; P., **1899**, 3.
  o-chloro-, phenylic salt (Michaelis and Kerkhof), A., i, 53.
  *di*chloro-, *p*-tolylic salt (Bertozzi), A., i, 878.
  o-nitro-, aminolytic constants of aniline and pyridine in presence of (Goldschmidt and Salcher), A., ii, 551.
  m-nitro-, α- and β-naphthylammonium, trimethylammonium, phenylammonium, and 2:4:5-trimethylphenyl-, *m*-bromophenyl-, and *m*-nitrophenyl-ammonium salts (Lloyd and Sudborough), T., 594 ; P., **1899**, 3.
  p-nitro-, *di*nitrophenylic salt (Kym), A., i, 648.
  o-nitro-, and *p*-nitro-, amino*iso*propylic salts (Uedinck), A., i, 498, 499.
  o-, *m*-, and *p*-nitro-, solubilities of, in water, chloroform, and alcohol (Holleman), A., i, 141.
    solubility of mixtures of (Holleman), A., i, 282.
    amylic salts, densities and specific rotations of (Guye and Babel), A., ii, 718.
    estimation of (Holleman), A., ii, 257.
  2 : 4 : 6-*tri*nitro-, α- and β-naphthylammonium, phenylammonium, *m*-bromo- and *m*-nitro-phenylammonium, trimethylammonium, tripropylammonium, and tribenzylammonium, 2 : 4 : 5- and 2 : 4 : 6-trimethylphenylammonium, and phenyldiethylammonium salts (Lloyd and Sudborough), T., 585—586 ; P., **1899**, 3.
Benzoic acids, di-*o*-substituted, etherification of, and hydrolysis of ethereal salts of (Lloyd and Sudborough), T., 580.
Benzoic chloride, compound of, with benzophenone and ferric chloride (Nencki), A., i, 879.
  di-*o*-substituted, hydrolysis of (Lloyd and Sudborough), T., 581.
Benzoic peroxide, physiological action of (Nencki and Zaleski), A., ii, 676.
Benzoic-series, chloro-derivatives, thermochemistry of (Rivals), A., ii, 204.
o-**Benzoicsulphinide** ("*saccharin*"), action of methylic alcohol on (Hoogewerff and Dorp), A., i, 870.
  See also "Saccharin."
Benzoin, electrolysis of (James), A., i, 909.
  velocity of crystallisation of (Bogojawlensky), A., ii, 206.
  condensation of, with phenol, thymol, catechol, resorcinol, quinol, and phloroglucinol (Japp and Meldrum), T., 1037 ; P., **1899**, 167.
  condensation of, with *o*-, *m*-, and *p*-phenylenediamines (Japp and Meldrum), T., 1043 ; P., **1899**, 169.
  condensation of, with resorcinol (von Liebig), A., i, 915.
γ-**Benzoinphenylhydrazone** (Freer), A., i, 358.
Benzoinphenylhydrazones (Smith), A., i, 909.
Benzoinpinacone (*tetraphenylerythritol*) (Kauffmann), A., i, 152.
Benzoin-yellow, and acetyl derivative, lead salt, and dibromide (Graebe), A., i, 220.
Benzo-*o*-nitranilide, *o*-nitro- (von Niementowski), A., i, 643.
Benzonitrile, formation of (Mathews), A., i, 56 ; (Wheeler and Johnson), A., i, 431 ; (Delépine), A., i, 694.
  conductivity of solutions of potassium chloride and iodide, and of sodium bromide and iodide in (Euler), A., ii, 462.
  reactions of metallic salts dissolved in (Naumann), A., ii, 423.
  absorption of argon by (Berthelot), A., ii, 653.
  action of cuprous chloride on (Rabaut), A., i, 557.
  condensation of, with benzilic acid, and with benzhydrol (Japp and Findlay), T., 1028; P., **1899**, 165.
Benzonitrile, *o*-amino-, and its acetyl derivative (Friedländer), A., i,350.
  p-chloro-, *p*-bromo-, and *p*-nitro-, action of cuprous chloride on (Rabaut), A., i, 557.
Benzonitriles, di-*o*-substituted; hydrolysis of (Lloyd and Sudborough), T., 581.
β-**Benzo-*p*-nitrophenylhydrazide** (Hyde) A., i, 688.
Benzo-*m*-nitro-*p*-toluidide, *o*-nitro- (von Niementowski), A., i, 644.
Benzophenone, melting point of, influence of pressure on (Hulett), A., ii 469.

Benzophenone, osmotic pressure of ethereal solutions of (Goodwin and Burgers), A., ii, 274.

  velocity of crystallisation of, and specific heats and heat of fusion of (Tammann), A., ii, 549.

  effect of, on transition temperature of *p*-azoxyanisoil (Schenck and Schneider), A., ii, 637.

  compound of, with benzoic chloride and ferric chloride (Nencki), A., i, 879.

Benzophenone, *o-di*amino-, diacetyl derivative of, diazo-derivative of (Heyl), A., i, 216, 701.

  o-chloro- (Graebe and Keller), A., i, 703.

  di-o-iodo- (Heyl), A., i, 216.

  s-o-nitro-*o*-amino- (Heyl), A., i, 701.

Benzophenone-*p*-nitrophenylhydrazone (Hyde), A., i, 689.

Benzophenonephenylimine, *o*-chloro- (Graebe and Keller), A., i, 703.

Benzophenylcarbamide (Walther and Wlodkowski), A., i, 590.

Benzophenylenediamide, *p*-nitro-, *di-o*-nitro-, *di-m*-nitro-, and *di-p*-nitro- (Walther and Pulawski), A., i, 641.

Benzophenylhydrazide, *o*-amino-, and *o*-nitro- (König and Reissert), A., i, 457.

Benzo-4-phosphinic acid, 2-chloro-, and its barium hydrogen salt (Melchiker), A., i, 208.

Benzopurin, use of, in alkalimetry (Glaser), A., ii, 573.

Benzoquinone. See Quinone.

o-, *m*-, and *p*-**Benzotetraphenyldifurfurans** (Japp and Meldrum), T., 1039, 1041, 1042; P., **1899**, 167.

m-**Benzotetraphenyldipyrroline** (Japp and Meldrum), T., 1044; P., **1899**, 169.

Benzo-*o*-tolycarbamide (Walther and Wlodkowski), A., i, 590.

Benzotrichloride, action of lead acetate on (Bodroux), A., i, 678.

2-Benzo-*m*-xylidide (Friedländer and Brand), A., i, 351.

Benzo-*m*-xylylcarbamide (Walther and Wlodkowski), A., i, 591.

3-Benzoxy-1-methylbenzoxazole (Heinrich), A., i, 173.

Benzoylacetic acid,

  ethylic salt, electrical dispersion of (Löwe), A., ii, 201.

    copper compound and basic copper methoxide of (Wislicenus), A., i, 192.

Benzoylacetic acid,

  ethylic salt, condensation of, with ethylic *p*-nitrophenylpropiolate, and with ethylic acetylenedicarboxylate (Ruhemann and Cunnington), T., 782; P., **1899**, 169.

    condensation of, with ethylic phenylpropiolate (Ruhemann), T., 253; P., **1899**, 6.

Benzoylacetoacetic acid, ethylic salt, action of *p*-phenetidine on (Foglino), A., i, 132.

Benzoylacetone, condensation of, with ethylic phenylpropiolate (Ruhemann), T., 415; P., **1899**, 15; (Ruhemann and Cunnington), T., 781; P., **1899**, 169.

  *di*thio-, and metallic derivatives (Vaillant), A., i, 600.

Benzoylacetonechloral, and its oxime (Gigli), A., i, 12.

Benzoylacetophenetidine (Foglino), A., i, 132.

Benzoylacetoxime, isomeric forms of (Schmidt), A., i, 206.

Benzoylacrylic acid, action of hydrazine on (Gabriel and Colman), A., i, 390.

Benzoylalanine (*α-benzamidopropionic acid*), *d*- and *l*-, specific rotations of (Fischer), A., i, 888.

Benzoylanthracene. See Anthraphenone.

Benzoylaspartic acid, *d*-, *l*- and *r*-, specific rotations of (Fischer), A., i, 889.

p-**Benzoylazobromobenzene**, *per*bromides (Freer), A., i, 357.

Benzoylazotide, distillation of (Snape and Brooke), T., 208; P., **1899**, 22.

Benzoylbenzhydroxamic acid, *m*-chloro-, *o*-nitro-, *m*-nitro- and *p*-nitro- (Werner and Skiba), A., i, 690, 691.

Benzoylbenzylmalononitrile (Hessler), A., i, 899.

Benzoylbiuret, from carbamide and benzoic chloride (Walther and Wlodkowski), A., i, 590.

Benzoyl-*p*-bromophenylsemicarbazide, *p*-bromo- (Curtius and Portner), A., i, 136.

Benzoylcapsaicin (Micko), A., i, 715.

Benzoylcarbinol, formation of (Collet), A., i, 434.

Benzoylcerin (Thoms), A., ii, 324.

Benzoylcreosol, and its acetyl and benzoyl derivatives (Bartolotti), A., i, 368.

Benzoyldiketonaphthadihydropyrazole (von Pechmann and Seel), A., i, 948.

Benzoyldimethylcrotonic acid, two isomeric forms of (Bossi), A., i, 522.

Benzoyl-1′ : 3′-dimethyl-3′-ethyl-2′-methylenindoline (Plancher), A., i, 452.

Benzoyl-3′ : 3′-dimethyl-1′-ethyl-2′-methyleneindoline (Plancher and Bettinelli), A., i, 455.

Benzoylethylbornylamine (Forster), T., 946.

Benzoylethyltetrahydrophthalazine (Paul), A., i, 777.

ab-**Benzoylethylthiocarbamic acid**, and amide (Dixon), T., 376 ; P., **1899**, 52.

aa- and *ab*-**Benzoylethylureas** (Dixon), T., 383, P., **1899**, 53.

ψ-*n*-**Benzoylethylurea** (Dixon), T., 380 ; P., **1899**, 52.

Benzoylfabianaresen (Kunz-Krause), A., i, 449.

Benzoylfurfuran and oxime, and its two acetyl derivatives (Marquis), A., i, 798.

Benzoylglutamic acid, *d*-, *l*-, and *r*-, specific rotations of (Fischer), A., i, 889.

Benzoylhydroxydimethylbenzoxazole (Henrich), A., i, 172.

Benzoylhydroxydiphenyleneketone (Heyl), A., i, 216.

Benzoylmalic acid, methylic and ethylic salts, molecular volumes of (Frankland), T., 349.
  preparation and specific rotations of (Frankland and Wharton), T., 339 ; P., **1899**, 26.

Benzoylmesitylene, hydrolysis of, by phosphoric acid (Klages and Lickroth), A., i, 599.

Benzoylmethylbornylamine (Forster), T., 943.

Benzoylmethylcreosol (Bartolotti), A., i, 368.

Benzoylmethyldithiodiazolonethiol (Busch and Ziegele), A., i, 827.

Benzoylmethylmorpholquinone (Vongerichten), A., i, 307.

β-**Benzoyl-α-methylpropionic anhydride** and **anilide** (Klobb), A., i, 511.

Benzoylmethylpyrazoline (Curtius and Zinkeisen), A., i, 166.

ab-**Benzoylmethylthiocarbamide** (Dixon), T., 383 ; P., **1899**, 53.

ab-**Benzoylmethylurea** (Dixon), T., 383 ; P., **1899**, 53.

ψ-*n*-**Benzoylmethylurea** (Dixon), T., 381 ; P., **1899**, 53.

Benzoylmorphine hydrochloride (Merck), A., i, 649.

Benzoylnaphthalanmorpholine (Knorr), A., i, 782.

Benzoylnaphthyldithiodiazolonethiol (Busch and Münker), A., i, 952.

Benzoyl-*m*- and -*p*-**nitrobenzhydroxamic acids**, and *m*- and *p*-nitro-derivatives (Werner and Skiba), A., i, 691.

Benzoyl*iso***nitrosophenylindole** (Spica and Angelico), A., i, 938.

Benzoyloporesinotannol (Tschirch and Knitl), A., i, 714.

Benzoylornithine, from hydrolysis of ornithuric acid (Schulze and Winterstein), A., i, 107.

Benzoyloxybenzeneazo-3-hydroxy-2′-phenyl-1-methylbenzoxazole (Henrich), A., i, 172.

Benzoyloxybenzoic acid, ethylic salt (Limpricht), A., i, 292.

Benzoyloxyhydroxydimethylglutaric acid, lactone of (Lawrence), T., 421.

Benzoylphenetidide (Bischoff and Schatz), A., i, 278.

3-Benzoyl-1-phenyl-4 : 5-campho-oxypyrazole, and **5-Benzoyl-1-phenyl-3 : 4-campho-oxypyrazole** and its methiodide (Wahl), A., i, 778.

Benzoylphenylcyanamide, formation of (Rizzo), A., i, 53.

Benzoylphenylhydrazonecarbodiphenylamine (Schall), A., i, 281.

Benzoyl-1-phenyl*iso***indazolone** (König and Reissert), A., i, 457.

Benzoyl-4′-phenyl-3-methyl-3′ : 4′-dihydroquinazoline, and **Benzoyl-4′-phenyl-3-methyl-2′-ketodihydroquinazoline** (Hanschke), A., i, 775.

Benzoylphenylmethyl-α-pyrone. See Diphenylaceto-α-pyrone.

Benzoylphloroglucinol methylic ether. See Cotoin.

Benzoylpicrotin (Meyer and Bruger), A., i, 227.

Benzoyl*cyclo***propanetricarboxylic acid**, ethylic salt (Ruhemann and Cunnington), T., 785 ; P., **1899**, 161.

β-**Benzoylpropionic acid** (Klobb), A., i, 114.
  α-cyano-. See Phenacylcyanoacetic acid.

β-**Benzoylpropionic anhydride**, and **anilide** (Klobb), A., i, 510.

Benzoylpropylaniline (Piccinini and Camozzi), A., i, 74.

Benzoylpropylbornylamine (Forster), T., 949.

Benzoylpulegenacetone (Barbier), A., i, 300.

Benzoyltartaric acid, ethylic salt, molecular volume of (Frankland), T., 349.

Benzoyltetrahydroquinaldine, *d*- and *l*-, rotation, density, and molecular volume of, and *r*-, density of, and crystalline forms (Pope and Peachey), T., 1073, 1089 ; P., **1899**, 199.

Benzoyltetrahydro-*p*-toluquinaldine, *l*-, rotatory power of, and *r*-, crystalline form of (POPE and RICH), T., 1100.

Benzoylthiocarbimide (DIXON), T., 379.

Benzoylthiocarbonic acid, imino-, diethylic salt (DIXON), T., 378; P., **1899**, 52.

Benzoyl-*p*-tolyldithiodiazolonethiol (BUSCH and VON BAUR-BREITENFELD), A., i, 951.

Benzoyltriethylbenzene, hydrolysis of, by phosphoric acid (KLAGES and LICKROTH), A., i, 599.

Benzoyltrimethylenetricarboxylic acid, ethylic salt (RUHEMANN and CUNNINGTON), T., 785; P., **1899**, 169.

Benzoyltrimethylindolenine (PLANCHER and BETTINELLI), A., i, 543.

Benzoyltyrosine (ERLENMEYER and HALSEY), A., i, 761.

Benzoyltyrosines, *d*- and *r*-, and *r*-brucine salt, specific rotation of (FISCHER), A., i, 889.

Benzoyl-*m*-xylene, hydrolysis of, by phosphoric acid (KLAGES and LICKROTH), A., i, 599.

Benzylallylamine, formation of (PAAL and APITZSCH), A., i, 269.

Benzylallylaniline (WEDEKIND), A., i, 353.

Benzylamine, formation of (BAILLIE and TAFEL), A., i, 268.

action of aqua regia on (SOLONINA), A., i, 663.

action of chromic acid on (OECHSNER DE CONINCK and COMBE), A., i, 244.

action of nitrosyl chloride on (SOLONINA), A., i, 473.

Benzylamine, *o*-cyano-, preparation of, and its salts (GABRIEL and LANDSBERGER), A., i, 134.

Benzylaniline, cryoscopic behaviour of, in azobenzene solution (BRUNI and GORNI), A., ii, 731.

depression of freezing point of dibenzyl by: and depression of freezing point of, by dibenzyl, stilbene, azobenzene, and benzylideneaniline (GARELLI and CALZOLARI), A., ii, 732.

Benzylaniline, *o*-cyano-, and its salts (LANDSBERGER), A., i, 210.

Benzyl-*o*-anisidine, *p*-nitro-, and its formyl and acetyl derivatives (PAAL and BENKER), A., i, 587.

Benzyl-*o*-anisylphenylcarbamide, *p*-nitro- (PAAL and BENKER), A., i, 587.

2-Benzylbenzimidazole, and salts (WALTHER and PULAWSKI), A., i, 640.

γ-Benzyl-γ-benzylidenepyrotartaric acid, and salts (STOBBE, RUSSWURM, and SCHULTZ), A., i, 903.

n-**Benzyl-*v*-benzylmethylthiourea** (DIXON), T., 374; P., **1899**, 54.

Benzylbornylamine, hydrochloride, platinochloride (FORSTER), T., 951; P., **1899**, 72.

o-nitro-, *p*-nitro-, hydrochlorides, platinochlorides (FORSTER), T., 952, 953; P., **1899**, 72.

Benzylcarbamide, oxidation of (OECHSNER DE CONINCK), A., i, 421.

Benzyl-β-chloro-(-bromo-and -iodo-)-propylamine, salts of (UEDINCK), A., i, 497.

Benzylcyanoacetic acid, and ethylic and silver salts and amide (HESSLER), A., i, 898.

Benzyldicyanoacetic acid, ethylic salt (HESSLER), A., i, 899.

Benzyldiethylamine, aminolytic constant of (GOLDSCHMIDT and SALCHER), A., ii, 551.

Benzyldihydrocarvol (WALLACH), A., i, 532.

Benzyldimethylamine, formation of (BAILLIE and TAFEL), A., i, 268.

aminolytic constant of (GOLDSCHMIDT and SALCHER), A., ii, 551.

n-**Benzyl-*v*-dimethylthiourea** and *r*-**Benzyl-*n*-*v*-dimethylthiourea** (DIXON), T., 375; P., **1899**, 54.

a-**Benzyl-*e*-diphenylthiobiuret** (DIXON), T., 397; P., **1899**, 63.

Benzyl-α-ethyl benzyl ketoxime (FRANCIS), T., 869.

Benzylethylcyanoacetimidoethyl ether (HESSLER), A., i, 900.

Benzylethylenediamine (BLEIER), A., i, 665.

v-**Benzylethylene-ψ-thiocarbamide** (UEDINCK), A., i, 498.

Benzylethyloxythiocarbamide (MARCKWALD), A., i, 505.

Benzylformhydroxamic acid (NEF), A., i, 109.

Benzylguaiacol (BOSCOGRANDE), A., i, 427.

Benzylglutaconic acid, from hydrolysis of ethylic benzyl*iso*aconitate (GUTHZEIT and LASKA), A., i, 261.

α-**Benzylhydroxylamine**, action of formic acid on (NEF), A., i, 109.

Benzyl-β-hydroxypropyl-amine, and -**nitrosamine** (UEDINCK), A., i, 497.

Benzylic alcohol, specific heat, and heat of vaporisation of (LUGININ), A., ii, 269.

depression of freezing point of *o*-nitrophenol by (AMPOLA and RIMATORI), A., ii, 353.

and its benzenesulphonate, velocity of reaction between (SAGREBIN), A., ii, 735.

Benzylic alcohol, and acetate, estimation of (Hesse and Müller), A., i, 441.
p-bromo-, preparation of (Bodroux), A., i, 678.
Benzylic amylic ether, density, specific rotation and molecular volume of (Frankland), T., 360.
chloride, formation of (Grassi-Cristaldi and Masselli), A., i, 410; (Delépine), A., i, 694.
diffusion coefficient of, across vulcanised caoutchouc (Flusin), A., ii, 205.
5-nitro-2-cyano- (Gabriel and Landsberger), A., i, 133.
cyanide. See Phenylacetonitrile.
o- and *p*-cyanophenylic ether (Auwers and Walker), A., i, 198.
ethylic ether, formation of (Paal and Apitzsch), A., i, 269.
o-nitro-, *o*-amino- and salts (Thiele and Dimroth), A., i, 426.
hyponitrite (Divers), T., 121.
mercaptan, *o*-cyano- (Gabriel and Leupold), A., i, 121.
methylic ether, *o*-nitro-, *o*-amino- and its oxalate (Thiele and Dimroth), A., i, 426.
propylic ether (Paal and Apitzsch), A., i, 269.
sulphide, *o*-*di*amino-, and *p* *di*amino- (Thiele and Dimroth), A., i, 427.
Benzylidene*bis*acetoacetic acid, ethylic salt, isomeric forms of (Schiff), A., i, 366.
Benzylideneacetone, condensation of, with benzil (Japp and Findlay), T., 1026; P., **1899**, 164.
Benzylideneacetophenone. See Chalkone.
Benzylideneaminobiuret, and action of hydrochloric acid on it (Thiele and Uhlfelder), A., i, 118.
Benzylideneaminodicyanodiamidine, hydrochloride of (Thiele and Uhlfelder), A., i, 119.
Benzylideneaminoguanidine, *o*-nitro-, *m*-nitro-, and *p*-nitro-, and their nitrates; and diacetyl derivative (Thiele and Bihan), A., i, 46.
Benzylideneanhydracetonebenzil (Japp and Findlay), T., 1023, 1026; P., **1899**, 164.
action of hydriodic acid on (Japp and Findlay), T., 1023; P., **1899**, 164.
Benzylideneanhydracetonebenzil-α-carboxylic acid (Japp and Findlay), T., 1025; P., **1899**, 164.
Benzylidene-α-anhydrobenzillævulic acid (Japp and Findlay), T., 1025; P., **1899**, 164.
Benzylideneaniline, cryoscopic behaviour of, in azobenzene solution (Bruni and Gorni), A., ii, 731.
depression of freezing point of dibenzyl, or of benzylaniline by (Garelli and Calzolari), A., ii, 732.
compounds of, with acetic or benzoic chloride (Garzarolli-Thurnlackh), A., i, 881.
action of, on pyruvic acid (Garzarolli-Thurnlackh), A., i, 823, 940.
Benzylideneanilinoacetoacetic acid, ethylic salt, isomeric forms of (Schiff), A., i, 366.
Benzylidene-*p*-anisidine (Miller, Plöchl, and Scheitz), A., i, 128.
Benzylidenearabitol (de Bruyn and Alberda van Ekenstein), A., i, 662.
Benzylideneazine hydrochloride (Curtius and Quedenfeldt), A., i, 277.
Benzylideneazone, *o*-amino- (Gabriel and Leupold), A., i, 85.
Benzylidenebenzenesulphonehydrazine (Curtius and Lorenzen), A., i, 149.
Benzylidenebornylamine, methiodide (Forster), T., 936.
methiodide, behaviour towards phenylhydrazine; *o*-nitro- and *p*-nitro-derivatives (Forster), T., 1151, 1154; P., **1899**, 194.
Benzylidene-*m*- and *p*-bromobenzhydrazides (Curtius and Portner), A., i, 136.
Benzylidenecamphors, enantiomorphous structure of (Minguin), A., i, 771.
Benzylidenecornicularic acid, methylic salt (Thiele and Rössner), A., i, 614.
Benzylidenediacetoacetic acid, ethylic salt (Knoevenagel and Faber), A., i, 146.
desmotropic forms of (Rabe), A., i, 289.
Benzylidenediacetoacetic acid, *p*-chloro-, ethylic salt (Knoevenagel and Weiss), A., i, 215.
m-nitro-, ethylic salt, and oxime, and phenylhydrazone (Knoevenagel and Schürenberg), A., i, 214.
o-nitro-, and *p*-nitro-, ethylic salts (Knoevenagel and Hoffmann), A., i, 214.
Benzylidenediacetylacetone (Knoevenagel and Faber), A., i, 146.
Benzylidenedibenzyl ketone, hydrogen chloride additive product of (Goldschmiedt and Knöpfer), A., i, 141.
Benzylidenedihydrocarvone, oxime (Wallach), A., i, 532.
Benzylidene*iso*diphenylhydroxyethylamine, and acetate (Erlenmeyer), A., i, 760.

Benzylidenediphenyl*cyclo*pentenone (Japp and Findlay), T., 1023; P., **1899**, 164.

Benzylidene-α-glucoheptonic acid, specific rotation and solubility of (Alberda van Ekenstein and de Bruyn), A., i, 904.

Benzylidenehydrazinesulphonic acid (Stollé), A., i, 430.

Benzylideneiminophenyltriazoline, (Bamberger and von Goldberger), A., i, 547.

Benzylidenemalonic acid, and *p*-nitro-, ethylic salts (Knoevenagel), A., i, 116.

Benzylidenemethylamine (Wallach), A., i, 532.

Benzylidenemethylhydroxy-*m*-diazinehydrazine (Thiele and Bihan), A., i, 47.

Benzylidenemethyltriazylhydrazine and hydrochloride (Thiele and Manchot), A., i, 168.

Benzylidene-β-naphthylsulphonehydrazide and its acetyl derivative (Curtius and Lorenzen), A., i, 149.

Benzylidenepaeonol, and acetyl derivative and dibromide (Emilewicz and von Kostanecki), A., i, 368.

Benzylidenephenacylcinnamic acid (Thiele), A., i, 610.

Benzylidenephenylacetone (Goldschmiedt and Knöpfer), A., i, 141.

Benzylidene-β-pyridylhydrazine (Mohr), A., i, 72.

Benzylidenequinone (Zincke), A., i, 265.

Benzylidene-*d*-saccharic acid, specific rotation and solubility of (Alberda van Ekenstein and de Bruyn), A., i, 904.

Benzylidene-*d*-sorbitol (de Bruyn and Alberda van Ekenstein), A., i, 662.

Benzylidene-*m*-tolylenediamine (Meyer and Gross), A., i, 945.

Benzylidenetriphenylacetone, action of sulphuric acid on (Goldschmiedt and Knöpfer), A., i, 141.

1 : 3 : 2-Benzylidene-*m*-xylidine, and *o*- and *m*-nitro- (Busch), A, i, 496.

Benzylidenexylylhydrazine, and *m*-nitro- (Busch), A., i, 497.

Benzylidenic bromide (Curtius and Quedenfeldt), A., i, 277.

Benzylmalonic acid, and its dinitrile, from hydrolysis of *tri*cyanethylbenzene (Hantzsch and Osswald), A., i, 406.

Benzylmalononitrile, and sodium, silver and bromo-derivatives, (Hessler), A., i, 898.

Benzylmenthol (Wallach), A., i, 532.

Benzylmethylaniline, *p*-amino- (Francke), A., i, 46.

Benzylmethylcyanacetimidoethyl ether (Hessler), A., i, 900.

Benzylmethylketone-*o*-carboxylic acid, and salts, anhydride, oxime, phenylhydrazone, and its anhydride (Gottlieb), A., i, **512**, 513.

Benzylmethylmalononitrile (Hessler), A., i, 899.

Benzylmethyloxythiocarbamide (Marckwald), A., i, 505.

Benzylmethyltetramethylenedisulphone (Autenrieth and Wolff), A., i, 580.

Benzyl*iso*nitramine, compound of, with zinc ethyl (Hantzsch), A., i, 692.

Benzyl-*o*- and *p*-nitranilines, *p*-nitro-, and bis-*p*-nitro-, and formyl and acetyl derivatives (Paal and Benker), A., i, 587.

Benzyl-*m*-nitrodiphenylcarbamide, *p*-nitro- (Paal and Benker), A., i, 587.

Benzyl-2′-nitrophenyl-3-nitrobenzimidazole, 1′-nitro- (Pinnow and Wiskott), A., i, 501.

Benzylnitrosoacetamide (Paal and Apitzsch), A., i, 268.

***p*-Benzyloxybenzaldoxime** (Auwers and Walker), A., i, 198.

Benzyloxybenzene-*p*-sulphonic acid, action of bromine on (Armstrong), P., **1899**, 177.

Benzylparaconic acid (Thiele and Meisenheimer), A., i, 603.

Benzylphenylacetone, chloro-, and its oxime (Goldschmiedt and Knöpfer), A., i, 140.

***n*-Benzylphenylcarbamylthiourantoin** (Dixon), T., 409; P., **1899**, 64.

Benzylphenylethylene, and its *di*bromide (Francis), T., 869.

Benzylphthalaminic acid, formation of (Gabriel and Landsberger), A., i, 134.

Benzylpiperidine, formation of (Baillie and Tafel), A., i, 268.
  oxide, and picrate (Auerbach and Wolffenstein), A., i, 936.

***v*-Benzylpropylene-ψ-thiocarbamide** (Uedinck), A., i, 498.

Benzylpulegol (Wallach), A., i, 532.

1′-Benzylpyridone (O. Fischer, Hoerger, and Jaeger), A., i, 634.

1′-Benzylpyrrolidine, and its *o*- and *p*-nitro-derivatives (Schlinck), A., i, 540.

Benzylpyruvic acid from different sources (Wislicenus), A., i, 286.

Benzyl*iso*rosindone and salts (Fischer and Hepp), A., i, 78.

Benzylsalicylaldoxime (Auwers and Walker), A., i, 198.

Benzylstrychnine (Moufang and Tafel), A., i, 310.

Benzylsuccinic acid, formation of (Fittig and Brooke), A., i, 438.
Benzylthiocarbimide, from oil of *Tropæolum majus* (Gadamer), A., i, 535.
Benzyltoluquinoneoxime, 4-bromo-, two forms of (Kehrmann and Rüst), A., i, 129.
Benzylurethane and nitroso-derivative (von Pechmann), A., i, 134.
Berberine, estimation of (Gordin and Prescott), A., ii, 826.
Beryllium (Lebeau), A., ii, 554.
Beryllium azoimide (Curtius and Rissom), A., ii, 92.
  lead iodide (Mosnier), A., ii, 222.
  sulphate and chloride, taste of (Höber and Kiesow), A., ii, 207.
Betaine, from the root of *Althæa officinalis*; also its hydrochloride and aurochloride (Orloff), A., i, 4.
Betol, specific heat, heat of fusion, and velocity of crystallisation of (Tammann), A., ii, 549.
Bilberry must, fermentation of (Otto), A., ii, 505.
Bile pigments (Küster), A., i, 314; (Jolles), A., i, 830.
  estimation of, in urine (Jolles), A., ii, 459.
Bilianic acid and *iso*-**Bilianic acid**, preparation of (Lassar-Cohn), A., i, 552.
Biliary acids, detection of, in urine (Vitali), A., ii, 263.
Bilirubin (Küster), A., i, 314; (Hugounenq and Doyon), A., ii, 377; (Jolles), A., i, 830.
  detection of (Gnezda), A., ii, 715.
  estimation of (Jolles), A., i, 830.
Biliverdic acid (*dibasic hæmatic acid*) (Küster), A., i, 314, 468.
Biliverdin (Küster), A., i, 314; (Hugounenq and Doyon), A., ii, 377; (Jolles), A., i, 830.
Bilixanthin (Jolles), A., i, 831.
Binary systems, pressure-temperature diagram for (Bancroft), A., ii, 402.
Bindone. See Anhydrobisdiketohydrindene.
Bionucleins and their relation to toxins (Sacharoff), A., ii, 786.
Biotite from the Riesengebirge (Milch), A., ii, 112.
  from Sierra Nevada, U.S.A. (Turner and others), A., ii, 498.
  artificial (Morozewicz), A., ii, 765.
  vanadium in (Hillebrand), A., ii, 113.
4 : 4′-Bisacetoaceticazodiphenyl-3 : 3′-dicarboxylic acid (Bülow and von Reden), A., i, 150.
Bisacetonediphenyl-4 : 4′-dihydrazone-3 : 3′-dicarboxylic acid (Bülow and von Reden), A., i, 150.
Bisazidiphenylmethane (Curtius and Quedenfeldt), A., i, 276.
Biscarvene (Harries and Kaiser), A., i, 579.
4 : 4′-Bisdiazoiminodiphenyl-3 : 3′-dicarboxylic acid and methylic and ethylic salts (Bülow and von Reden), A., i, 150.
Bisdemethylnitrobrucine hydrate, hydrochloride and nitrate (Moufang and Tafel), A., i, 309.
Bisdimethylacetone, nitrosoimino- (Conrad and Hock), A., i, 632.
4 : 4′-Bismesoxalicdihydrazonediphenyl-3 : 3′-dicarboxylic acid, ethylic salt (Bülow and von Reden), A., i, 151.
Bisindonephloroglucinol, chloro-, and its triacetyl derivative (Liebermann), A., i, 374, 523.
Bismethylheptenone (Léser), A., i, 190.
Bismuth, atomic weight of (Landolt, Ostwald, and Seubert), A., ii, 87.
  colloidal (Lottermoser), A., ii, 558.
  cathodes, pulverisation of, during electrolysis (Bredig and Haber), A., ii, 78.
  action of, on sulphuric acid (Adie), P., **1899**, 133.
Bismuth alloys with calcium (Moissan), A., ii, 153; (Tarugi), A., ii, 749.
Bismuth salts, reduction of, with calcium carbide; (Tarugi), A., ii, 749.
  reduction of, by hypophosphorous acid and palladium (Engel), A., ii, 750.
Bismuth, basic carbonate from Saxony (Arzruni, Thaddéeff and Dannenberg), A., ii, 563.
  chloride solutions of, in various solvents, conductivity of; molecular weight of, in nitrobenzene (Kahlenberg and Lincoln), A., ii, 397.
  iodides, estimation of iodine in (Spindler), A., ii, 245.
  lead iodide (Mosnier), A., ii, 222.
  *sub*oxide (Schneider), A., ii, 227.
    and *sub*sulphide (Vanino and Treubert), A., ii, 428.
  *tet*roxide, preparation of, and its dihydrate (Deichler), A., ii, 429.
    Bismuthic acid, preparation of (Deichler), A., ii, 429.
      action of hydrofluoric acid on (Weinland and Lauenstein), A., ii, 370.
  phosphate (Caven and Hill), A., ii, 29.
  sulphide, separation of lead sulphide from (Moyer), A., ii, 697.

Bismuth, estimation and separation of:—
estimation of, volumetrically (SPINDLER), A., ii, 252; (REICHARD), A., ii, 386.
separation of mercury from (JANNASCH and DEVIN), A., ii, 59.
separation of antimony and arsenic from (ATKINSON), A., ii, 615.
Bismutite from Argentina (BODENBENDER), A., ii, 758.
variations in composition of (ARZRUNI, THADDÉEFF, and DANNENBERG), A., ii, 563.
4 : 4′-Bisphenolazodiphenyl-3 : 3′-dicarboxylic acid (BÜLOW and VON REDEN), A., i, 150.
Bistrimethylendi-imine and **Bistrimethylenedi-*p*-toluenesulphonamide** (HOWARD and MARCKWALD), A., i, 750.
Biuret, amino-, and action of nitrous acid on (THIELE and UHLFELDER), A., i, 118.
nitro- and *di*nitro- (THIELE and UHLFELDER), A., i, 118.
*di*thio- (FROMM and PHILIPPE), A., i, 484.
Blastenia arenaria, and var. *teicholytum* constituents of (HESSE), A., i, 382.
Blastenin (HESSE), A., i, 382.
Bleaching powder, formation and composition of (DITZ), A., ii, 26.
Blende (ferriferous) with metallic lustre (MIERS and HARTLEY), A., ii, 431.
Blood, electrical conductivity of (RÖTH), A., ii, 311.
basic and acid capacity of (SPIRO and PEMSEL), A., ii, 230.
coagulation of, chemical process in the (HAMMARSTEN), A., ii, 776.
amount of cholesterol in (HEPNER), A., ii, 311.
cholesterol and cholesterylic salts in birds' (BROWN), A., ii, 311.
determination of relative volumes of corpuscles and serum in (STEWART), A., ii, 603.
origin of the fibrinogen of (MATHEWS), A., ii, 777.
a new glucoproteid in ox (ZANETTI), A., i, 180.
hæmoglobin and corpuscles in human, at different ages (SCHWINGE), A., ii, 166.
amount of iron in the plasma and leucocytes of (HÄUSERMANN), A., ii, 231.
amount of urea in (SCHÖNDORFF), A., ii, 373.
effect of injection of various carbohydrates into the circulation (PAVY), A., ii, 677.
Blood, influence of carbonic anhydride and alkali on the bactericidal action of (HAMBURGER), A., ii, 603.
reducing power of the (HELIER), A., ii, 502.
action of *m*-tolylenediamine on the (LAPICQUE and VAST), A., ii, 504.
detection of, by the guaiacol test (SCHAER), A., ii, 195.
detection of, in urine (ARNOLD), A., ii, 194.
Blood meal. See Agricultural chemistry.
Blood pigment, action of hydrogen sulphide and acids on (HARNACK), A., i, 467.
Blood-serum, anti-rennet action of (BRIOT), A., ii, 780.
globulins of (DE KERCKHOF), A., ii, 231.
a new glucoproteid in (ZANETTI), A., i, 180.
estimation of proteids in (PATEIN), A., ii, 327.
Boheic acid, action of sodium on, in alcohol (KUNZ-KRAUSE), A., i, 201.
Boiler waters, acidity of (BAILEY and JOHNSTON), A., ii, 697.
Boiling point, alternation in, in the series of the chlorides of the normal acids (HENRY), A., i, 735.
of aqueous colloidal solutions (KRAFFT), A., ii, 470.
of compounds of the general formula $CH_3\cdot(CH_2)_n\cdot R$ (BOGGIO-LERA), A., i, 843.
of liquids in exhausted vessels, influence of height of vapour column on (KRAFFT), A., ii, 464.
determination of, by Holborn and Wien's method (LADENBURG and KRÜGEL), A., ii, 545.
curves of mixtures of two of the liquids, acetone, chloroform, carbon tetrachloride (HAYWOOD), A., ii, 632.
for mixtures of alcohol, acetone, and chloroform in pairs (THAYER), A., ii, 402.
of mixtures of methylic alcohol with chloroform or acetone (PETTIT), A., ii, 632.
Boletus edulis. See Agricultural chemistry.
Bombus muscarum and *B. lapidarius*, composition of the wax of (SUNDVIK), A., i, 112.
Bone fats, analysis of (SHUKOFF and SCHESTAKOFF), A., ii, 191.
Bone meal, estimation of citrate-soluble phosphoric acid in (BÖTTCHER), A., ii, 55.
See also Agricultural chemistry.

- **Boracite**, transition temperature of, and volume change at (Meyerhoffer), A., ii, 729.
  - estimation of boric anhydride in (Schwartz), A., ii, 808.
- **Boracites** containing chlorine, preparation of (Allaire), A., ii, 156.
- **Borneol**, from oil of thyme (Labbé), A., i, 621.
  - methylenic acetal of (Brochet), A., i, 530.
- *d*-**Borneol** in oils of cardamoms and rosemary (Schimmel and Co.), A., i, 63.
- *iso*-**Borneols**, synthetical, identity of, with fenchylic alcohols (Bouchardat and Lafont), A., i, 156.
- **Bornite.** See Erubescite.
- *l*-**Bornylic acid**, in oils of hemlock and spruce (Schimmel and Co.), A., i, 63.
- **Boron**, valency of (Frankland), A., i, 246.
  - position of, in periodic system (Wilde), A., ii, 148.
  - reduction of alumina by, in chlorine (Duboin and Gautier), A., ii, 652.
- **Boron** nitride, action of magnesium on (Eidmann), A., i, 317.
  - *tri*oxide (*boric anhydride*), reduction of, by aluminium (Franck), A., ii, 103.
    - use of, in the decomposition of silicates (Jannasch and Weber), A., ii, 578.
  - **Boric acid**, equilibrium between, and hydrocyanic acid in combination with potassium (Berthelot), A., ii, 737.
    - triethylic salt, compound of, with sodium ethoxide, constitution of (Frankland), A., i, 246.
      - action of chlorine and of sodium ethoxide on (Copaux), A., i, 183.
    - detection of (Lenher and Wells), A., ii, 520.
    - detection of, in milk (de Koningh), A., ii, 708.
    - estimation of (Gooch and Jones), A., ii, 331.
    - estimation of, by physical processes (Blyth), T., 722; P., **1899**, 51.
    - estimation of, volumetrically (Vadam), A., ii, 56; (Copaux), A., ii, 181; (Jones), A., ii, 332.
    - estimation of, in boracite (Schwartz), A., ii, 808.
  - sulphide, formation of (Duboin and Gautier), A., ii, 652.
- **Boswellic acid**, from olibanum resin, and its salts (Tschirch and Halbey), A., i, 69.
- **Boulangerite** from Germany and California (Guillemain), A., ii, 757.
- **Boulangerite**, artificial (Sommerlad), A., ii, 217.
- **Bournonite** from Cornwall and the Harz (Guillemain), A., ii, 757.
- **Bowlingite** from Lake Superior (Winchell), A., ii, 765.
- **Brain**, leucomaines of the (Gulewitsch), A., ii, 439.
  - lecithin and myelin substances of the (Zuelzer), A., ii, 504.
  - proportion of protagon in the (Noll), A., ii, 568.
- **Brass**, electrodeposition of (Baker), A., ii, 749.
  - action of a hard water on (Howe and Morrison), A., ii, 476.
- *Brassica.* See Agricultural chemistry.
- **Brassic acid** and erucic acid, isomerism of (Albitzky), A., i, 862.
  - and sodium salt, melting points, and temperature of solidification of solutions of (Krafft), A., ii, 472.
- **Brazilein**, constitution of (Gilbody and Perkin), P., **1899**, 75; (Feuerstein and von Kostanecki), A., i, 539.
  - action of potassium acetate on (Perkin), T., 443; P., **1899**, 66.
  - and acetyl derivatives (Herzig), A., i, 381.
- **Brazilin**, constitution of (Gilbody and Perkin), P., **1899**, 75; (Feuerstein and von Kostanecki), A., i, 538; (Schall), A., i, 539; (Herzig), A., i, 821.
  - derivatives of (Gilbody and Perkin), P., **1899**, 27.
  - decomposition products of (Herzig), A., i, 381.
- **Brewing**, influence of mineral constituents of water used in (Lott), A., ii, 683.
  - sugars, analysis of (Morris), A., ii, 187.
- **Broad bean.** See Agricultural chemistry.
- **Brochantite** from Chili (Arzruni, Thaddéeff, and Dannenberg), A., ii, 563.
- **Bromal hydrate**, heat of dissolution, and crystalline form of (Pope), T., 460.
- **Bromine** in Vesuvian products (Matteucci), A., ii, 600.
  - solubility of, in water (Dietz), A., ii, 150; (Winkler), A., ii, 742.
  - solution of, in compressed gases (Villard), A., ii, 143.
  - decomposition of water by (Berthelot), A., ii, 197.
  - compounds, colour and stability of (Kastle), A., ii, 476.
  - **Hydrobromic acid**, preparation of (Vandenberghe), A., ii, 150; (Menschutkin), A., i, 500.

Bromine:
- **Hydrobromic acid**, aminolytic constants of aniline and pyridine in presence of (Goldschmidt and Salcher), A., ii, 551.
  - decomposition of, by oxygen (Berthelot), A., ii, 197.
- **Bromic acid**, action of hydrogen peroxide on (Tanatar), A., ii, 414.
  - oxidation of iodide by, catalytic action in (Schiloff), A., ii, 147.
- **Bromates**, electrolytic formation of (Vaubel), A., ii, 88.
  - action of, on acidified iodides (Wagner), A., ii, 326.
  - detection of chlorates and iodates in presence of (Vitali), A., ii, 803.

Bromine, detection, estimation, and separation of:—
- detection of small quantities of, in chlorides (Baubigny), A., ii, 516.
- estimation of (Bougault), A., ii, 803; (Denigès), A., ii, 826.
- estimation of, in organic substances (Longhi), A., ii, 328.
- estimation of, in presence of chlorides (Baubigny), A., ii, 516.
- estimation of, in presence of chlorine and iodine (Baubigny), A., ii, 244.
- estimation of chlorine in large quantities of (Baubigny), A., ii, 611.
- separation of chlorine and iodine from (Swinton), A., ii, 122; (Speketer), A., ii, 123; (Baubigny), A., ii, 328.

Bromoform, depression of freezing point of *o*-nitrophenol by (Ampola and Rimatori), A., ii, 353.
- action of solution of aluminium bromide in carbon disulphide on (Konowaloff), A., i, 471.
- action of bromine on, in presence of aluminium bromide (Mouneyrat), A., i, 397.
- estimation of (Richard), A., ii, 527.

Brongniardite, possible identity of, with diaphorite (Spencer), A., ii, 108.

Bronzite, from N. Carolina (Hidden and Pratt), A., ii, 300.
- from the Zinjenj meteorite (Melikoff), A., ii, 771.

Brookite from Dublin (O'Reilly), A., ii, 497.

Brucine, formula of, and water of crystallisation; methyl derivatives of (Moufang and Tafel), A., i, 309.
- action of *o*-xylylenic bromide on (Scholtz), A., i, 649.
- *hept*iodide (Prescott), A., i, 90.
- hydrate, nitro-, and its platinochloride, mercurichloride, and bidemethyl derivative (Moufang and Tafel), A., i, 309.

Brucine, hydrazoate (Pommerehne), A., i, 88.
- *d*- and *l*-mandelates (McKenzie), T., 967.
- detection of, with Piutti's reagent (Scarpitti; Simoncelli), A., ii, 344.
- separation of strychnine from (Stoeder), A., ii, 715.

Brucinic acid, and nitrosamine hydrochloride, and methiodide (Moufang and Tafel), A., i, 309.

Brucite from Sweden, origin of (Sjögren), A., ii, 761.

Buckwheat. See Agricultural chemistry.

Burette, automatic (Richmond; Stokes), A., ii, 450.
- new form of, and improved form of Erdmann's float for (Gawalowski), A., ii, 515.
- a method of using (Stöber), A., ii, 552.

iso-**Butaldazine**, and its reduction, and the action of bromine on it (Franke), A., i, 329.

iso-**Butaldehyde**, action of potassium carbonate, of sodium acetate, and of alcoholic soda, on; also condensation with acetone (Franke and Kohn), A., i, 10.
- condensation with benzaldehyde (Stritar), A., i, 889.
- action of ethylenediamine on (Kolda), A., i, 328.
- action of, on ethylenic glycol in presence of phosphoric acid (Verley), A., i, 666.
- action of potassium cyanide on (Kohn), A., i, 328.
- condensation of, with propionic acid (Kietreiber), A., i, 331.

iso-**Butaldol**, action of hydrazine hydrate on (Franke), A., i, 329.
- cyanhydrin, preparation of (Claisen), A., i, 667.
  - and its hydrolysis (Kohn), A. i, 328.

n-**Butane**, from the decomposition of hexane by aluminium chloride, and solubility in amylic alcohol (Friedel and Gorgeu), A., i, 181.
- *tetra*bromo- (*erythrene* tetra*bromide*) formation of (Miller and Tschitschkin), A., i, 789.
- αβγ-*tri*chloro-, βγ-*di*chloro-α-bromo-, α-chloro-βγ-*di*bromo-, and αβγ-*tri*bromo- (Charon), A., i, 848.
- *di*nitro-, from the action of nitric acid on ethyl butyl ketone (Fileti and Ponzio), A., i, 111.

iso-**Butane**, ratio of specific heats for (Daniel and Pierron), A., ii, 725.
  *tri*bromo- and *tetra*bromo- (Mouneyrat), A., i, 787.
cyclo-**Butane**, cyano- (*cyanotetramethylene*; cyclo*butanecarboxylonitrile*) (Carpenter and Perkin), T., 932.
Butanedicarboxylic acids. See :—
  Adipic acid.
  Dimethylsuccinic acids.
  Ethylsuccinic acid.
  Methylglutaric acids.
cyclo-**Butanedicarboxylic acid** (*tetramethylenedicarboxylic acid*), and its cyano-derivative (Carpenter and Perkin), T., 930, 932; P., **1899**, 134.
Butanetetracarboxylic acid (*ethylidenebismalonic acid*), ethylic salt (Knoevenagel), A., i, 116.
Butenoic acids (*α*- and *β-methylacrylic acids*), nitriles of (Henry), A., i, 257.
Butenoic acid (*vinylacetic acid*), nitrile of (Henry), A., i, 257.
Butinene (*divinyl*), formation of (Charon), A., i, 848.
sec-**Butoxysuccinic acid**, and *iso*-**Butoxysuccinic acid**, and rotatory powers of (Purdie and Pitkeathly), T., 155, 156.
Butter, adulterations of (Cochran), A., ii, 709; (Pfeiffer), A., ii, 823.
  analysis of (Gadd; Zega), A., ii, 823.
  detection of sesamé oil in (Soltsien), A., ii, 71.
  estimation of boric acid in (Vadam), A., ii, 57.
  examination of (Leonard), A., ii, 190.
  examination of, cryoscopically (Pouret), A., ii, 710.
  fatty acids of (Henriques), A., ii, 258.
  Reichert-Meissl numbers for (van Rijn), A., ii, 822.
  rancidity of (Scala), A., i, 478; (Amthor), A., ii, 259.
  See also Agricultural chemistry.
Butter-fat, physical and chemical constants of (Browne), A., ii, 709.
iso-**Butylacetic acid**. See Hexoic acid.
iso-**Butylacetonitrile**. See *iso*-Hexonitrile.
iso-**Butyl***iso***aconic acid** (Fittig and Erlenbach), A., i, 339.
Butylamine, δ-chloro- (Schlinck), A., i, 540.
iso-**Butylamine**, action of aqua regia on (Solonina), A., i, 663.
iso- and *pseudo*-**Butylamines**, action of nitrosyl chloride on (Solonina), A., i, 473.
iso-**Butylaticonic acid**, and its *di*bromide; also its conversion into *iso*butylitaconic acid (Fittig and Erlenbach), A., i, 338.
tert-p-**Butylbenzaldehyde** (Verley), A., i, 424.
tert-**Butylbenzene**, formation of (Verley), A., i, 425.
tert-p-**Butylbenzoic acid**, *di*nitro- (Verley), A., i, 424.
Butylbenzoic acids, *m*- and *p*- (Konowaloff and Egoroff), A., i, 801.
tert-p-**Butylbenzylic alcohol**, its acetate, bromide, and *di*nitro-derivative (Verley), A., i, 424.
Butylbornylamine, hydrochloride, hydriodide, nitrite, platinochloride (Forster), T., 950; P., **1899**, 72.
iso-**Butylchlorophosphine**, and action of water, chlorine, and sulphur on (Guichard), A., i, 563.
iso-**Butylcitraconic acid**, and its anhydride; also the action of bromine on it, and its conversion into *iso*butylitaconic acid (Fittig and Schirmacher), A., i, 338.
  oxidation of (Fittig and Kaehlbrandt), A., i, 418.
γ-**Butylcrotononitrile**. See Octenoic acid, nitrile of.
iso-**Butylene** (Jocitsch), A., i, 748.
  α-bromo- (Solonina), A., i, 681.
  *di*bromo-, action of ethylic sodiomalonate on (Ipatieff), A., i, 481.
  α-*di*chloro- (Jocitsch), A., i, 748; (Jocitsch and Faworsky), A., i, 786.
ψ-**Butylene** (*dimethylethylene*), action of nitric anhydride and peroxide on (Demjanoff), A., i, 845.
  α bromo- (*crotonylic bromide*), and action of potassium formate on (Charon), A., i, 848.
  β-bromo- (Solonina), A., i, 681.
  *di*bromo-, action of zinc dust on (Ipatieff), A., i, 470.
  α-chloro- (*crotonylic chloride*) (Charon), A., i, 848.
  α-iodo- (*crotonylic iodide*), and its polymeride (Charon), A., i, 848.
Butylenedicarboxylic acids. See :—
  Methylmesaconic acid.
  Methylitaconic acid.
  Pyrocinchonic acid.
iso-**Butylenic** bromide (Mouneyrat), A., i, 787.
  αγ-glycol, ββ-bromonitro- (Maas), A., i, 322.
  nitrosate (Demjanoff), A., i, 845.
iso-**Butylethanetricarboxylic acid** (*hexanetricarboxylic acid*), and salts (Fittig and Thron), A., i, 337.

β-iso-**Butylglutaric acid** (*heptanedicarboxylic acid*) (Knoevenagel), A., i, 116.

n-**Butylic alcohol,** specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.
  critical temperature of mixtures of, with ethane (Kuenen and Robson), A., ii, 356.
  aluminium derivative of (Tistschenko), A., i, 408.
  sodium derivative, action of, on ethylic salts of α-bromo-fatty acids (Bischoff), A., i, 670.

n-**Butylic alcohol,** βγ-*di*bromo- (Charon), A., i, 848.

iso-**Butylic alcohol,** dielectric constant of, temperature coefficient of (Abegg and Seitz), A., ii, 623.
  specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.
  depression of freezing point of *o*-nitrophenol by (Ampola and Rimatori), A., ii, 353.
  and its benzenesulphonate, velocity of reaction between (Sagrebin), A., ii, 735.
  action of aluminium amalgam on (Tistschenko), A., i, 408.
  action of phosphorus tribromide on (Menschutkin), A., i, 937.
  sodium derivative, action of, on ethylic salts of α-bromo-fatty acids (Bischoff), A., i, 670.

sec-**Butylic alcohol** (*methylethylcarbinol*), action of aluminium amalgam on (Tistschenko), A., i, 408.

tert-**Butylic alcohol** (*trimethylcarbinol*), heat of combustion of (Zouboff), A., ii, 589.
  effect of pressure of melting point curve of (Tammann), A., ii, 636.
  depression of freezing point of *o*-nitrophenol by (Ampola and Rimatori), A., ii, 353.
  action of aluminium amalgam on (Tistschenko), A., i, 408.
  sodium derivative, action of, on ethylic salts of α-bromo-fatty acids (Bischoff), A., i, 670.
  phenylurethane of (Lambling), A., i, 53.

Butylic alcohols, electrical dispersion of (Löwe), A., ii, 201.

n- and *iso*-**Butylic** amylic ethers, density, specific rotation and molecular volume of (Frankland), T., 360.

iso-**Butylic** bromide, action of bromine on, in presence of aluminium bromide and chloride (Mouneyrat), A., i, 786.
  iodide, action of, on zinc ethyl iodide (Simonowitsch), A., i, 471.

tert-**Butylic** hydrogen carbonate (Hempel and Seidel), A., ii, 152.

iso-**Butylideneacetoacetic acid,** ethylic salt, condensation of, with ethylic malonate (Barbier and Grignard), A., i, 112.

iso-**Butylideneacetone,** from condensation of *iso*butaldehyde with acetone, and its oxime (Franke and Kohn), A., i, 11.

iso-**Butylideneazine,** and its hydrochloride; also the action of potash on the latter (Franke), A., i, 247.

iso-**Butylidenebismalonic acid** (*hexanetetracarboxylic acid*), ethylic salt (Knoevenagel), A., i, 116.

Butylidenecyanhydrins. See α-Hydroxy-*n*-valeronitrile and α-Hydroxy*iso*valeronitrile.

iso-**Butylitaconic acid,** and its conversion into *iso*butylparaconic acid; also its reduction (Fittig and Schirmacher), A., i, 338.
  oxidation of (Fittig and Kaehlbrandt), A., i, 418.

Butylmalonic acid, and its potassium salts, heats of solution and formation of (Massol), A., ii, 547.

iso-**Butylmesaconic acid,** and its conversion into *iso*butylitaconic acid (Fittig and Schirmacher), A., i, 338.
  oxidation of (Fittig and Kaehlbrandt), A., i, 118.

iso-**Butyl-β-naphthylic methylic ether** (Cahen), A., i, 617.

Butylnitramine, action of sulphuric acid on (Franchimont and Umbgrove), A., i, 106.

iso-**Butyloxychlorophosphine** (Guichard), A., i, 564.

iso-**Butylparaconic acid,** formation of (Fittig and Schirmacher), A., i, 338.

iso-**Butyl*iso*paraconic acid,** and its bromo-derivative (Fittig and Erlenbach), A., i, 339.

Butylphenol, synthesis of (Gurewitsch), A., i, 880.

p-iso-**Butylphenylglyoxylic acid** (Verley), A., i, 425.

iso-**Butylphosphinic acid** and *iso*-**Butylphosphinous acid** (Guichard), A. i, 564, 565.

Butylphthalimide, δ-bromo- (Gabriel and Maass), A. i 595.

iso-**Butylpyruvic acid**, and its phenylhydrazone (Fittig and Kaehlbrandt), A., i, 118.

iso-**Butylsuccinic acid** (*hexanedicarboxylic acid*), formation of (Fittig and Thron), A., i, 337.
and its oxidation (Fittig and Burwell), A., i, 337.
and its paratolilic acid and paratolil (Hjelt), A., i, 332.

sec-**Butylthiocarbamide** (Gadamer), A., i, 534.

sec-**Butylthiocarbimide**, from essential oil of *Cochleria officinalis* (Gadamer), A., i, 534.

iso-**Butylthiochlorophosphine** (Guichard), A., i, 564.

iso-**Butylthiophosphinic** phenylhydrazide (Guichard), A., i, 565.

tert-p-**Butyltoluene**, preparation of, and *di*nitro- (Verley), A., i, 424.

iso-**Butylxanthic acid**, potassium salt, electrolysis of solution of (Schall and Kraszler), A., i, 414.

iso-**Butyraldol**, action of hydrazine hydrate on (Franke), A., i, 247.

Butyramide and *iso*-**Butyramide**, preparation of (Aschan), A., i, 14.

Butyramidoazobenzene, α-bromo-, and its lactyl derivative (Bischoff and Kaiserstein), A., i, 231.

iso-**Butyramidoazobenzene**, α-bromo- (Bischoff and Sobolewski), A., i, 231.

Butyric acid, physical constants of (Scheij), A., i, 668.
diffusion velocity and association of (Hüfner), A., ii, 9.
amylic salt, density, specific rotation, and molecular volume of (Frankland), T., 358.
l-amylic salt, molecular rotation of (Walden), A., ii, 622.
ethoxyphenylic salt (Merck), A., i, 802.
separation of acetic, formic, and propionic acids from (Haberland), A., ii, 531.
separation of, from other fatty acids (Holzmann), A., ii, 68.

Butyric acid, α-bromo-, ethylic salt, action of benzylaniline and diphenylamine on (Bischoff), A., i, 125.
action of sodium butoxides, *iso*amyloxide, octyloxide, *iso*capryloxide, methoxide, ethoxide, and *n*- and *iso*-propoxides on (Bischoff), A., i, 669, 670.
α-, β-, and γ-chloro-, methylic, allylic, and propylic salts of (Henry), A., i, 255.

Butyric acid, β-chloro-, ethylic salt (Henry), A., i, 257.
βγ-*di*chloro-, and its ethylic salt and nitrile (Lespieau), A., i, 790.
ααβ-*tri*chloro-, electrolysis of (Troeger and Ewers), A., i, 667.

iso-**Butyric acid** (*dimethylacetic acid*), depression of freezingpoint of *o*-nitrophenol by (Ampola and Rimatori), A., ii, 353.
silver salt, solubility of (Arrhenius), A., ii, 360.
benzylic salt (Bodroux), A., i, 678.
ethylic salt, velocity of formation and hydrolysis of (Sudborough and Lloyd), T., 474; P., **1899**, 3.
separation of, from other fatty acids (Holzmann), A., ii, 68.

iso-**Butyric acid**, α-bromo-, ethylic salt, velocity of formation and hydrolysis of (Sudborough and Lloyd), T., 474; P., **1899**, 3.
action of benzylaniline and diphenylamine on (Bischoff, A., i, 125.
action of sodium butoxides, *iso*amyloxide, octyloxide, and *iso*capryloxide on (Bischoff), A., i, 670.
condensation of, with ethylic acetoacetate, methylacetoacetate, malonate, methylmalonate, and cyanacetate (Bone and Sprankling), T., 847.
action of the sodium derivatives of ethylic malonate and ethylic cyanacetate on (Bone), P., **1899**, 5.
action of sodium methoxide, ethoxide, and *n*- and *iso*-propoxides on (Bischoff), A., i, 669.

iso-**Butyric chloride**, action of zinc ethyl on (Ponzio and de Gaspari) A., i, 252.

iso-**Butyroanilide**, α-bromo- (Bischoff), A., i, 278.

n- and *iso*-**Butyrobenzylamide**, α-bromo- (Bischoff and Tschunkew), A., i, 277.

n- and *iso*-**Butyrobenzylanilides**, α-bromo- (Bischoff), A., i, 126.

n- and *iso*-**Butyrodiphenylamides**, α-bromo- (Bischoff), A., i, 126.

Butyrodiphenylhydrazide, α-bromo- (Bischoff), A., i, 278.

Butyrolactone, from reduction of β-aldehydopropionic acid (Perkin and Sprankling), T., 17.

n- and *iso*-**Butyro-*o*-nitranilides**, α-bromo- (Bischoff and Päpke), A., i, 278.

n- and *iso*-**Butyro-*m*-nitranilides,** α-bromo-(BISCHOFF and WATSCHJANZ), A., i, 278.
n- and *iso*-**Butyro-*p*-nitranilides,** α-bromo-(BISCHOFF and HIRSCHFELD), A., i, 278.
Butyronitrile (*propylic cyanide*), conductivity of electrolytes in (DUTOIT and FRIDERICH), A., ii, 350.
γ-bromo-, γ-chloro-, and γ-iodo-(HENRY), A., i, 183.
γ-chloro-, action of potash on (HENRY), A., i, 257, 675.
nitro-, and action of hydrochloric acid on it (HENRY), A., i, 251.
iso-**Butyrophenylhydrazide,** preparation of (LEIGHTON), A., i, 51.
n- and *iso*-**Butyropiperidides,** α-bromo-(BISCHOFF and HOLM), A., i, 230.
n- and *iso*-**Butyryl-*m*-toluidides** and **-*m*-xylidides,** α-bromo- (BISCHOFF and PÄPKE), A., i, 278.
Butyrylcarbazole, α-bromo- (BISCHOFF and KARUKOWSKI), A., i, 231.
iso-**Butyryl-*p*-cymene,** preparation of (VERLEY), A., i, 434.
n- and *iso*-**Butyrylmalic acids,** ethereal salts, specific rotations and molecular volumes of (FRANKLAND), T., 348, 352.
iso-**Butyrylmalonic acid,** ethylic salt (KNOEVENAGEL and FABER), A., i, 146.
Buxine, crystallisation of (SCHOLTZ), A., i, 92.

C.

Cacao butter, adulteration of (LEWKOWITSCH), A., ii, 712.
Cacothelin. See Bidemethylnitrobrucine hydrate.
Cadinene, from oil of Angostura bark (BECKURTS and TROEGER), A., i, 65.
Cadmium, potential difference between, and solutions of its salts in organic solvents (KAHLENBERG), A., ii, 624.
boiling point and latent heat of vaporisation of, and chloride, and bromide, latent heats of fusion of, and melting and boiling points of chloride (WEBER), A., ii, 725.
heat of vaporisation of (SUTHERLAND), A., ii, 7.
heat of amalgamation of (RICHARDS and LEWIS), A., ii, 267.
in copper or silver precipitated by its use (SHENGLE and SMITH), A., ii, 749.
action of, on sulphuric acid (ADIE), P., **1899**, 133.
action of sulphuric and sulphurous acids on (BERTHELOT), A., ii, 283.
Cadmium amalgams of different concentrations, electromotive force between (CADY), A., ii, **395.**
Cadmium salts, diffusion of light by solutions of (SPRING), A., ii, 585.
absorption of Röntgen rays by (HÉBERT and REYNAUD), A., ii, 586.
reduction of, by calcium carbide; alloys with calcium (TARUGI), A., ii, 749.
haloid, solubility of, in alcohols (ROHLAND), A., ii, 144.
Cadmium antimonate (SENDERENS), A., ii, 557.
*pyro*arsenite (REICHARD), A., ii, 23.
bromide, molecular refraction and density of solutions of (HALLWACHS), A., ii, 462.
hydrates of (DIETZ), A., ii, 221.
double ammonio-compounds of, with mercuric cyanide (VARET), A., i, 99.
chloride, spark-spectrum of (DE GRAMONT), A., ii, 137.
transference ratio of, with various septa (BEIN), A., ii, 399.
molecular weight of, in urethane (CASTORO), A., ii, 360.
hydrates of (DIETZ), A., ii, 221.
ammoniacal, dissociation pressures of (LANG and RIGAUT), T., 883; P., **1899**, 182.
potassium chloride, conductivity of aqueous solutions of (JONES and OTA), A., ii, 587.
strontium chloride, and barium, potassium or sodium bromides, conductivities of solutions of (JONES and KNIGHT), A., ii, 628.
iodide, molecular refraction and density of solutions of (HALLWACHS), A., ii, 462.
spark spectrum of (DE GRAMONT), A., ii, 137.
conductivity of, in organic solvents (DUTOIT and FRIDERICH), A., ii, 351.
solubility of (DIETZ), A., ii, 221.
double ammonio-compound of, with mercuric cyanide (VARET), A., i, 99.
reactions of, in ethylic acetate (NAUMANN), A., ii, 423.
lead iodide (MOSNIER), A., ii, 222.
molybdiodate (CHRÉTIEN), A., ii, 363.
nitrate, hydrates of (FUNK), A., ii, 209.
oxide, apparent volatility of (RICHARDS), A., ii, 101.
sulphate, boiling point of solutions of, containing sodium chloride (GORDON, HENDERSON, and HARRINGTON), A., ii, 141.

Cadmium sulphate, densities of solutions of (Barnes and Scott), A., ii, 406.
  potassium *para*tungstate (Hallopeau), A., ii, 160.
Cadmium organic compounds :—
  antipyrine salicylate (Schuyten), A., i, 306.
  azoimide, and its pyridine compound (Curtius and Rissom), A., ii, 92.
  phenylhydrazine dithionate and thiosulphate (Moitessier), A., i, 688.
  pyridine and quinoline, salts (Reitzenstein), A., i, 163.
  tripyridine sulphate dihydrate (Reitzenstein), A., i, 162.
  Triethylenediaminecadmium salts (Werner, Megerle, Pastor, and Spruck), A., i, 856.
Cadmium, detection, estimation, and separation of :—
  detection of copper in presence of (Trey), A., ii, 182.
  estimation of silver and mercury in presence of (Kollock), A., ii, 811.
  precipitation of, by hydrogen sulphide (Meldrum), A., ii, 812.
  separation of antimony and arsenic from (Atkinson), A., ii, 615.
  separation of copper from (Bornemann), A., ii, 813.
  separation of iron from (Stortenbeker), A., ii, 126.
  separation of mercury from (Jannasch and Devin), A., ii, 59.
Cadmium-boracite, containing iodide (Allaire), A., ii, 156.
Cadmium-cell, electromotive force of (Kahle), A., ii, 348.
Cæsium, preparation of (Erdmann and Menke), A., ii, 483.
  specific gravity of (Menke), A., ii, 483.
  ion, velocity of, in flames (Wilson), A., ii, 723.
Cæsium azoimide (Curtius and Rissom), A., ii, 92.
  *di*fluoriodate (Weinland and Lauenstein), A., ii, 364.
  *mono*fluorophosphate, *di*fluorodisulphate, and *mono*fluorodithionate (Weinland and Alfa), A., ii, 595.
  selenibromide (Lenher), A., ii, 19.
  silicate, hydrolysis of, in aqueous solution (Kahlenberg and Lincoln), A., ii, 95.
  sulphate crystals, thermal expansion of (Tutton), A., ii, 630.
  iron alum and cobalt alum (Howe and O'Neal), A., ii, 103.
  manganese alum (Piccini), A., ii, 367.
Cæsium *per*sulphate, preparation and solubility of (Foster and Smith), A., ii, 747.
Caffeine, properties of (Tassilly), A., i, 174.
  derivatives, distinction of, from theobromine derivatives (Brunner), A., i, 306.
  fate of, in the living body (Albanese), A., ii, 777.
  estimation of (Brunner and Leins), A., ii, 261; (Ladd), A., ii, 262; (Gadamer), A., ii, 390.
  estimation of, in coffee (Tassilly), A., ii, 134.
  separation of theobromine from (Brunner and Leins), A., ii, 261.
allo-**Caffeine,** conversion of, into *allo*-caffuric acid (Torrey), A., i, 86.
allo **Caffuric acid** and its decomposition products (Torrey), A., i, 86.
Caladium bulbosum, constituents of (Hébert), A., i, 240.
Calamine, from Arkansas (Miller), A., ii, 761.
Calcium, preparation of (Lengyel), A., ii, 218.
  properties of (Moissan), A., ii, 153.
  heat of combustion of (Ditte), A., ii, 426.
Calcium alloys, formed by reduction of metallic salts by calcium carbide (Tarugi), A., ii, 749.
  with bismuth, magnesium, zinc, nickel, tin, and mercury (Moissan), A., ii, 153, 154.
Calcium amalgams (Ferée), A., ii 155.
  of different concentrations, electromotive force between (Cady), A., ii, 394.
Calcium salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
  agents for removing, from natural waters (Griffin), A., ii, 655.
  relation of, to fibrin formation (Hammarsten), A., ii, 776.
Calcium ammonia, and calcamide (Moissan), A., ii, 153, 154.
  antimonate (Senderens), A., ii, 557.
  arsenide (Lebeau), A., ii, 288.
  azoimide (Curtius and Rissom), A., ii, 92.
  boride (Moissan), A., ii, 154.
  bromide, spark-spectrum of (Gramont), A., ii, 137.
  carbide, formation of (Moissan), A., i, 241.
    colour of (Moissan), A., ii, 219.
    impurities in, silicide (Le Chatelier), A., ii, 219.

Calcium carbide, action of water on (Moissan), A., ii, 155.
reducing action of, on copper oxide, and on metallic salts (Tarugi), A., ii, 749.
carbonate, in the efflorescence on walls (van Erp), A., ii, 96.
reduction of, by aluminium (Franck), A., ii, 102.
estimation of, in marl and in soil (Mayer), A., ii, 385.
hydrogen carbonate (Kippenberger; Treadwell), A., ii, 220.
action of, on alkali sulphate (Vater), A., ii, 109.
chlorate, electrolytic formation of (Oettel), A., ii, 219; (Foerster and Yorre), A., ii, 280.
*sub*chloride (Moissan), A., ii, 154.
chloride, transference ratio of, with various septa (Bein), A., ii, 399.
electrolysis of aqueous solutions of (Bischoff and Foerster), A., ii, 89.
heat of dilution of (Dunnington and Hoggard), A., ii, 728.
hydrated, effect of pressure on melting point curve of (Tammann), A., ii, 636.
thermal change on diluting a saturated solution of (Pollok), P., **1899**, 8.
contraction of aqueous solutions of, on dilution (Wade), T., 270; P., **1899**, 8.
absorption of water vapour by (Busnikoff), A., ii, 361.
chloraluminate (Friedel), A., ii, 366.
ammonium chloride, dissociation of, change of entropy in (Matignon), A., ii, 273.
uranium chloride and bromide (Aloy), A., ii, 556.
hydride, preparation and properties of (Moissan), A., ii, 25; (Lengyel), A., ii, 218.
sulphide, phosphide, arsenide, antimonide, and silicide, from metallic calcium (Moissan), A., ii, 153.
hydroxide, electrolysis of aqueous solutions of (Glaser), A., ii, 79.
solubility of, in solutions of ammonium chloride (Noyes and Chapin), A., ii, 405.
iodate, crystalline (Schulten), A., ii, 161.
*sub*iodide (Moissan), A., ii, 154.
lead iodide (Mosnier), A., ii, 222.
molybdiodate (Chrétien), A., ii, 363.
nitrate, heat of dilution of (Dunnington and Hoggard), A., ii, 728.

Calcium nitride (Moissan), A., ii, 154; (Ferée), A., ii, 155.
hyponitrite, and hyponitrosoacetate, constitution of (Divers), T., 117; P., **1898**, 224.
oxide (*lime*), caustic, in ancient masonry (Arth), A., ii, 483.
amount of, in Egyptian porcelain (Le Chatelier), A., ii, 751.
heat of formation of (Moissan), A., ii, 352.
hydration of, and heat of dissolution in hydrochloric acid (Gautier), A., ii, 399.
influence of a third substance on the hydration of (Rohland), A., ii, 596.
solubility of, in water at different temperatures (Herzfeld), A., ii, 25.
solubility of, in water and in sugar solutions (Weisberg), A., ii, 748.
solubility of, in aqueous solutions of sodium or potassium chloride (Cabot), A., ii, 25.
absorption of nitrogen by mixtures of magnesium, sodium, or lithium, and (Hempel), A., ii, 594.
estimation of, in soils (Maxwell), A., ii, 521.
estimation of carbonic anhydride in (Schenke), A., ii, 809.
phosphate, solubility of, in water, and in water saturated with carbon dioxide (Joffre), A., ii, 419.
rate of filtration of water or alcohol through (Hausser), A., ii, 277.
reduction of, by aluminium (Franck), A., ii, 102.
reduction of, by the carbon of the electric arc (Renault), A., ii, 419.
hydrogen phosphate, preparation of (Barillé), A., ii, 97.
dihydrogen phosphate, decomposition of, by water at 100° (Viard), A., ii, 26.
phosphide, preparation and properties of (Moissan; Renault), A., ii, 418, 419.
*meta*plumbate, and *per*plumbate (Kassner), A., ii, 657.
zinc silicate from New Jersey (Wolff), A., ii, 435.
silicide (Le Chatelier), A., ii, 219.
sulphate, action of, on halogen alkali salts (Ditte), A., ii, 289.
sulphide, crystalline (Mourlot), A., ii, 97.
phosphorescence of (Mourelo), A., ii, 420.
potassium *per*tantalate (Melikoff and Pissarjewsky), A., ii, 491.

Calcium organic compounds :—
  acetylide, ammonio-compound of (Moissan), A., i, 241.
  citrate, analysis of (Soldaini and Berté), A., ii, 820.
  ethoxide, formation of (Moissan), A., ii, 155.
Calcium, estimation and separation of:—
  estimation of, in ashes (Haywood), A., ii, 612.
  estimation of, in presence of strontium and barium (Knobloch), A., ii, 182.
  separation of, from barium and strontium in mixed sulphates, theory of (Morgan), A., ii, 627.
  separation of manganese and magnesium from (Villiers), A., ii, 523.
  separation of phosphates from (Antony and Mondolfo), A., ii, 330.
Calluna vulgaris, presence of quercetin in : its dyeing and tanning properties (Perkin and Newbury), T., 837 ; P., **1899**, 199.
Calycin, and its presence in various lichens, its potassium, acetyl, and decomposition derivatives (Hesse), A., i, 385.
Calycium chrysocephalum, constituents of (Hesse), A., i, 385.
ω-**Camphanamide**, π-bromo- (Kipping), T., 142 ; P., **1898**, 250.
Camphanemorpholine and its derivatives (Knorr), A., i, 784.
Camphanic acid, π-bromo-, methylic salt (Kipping), T., 138, 143 ; P., **1898**, 250.
cis-π-**Camphanic acid**, two isomeric α-hydrindamine salts of (Kipping), P., **1899**, 173.
Camphene, in oil of rosemary (Schimmel and Co.), A., i, 63.
  constitution of (Marsh), P., **1899**, 54.
  oxidation of, with nitric acid (Jagelki), A., i, 627.
  nitronitrosite and nitrosite (Jagelki), A., i, 627.
Camphenemorpholine, derivatives of (Knorr and Duden), A., i, 783.
Camphenilene and **Camphenilol** (Jagelki), A., i, 628.
Camphenilone (Jagelki), A., i, 627 ; (Majewski and Wagner), A., i, 629.
iso-**Campheniloneoxime**, platinochloride (Jagelki), A., i, 628.
Camphenilonepinacone (Jagelki), A., i, 628.
Camphenilylic choride (Jagelki), A., i, 628.
Camphenylic nitrite (Jagelki), A., i, 627.
Campheride and triacetyl derivatives (Ciamician and Silber), A., i, 537.
Camphoantipyrine. See **1-Phenyl-2-methyl-3 : 4-campho-5-pyrazolone.**
Campho*iso*antipyrine. See **1-Phenyl-2-methyl-4 : 5-campho-3-pyrazolone.**
Camphoceenic acid, amide and **nitrile** (Jagelki), A., i, 628.
Camphoceonic acid (Jagelki), A., i, 628.
Camphoic acid (*carboxylapocamphoric acid*) (Jagelki), A., i, 627.
ψ-**Campholactone**, behaviour of, towards phosphorus pentabromide (Lees and Perkin), P., **1899**, 24.
α- and β-**Campholenamides**, oxidation (Blaise and Blanc), A., i, 820.
Campholene, α-amino- and β-amino-, salts, oxamides, and carbamides (Blaise and Blane), A., i, 820.
Campholenic acids, constitution of (Bouveault), A., i, 536.
Campholide, α-bromo-, oxidation of, to homocamphoronic acid ; constitution of (Lapworth), T., 1137 ; P., **1899**, 203.
  *di*bromo-, constitution of (Lapworth), T., 1140 ; P., **1899**, 202.
Camphononic acid, phenylhydrazone, *p*-bromophenylhydrazone, semicarbazone (Lapworth and Chapman), T., 1000 ; P., **1899**, 160.
Camphoquinone, behaviour of, towards sulphuric acid (Manasse and Samuel), A., i, 300.
Camphor, from cardamoms oil (Schimmel and Co.), A., i, 63.
  constitution of (Bouveault), A. i, 536 ; (Noyes), A., i, 929.
  latent heat of fusion of, influence of pressure on (Hulett), A., ii, 469.
  vapour pressure of (Allen), P., **1899**, 135.
  volatilisation of, in compressed gases (Villard), A., ii, 143.
  solubility of, in water and in hydrochloric acid (Istrati and Zaharia), A., i, 225.
  racemisation of (Debierne), A., i, 625.
  behaviour of, towards sulphuric acid in acetic anhydride (Reychler), A., i, 445.
  compounds of, with aromatic aldehydes ; molecular refraction and dispersion and specific rotation of (Haller and Muller), A., ii, 622.
  derivatives of (Blanc), A., i, 442.
Camphor, amino-, melting points of derivatives of (Manasse), A., i, 300.
    salts (Duden and Pritzkow), A., i, 626.
  bromo-, behaviour of, towards phosphoric anhydride (Moureu), A., i, 68.

Camphor, α-*di*bromo-, behaviour of, towards compounds of silver, mercury, and lead (Lapworth), T., 1134 ; P., **1899**, 202.
oxidation of, with nitric acid and silver nitrate (Lapworth and Chapman), T., 992 ; P., **1899**, 159.
αα'π-*tri*bromo- (Lapworth), T., 573 ; P., **1899**, 61.
π-bromonitro-, cause of mutarotation of (Lowry), T., 223 ; P., **1899**, 25.
α-chloro-, oxidising action of (Vittenet), A., i, 225.
nitro-, behaviour towards nitrous acid (Lowry), T., 230.
normal nitro-, cause of mutarotation of (Lowry), T., 215 ; P., **1899**, 25.
Camphor-liniment, examination of (Leonard and Smith), A., ii, 193.
Camphors and allied compounds, physical properties of (Brühl), A., i, 625.
Camphorenic acid, bromo-, from α-dibromocamphor ; constitution of (Lapworth), T., 1135, 1138 ; P., **1899**, 202.
Camphorformaldoxime and **Camphorparaformaldoxime** (Frankforter and Glasoe), A., i, 713.
Camphoric acid, experiments on the synthesis of (Auden, Perkin, and Rose), T., 909 ; P., **1899**, 162.
constitution of (Bouveault), A., i, 300, 536 ; (Blanc), A., i, 443, 926, 928 ; (Balbiano), A., i, 537 ; (Noyes), A., i, 759, 928.
action of potash on (Holleman), A., i, 283.
oxidation of (Balbiano), A., i, 537, 867.
phenylic hydrogen, thymylic hydrogen, guaiacylic hydrogen, carvacrylic hydrogen, eugenylic hydrogen, and β-naphthylic hydrogen salts (Schryver), T., 663 ; P., **1899**, 121.
salyl hydrogen, *m*-nitrophenylic hydrogen, *p*-bromophenylic hydrogen, and 2 : 4-*di*bromophenylic hydrogen salts (Schryver), T., 667 ; P., **1899**, 121.
Camphoric acid, πω-*di*bromo-, and anhydride (Kipping), T., 133 ; P., **1898**, 250.
π-bromo-ω-chloro, and anhydride (Kipping), T., 138 ; P., **1898**, 250.
Camphorone, constitution of (Harries and Matfus), A., i, 629.
Camphoronehydroxylamine (Harries and Matfus), A., i, 629.
Camphoronic acid from camphononic acid (Lapworth and Chapman), T., 1003 ; P., **1899**, 160.
Camphoronic acid, methylic dihydrogen salt (Aschan), A., i, 69.
iso-**Camphoronic acid**, constitution of (Perkin and Thorpe), T., 897 ; P., **1899**, 184.
Camphoroxime, *r*-, resolution of ; *d*- and *l*-, and their *d*-camphorsulphonates, rotatory power of (Pope), T., 1105 ; P., **1899**, 199.
acyl derivatives (Frankforter, Mayo, and Glasoe), A., i, 713.
behaviour of, towards potassium hypobromite (Forster), T., 1141 ; P., **1899**, 193.
Camphoroxime, chloro- (Frankforter and Glasoe), A., i, 713.
Camphor-α-phenylhydrazone, desmotropic forms of (Betti), A.., i, 771.
Camphorquinone, from nitrocamphor (Lowry), T., 230.
Camphorsulphonic acid, metallic, phenylic, and quinine salts, chloride, amide, anilide, oxime, phenylhydrazone (Reychler), A., i, 445.
bromo-, two isomeric α-hydrindamine, salts of (Kipping), P., **1899**, 172.
αα'-*di*bromo-, and salts, chloride, bromide, amide, piperidide (Lapworth), T., 561 ; P., **1899**, 61.
d-**Camphorsulphonic acid**, *d*- and *l*-camphoroxime salts, crystalline form and rotatory power of (Pope), T., 1105 ; P., **1899**, 199.
i-α-phenethylamine salt, rotatory power of (Pope and Harvey), T., 1110 ; P., **1899**, 200.
d- and *l*-α-phenylbenzylmethylallylammonium salts, rotatory power of (Pope and Peachey), T., 1128 ; P., **1899**, 192.
d- and *l*-tetrahydroquinaldine salts of, and ammonium salt ; and α-bromo-, *l*-salt, rotatory powers of (Pope and Peachey), T., 1067, 1084 ; P., **1899**, 199.
d-**Camphorsulphonic acid**, bromo-, *d*- and *l*-tetrahydro-*p*-toluquinaldine salts of (Pope and Rich), T., 1093 ; P., **1899**, 200.
Camphorsulphonic chlorides, *d*- and pseudoracemic (Kipping and Pope), T., 1121 ; P., **1899**, 201.
α-**Camphylamine**, action of nitrosyl chloride on (Solonina), A., i, 473.
α-**Camphylic** chloride, formation of, and the action of bromine and sodium phenoxide on it (Solonina), A., i, 473.
phenylic ether (Solonina), A., i, 473.
Cananga oil (Schimmel and Co.), A., i, 923.

Candellaria vitellina and *C. concolor*, stictaurin from (ZOPF), A., i, 716.
Cane sugar. See Sucrose.
Cannabinol, and *tri*nitro- and acetyl derivatives (WOOD, SPIVEY, and EASTERFIELD), T., 20, 21; P., **1898**, 153, 185.
Cannabinolactone, and amino-, iodo-, oxidation and reduction derivatives (WOOD, SPIVEY, and EASTERFIELD), T., 20; P., **1898**, 60, 185.
Cannabinolactonic acid, ethylic and potassium salts, and decomposition products (WOOD, SPIVEY, and EASTERFIELD), T., 34, 35; P., **1898**, 185.
Cantharic acid, constitution of (MEYER), A., i, 380.
iso-**Cantharidic acid** (MEYER), A., i, 380.
Cantharidin, isomerides of (MEYER), A., i, 380.
iso-**Cantharidin** (MEYER), A., i, 380.
Caoutchouc, action of carbon *di*oxide, nitrogen, and oxygen on (D'ARSONVAL), A., i, 771.
  vulcanised, estimation of sulphur in (HERTING), A., ii, 804.
Caoutchouc-milk (GIRARD: LINDET), A., ii, 507.
Caparrapi, oil of, Caparrapene, Caparrapiol (TAPIA), A., i, 533.
Caperatic acid from *Platysma glaucum* and *Mycoblastus sanguinarius* (ZOPF), A., i, 716.
Capric acids. See Decoic acids.
Caproic acids. See Hexoic acids.
iso-**Caprolactone.** See Hydroxyhexoic acid, lactone of.
Capronitriles. See Hexonitriles.
Caprylic acid. See Octoic acid.
iso-**Caprylic alcohol.** See *iso*-Octylic alcohol.
Caprylonitrile. See Octonitrile.
Capsaicin and its benzoyl derivative (MICKO), A., i, 716.
Caramel, detection of, in spirits and vinegar (CRAMPTON and SIMONS), A., ii, 530.
  estimation of (FRADISS), A., ii, 819.
Carbamic acid, benzylic and *p*-nitrobenzylic salts (THIELE and DENT), A., i, 15.
  and nitro-, ethylic lactate and ethylic glycollate compounds of (THIELE and DENT), A., i, 15.
  nitro-, methylic and *p*-nitrobenzylic salts (THIELE and DENT), A., i, 14, 15.
  nitroso-, methylic salt (THIELE and DENT), A., i, 14.
Carbamide (*urea*), heat of formation of (BERTHELOT), A., ii, 142.
Carbamide (*urea*), solutions, molecular depression of vapour pressure of (DIETERICI), A., ii, 403.
  contraction of aqueous solutions of, on diluting (WADE), T., 271; P., **1899**, 8.
  action of chromic acid and potassium chromate on (OECHSNER DE CONINCK), A., i, 244.
  action of ethylic dioxysuccinate on (GEISENHEIMER and ANSCHÜTZ), A., i, 574.
  nitrous oxide obtained from, by action of hypobromite (RAYLEIGH), A., ii, 744.
  mercury compound of, constitution of (KIESERITZKY), A., ii, 395.
Carbamides, formation of (JOUVE), A., i, 420.
  oxidation of (OECHSNER DE CONINCK), A., i, 420.
  thio-, aromatic, preparation of (HUGERSHOFF), A., i, 886.
ψ-**Carbamides** (SCHMIDT), A., i, 16.
Carbanil. See Phenylcarbimide.
Carbanilide. See Diphenylcarbamide.
Carbazinic acids, diazoles of (BUSCH), A., i, 825.
Carbazole, heats of combustion and formation of (BERTHELOT and ANDRÉ), A, ii, 400.
  equilibrium between benzene, phenanthrene and (BRUNI), A., ii, 406.
  cryoscopic behaviour of picrates of (BRUNI and CARPENÈ), A., ii, 8.
Carbethoxydiazohydrate. See Diazourethane.
Carbethoxypropionic chloride, action of zinc methyl on (BLAISE), A, i, 793.
Carbimide derivatives, salts of, constitution of (STIEGLITZ), A., i, 359.
Carbimidoacetyl-amylurethane, and **-ethylurethane,** thio- (FRERICHS), A.. i, 796.
Carboallylphenylimide, and its sesquichloride (DAINS), A., i, 593.
Carbocyclic compounds, formation of, from 1 : 5- and 1 : 6-diketones (WISLICENUS), A., i, 59.
Carbodiphenylimide, mono- and di-platinochlorides (DAINS), A., i, 592.
a-**Carbodiphenylimide** (SCHALL), A., i, 280.
Carbodi-*o*-tolylimide and **Carbodi-*p*-tolylimide** (DAINS), A., i, 592, 593.
Carbohydrate from yeast extract (WRÓBLEWSKI), A, ii, 170.
Carbohydrate. See Agricultural chemistry.
Carbohydrates of egg-albumin, isolation of the (FRÄNKEL), A., i, 396.

Carbohydrates in monocotyledons, the metabolism of (Parkin), A., ii, 790.
  - antiseptic action of (Salkowski), A., i, 724.
  - action of hydrogen bromide on (Fenton and Gostling), T., 423; P., **1899**, 57.
  - action of hydrogen peroxide on, in presence of ferrous salts (Morrell and Crofts), T., 786; P., **1899**, 99.
  - oxidation of, by sorbose bacterium (Bertrand), A., ii, 170.
  - estimation of (Traphagen and Cobleigh), A., ii, 529.

Carbon, atomic weight of (Dewar), P. **1898**, 175; (Berthelot), A., ii, 207.
  - influence of, on magnetic properties of steel (Osmond), A., ii, 630.
  - mode of burning of (Dixon), T., 630; P., **1899**, 118.
  - absorption of hydrogen by (Hemptinne), A., ii, 228.
  - absorption of hydrogen by, at low temperatures (Hemptinne), A., ii, 146.
  - decomposition of carbon *mon*oxide in presence of (Boudouard), A., ii, 596.
  - action of, on dry oxygen or carbon *di*oxide (Dixon; Baker), T., 638; P., **1899**, 118.
  - action of, on sulphuric acid (Adie), P., **1899**, 133.

Carbon *tetra*chloride, boiling points of mixtures of, with acetone or chloroform (Haywood), A., ii, 632.
  - vapour pressures of mixtures of, in benzene, toluene, or alcohol (Lehfeldt), A., ii, 11.
  - vapour pressures of solutions of, in benzene or toluene (Lehfeldt), A., ii, 633.
  - partition of chlorine between water and (Jakowkin), A., ii, 736.

Carbon *mon***oxide** (*carbonic oxide*), electromotive efficiency of (Hoeper), A., ii, 541.
  - absorption of, by platinum or palladium, at low temperatures (Hemptinne), A., ii, 146.
  - the first product of oxidation of carbon (Dixon), T., 639; P., **1899**, 118.
  - combination of, with oxygen at different temperatures (Hélier), A., ii, 85.
  - and oxygen, inflammability of mixtures of, and influence of water vapour on (Emich), A., ii, 13.
  - reduction of, by aluminium (Franck), A., ii, 102.
  - effect of silent electric discharge on mixture of, with carbon *di*sulphide (Berthelot), A., ii, 648.
  - action of electric glow discharge on mixture of, with nitric oxide (Mixter), A., ii, 267.
  - action of ammoniacal cuprous chloride and amines on (Jouve), A., i, 420.
  - decomposition of, in presence of metallic oxides (Boudouard), A., ii, 287, 365, 417, 595, 596.
  - fate of, in the living body (Wachholtz), A., ii, 372, 503.

Carbon *mon***oxide** (*carbonic oxide*), estimation of (Schlagdenhauffen and Pagel), A., ii, 384.
  estimation of, by combustion (Dennis and Hopkins), A., ii, 332.
Carbon *di***oxide** (*carbonic anhydride*), in atmosphere at different altitudes (de Thierry), A., ii, 653.
  in moorland waters (Ackroyd), T., 196; P., **1899**, 2.
  solid, collection of (Hempel), A., ii, 140.
  ionic charges produced in, by Röntgen rays (Townsend), A., ii, 730.
  viscosity of (Breitenbach), A., ii, 403.
  effect of pressure on melting point curves of (Tammann), A., ii, 636.
  diffusion of, through caoutchouc (d'Arsonval), A., i, 771.
  invasion and evasion coefficients of, in water, and in aqueous salt solutions (Bohr), A., ii, 641.
  in air, absorption of (Lévy and Henriet), A., ii, 94.
  behaviour of, and van der Waals' equation (Boltzmann and Mache), A., ii, 635.
  compressed, volatilisation of iodine in (Villard), A., ii, 144.
  compressibility of mixture of, with sulphur *di*oxide (Berthelot and Sacerdote), A., ii, 404.
  critical temperature of mixtures of, with water (Kuenen and Robson), A., ii, 356.
  action of, on hydrazine (de Bruyn), A., ii, 745.
  decomposition of, in presence of carbon (Boudouard), A., ii, 417.
  combustion of mixtures of, with hydrogen (Berthelot), A., ii, 282.
  reduction of, by aluminium (Franck), A., ii, 102.
  compounds of, with water, ether, and alcohols (Hempel and Seidel), A., ii, 151.
  action of, on potassium ferrocyanide (Gigli), A., ii, 387.
  absorption of traces of, in gaseous mixtures (Marboutin, Pécoul, and Bouyssy), A., ii, 577.
  estimation of (Hempel and Scheffler), A., ii, 380.
  estimation of, in minerals (Marshall), A., ii, 249.
  estimation of combined, in soils (Stutzer and Hartleb), A., ii, 521.
Carbon:
  Chlorocarbonic acid, benzylic and *p*-nitrobenzylic salts, and the action of ammonia on them (Thiele and Dent), A., i, 15.
    ethylic lactate and ethylic glycollate compounds of (Thiele and Dent), A., i, 15.
  Carbonates, analogy of hyponitrites to (Divers), T., 124.
  Thiocarbonates, synthesis of (Konowaloff), A., i, 470.
Carbon oxides and hydrogen, chemical equilibrium between (Berthelot), A., ii, 286.
  silicide (Le Chatelier), A., ii, 219.
Carbon *di***sulphide,** specific volume of (Leduc), A., ii, 729.
  vicoscity coefficient of (Guye and Friderich), A., ii, 358.
  diffusion coefficient of, across vulcanised caoutchouc (Flusin), A., ii, 205.
  solution of, in compressed methane (Villard), A., ii, 143.
  and water, mutual solubilities of (Herz), A., ii, 83.
  influence of moisture on the combustion of; ignition and decomposition temperatures of; action of light on (Dixon and Russell), T., 600; P., **1899**, 114.
  absorption of argon by (Berthelot), A., ii, 654.
  and benzene, composition of mixed vapours of (Carveth), A., ii, 467.
  action of chlorine on, in presence of aluminium chloride (Mouneyrat), A., ii, 365.
  mixtures of, with hydrogen, nitrogen, argon or carbon *mon*oxide, influence of silent electric discharge on (Berthelot), A., ii, 648.
  estimation of (Goldberg), A., ii, 333.
Carbon, estimation of:
  combustions of, in a platinum crucible (Shimer), A., ii, 694.
  estimation of, volumetrically (Imbert and Compan), A., ii, 577.
  estimation of, in iron (Spüller), A., ii, 809.
  estimation of, in cast iron or steel (Wdowiszewski), A., ii, 181.
  estimation of, in iron products (Carnot and Goutal), A., ii, 809.
  estimation of, in organic substances containing nitrogen (Tower), A., ii, 694.
Carbonyl, and its derivatives, metallic and organic, molecular refraction of (Ferreira da Silva), A., ii, 393.

Carbonyl chloride, action of, on hydrazine (DE BRUYN), A., ii, 745.
  sulphide (*carbon oxysulphide*) and *mon*oxide, formed in explosion of carbon *di*sulphide with oxygen (DIXON and RUSSELL), T., 610; P., **1899**, 114.
    action of cuprous chloride on (BERTHELOT), A., ii, 287.

Carbonylamidohydrazopropionic acid, and its ethylic salt, amide and nitrile (THIELE and BAILEY), A., i, 169.

Carbonylamidophenol, 3 : 5-*di*bromo-, and its isomeride (McCOY), A., i, 359.

Carbonyl-*β*-*o*-**amidophenyl-benzimidazole,** -*m*-(*p*-)**tolimidazole,** and **Carbonyl**-*β*-*o*-**amido**-*p*-**tolyl**-*m*- (*p*-)**tolimidazole** (VON NIEMENTOWSKI), A., i, 647.

Carbonylferrocyanides, estimation of (MÜLLER), A., ii, 616.

Carbonyl group, influence of, on adjacent groups (VORLÄNDER), A., i, 812.

Carbonylphenylcarbazinic acid, chloro-, ethylic salt of (BUSCH and STERN), A., i, 957.

iso-**Carbopyrotritaric acid** (*isodimethylfurfurandicarboxylic acid*), decomposition of (KNORR and CASPARI), A., i, 194.

Carbostyril, absorption spectra and constitution of (HARTLEY and DOBBIE), T., 646; P., **1899**, 47.

α-**Carboxy**-*α′*-**acetyladipic acid,** *ββ*-*di*imino, ethylic salt (TRAUBE), A., i, 192.

o- and *m*-**Carboxybenzenesulphinic acids** (GATTERMANN), A., i, 517.

Carboxy*apo***camphoric acid.** See Camphoic acid.

Carboxyglutaric acid ($\grave{\omega}_2\omega_1$-*propanetricarboxylic acid*), ethylic salt and amide (GUTHZEIT and LASKA), A., i, 261.

Carboxyhæmoglobin. See under Hæmoglobin.

3-Carboxy-2-methylfurfuranacetic acid and ethylic and hydrogen ethylic salt (FEIST and MOLZ), A., 1, 675.

Carboxyoxalacetic acid, ethylic salt (BOUVEAULT), A., i, 416.

o-**Carboxyphenylacetic acid** (*Homophthalic acid*), products of action of acetonitrile on (MATHEWS), A., i, 57.
  preparation of, and 4-nitro- (HEUSLER and SCHIEFFER), A., i, 365.
  formation of imide of (*Homophthalimide*), (MATHEWS), A., i, 57.

5-Carboxyphenyl-1 : 3-diphenylpyrazoline and its sodium salt (HAMBURGER), A., i, 144.

β-*o*-**Carboxyphenyl**-*α*-**ethylpropionic acid** and *β*-*o*-**Carboxyphenyl**-*α*-**methylpropionic acid** (LANDSBERGER), A., i, 211.

3-Carboxyphenyl-5-phenyl*iso***oxazoline** (HAMBURGER), A., i, 143.

Carcenomata, composition of (PETRY), A., ii, 568.

Cardamoms oil, from Malabar, Siam, Cameroon, and Ceylon, components of (SCHIMMEL and Co.), A., i, 63.
  seeds and husks, ash of, and its constituents (YARDLEY), A., ii, 793; (BRIDGES; WILL), A., ii, 794.

Carnations. See Agricultural chemistry.

Carnotite from Colorado (FRIEDEL and CUMENGE), A., ii, 434.

cis-**Caronic acid** (cis-*dimethyl*cyclo*propane*-1 : 2-*dicarboxylic acid*), synthesis of, and its conversion into terebic acid; also its anhydride (PERKIN and THORPE), T., 56; P., **1898**, 108.

trans-**Caronic acid** (trans-*dimethyl*cyclo*propane*-1 : 2-*dicarboxylic acid*), synthesis of; also its conversion into terebic acid and into *cis*-caronic acid (PERKIN and THORPE), T., 56; P., **1898**, 108.

Carob seed, albumin of (BOURQUELOT and HÉRISSEY), A., i, 839, 968.

Carrotene, presence of, in *Aspidium filix fœmina* (ÉTARD), A., ii, 792.

Carpets, detection of arsenic in (RÖSSLER), A., ii, 530.

Carvacrol, from carvone and formic acid (KLAGES), A., i, 624.
  from oil of *Monarda fistulosa* (KREMERS and HENDRICKS), A., i, 770.
  from oil of pepperwort (SCHIMMEL and Co.), A., i, 64.

Carvacrylglucoside (RYAN), T., 1056; P., **1899**, 196.

Dd-**Carvenolic acid** and *i*-**Carvenolic acid** (WALLACH), A., i, 532.

Dl-**Carvenolide,** *Ld*-**Carvenolide,** *i*-**Carvenolide,** dibromides of (WALLACH), A., i, 532.

Carvenone, from dihydrocarvone and formic acid (KLAGES), A., i, 624.
  oxidation of (TIEMANN and SEMMLER), A., i, 224.

Carvone, from pinole tribromide and *iso*pinole dibromide (WALLACH, STIEHL, and SIEVERTS), A., i, 710.

Carvyldioxime, dibenzoyl derivative; isomeride (HARRIES and MAYRHOFER), A., i, 625.

Caryophyllene, nitrosochloride, nitrosate, nitrosite, *iso*nitrosite (or bisnitrosite), nitrolbenzylamine and nitrolpiperidine (KREMERS, SCHREINER, and JAMES), A., i, 619.

Cascara sagrada, constituents of bark (LEPRINCE), A., i, 820.
Cascarilline (NAYLOR), A. ; 179.
Casein, animal- or vegetable-, absorption spectrum of (BLYTH), T., 1163 ; P., **1898**, 175.
  decomposition products of (COHN), A., i, 315
  fermentation products of (RÖHMANN), A., i, 96.
  first products of the peptic digestion of (SALKOWSKI), A., ii, 567.
Cassiterite from Swaziland (PRIOR), A., ii, 434.
  artificial (VOGT), A., ii, 562.
Castillon elastica, caoutchouc from (LINDET), A., ii, 508.
Catechin, action of sodium on, in alcohol (KUNZ KRAUSE), A., ii, 201.
Catechol (*pyrocatechol*, *1 : 2-dihydroxybenzene*), condensation of, with benzoin (JAPP and MELDRUM), T., 1039 ; P., **1899**, 167.
  action of ozone on (OTTO), A., ii, 282.
  action of sodium on, in alcohol (KUNZ-KRAUSE), A., i, 200.
  sodium and disodium salts, heats of formation of (DE FORCRAND), A., ii, 589.
  and its isomerides, separation of (CAUSSE), A., i, 363.
  derivatives (COUSIN), A., i, 346.
  acetylenic ether, and dibromide (MOUREU) A., i, 494.
  methylacetylenic ether, and dibromide (MOUREU), A., i, 494.
  ethylenic ether, amino-, and its salts (MOUREU), A., i, 494.
Catechol-ethylenic-ether-carbinol, and acetate (MOUREU), A., i, 493.
Catecholglyoxal (MOUREU), A., i, 138.
Catechoylcarboxylic acid (BOUVEAULT), A,, i, 437.
Cattle. See Agricultural chemistry.
Cattleya, degeneration of (HÉBERT and TRUFFAUT), A., ii, 174.
Cedar seeds, composition of the fatty oil of (KRYLOFF), A., ii, 711.
Cedarite. See Chemawinite.
Celadonite and glauconite, action of reagents on (GLINKA), A., ii, 112.
Celloxin, and its decomposition (FABER and TOLLENS), A., i, 854.
Cells, oxyphile, action of, on bacilli (HARDY), A., ii, 165.
Cellulose, acetylation of (SKRAUP and PREGL), A., i, 852.
  action of nitrogen peroxide and nitric acid on (BUMCKE and WOLFFENSTEIN), A., i, 853.
  oxidation of (ZANOTTI), A., i, 851.
Cellulose, digestion of, by a soluble ferment in *Helix pomatia* (BIEDERMANN and MORITZ), A., ii, 166.
  estimation of (LEBBIN), A., ii, 67.
  nitrate (LUNGE and WEINTRAUB), A., i, 559.
Cements, action of bacteria on (STUTZER and HARTLEB), A., ii, 505 ; (BARTH), A., ii, 607.
  hydraulic, constitution of (REBUFFAT), A., ii, 289.
  ancient, from Ephesus and Smyrna (DÖRNER), A., ii, 554.
Cenosite. See Kainosite.
Centrifugal machine for collecting precipitates in quantitative analysis (MEILLÈRE), A., ii, 610.
Ceratonia siliqua seed, albumen of (BOURQUELOT and HÉRISSEY), A., i, 839, 968.
Cereals. See Agricultural chemistry.
Cerebro-spinal fluid, nature of reducing substance in (GUERBET), A., ii, 780.
Cerin (ISTRATI and OSTROGOVICH), A., i, 772.
  from cork, and its acetyl and benzoyl derivatives (THOMS), A., ii, 324.
Cerite, action of hydrogen sulphide on (DIDIER), A., ii, 596.
Cerium in bismutite from Argentina (BODENBENDER), A., ii, 758.
  in didymium from monazite sands (URBAIN), A., ii, 425.
  mineral containing, from Caucasus (TSCHERNIK), A., ii, 668, 669.
  Cerous salts, oxidation of, in solution of an alkali carbonate (JOB), A., ii, 291.
  oxide, constitution of (WYROUBOFF and VERNEUIL), A., ii, 598.
  Cerosoceric oxide, its polymerides, and their nitrates and sulphates (WYROUBOFF and VERNEUIL), A., ii, 224.
    solubility of, in nitric acid, influence of didymium or lanthanum oxides on (WYROUBOFF and VERNEUIL), A., ii, 423, 424.
  *per*oxide (JOB), A., ii, 291.
  didymium, and cerium lanthanum nitrates and sulphates ; oxides and their polymerides (WYROUBOFF and VERNEUIL), A., ii, 424.
  per-**Ceric** carbonate, and double potassium carbonate (JOB), A., ii, 487.
  *tetra*chloride, dipyridine *hexa*chloride, diquinoline *hexa*chloride, ditriethylamine *hexa*chloride, potassium and ammonium *hexa*chlorides (KOPPEL), A., ii, 98.

Cerium, estimation and separation of:—

estimation of (Wyrouboff and Verneuil), A., ii, 613.

estimation of, volumetrically (Job), A., ii, 334.

separation of, from lanthanum and didymium, and estimation of (Mengel), A., ii, 223.

Cerotic acid, separation of, from other fatty acids (Holzmann), A., ii, 68.

Cetraria islandica, constituents of (Hesse), A., i, 386.

Cetraric acid, presence of, in *Pertusaria communis* (Hesse), A., i, 383.

Cevadine. See Veratrine.

Cevine, and its sodium and potassium derivatives, hydrochloride and methiodide; physiological action (Freund and Schwarz), A., i, 465.

Chabazite, vapour pressure of (Tammann), A., ii, 8.

Chaff. See Agricultural chemistry.

Chalcanthite from British Columbia (Hoffmann), A., ii, 110.

Chalcophyllite from Cornwall (Hartley), A., ii, 433.

Chalk. See Agricultural chemistry.

Chalybite in Dutch peat (Bemmelen), A., ii, 371.

in Mecklenburg peat (Gaertner), A., ii, 302.

Charcoal, animal. See Animal charcoal.

Cheese. See Agricultural chemistry.

Cheiranthin from leaves and seeds of wallflower (Reeb), A., i, 378.

Chemawinite from Canada (Klebs), A., ii, 34.

Chemical individual, definition of (Wald), A., ii, 276.

statics (Duhem), A., ii, 85.

Chemotaxis in *Paramœcium* (Jennings) ii, 440.

Chicory, mixtures of, with coffee, detection of glycerol in (Grünhut), A., ii, 253.

Chili saltpetre. See Sodium nitrate.

Chione glabra, constituents of, and presence of *o*-hydroxyacetophenone in wood of (Dunstan and Henry), T., 67; P., **1898**, 220.

Chitin, preparation of, from fungi (Tanret), A., ii, 171.

Chitosamine. See Glucosamine.

Chloral, equilibrium between metachloral and, in presence of water (Bancroft), A., ii, 411.

action of bromine and iodine on, in presence of aluminium chloride (Mouneyrat), A., i, 247.

Chloral hydrate, latent heat of fusion and crystalline form of (Pope), T., 455.

Chloral hydrate, equilibrium in dissociation of (Bancroft), A., ii, 411.

Chloralacetone, action of potash and sodium ethoxide on (Salkind), A., i, 734.

Chloralacetones (Gigli), A., i, 12.

Chloral-ammonia, molecular weight of (Delépine), A., i, 414.

Chloralcamphoroxime (Frankforter and Mayo), A., i, 713.

Chloranilic acid, cyanamide derivative of, and its potassium salt (Imbert), A., i, 51.

compound of, with phenylhydrazine (Descomps), A., i, 205.

Chlorhydrins, aliphatic, action of potassium thiocyanate on (Engle), A., i, 3.

Chlorine, atomic weight of (Berthelot), A., ii, 207.

dissociation of (Leduc), A., ii, 729.

solutions of, in water, equilibrium in, and conductivity of; partition of, between carbon *tetra*chloride and water (Jakowkin), A., ii, 736.

inflammability of mixtures of, with hydrogen (Emich), A., ii, 12.

organic, presence of, in normal urine (Vitali), A., ii, 41.

Hydrochloric acid (*hydrogen chloride*), pure, preparation of (Vandenberghe), A., ii, 150.

molecular refraction of solutions of (Hallwachs), A., ii, 462.

transference ratio of, with various septa (Bein), A., ii, 399.

vapour pressures of aqueous solutions of (Allan), A., ii, 82.

densities and refractive indices of solutions of (Conroy), A., ii, 717.

densities of solutions of (Barnes and Scott), A., ii, 406.

contraction of aqueous solutions of, on dilution (Wade), T., 270; P., **1899**, 8.

affinity constant of, in methylic alcohol or water (Minozzi), A., ii, 643.

decomposition of, by oxygen (Berthelot), A., ii, 197.

aminolytic constants of aniline and pyridine in presence of (Goldschmidt and Salcher), A., ii, 551.

action of, on cupric chloride dissolved in ethylic acetate (Naumann), A., ii, 423.

heat evolved in decomposition of potassium cyanide by (Berthelot), A., ii, 737.

action of potassium permanganate on, in presence of catalytic agents (Wagner), A., ii, 275.

Chlorine :—
  Hydrochloric acid, (*hydrogen chloride*), inversion of sugar by, in aqueous alcohol (COHEN), A., ii, 275.
    influence of, on hydrolysis of maltose or cane sugar (SIGMOND), A., ii, 146.
    action of, on sulphates, selenates, tellurates, and phosphates (TUNNELL and SMITH), A., ii, 744.
    detection of, in gastric juice (RAIKOW), A., ii, 52.
    estimation of (ULSCH), A., ii, 802.
    estimation of, in stomach contents (LEO), A., ii, 516; (SIRINGO), A., ii, 803.
  Chlorides in sea air (GAUTIER), A., ii, 592.
    of the alkalis, electrolysis of (WINTELER), A., ii, 212; (WOHLWILL), A., ii, 213.
    influence of, on the reaction between potassium permanganate and hydrochloric acid (WAGNER), A., ii, 275.
    excretion of, in pneumonia and fevers (HUTCHISON), A., ii, 168.
  Chloride of lime. See Bleaching powder.
  Hypochlorous acid, preparation of (FOERSTER and YORRE), A., ii, 281.
    in solutions of chlorine in water (JAKOWKIN), A., ii, 736.
    stability of solutions of (THOMSEN), A., ii, 476.
  Hypochlorites, electrolytic formation of (VAUBEL), A., ii, 88.
  Chlorates, electrolytic production of (VAUBEL), A., ii, 88.
    detection of bromates and iodates in presence of (VITALI), A., ii, 803.
  *per***Chlorates,** electrolytic preparation of (FOERSTER), A., ii, 88.
    detection of, in Chili saltpetre (NYSSENS), A., ii, 327.
    estimation of, in alkali nitrates (FOERSTER), A., ii, 57; (FREYTORG), A., ii, 179; (AHRENS and HETT), A., ii, 245; (BLATTNER and BRASSEUR), A., ii, 328.
Chlorine, detection and estimation of :—
  detection of small quantities of bromine in (BAUBIGNY), A., ii, 516.
  estimation of (BOUGAULT), A., ii, 803.
  estimation of, in large quantities of bromine (BAUBIGNY), A., ii, 611.
  estimation of, in presence of bromine and iodine (BAUBIGNY), A., ii, 244.
  estimation of bromine in presence of (BAUBIGNY), A., ii, 516.
Chlorine, estimation and separation of :—
  estimation of, in organic substances (LONGHI), A., ii, 328.
  estimation of, in plants (BERTHELOT), A., ii, 327.
  separation of bromine and iodine from (SWINTON), A., ii, 122; (SPECKETER), A., ii, 123; (BAUBIGNY), A., ii, 328.
Chloritoid from Hungary (SZÁDECZKY), A., ii, 497.
Chloroform, purification and preservation of (MASSON), A., i, 786.
  viscosity coefficient of (GUYE and FRIDERICH), A., ii, 358.
  diffusion coefficient of, across vulcanised caoutchouc (FLUSIN), A., ii, 205.
  mutual solubilities of water and (HERZ), A., ii, 83.
  method for providing a mixture of, with air in any desired proportion, and its estimation in such mixtures (HARCOURT), T., 1060; P., **1899**, 188.
  boiling point curves of mixtures of, with acetone or carbon *tetra*chloride (HAYWOOD), A., ii, 632.
  boiling points of mixtures of, with alcohol or acetone (THAYER), A., ii, 402.
  boiling point curves of mixtures of, with methylic alcohol (PETTIT), A., ii, 632.
  action of, on aqueous alkali (THIELE and DENT), A., i, 1.
  action of chlorine on, in presence of aluminium chloride (MOUNEYRAT), A., i, 397.
Chloropal from Colorado (HILLEBRAND), A., ii, 564.
Chlorophyll. See Agricultural chemistry.
Chlorosulphonic acid, action of, on the paraffins and other hydrocarbons as a means of purifying the normal paraffins (YOUNG), T., 172; P., **1899**, 22.
Chocolate, detection of gelatin in (OUFROY), A., ii, 76.
  estimation of sugar in (CARLES), A., ii, 67; (WOY), A., ii, 187.
Cholesterol, preparation of (BÖMER), A., ii, 191.
  in a waste liquor from beet sugar manufacture (LIPPMANN), A., i, 586.
  heat of combustion and formation of (BERTHELOT and ANDRÉ), A., ii, 400.
  extraction of, from fats (JUCKENACK and HILGER), A., i, 38; (WIRTHLE; FOERSTER), A., ii, 824.
  salts of, in birds' blood (BROWN), A., ii, 311.

- **Cholesterol**, amount of, in blood-corpuscles and plasma (Hepner), A., ii, 311.
  - fate of, in the living body (Humnicki), A., ii, 780.
  - detection of, in fats (Kreis and Wolf), A., ii, 343.
- *iso*-**Cholesterol**, non-occurrence of, in beetroot-liquors (Andrlík and Votoček), A., i, 157.
- **Cholic acid**, heats of combustion, formation, and dissolution of (Berthelot), A., ii, 726.
  - oxidation of (Lassar-Cohn), A., i, 552.
  - detection of (Gnezda), A., ii, 715.
- **Choline**, presence of, in Cascarilla bark (Naylor), A., i, 179.
  - presence of, in *Fabiana imbricata* (Kunz-Krause), A., i, 448.
  - presence of, in the intestine (Nesbitt), A., ii, 310.
  - physiological action of (Mott and Halliburton), A., ii, 315, 781; (Asher and Wood), A., ii, 373.
- **Chromite**, origin of, in North Carolina (Pratt), A., ii, 494.
- **Chromium** in peat (Baskerville), A., ii, 666.
  - anode, solution of, in electrolysis of sodium acetate and acetic acid (Hittorf), A., ii, 724.
  - action of, on copper silicide, arsenide, or antimonide (Lebeau), A., ii, 427.
- **Chromium salts**, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
  - diffusion of light by solutions of (Spring), A., ii, 585.
- **Chromium compounds**, toxic action of on wheat (Coupin), A., ii, 242.
- **Chromium** azoimide (Curtius and Rissom), A., ii, 92.
  - iron carbide (Williams), A., ii, 157.
  - **Chromic** chloride, violet, dissolution of, in water containing chromous chloride (Rohland), A., ii, 599.
    - influence of, on the reaction between potassium permanganate and hydrochloric acid (Wagner), A., ii, 275.
  - *sesqui*oxide, occurrence of, in Algerian phosphates (Schüler), A., ii, 335.
    - reduction of, by aluminium (Franck), A., ii, 103.
  - *tetr*oxide, hydrates of, and sulphide (Baugé), A., ii, 157.
  - phosphate, precipitation of, and detection of, in presence of ferric phosphate (Caven and Hill), A., ii, 29.
  - silicide (Warren), A. ii, 158.
- **Chromium** ammonium alum (Howe and O'Neal), A., ii, 103.
  - sulphites, basic (Recoura), A., ii, 369.
  - **Chromammonium salts**, constitution of (Jörgensen), A., ii, 293.
  - **Chromic acid**, electrolysis of (Bose), A., ii, 349.
    - oxidation of hydrogen by, influence of sulphuric acid on (Reese), A., ii, 647.
    - reduction of, by acetic acid (Bassett), A., ii, 815.
    - compounds of, with titanic acid (Blondel), A., ii, 369.
  - **Chromates**, action of, on acidified iodides (Wagner), A., ii, 326.
  - **Chromic acid**, salts of, with tetramethylammonium, trimethylammonium, quinoline, and piperidine (Wiede), A., i, 244.
  - **Chromosulphochromic acids** (Recoura), A., ii, 226.
  - **Chromous** chloride, action of nitric oxide on (Chesneau), A., ii, 661.
      - decomposition of water by (Berthelot), A., ii, 30.
    - lead iodide (Mosnier), A., ii, 222.
  - **Chromylamide** (Ohly), A., ii, 754.
- **Chromium organic compounds**:—
  - Chromoacetic acid, violet and green, and its heat of neutralisation by sodium hydroxide (Recoura), A., ii, 662, 663.
  - Chromodiacetic acid, and its heat of neutralisation by sodium hydroxide (Recoura), A., ii, 663.
  - Chromium *tetr*oxide potassium cyanide (Wiede), A., i, 319.
- **Chromium, separation of**:—
  - separation of mercury from (Jannasch and Alffers), A., ii, 60.
- **Chromogens** of the broad bean (Bourquelot and Hérissey), A., ii, 325.
- **Chromotropic acid.** See Phenylazochromotropic acid.
- **Chrysammic acid**, detection of (Kremel), A., ii, 389.
- **Chrysatropic acid**, presence of, in *Fabiana imbricata* (Kunz-Krause), A., i, 448.
  - solution of, in aniline and in pyridine; action of sodium on (Kunz-Krause), A., i, 201.
- **Chrysean**, constitution of (Hellsing), A., i, 563.
- **Chrysin**, synthesis of (von Kostanecki and Tambor), A., i, 911.
  - action of potassium acetate on (Perkin), T., 441; P., **1899**, 66.
- **Chrysocolla**, iodine in (Dieseldorff), A., ii, 760.

Chrysotile from Canada (Kersting), A., ii, 765.
  from Lombardy (Brugnatelli), A., ii, 372.
Cigars and Cigarettes, amount of nicotine in (Sinnhold), A., ii, 48.
Cilianic acid and salts (Lassar-Cohn), A., i, 552.
Cinchenine (*cinchine*), sulpho-derivative of (Koenigs and Höppner), A., i, 88.
Cincheninesulphonic acid (*cinchinesulphonic acid*) (Koenigs and Höppner), A., i, 88.
Cinchona Bark, estimation of alkaloids in (Lenz), A., ii, 391.
  estimation of the total alkaloids in (Ekroos), A., ii, 74.
Cinchonic acid (*quinoline-4′-carboxylic acid*), 4-nitro- (Koenigs and Lossow), A., i, 456.
Cinchonic aldehyde, 4-amino- (Koenigs and Lossow), A., i, 456.
Cinchonicine and salts (Roques), A., i, 177.
Cinchonidine, *d*- and *l*-mandelates (McKenzie), T., 967.
Cinchonine, isomerides of (Skraup), A., i, 960.
  molecular transformation of, into α-*iso*cinchonine (Skraup), A., i, 961.
  hydrobromide, hydrolytic products of (Lowenhaupt), A,, i, 176.
  hydrochloro-, the hydrolytic products of (Skraup), A., i, 963.
  hydriodide, decomposition products of (Koenigs and Höppner), A., i, 88.
  d- and *l*-mandelates (McKenzie), T., 966.
  dinitrate (Skraup), A., i, 962.
  estimation of, in cinchona bark (Lenz), A., ii, 391.
allo-**Cinchonine**, *apo*-**Cinchonine**, *apo-iso*-**Cinchonine**, and *isoapo*-**Cinchonine**, identity of (Skraup), A., i, 960, 961.
apo-iso-**Cinchonine** (Lowenhaupt), A., i, 177.
δ-**Cinchonine** and hydrobromide (Lowenhaupt), A., i, 177.
δ- and ε-**Cinchonine** (Skraup), A., i, 960.
ε-**Cinchonine**, and zincochloride and hydrochloride (Lowenhaupt), A., i, 177.
ψ-**Cinchonine**, identity of, with cinchotine, and preparation (Skraup), A., i, 962.
  hydrobromide (Lowenhaupt), A., i, 177.
tauto-**Cinchonine** and its sulphate and dihydriodide (Lowenhaupt), A., i, 176.
α-*iso*-**Cinchonine** and dihydriodide and hydrobromide (Lowenhaupt), A., i, 177.
α- and β-*iso*-**Cinchonine** (Skraup), A., i, 960.
Cinchotine, identity of ψ-cinchonine with (Skraup), A., i, 962.
Cineol, in cardamoms oil (Schimmel and Co.), A., i, 63.
Cineolenic acid and **Cineolic acid**, action of water on (Rupe), A., i, 340.
Cinnabar from Servia (Raušar), A., ii, 667.
Cinnamaldehyde, condensation of, with anhydracetonebenzil (Japp and Findlay), T., 1024; P., **1899**, 164.
  condensation of, with benzaldehyde (Thiele), A., i, 216.
  hydrosulphonic acids of (Tiemann and Krüger), A., i, 247.
Cinnamaldehyde-*p*-nitrophenylhydrazone (Hyde), A., i, 689.
Cinnamanilide, acid obtained from, by action of ethylic sodiomalonate (Herrmann and Vorländer), A., i, 814.
Cinnamein, composition of (Thoms), A., i, 715.
Cinnamene. See Styrene.
Cinnamenylsuccinic acid, and anhydride (Thiele and Meisenheimer), A., i, 603.
Cinnamic acid (*β-phenylacrylic acid*), cryoscopic behaviour of, in phenylpropionic acid (Bruni and Gorni), A., ii, 731.
  compounds of, with sulphuric acid (Hoogewerff and Dorp), A., i, 672.
  action of sodium on, in alcohol (Kunz-Krause), A., i, 201.
  derivatives (Vorländer), A., i, 812.
  ethylic salt, action of ethylic cyanacetate on (Thorpe and Udall), T., 906; P., **1899**, 184.
Cinnamic acid, α- and β-*di*bromo-, and their ethylic salts (Ruhemann and Cunnington), T., 960; P., **1899**, 185.
  αβ-*di*bromo-, preparation of *di*bromindone from (Lanser), A., i, 895.
  β-iodo-, and pyridine and silver salts (Ortoleva), A., i, 894.
Cinnamide, action of bromine on, in presence of sodium methoxide (Jeffreys), A., i, 731.
Cinnamo-ethylamide, **-diethylamide**, **-methylamide**, **-dimethylamide**, **-diphenylamide**, and **-piperidide** (Herrmann and Vorländer), A., i, 813.
Cinnamoylperuviol (Thoms), A., i, 715.
Cinnamylformic acid (Erlenmeyer), A., i, 601.

Cinnamylideneanhydracetonebenzil (Japp and Findlay), T., 1024; P., **1899**, 164.

Cinnamylidenedimethylcrotonolactone, and an ammonia additive compound, and imide (Thiele), A., i, 601.

Cinnamylidenedimethylcrotonolactonecarboxylic acid (Thiele), A., i, 601.

Cinnamylidenemalonic acid, methylic and ethylic salts (Thiele and Meisenheimer), A., i, 603.

Citraconic acid and its barium salt; also its conversion into itaconic and mesaconic acids (Fittig and Langworthy), A., i, 332.
oxidation of (Fittig and Köhl), A., i, 418.

Citral, history of (Tiemann), A., i, 247.
from essential oil of *Lippia citriodora* (Barbier), A., i, 769.
in lemon-grass oil (Tiemann), A., i, 623.
identity of, with geranial (Semmler), A., i, 223.
sodium hydrogen sulphite compound and mono- and di-hydrosulphonic acids of; also action of semicarbazide on the last (Tiemann and Lemme), A., i, 248.
action of acids and soda on; also action of semicarbazide on (Tiemann), A., i, 250.
behaviour of, towards sulphuric acid (Verley), A., i, 768.
detection and estimation of; also its semicarbazones (Tiemann), A., i, 249.
separation of citronellal from (Flatau and Labbé), A., i, 622.
separation of citronellal and methylheptenone from (Tiemann), A., i, 622.
See also Geranial.
polymeride of (Labbé), A., i, 769.

Citrals, isomeric (Bouveault), A., i, 767.

Citralidenecyanacetic acid (Tiemann), A., i, 249.

d- and *r*-**Citramalic acids** (*methylmalic acid*), and the brucine salt and rotatory power of the former (Marckwald and Axelrod), A., i, 418.

Citrapyrotartaric acid. See Methylsuccinic acid.

Citrazinic acid, action of nitrous acid on (Sell and Jackson), T., 508; P., **1899**, 98.
β′-nitroso-, action of acetyl chloride on (Sell and Jackson), T., 513; P., **1899**, 98.

Citric acid and potassium salt, electric conductivity of solutions of, at high pressures (Bogojawlensky and Tammann), A., ii, 138.
action of, on metallic iron (Ulsch), A., i, 868.
mono-alkali salts of, action of molybdic, tungstic, titanic, and stannic oxides on (Henderson, Orr, and Whitehead), T., 546; P., **1899**, 107.
ammonium salt, preparation of a neutral solution of (Cook), A., ii, 55.
cadmium salt, boiling point of solution of, in presence of hydrochloric acid (Richards and Harrington), A., ii, 141.
copper salt, dissociation of, in solution (Calame), A., ii, 145.
double zirconium and ammonium salt (Harris), A., i, 262.
triethylic salt, action of phosphorus trichloride on (Hanna and Smith), A., i, 577.
estimation of, in presence of oxalic and malic acids (Kissling), A., ii, 821.

Citrine, colouring matter of (Nabl), A., ii, 561.

Citriodoraldehyde, from lemon-grass oil (Stiehl), A., i, 66.
composition of (Doebner), A., i, 223.
identity with citral and *allo*lemonal (Tiemann), A., i, 623.

Citriodorylidene-acetone (Stiehl), A., i, 67.

Citronella, oil of (Schimmel and Co.), A., i, 298; (Flatau and Labbé), A., i, 534; (Flatau), A., i, 711.

Citronellaldehyde, formation of (Tiemann), A., i, 191.
in lemon-grass oil (Tiemann), A., i, 623.
action of sulphurous acid on; also its sodium hydrogen sulphite compound, semicarbazone and hydrosulphonic acids (Tiemann and Krüger), A., i, 248.
separation of citral from (Flatau and Labbé), A., i, 622.

Citronellamide (Tiemann), A., i, 191.

Citronellic acid, from reduction of geranic acid (Tiemann), A., i, 190.

Citronellonitrile, action of alkali on (Tiemann), A., i, 191.

Citronellylidenecyanacetic acid, sodium salt (Tiemann), A., i, 624.

Citrus bigaradia, oil of (Charabot and Pillet), A., i, 711.

Citryldiphenylhydrazide, and diacetyl, dibenzoyl, dibenzoylnitroso, and nitroso-derivatives (Manuelli and de Righi), A., i, 885.

Citrylideneacetonitrile (Verley), A., i, 768.
Citrylidenemalonic acid, ethylic salt (Verley), A., i, 768.
Citryl-β-naphthacinchonic acids, formation and melting points of (Tiemann), A., i, 248, 249.
Cladonia rangiferina, *C. silvatica*, and *C. floerkeana*, constituents of (Hesse), A., i, 381, 386.
Claviceps purpurea, the fungose of, and yield of chitin (Tanret), A., ii, 171.
Clay with quartz-veins in Brazil (Derby), A., ii, 501.
  from Dublin (O'Reilly), A., ii, 498.
  from Hungary (Kalecsinszky), A., ii, 493.
  from Russia (Alexéeff), A., ii, 673; (Thal), A., ii, 769.
  plasticity of (Kasai), A., ii, 435.
Clover. See Agricultural chemistry.
Clupeine, hydrolytic products of (Kossel), A., i, 833.
Coagulation of blood, nature of chemical process in (Hammarsten), A., ii, 776.
  of blood, action of peptone (Thompson), A., ii, 604.
  of proteid by electricity (Hardy), A., ii, 567.
Coal from Austria (John and Eichleiter), A., ii, 493.
  Canadian (Hoffmann), A., ii, 110.
  from Caucasus, ash of (Tschernik), A., ii, 669.
  from Hungary (Kalecsinszky), A., ii, 493.
  containing sulphur or pyrites, products of combustions of (Thörner), A., ii, 746.
  microscopic examination of (Bertrand), A., ii, 161.
  estimation of sulphur in (Heath), A., ii, 52; (Antony and Lucchesi), A., ii, 517; (Herting), A., ii, 804.
Coal gas, mixtures of acetylene with, explosibility of (Berthelot and Vieille), A., ii, 412.
Cobalt, atomic weight of (Richards and Baxter), A., ii, 753.
  action of, on sulphuric acid (Adie), P., **1899**, 133.
  action of, on copper silicide, arsenide, or antimonide (Lebeau), A., ii, 427.
Cobalt salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
  oxidation of, in presence of alkalis (Job), A., ii, 61.
Cobalt salts, reduction of, by calcium carbide; alloys with calcium (Tarugi), A., ii, 749.
Cobalt bases, constitution of (Jörgensen), A., ii, 293.
  Carbonatotetramminecobalt hydrogen carbonate (Miolati), A., ii, 369.
  Diozotri-imino-decamminetetracobalt salts, and their constitution Werner, Steinitzer, and Rücker) A., ii, 659.
  Hexamminecobalt chloride and **chloropentamminecobalt** chloride (Jörgensen), A., ii, 226.
  Nitratoimino-hexamminedicobalt nitrate and chloride (Werner, Steinitzer, and Rücker), A., ii, 658.
  Oxalatodiethylenediamminecobalt hydroxide, and its salts (Werner and Vilmos), A., ii, 660.
  Ozoimino-hexamminedicobalt salts, and their constitution (Werner, Steinitzer, and Rücker), A., ii, 659.
  Sulphatoimino-octamminedicobalt chloride and nitrate (Werner, Steinitzer, and Rücker), A., ii, 658.
Cobalt antimonate (Senderens), ii, 557.
  thioantimonite (Pouget), A., ii, 663.
  pyroarsenite (Reichard), A., ii, 23.
  azoimide, basic, and potassium and ammonium cobaltoazoimides (Curtius and Rissom), A., ii, 92.
  chloride, molecular weight of, in urethane (Castoro), A., ii, 360.
    hydrates of (Kuznetzoff), A., ii, 658.
  iodide, hydrates of (Bolschakoff), A., ii, 427.
  lead iodide (Mosnier), A., ii, 222.
  molybdiodates (Chrétien), A., ii, 363.
  nitrate, hydrates of (Funk), A., ii, 210.
  oxide, decomposition of carbon *mon*oxide in presence of (Boudouard), A., ii, 417, 595.
    reduction of, by aluminium (Franck), A., ii, 103.
  rubidium and cæsium alums (Howe and O'Neal), A., ii, 103.
  sulphide, theory of formation of (Morgan and Gotthelf), A., ii, 626.
Cobalt, organic compounds:—
  Cobalt pyridine salts (Reitzenstein), A., i, 161.
    thiosulphate phenylhydrazine (Moitessier), A., ii, 688.
  Compounds of sucrose and dextrose with cobalt (Herzog), A., ii, 818.

Cobalt organic compound :—
  Triethylenediaminecobalt sulphate (Werner, Megerle, Pastor, and Spruck), A., i, 856.

Cobalt, detection, estimation, and separation of :—
  detection of (Papasogli), A., ii, 335.
  detection of, in presence of iron (Bettink), A., ii, 815.
  detection of, in presence of nickel (Jaworowski), A., ii, 61.
  estimation of silver, gold, and mercury in presence of (Kollock), A., ii, 811.
  separation of iron from (Brearley), A., ii, 815.
  separation of mercury from (Jannasch and Alffers), A., ii, 60.
  separation of nickel from (Havens; Coehn), A., ii, 127.

Cobalt boracite, containing iodide (Allaire), A., ii, 156.

Cobalt ores, from New South Wales (Jaquet), A., ii, 162.

Cocaine, viscosity of undercooled (Tammann), A., ii, 272.
  preparation of caffeine and theobromine from, and its composition (Schweitzer), A., i, 301.
  detection of (Vulpius), A., ii, 392; (Schaefer), A., ii, 715.
  MacLagan's reaction for, and the presence of an active base in, and test of purity of (Günther), A., i, 963.

Coccellic acid, presence of, in *Cladonia Floerkeana* (Hesse), A., i, 382.

Cochineal, use of, in alkalimetry (Glaser), A., ii, 573.

Cochlearia officinalis, oil of (Gadamer), A., i, 534.

Cocoa, analysis of (Hehner and Skertchly), A., ii, 702.

Cocoanut Oil, detection of, in butter (Leonard), A., ii, 190.

Codiene, heat of combustion and formation of, and hydrochloride, heat of combination of (Leroy), A., ii, 631.
  azoimide (Pommerehne), A., i, 89.
  detection of (Melzer), A., ii, 193.

iso-**Codeine** (Freund), A., i, 309.

Coffee, Java (*Coffea arabica* and *liberica*), constituents of (Warnier), A., ii, 794.
  analysis of (Hehner and Skertchly), A., ii, 702.
  artificial coloration of (Morpurgo), A., ii, 135.
  estimation of caffeine in (Tassilly), A., ii, 134; (Gadamer), A., ii, 390.

Coffee-chicory mixtures, detection of glycerol in (Grünhut), A., ii, 253.

Cognac oil (Schimmel & Co.), A., i, 923.

Cohenite, action of cupric ammonium chloride on (Cohen), A., ii, 113.

Coke, action of oxygen and of oxygen containing carbon *di*oxide or carbon *mon*oxide on (Dixon) T., 632; P., **1899**, 118.
  estimation of sulphur in (Herting), A., ii, 804.

α-**Collidine.** See 2-Methyl-4-ethylpyridine.

β-**Collidine.** See 4-Methyl-3-ethylpyridine.

γ-**Collidine.** See 2 : 4 : 6-Trimethylpyridine.

Colloidal salts. See Salts.
  solutions. See Solutions.

Colloids, formation and structure of (Bemmelen), A., ii, 12.
  evaporation of water from, and absorption of water by (van Bemmelen), A., ii, 84.

Colouring matter of natural waters (Spring), A., ii, 228.
  coal tar, detection of arsenic in (Ortmann) A., ii, 181.
  organic, detection of (Rota), A., ii, 135.
  phenolic, formation of salts by (Perkin), T., 433; P., **1899**, 68.

  Rosolic acid.
  Rottlerin.
  apo-Saffranone.
  Santalin.
  Scoparein.
  Scoparin.
  Substance, $C_{18}H_{11}O_{10}N_5$, from melanin.
  Sulph-hæmoglobin.
  Tetramethylindigotin.
  Thujetin.
  Tropæolin OO.
  Turmeric.
  Vitexin.
  Xanthones.
Colza. See Agricultural chemistry.
Compressibility of liquid sulphur *di*oxide (Lange), A., ii, 478.
  of mixtures of gases (Berthelot), A., ii, 466.
Conchiolin, action of acids on (Wetzel), A., i, 466.
Conductivity, electrical. See under Electrochemistry.
Confluetin, from *Lecidea confluens* (Zopf), A., i, 717.
Congo-red, use of, in alkalimetry (Glaser), A., ii, 573.
Conicine, heats of formation, combustion and dissolution of, and of its hydrochloride (Berthelot), A., ii, 726.
Conicine-phenylurethane -α- and -β-naphthylurethanes, and **-methoxyphenylurethane** (Cazeneuve and Moreau), A., i, 133.
Coniferin, action of moulds on (Puriewitsch), A., ii, 683.
Conifer-seeds, presence of a proteid compound of arginine in (Susuki), A., ii, 793.
Conifer. See also Agricultural chemistry.
Coniine, actions of carbon bisulphide and of hydrogen sulphide on (Melzer), A., i, 394.
  action of *o*-xylylenic bromide on (Scholtz), A., i, 649.
  *di*thiocarbamate, from action of carbon *di*sulphide on aminopropylvaleraldehyde (Maas and Wolffenstein), A., i, 110.
  coniylthiocarbamate (Melzer), A., i, 394.
  "racemic," molecular refraction of (Pope and Peachey), T., 1111.
Constitution, chemical, in relation to taste (Sternberg), A., ii, 772.
Convicin, from seeds of vetch and *Vicia fabia* (Ritthausen), A., i, 715.
Convolvulus althæoides root, resin of (Georgiadès), A., i, 929.
Convolvulus scoparius, oil of (Schimmel and Co.), A., i, 924.
Copal, discrimination of amber from (Rössler), A., ii, 530.
Copper, "nascent" (Colson), A., ii, 597.
  native, from the Caucasus (Jereméeff), A., ii, 108.
  metallic, occurrence of, in oak-wood (Frankforter), A., ii, 323.
  precipitated by zinc or cadmium, presence of zinc or cadmium in (Shengle and Smith), A., ii, 749.
  colloidal (Lottermoser), A., ii, 558.
  potential difference between, and solutions of its salts in organic solvents (Kahlenberg), A., ii, 624.
  action of, on nitric acid (Freer and Higley), A., ii, 480.

Copper, action of hydrogen phosphide on (Rubénovitch), A., ii, 652.
  action of, on sulphuric acid (Adie), P., **1899**, 133.
  action of sulphuric, sulphurous, or hydrochloric acids on (Berthelot), A., ii, 283, 284.
  action of water on (Meldrum), A., ii, 100.
  action of, on the animal organism (Baum), A., ii, 167.
Copper alloys with calcium (Tarugi), A., ii, 749.
Copper amalgams of different concentrations, electromotive force between (Cady), A., ii, 395.
Copper salts, diffusion of light by solutions of (Spring), A., ii, 585.
  absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
  action of hydrogen phosphide on (Rubénovitch), A., ii, 652.
  influence of, on hæmoglobin formation (Wolf), A., ii, 231.
  toxic action of, on plants (Coupin), A., ii, 118.
Copper and copper potassium thioantimonites (Pouget), A., ii, 663.
  haloid salts of, solubility of, in alcohols (Rohland), A., ii, 144.
  oxides, hydroxide, and carbonate, action of hydrogen phosphide on (Rubénovitch), A., ii, 749.
    reduction of, by aluminium (Franck), A., ii, 103.
  phosphides (Rubénovitch), A., ii, 102, 750.
  *sub*phosphide, crystalline (Maronneau), A., ii, 421.
  silicide, arsenide, and antimonide, action of cobalt, nickel, or chromium on (Lebeau), A., ii, 427.
  Cupric salts, action of pyridine on (Moitessier), A., i, 808.
    antimonate (Senderens), A., ii, 557.
    antimonite (Harding), A., ii, 490.
    arsenite (Reichard), A., ii, 23.
    azoimide (Curtius and Rissom), A., ii, 92.
    bromide, double ammonio-compound of, with mercuric cyanide (Varet), A., i, 99.
    lithium bromide, and potassium chloride and bromide (Kurnakoff and Sementschenko), A., ii, 287.
    chlorate and basic chlorate, bromate and basic bromate, nitrate and basic nitrate (Bourgeois), A., ii, 157.
    chloride, molecular weight of, in urethane (Castoro), A., ii, 360.

Copper :—
  Cupric chloride, reactions of, in organic solvents (Naumann), A., ii, 423.
      double ammonio-compound of, with mercuric cyanide (Varet), A., i, 99.
    potassium chloride (Gröger), A., ii, 289.
    hydroxide, compounds of, with silver salts (Sabatier), A., ii, 654.
    molybdiodate (Chrétien), A., ii, 363.
    nitrate, electrolysis of, with copper ferrocyanide membrane (Schreber), A., ii, 273.
      mixtures of, with silver nitrate, electrolysis of, application of principle of maximum work to (Tommasi), A., ii, 412.
      hydrates of (Funk), A., ii, 210.
      compound of, with hydrazine (Hofmann and Marburg), A., i, 488.
    thallium lead, and thallium barium, nitrites (Przibylla), A., ii, 223.
    hydroxide hyponitrite (Divers), T., 121 ; P., **1898**, 224.
    oxide prepared from nitrate, occluded gas in (Richards), A., ii, 101.
      amount of, in Egyptian porcelain, and in glaze of Egyptian pottery (Le Chatelier), A., ii, 751.
      and salts, reduction of, by calcium carbide (Tarugi), A., ii, 749.
      influence of, on formation of sodium sulphate (Krutwig and Dernoncourt), A., ii, 214.
    phosphate, and basic phosphate (Caven and Hill), A., ii, 29.
    phosphide (Rubénovitch), A., ii, 652.
    hypophosphite, reduction of, by palladium (Engel), A., ii, 750.
    selenate, and basic selenate (Metzner), A., ii, 20.
    sulphate, determination of polarisation in cells containing (Heim), A., ii, 78.
      thermal change on diluting a saturated solution of (Pollok), P., **1899**, 8.
      action of hydrogen on (Colson), A., ii, 215.
    potassium sulphate, conductivity of solutions of (MacGregor and Archibald), A., ii, 201.
  Cuprosocupric sulphite (Paternò and Alvisi), A., ii, 17.
  Cuprous thioantimonite and pyrothioarsenite (Sommerlad), A., ii, 216, 217.

Copper :—
  Cuprous chloride, action of carbon oxysulphide on (Berthelot), A., ii, 287.
    oxide, action of hydrogen phosphide on (Rubénovitch), A., ii, 652.
      estimation of (Caven and Hill), A., ii, 59.
Copper organic compounds :—
  Copper acetylide, explosion of, in presence of acetylene (Freund and Mai), A., i, 657.
    antipyrine salicylate (Schuyten), A., i, 306.
  Cuprous cyanide, formation of (Vittenet), A., i, 658.
  Copper cyanide, electrolysis of (Baker), A., ii, 749.
    thiocyanomercaptide, and action of hydrochloric and nitric acids on (Kohler), A., i, 737.
  Cuprotartaric acid, and its potassium, sodium, lead, and silver salts (Masson and Steele), T., 725 ; P., **1899**, 120.
  Diethylenediaminecopper salts (Werner, Megerle, Pastor, and Spruck), A., i, 857.
  Dipyridylcopper salts (Blau), A., i, 388.
  Phenylhydrazine cupro-chloride, -bromide, and -iodide (Moitessier), A., i, 807.
  Triethylenediaminecopper salts (Werner, Megerle, Pastor, and Spruck), A., i, 856.
Copper, detection, estimation, and separation of :—
  detection of traces of (Bach), A., ii, 385.
  detection of, in mineral waters (Garrigou), A., ii, 616.
  detection of cadmium in presence of (Trey), A., ii, 182.
  estimation of, colorimetrically (Lucas), A., ii, 522.
  estimation of, volumetrically (Meade), A., ii, 58.
  estimation of, in grapes, wines, lees, and marcs (Vignon and Barrillot), A., ii, 452.
  estimation of, in vegetables (Lehmann ; Vedrödi), A., ii, 59.
  estimation of oxygen in (Lucas), A., ii, 52.
  estimation of silver, gold, and mercury in presence of (Kollock), A., ii, 811.
  separation of antimony from (Lucas), A., ii, 523.
  separation of antimony and arsenic from (Atkinson), A., ii, 615.
Copper, separation of :—
  separation of arsenic, mercury, and silver from (Revay), A., ii, 127.
  separation of cadmium from (Bornemann), A., ii, 813.
  separation of iron from (Brearley), A., ii, 815.
  separation of iron, lead, tin, and zinc from (Langmuir), A., ii, 522.
  separation of mercury from (Jannasch and Devin), A., ii, 59.
  separation of zinc from (Dederichs), A., ii, 812.
Copper glance, pseudomorphous, from Altai Mountains (Jereméeff), A., ii, 666.
Copper ores, iodine in (Autenrieth ; Dieseldorff and Ochsenius), A., ii, 760.
Copper pyrites, alteration of (Jereméeff), A., ii, 666.
Copper refining, sediment formed in electrolytic (Hollard), A., ii, 452.
Copper-beech. See Agricultural chemistry.
Coprine chloride. See **Trimethylacetonylammonium chloride.**
Corallin as an indicator (Waddell), A., ii, 83.
Cordierite from N. Carolina (Hidden and Pratt), A., ii, 300.
  artificial (Morozewicz), A., ii, 762.
Cork, constituents of (Thoms), A., ii, 324.
  presence of cerin and friedelin in (Istrati and Ostrogovich), A., i, 772.
Cornicularic acid and methylic salts (Thiele and Rössner), A., i, 613.
Cornicularolactone (Thiele and Rössner), A., i, 613.
Corona, unknown gases in (Lockyer), A., ii, 717.
Coronium, presence of, in the solfatara of Pozzuoli and Vesuvius (Nasini, Anderlini, and Salvadori), A., ii, 482.
Corpse, strychnine-like alkaloid from a (Mecke and Wimmer), A., i, 311.
Corpuscles, number of red and white, in human blood (Schwinge), A., ii, 166.
"*Cortex chinæ succirube,*" estimation of the total alkaloids in (Ekroos), A., ii, 74.
Corundum from the Appalachians (Lewis), A., ii, 561.
  artificial (Morozewicz), A., ii, 762.
  formation of, in magmas (Pratt), A., ii, 758 ; (Morozewicz), A., ii, 762.
Corundum-pegmatite and **-syenite** from the Urals (Morozewicz), A., ii, 763.
Corydaldine, preparation of (Dobbie and Lauder), T., 673 ; P., **1899**, 129.

Corydaldine, nitroso-, action of sodium hydroxide on (DOBBIE and LAUDER), T., 673; P., **1899**, 129.
Cotoin, velocity of crystallisation of (BOGOJAWLENSKY), A., ii, 206.
Cotton-cake. See Agricultural chemistry.
Cotton flowers, colouring matter of (PERKIN); T., 827; P., **1899**, 161.
seed. See Agricultural chemistry.
Cotton-seed oil, presence of gossypol in (MARCHLEWSKI), A., i, 821.
presence of chlorinated, and absence of sulphurised compounds in (RAIKOW), A., ii, 824.
detection of (SOLTSIEN), A., ii, 823.
detection of, in butter (LEONARD), A., ii, 190.
detection of, in lard (BÖMER), A., ii, 259.
action of silver nitrate on the fatty acids of (CHARABOT and MARCH), A., ii, 618.
estimation of fatty acids in (TWITCHELL), A., ii, 69.
iodine number of (ZEGA and MAJSTOROVIC), A., ii, 820.
Coumaranone. See Ketocoumaran.
Coumaric acid, iodo- (SEIDEL), A., i, 597.
Coumarin, formation of (REYCHLER), A., i, 56.
velocity of crystallisation of (BOGOJAWLENSKY), A., ii, 206.
separation of vanillin from, in flavouring extracts (HESS and PRESCOTT), A., ii, 531.
Coumarincarboxylic acid, formation of (KNOEVENAGEL), A., i, 145; (CAJAR), A., i, 147.
and its ethylic salt (KNOEVENAGEL and HOFFMANN), A., i, 116.
Covellite from Montana (HILLEBRAND), A., ii, 302.
from Sweden (PETRÉN), A., ii, 759.
Cream, detection of the previous heating of (STORCH), A., ii, 76.
See Agricultural chemistry.
Cream of tartar, analysis of (LOMBARD), A., ii, 820.
Creatine, separation of (LADD and BOTTERFIELD), A., ii, 262.
Creatinine, chemical identity of preparations of, from different sources (WÖRNER), A., ii, 438.
nitroso- (KRAMM), A., i, 85.
Creosote, detection of (FONZES-DIACON), A., ii, 388.
Cresegol (*mercury potassium* o-*nitrocresol*-p-*sulphonate*), GAUTRELET), A., i, 802.
o-**Cresol,** 3 : 5-*di*chloro-, constitution of (MARTINI), A., i, 877.
o-**Cresol** and *p*-cresol, action of acetylchloroglucose on (RYAN), T., 1056; P., **1899**, 196.
m-**Cresol,** 4-bromo-2-amino-, and its diacetyl derivative, 4-bromo-2 : 6-*di*nitro-, and *tri*nitro- (KEHRMANN and RÜST), A., i, 130.
4-chloro-2-amino-, and its diacetyl derivative, and 4-chloro*di*nitro- (KEHRMANN and TICHVINSKY), A., i, 129.
p-**Cresol,** 3 : 5-*di*chloro-, constitution of (BERTOZZI), A., i, 878.
Cresols, products of destructive distillation of (MÜLLER), A., i, 27.
o-**Cresolquinone,** *p*-**Cresolquinone,** and *p*-**Cresolphenolquinone** (BILTRIS), A., i, 199.
o-**Cresylaniline,** bromo-, and *di*bromo- (AUWERS and BÜTTNER), A., i, 37.
o-**Cresylic** bromide, bromo-, and *di*bromo-, derivatives of (AUWERS and BÜTTNER), A., i, 37.
o-**Cresylic** methylic ether, *di*bromo- (AUWERS and BÜTTNER), A., i, 37.
o-**Cresylpiperidine,** bromo- and *di*bromo- (AUWERS and BÜTTNER), A., i, 37.
Critical pressure of liquid hydrogen (VAUBEL), A., ii, 475.
Crocidolite from South Africa (KERSTING), A., ii, 765.
Cromfordite from Laurion, Greece (SMITH and PRIOR), A., ii, 433.
Crotonaldehydepinacone. See Dipropenylic glycol.
Crotonic acid, melting point of, influence of pressure on (HULETT), A., ii, 469.
β-amino-, ethylic salt, two modifications of (BEHREND), A., i, 331; (KNOEVENAGEL), A., i, 478.
iso-**Crotonic acid,** from decomposition of β-hydroxyglutaric acid (FICHTER and KRAFFT), A., i, 255.
Crotonic acids, constitution of (FICHTER and KRAFFT), A., i, 255.
cryoscopic behaviour of, in butyric acid (BRUNI and GORNI), A., ii, 731.
Crotonic chloride and action of alcohol on it (HENRY), A., i, 257.
Crotonyl-carbamide and **-thiocarbimide** (CHARON), A., i, 849.
Crotonylic bromide and chloride. See β-Butylene, α-bromo-, and α-chloro-.
ether (CHARON), A., i, 849.
iodide. See β-Butylene, α-iodo-.
iso-**Crotonylic** bromide, and the action of sodium on (POGORZELSKY), A., i, 785.
chloride (JOCITSCH), A., i, 748.
Crucible, tube- (MURMANN), A., ii, 122.
Cruciferæ seed. See Agricultural chemistry.

Cryohydric curve for mixtures of enantiomorphous isomerides (Bruni), A., ii, 732.
  mixtures, temperature and composition of (Ponsot), A., ii, 634.
Cryolite, action of oxalic or tartaric acid, or of steam on (Paternò and Alvisi), A., ii, 18.
Cryoscopic behaviour of picrates (Bruni and Carpené), A., ii, 8.
  constants for naphthylamine and diphenylamine (Stillmann and Swain), A., ii, 728.
  measurements (Ponsot), A., ii, 546, 728; (Raoult), A., ii, 590.
  observations, accuracy attainable in (Raoult), A., ii, 203.
Crystalline-liquids (Schenck), A., ii, 360; (Le Chatelier), A., ii, 740.
  dielectric behaviour of (Abegg and Seitz), A., ii, 623.
Crystallisation, fractional, of mixtures of sodium and potassium salts, from aqueous alcohol (Soch), A., ii, 84.
  of undercooled liquids (Tammann), A., ii, 272.
  velocity of (Bogojawlensky), A., ii, 206; (Tammann), A., ii, 548.
Crystallography of iodoform (Pope), T., 46; P., **1898**, 219.
  of malates (Traube), A., i, 484.
  Morphotropic relations of gold tellurides (Hobbs), A., ii, 493.
    of the plagionite groups (Spencer and Prior), A., ii, 431.
    series among minerals (Spencer), A., ii, 108.
Crystallographic relations of optically active substances (Fock), A., i, 819.
Crystals in blowpipe beads as characteristic of various elements (Florence), A., ii, 51.
  microscopic examination of (Schröder van der Kolk), A., ii, 16.
Crystal-volumes (Linck), A., ii, 416.
Cubanite from Montana (Winchell), A., ii, 108.
Cucumber. See Agricultural chemistry.
ψ-Cumenesulphinic acid (Gattermann), A., i, 517.
ψ-Cumenol carbanilate (Auwers), A., i, 343.
  *tri*bromo-, and acetate (Auwers), A., i, 343.
Cumenylanilinoacetic acid, nitrile and amide, and nitroso-derivative of the latter (Miller, Plöchl, and Gerngross), A., i, 127, 128.
Cuminaldehyde (*cuminol*), condensation of, with anhydracetonebenzil (Japp and Findlay), T., 1023; P., **1899**, 164.
Cuminic acid (o-*propylbenzoic acid*), and its chloride, anilide, ureide, amide, thioamide, nitrile, and amino- and nitro-derivatives (Gottlieb), A., i, 512.
Cuminilosazone (Biltz and Wienands), A., i, 910.
Cuminphenylhydrazone, formation of (Miller, Plöchl, and Gerngross), A., i, 127.
Cuminylidenediacetoacetic acid, ethylic salt (Knoevenagel and Faber), A., i, 146; (Knoevenagel and Wedemeyer), A., i, 215.
Cummingtonite from Brazil (Hussak), A., ii, 564.
ψ-Cumyl hydrosulphide (Cohen and Skirrow), T., 892; P., **1899**, 183.
ψ-Cumylene *di*sulphide (Cohen and Skirrow), T., 892; P., **1899**, 183.
Cumylideneanhydracetonebenzil (Japp and Findlay), T., 1024; P., **1899**, 164.
Cumylidenemalonic acid, ethylic salt (Knoevenagel and Giese), A., i, 116.
Cupric. See under Copper.
Cuprite, iodine in (Autenrieth; Dieseldorff; Ochsenius), A., ii, 760.
  estimation of traces of iodine in (Autenrieth), A., ii, 804.
Cupro-goslarite from Kansas (Rogers), A., ii, 667.
Cuprous. See under Copper.
Curcas oil, constants of (Archbutt), A., ii, 261.
Curcumin, action of potassium acetate on (Perkin), T., 443.
Curcumin W, use of, in alkalimetry (Glaser), A., ii, 573.
Currant-bushes. See Agricultural chemistry.
Cyanethine (4-*amino*-5-*methyl*-2 : 6-*diethyl*-m-*diazine*), and **Cyanmethine** (4-*amino*-2 : 6-*dimethyl*-m-*diazine*), heats of combustion and formation of (Lemoult), A., ii, 546.
Cyanoform, and its salts and alcoholate (Hantzsch and Osswald), A., i, 405.
Cyanogen, equivalent of (Dean), P., **1898**, 174.
  action of cuprous chloride on (Rabaut), A., i, 557.
  action of electric glow discharge on mixture of, with oxygen (Mixter), A., ii, 267.
  Hydrocyanic acid, and mercury salt, constitution of (Kieseritzky), A., ii, 395.
    effect of pressure on melting point curve of (Tammann), A., ii, 636.

Cyanogen:—
  Hydrocyanic acid, equilibrium between, and other acids, with potash: thermochemistry (Berthelot), A., ii, 737.
    equilibrium between silver potassium cyanide, hydrogen sulphide, and (Berthelot), A., ii, 422.
    action of cuprous chloride on (Rabaut), A., i, 557.
    mercury salt, electrolytic behaviour of (Ley and Kissel), A., ii, 485.
  Cyanides, action of magnesium on (Eidmann), A., i, 317.
    distinction between oxycyanides and, of mercury (von Pieverling), A., ii, 698.
  Cyanic acid, heat of formation of (Berthelot), A., ii, 142.
Cyanuramide, heats of combustion and formation of (Lemoult), A., ii, 546.
Cyanur-amido-dihydride, and-dichloride, **-methylamido**-dichloride, **-ethylamido**-dichloride, and **-methylamidoethylamide** (Diels), A., i, 406, 407.
Cyanuric acid, absorption spectrum and constitution of (Hartley), P., **1899**, 46.
  stability of, towards alkalis, relative to that of trimethylic *iso*cyanurate (Fischer), A., i, 262.
  mercury compound of, constitution of (Kieseritzky), A., ii, 395.
Cyanuric chloride, action of ammonia, methylamine, and ethylamine on (Diels), A., i, 406.
    *di*amino-, action of hydriodic acid on (Diels), A., i, 406.
  hydride, *di*amino-, and its salts and diacetyl derivative (Diels), A., i, 406.
      identity of, with formoguanamine (Diels), A., i, 558.
Cyaphenin, formation of, from benzimidoethylic ether (Wheeler and Johnson), A., i, 431.
Cydonia vulgaris seeds, oil of (Hermann), A., i, 822.
Cymene, from lemon-grass oil (Stiehl), A., i, 66.
  from oil of thyme (Labbé), A., i, 621.
  melting point of (Ladenburg and Krügel), A., ii, 545.
  absorption of argon by (Berthelot), A., ii, 653.
Cymeneacetophenone, synthesis of (Meissel), A., i, 880.
Cymenecarboxylic acid [Me : Pr : COOH = 1 : 4 : 2] (Bouveault), A., i, 287.
iso-**Cymenesulphonic acid**, from borneol and sulphuric acid (Tolloczko), A., i, 440.
Cymodiphenylfurfuran (Japp and Meldrum), T., 1038; P., **1899**, 167.
Cymophenone (Bouveault), A., i, 287.
Cymyl hydrosulphide (Cohen and Skirrow), T., 892; P., **1899**, 183.
Cymylglyoxylic acid and ethylic salt (Bouveault), A., i, 287.
  ethylic salt (Verley), A., i, 207, 434.
p-**Cymyl methyl ketone**, preparation of (Verley), A., i, 207.
Cynarasin and its coagulating power (Rasetti), A., i, 395.
Cyphelium trichiale, constituents of (Hesse), A., i, 385.
Cystinuria, presence of leucine and tyrosine in the urine during (Moreigne), A., ii, 317.
Cytase, presence of, in liver-secretion of *Helix pomatia* (Biedermann and Moritz), A., ii, 166.
Cytisine (Klostermann), A., i, 960.

D.

Dacryodes hexandra, the oleo-resin of (More), T., 718; P., **1899**, 150.
Dalton, presentation of daguerreotype of, P., **1899**, 68.
Damascenine (Pommerehne), A., i, 964.
Damourite from Bohemia (Preis), A., ii, 668.
Daphnetin, synthesis of (Gattermann and Köbner), A., i, 364.
Datolite from Minnesota (Berkey), A., ii, 371.
Datura fastuosa seeds, amount of fat and hyoscyamine in (van der Driessen Mareeuw), A., i, 829.
Daviesite from Chili (Arzruni, Thaddéeff, and Dannenberg), A., ii, 562.
"**Davyum**," rhodium and iridium in, and non-elementary nature of (Mallet), A., ii, 107.
β-**Decanaphthene** (1 : 3 : 5-*dimethylethyl*cyclo*hexane* ?) and its amino-, bromo-, bromonitro-, chloro-, *di*chloro-, and nitro-derivatives (Markownikoff and Rudewitsch), A., i, 581.
Decanaphthenol (1 : 3-*dimethyl*-5-*ethyl*cyclo*hexane*-4-*ol*) (Markownikoff and Rudewitsch), A., i, 582.
Decane in lignite tar (Oehler), A., i, 816.
  specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.
Decane, *di*bromo-, from action of hydrogen bromide on decylenic oxide (Wassiléef), A., i, 786.

Decane, nitro- (Worstall), A., i, 399.

Decane (*diïsoamyl*), oxidation of, by nitric acid (Markownikoff), A., i, 553.
  nitro-, action of stannous chloride on (Konowaloff), A., i, 733.

Decoic acid (*capric acid*), physical constants of (Scheij), A., i, 668.
  separation of, from other fatty acids (Holzmann), A., ii, 68.

Decoic acid (iso*capric acid*), amide of, preparation of (Aschan), A., i, 14.

Decoic acid (*divaleric acid*), and its sodium, calcium, and barium salts; also its chloride and amide (Guerbet), A., i, 472.

Decylenic oxide (*diamylenic oxide*), and the action of hydrogen bromide on it (Wassiléef), A., i, 786.

Decylic alcohol (*diamylic alcohol*), and its chloride, acetate, and *iso*valerate; also the action of potassium hydrogen sulphate on it (Guerbet), A., i, 472.

Dehydrocamphenylic acid (Jagelki), A., i, 627; (Majewski and Wagner), A., i, 629.

Dehydromucic acid, preparation of (Hill and Phelps), A., i, 576.
  reduction of (Hill and Wheeler), A., i, 576.

Dehydrotrimethylbrazilone and acetyl derivative (Gilbody and Perkin), P., **1899**, 27.

Delphinine, detection of (Melzer), A., ii, 193.

Delphinium Staphisagria seeds, presence of staphisagroine in (Ahrens), A., i, 652.

Delvauxite from Bohemia (Preis), A., ii, 668.

Denitrification. See Agricultural chemistry.

Density of pulverulent substances, determination of (Bremer), A., ii, 81, 271.
  corresponding with Baumé's hydrometer scale (Emery), A., ii, 466.
  of aqueous solutions (Wade), T., 255; P., **1899**, 7; (Barnes and Scott), A., ii, 406.
  maximum, of aqueous solutions of potassium, sodium, lithium, and rubidium chlorides (de Coppet), A., ii, 590.

Deoxybenzoin (*phenyl benzyl ketone*), condensation of, with benzylideneaniline (Francis), T., 867; P., **1899**, 181.
  condensation of, with flavinduline (Sachs), A., i, 239.

Deoxybenzoin-*o*-dicarboxylic acid, action of heat on (Gabriel and Leupold), A., i, 122.

Deoxycaffeine (Baillie and Tafel), A., i, 268.

Deoxycinchonidine methiodide (Koenigs and Höppner), A., i, 87.

Deoxytoluoin (Collet), A., i, 56.

Dephlegmator, forms of, for fractional distillation (Young), T., 698; P., **1899**, 147.

Desmotroposantonins, ferric chloride reaction with (Bertolo), A., i, 931.

r- and *l* **Desmotroposantonins**, acetyl and ethylic derivatives, and reduction to *r*- and *l*-santonous acids (Andreocci and Bertolo), A., i, 301.

Desylenebenzylideneacetone (Japp and Findlay), T., 1026; P., **1899**, 164.

p-**Desylphenol** (Japp and Meldrum), T., 1037; P., **1899**, 167.

Desylthymol, and acetyl derivatives (Japp and Meldrum), T., 1037; P., **1899**, 167.

Dextrin, formation of, from sucrose by action of *Aspergillus niger* (Tanret), A., ii, 171.
  formation of furfuraldehyde from (Sestini), A., i, 103.
  as a reserve material (du Sablon), A., ii, 444.
  detection of, in albumin (Bonnema), A., ii, 196.
  estimation of mannose in presence of (Bourquelot and Hérissey), A., ii, 817.

Dextrin, the stable, and its oxidation, hydrolysis, and constitution; also its relation to the malto-dextrins and soluble starch (Brown and Millar), T., 315; P., **1899**, 13.
  nitration and attempted recovery of (Brown and Millar), T., 310; P., **1899**, 13.

Dextrins of saccharification and their barium compounds (Petit), A., i, 559.
  estimation of (Warnier), A., ii, 339.

Dextrins. See also:—
    Amylodextrin.
    Maltodextrin.

Dextrinic acid, and its hydrolysis, nitration and constitution; also its calcium salt (Brown and Millar), T., 325; P., **1899**, 13.

Dextrose (d-*glucose*, *grape sugar*), from hydrolysis of dextrinic acid (Brown and Millar), T., 330; P., **1899**, 14.
  from acid hydrolysis of maltodextrin and maltodextrinic acids (Brown and Millar), T., 293; P., **1899**, 11.

Dextrose (d-*glucose, grape sugar*), viscosity of undercooled (Tammann), A., ii, 272.
  solutions, molecular depression of vapour pressure of (Dieterici), A., ii, 403.
  cobalt derivatives of (Herzog), A., ii, 818.
  influence of, on the hydration of calcium oxide (Rohland), A., ii, 596.
  action of various pathogenic bacteria on (Hugounenq and Doyon), A., ii, 377.
  hydrolysis of, with oxalic acid (Brown and Millar), T., 306; P., **1899**, 12.
  action of neutral salts on, at higher temperatures (Prinsen-Geerligs), A., i, 101.
  action of yeast-extract and Munich bottom-yeast on (Buchner and Rapp), A., ii, 606.
  oxidation of, by hydrogen peroxide (Morrell and Crofts), T., 788; P., **1899**, 99.
  oxidation of, by sorbose bacterium (Bertrand), A., ii, 170.
  from diabetic urine, and its osazone (Le Goff), A., i, 242.
  proof of the presence of, in diabetic urine (Patein and Dufau), A., ii, 375.
  fate of, after injection into the circulation (Parry), A., ii, 677.
  diastatic formation of, in plants (du Sablon), A., ii, 239.
  influence of, on growth of *Nostoc* (Bouilhac), A., i, 239.

Dextrose, detection and estimation of:—
  detection of (Gawalowski), A., ii, 255.
  detection of, in urine (Fröhlich), A., ii, 185.
  estimation of (Bickel; Maquenne), A., ii, 529.
  estimation of, volumetrically (Garnier), A., ii, 701.
  estimation of, as osazone (Lintner and Krober), A., ii, 66.
  estimation of, in brewing sugars (Morris), A., ii, 187.
  estimation of, in urine (Carpené), A., ii, 66; (Schlosser), A., ii, 185; (Lohnstein), A., ii, 580.

Diabase from Minnesota (Berkey), A., ii, 371.

Diabetes, nature of the sugar in the urine of (Patein and Dufau), A., ii, 375.
  pancreatic, causes of (Tuckett), A., ii, 676.
  phloridzin. See Glycosuria, phloridzin.

Diacetamidobenzaldehydine (Pinnow and Wiskott), A., i, 501.

Diacetamidobenzophenone (Heyl), A., i, 216.

Diacetamidodibenzyl (Thiele and Holzinger), A., i, 438.

Diacetamidodimethyl-*p*-toluidines (Pinnow and Matcovitch), A., i, 49, 50.

2 : 4′-Diacetaminodiphenyl, 5-bromo- and 5-chloro- (Jacobson and Strübe), A., i, 273, 274.

4 : 4′-Diacetamidodiphenyl-3 : 3′-dicarboxylic acid (Bülow and von Reden), A., i, 150.

Diacetamidodixylylphenylmethane, *p*-nitro- (Friedländer and Brand), A., i, 351.

2 : 4′-Diacetamido-5-hydroxydiphenyl and -5-ethoxydiphenyl (Jacobson and Tigges), A., i, 275.

Diacetamidoindazole (Bamberger and Goldberger), A., i, 545.

Diacetamido-β-naphthol (Kehrmann and Matis), A., i, 81.

Diacetamidophenol (Kehrmann and Gauhe), A., i, 28; (Kehrmann and Bahatrian), A., i, 31.

Diacetamidophenylbenzoxazole (Kym), A., i, 648.

Diacetanisidide and *di*nitro-derivative (Starke), A., i, 589.

Diacetoacetic acid, *di*cyano- (*$\alpha\alpha$-diacetyl-$\beta\beta$-diiminoadipic acid*), ethylic salt (Traube), A., i, 192.

Diacetoacetobenzidide, and *di*bromo-derivative and salts (Heidrich), A., i, 366.

Diacetobenzidine and its *di*chloro-derivative, action of fuming sulphuric acid on (Bagnall), T., 279; P., **1898**, 182.

Diacetobenzylideneamidoguanidine (Thiele and Bihan), A., i, 47.

Diacetobisaminoguanidine, and its hydrochloride, platinochloride, and nitrate (Thiele and Dralle), A., i, 8.

Diacetodaphnetin, synthesis of (Gattermann and Köbner), A., i, 364.

Diacetodidesyl-*p*-phenylenediamide (Japp and Meldrum), T., 1045; P., **1899**, 169.

Diacetodimethyltriamidodiphenyl (Jacobson and Kunz), A., i, 275.

Diacetohydrazide (Stollé), A., i, 413; (Pellizzari), A., i, 858.
  and its benzylidene derivative (Hofmann and Marburg), A., i, 488.

Diacetomethylxylylenediamide (Pinnow and Oesterreich), A., i, 203.

Diaceto-α-naphthylamide (Bamberger), A., i, 708.

Diacetophenetidide (Bistrzycki and Ulffers), A., i, 126.

Diacetophenyldiaminobenzoxazole (Kym), A., i, 648.

Diacetophenylpiperidine bromide (Schmidt), A., i, 5.

Diacetoxybenzophenonephenylimine (Graebe and Keller), A., i, 703.

Diacetoxydiketonaphthadihydropyrazole (von Pechmann and Seel), A., i, 948.

ββ-Diacetoxydinaphthalene (Fosse), A., i, 529.

Diacetoxy-ββ'-dipyridylene oxide (Sell and Jackson), T., 517 ; P., **1899**, 98.

2:4'-Diacetoxyflavone (von Kostanecki and Oderfeld), A., i, 705.

3:2'-Diacetoxyflavone (von Kostanecki and von Salis), A., i, 524.

3:4'-Diacetoxyflavone (von Kostanecki and Osius), A., i, 370.

Diacetoxyindigotin (Marchlewski and Radcliffe), A., i, 74.

Diacetoxymethylic ether, from the action of sodium acetate on *di*chlorotrioxymethylene (Grassi-Cristaldi and Maselli), A., i, 409.

Diacetoxymorphine (*heroine*) (Wesenberg), A., i, 650.

Diacetoxynaphthaquinone (Zincke and Ossenbeck), A., i, 765.

Diacetoxyxanthone (Meyer and Conzetti), A., i, 763.

Diacetyl. See Dimethyl diketone.

Diacetylacetone, *di*cyano- (*αα-tetramethyl-ββ-diiminobutane*) (Traube), A., i, 193.

Diacetylaconitine, physiological action of (Cash and Dunstan), A., ii, 42.

αα-**Diacetyladipic acid**, ββ-*di*imino-. See diacetoacetic acid, *di*cyano-.

Diacetylaloe-emodin (Oesterle), A., i, 538.

Diacetyl-*p*-chlorophenylhydrazoxime (Ponzio), A., i, 717.

Diacetylcitryldiphenylhydrazide (Manuelli and de Righi), A., i, 885.

Diacetylcyanhydrin, and **Diacetyldicyanhydrin**, and its *di*bromo- and *tetra*bromo-derivatives (Keller and Maas), A., i, 12.

Diacetylene glycol (*hexadiinediol*), and action of bromine on it ; also diacetyl derivative and dimethylic ether (Lespieau), A., i, 184.

Diacetylethebenine (Freund), A., i, 308.

Diacetylglyceric acid, and its *di-mono-*, *di-* and *tri*-chloro-derivatives, ethereal salts, densities, specific rotations and molecular volumes of (Frankland), T., 355.

Diacetylhydrocinnamoin (Thiele), A., i, 616.

Diacetylhydroxymethylanthranol (Bistrzycki and de Schepper), A., i, 151.

Diacetylmethebenine (Freund), A., i, 307.

Diacetyl-*p*-methylhydrazobenzene (Jacobson and Lischke), A., i, 276.

Diacetylmethyl*cyclo*pentenecarboxylic acid, *di*amino-, ethylic salt (Traube), A., i, 193.

Diacetylmorpholquinone and its azine (Vongerichten), A., i, 649.

Diacetylnaphthazarine, condensation of, with diazomethane (von Pechmann and Seel), A., i, 948.

γ-**Diacetyl-β-phenylcrotonic acid**, ethylic salt (Ruhemann), T., 415 ; P., **1899**, 15.

Diacetylphenylhydrazoxime, *p*-bromo- and *o*-chloro- (Ponzio), A., i, 718.

Diacetylphenylmethane, 2 : 4-*di*nitro- (Muttelet), A., i, 281.

Diacetylphenyl*di*thiobiuret (Fromm and Philippe), A., i, 485.

Diacetylphenylurazole (Cuneo), A., i, 9.

Diacetylphloroglucinol (Nencki), A., i, 879.

Diacetylpicrotin and **Diacetylpicrotoxinin** (Meyer and Bruger), A., i, 227.

Diacetylquinonedioxime, *m*-chloro- (Kehrmann and Grab), A., i, 129.

Diacetylsuccinic acid, ethylic salt (Kohler and MacDonald), A., i, 907.
  isomeric forms of (Knorr), A., i, 672.

Diacetyltartaric acid, and *mono-* and *di*-chloro-derivatives, ethereal salts, densities, specific rotations and molecular volumes of (Frankland), T., 362, 369.

Diacetyl-1 : 3 : 5-triethylbenzene (Gattermann, Fritz, and Beck), A., i, 492.

Diacetyltrimethylene, *di*imino-, from action of alcohol on dicyanacetylacetone (Traube), A., i, 193.

Di-*o*-aldehydophenoxyacetic acid, hydrazone, and its methylic salt (Cajar), A., i, 147.

Di-*o*-aldehydophenylic ethylic carbonate hydrazone and semicarbazimide (Cajar), A., i, 146, 147.

Diallage from Mexico (Lenk), A., ii, 305.
  from the Transvaal (Henderson), A., ii, 111.

Diallylcarbamide (*sinapoline*), and **Diallylthiocarbamide**, and the action of bromine and iodine on them (Rundqvist), A., i, 18.

"**Diamine pure blue,**" molecular weight of, in aqueous solution (Krafft), A., ii, 473.

Diamond, origin of South Africa (Friedländer), A., ii, 559.

minerals associated with, in Bahia (Hussak), A., ii, 494.

parent-rock of, in South Africa (Bonney), A., ii, 769.

artificial production of, in silicates (Friedländer), A., ii, 559.

Diamond-sands of Brazil (Hussak), A., ii, 432.

Di*iso*amyl. See Decane.

Di*iso*amylacetic acid. See Dodecoic acid.

Diamylamine, specific rotation of (Brjuchonenko), A., ii, 265.

*per*iodide (Norris and Franklin), A., i, 663.

cyano-, and action of ammonia and hydrogen sulphide on (Wallach), A., i, 659.

Di*iso*amylamine, action of nitrosyl chloride on (Solonina), A., i, 473.

Diamylenic oxide. See Decylenic oxide.

Diamylic alcohol. See Decylic alcohol.

Di*iso*amylidene-ethylenediamine and its platinochloride (Kolda), A., i, 328.

Di*iso*amylmalonic acid, and action of heat on (Fournier), A., i, 735.

Diamylresorcinol, and diacetyl derivative (Gurewitsch), A., i, 880.

Diamylthiocarbamide, formation of (Wallach), A., i, 659.

Dianilinodichloroquinonedisulphonic acid, potassium salt (Imbert and Pagès), A., i, 516.

Dianilinonitroquinone (Kehrmann and Idzkowska), A., i, 493.

Dianisidine, diacetyl and dibenzoyl derivatives, carbamide and thiocarbamide (Starke), A., i, 589.

Dianisyl (Starke), A., i, 589.

Dianisylacetic acid, and its salts (Fritsch and Feldmann), A., i, 600.

Dianisyldichlorethylene (Fritsch and Feldmann), A., i, 600.

Dianisyldihydrazinesulphonic acid, sodium salt (Starke), A., i, 589.

Di-*o*-anisyldihydrazoneacetylacetone (Favrel), A., i, 438.

Dianisyldihydrazonecyanoacetic acid, diethylic salt (Favrel), A., i, 58.

o-**Dianisyldihydrazonemalonic acid**, methylic and ethylic salts (Favrel), A., i, 521.

Dianisyldithiocarbimide (Bamberger), A., i, 697.

Dianisylpropane (Moureu), A., i, 495.

Diaphorite from U.S.A. (Spencer), A., ii, 108.

possible identity with brongniardite (Spencer), A., ii, 108.

Diarsonium compounds, hexa-alkylated (Partheil, Amort, and Gronover), A., i, 474.

Diaspore from Bahia (Hussak), A., ii, 494.

Diastase, preparation of, without alcohol (Sykes and Hussey), A., i, 313.

malt-, composition of, and action of, on pectin (Bourquelot and Hérissey), A., i, 93.

action of, on amylose, and relation to starch formation in plants (Meyer), A., ii, 321.

action of, on barley starch (Ling), A., ii, 187.

action of, on inulin (Chittenden and Siviter), A., ii, 310.

Diastases, estimation of, in urine (Chibret), A., ii, 459.

m-**Diazine.** See Pyrimidine.

Diazoacetic acid, ethylic salt, and nitrile (Curtius), A., i, 9.

Diazoamino-compounds, velocity of conversion of, into aminoazo-compounds (Goldschmidt and Salcher), A., ii, 551.

Diazoaminoindazole (Bamberger and von Goldberger), A., i, 546.

β-**Diazoaminopyridine** (Mohr), A., i, 72.

Diazobenzene, *per*bromide, and sulphonate, action of bromine on (Armstrong), P., **1899**, 176.

p-bromo-, constitution of (Hantzsch), A., i, 400.

anti-**Diazobenzene**, *p*-bromo- and *p*-nitro- (Hantzsch, Schümann, and Engler), A., i, 686.

4-Diazobenzeneimide, 1 : 3-*di*nitro- (Drost), A., i, 751.

iso-**Diazobenzenesodium**, *p*-nitro-, behaviour towards ethylic acetoacetate (Bülow), A., i, 271.

Diazobenzenesulphonic acid, rate of formation of azo-compounds from, and tertiary amines (Goldschmidt and Bürkle), A., ii, 276.

compounds of, with mercuric chloride and mercuric cyanide (Hofmann and Marburg), A., i, 487.

o-**Diazobenzoic acid**, reduction of (Henderson), A., i, 430.

Diazo-compounds, action of, on oximes (Bamberger), A., i, 589.

a new class of (Bamberger), A., i, 719.

3′-Diazo-1 : 3-dimethylindazole hydroxide (Bamberger), A., i, 514.

Diazoethane (von Pechmann), A., i, 134.

Diazoguanidine cyanide (*triazendicarbamidine nitrile, aminoiminomethylcyanotriazen*), the action of hydrogen chloride and hydroxylamine on; reduction of (Thiele and Osborne), A., i, 412, 413.

Diazohydrates, distinction of, from primary nitrosamines (Hantzsch, Schümann, and Engler), A., i, 685.

anti-**Diazohydrates**, behaviour of, with phosphorus pentachloride, acetic chloride, and ammonia (Hantzsch), A., i, 400.

Diazoindazole hydroxide (Bamberger and von Goldberger), A., i, 546.

Diazomethane, condensation of, with quinone, α-naphthaquinone, and with diacetylnaphthazarine (von Pechmann and Seel), A., i, 947.

Diazonium (*benzenediazonium*), hydroxide and salts, physico-chemical properties of (Davidson and Hantzsch), A., ii, 6, 7.
  salts (Bamberger), A., i, 750.
    action of thymol-*p*-sulphonic acid on (Stebbins), A., i, 916.

p-**Diazophenylhydroxylamine** chloride, and salts (Fischer), A., i, 349.

Diazosulphanilic acid, potassium salt (Hantzsch, Schümann, and Engler), A., i, 687.

Diazotates, normal, behaviour of, towards benzoic chloride (Hantzsch), A., i, 685.

iso-**Diazotates**, behaviour of, towards sodium amalgam (Hantzsch), A., i, 685.

Diazothiazol hydrates (Hantzsch, Schümann, and Engler), A., i, 686.

Diazotisation, velocity of (Hantzsch and Schümann), A., ii, 549.

o-**Diazotolueneimide**, *m*-nitro- (Zincke and Schwarz), A., i, 751.

Diazotriazolecarboxylic acid (Thiele and Manchot), A., i, 168.

Diazouracils (Hantzsch, Schümann, and Engler), A., i, 686.

Diazourethane, and methyl derivative, constitution of (Hantzsch, Schümann, and Engler), A., i, 686; (Brühl), A., i, 871.

Diazovanillic acid chloride (Vogl), A., i, 698.

4-Diazo-*m*-xyleneimide, 5-nitro-(Zincke and Schwarz), A., i, 751.

Dibebeerinexyleneammonium bromide (Scholtz), A., i, 92.

Dibenzamide, mercury compound of, constitution of (Kieseritzky), A., ii, 395.

Dibenzamidodibenzyl (Thiele and Holzinger), A., i, 438.

4 : 4′-Dibenzamidodiphenyl-3 : 3′-dicarboxylic acid (Bülow and von Reden), A., i, 150.

2 : 4′-Dibenzamido-5-ethoxydiphenyl (Jacobson and Tigges), A., i, 275.

Dibenzanilide ethylenic ether, dithio- (Bamberger), A., i, 695.

Dibenzanisidide (Starke), A., i, 589.

Dibenzenesulphinic acid, hydrazine salt (Curtius and Lorenzen), A., i, 149.

Dibenzenesulphoethylenediamide (Marckwald and Droste-Huelshoff), A., i, 290.

Dibenzenesulphonic acid hydrazine salt, and **Dibenzenesulphonehydrazide** (Curtius and Lorenzen), A., i, 149.

Dibenzenesulphonylphenyl-ethylhydrazine, and **-methylhydrazine** (Bamberger), A., i, 701.

Dibenzenesulphopiperazide (Marckwald and Droste-Huelshoff), A., i, 290.

Dibenzenylazoxime, *o*-*di*chloro- (Werner and Bloch), A., i, 754.

Dibenzocarbamide (Walther and Wlodkowski), A., i, 590.

Dibenzocitryldiphenylhydrazide (Manuelli and de Righi), A., i, 885.

Dibenzohydrazide, and the action of heat on it (Pellizzari), A., i, 858.

Dibenzomethylbutylenediamide (Etaix and Freundler), A., i, 245.

Dibenzo-*o*-phenylenediamide (Walther and Pulawski), A., i, 639.

Dibenzophenylhydrazide (Busch and Becker), A., i, 953.

Dibenzotricarballyldiphenylhydrazide (Manuelli and de Righi), A., i, 885.

Dibenzoylacetonitrile, and its methylic salt (Seidel), A., i, 139.

Dibenzoylanthracene (Lippmann and Fleissner), A., i, 918.

Dibenzoylarginine (Gulewitsch), A., i, 834.

Dibenzoyl*iso*barbaloin, preparation of (Léger), A., i, 158.

ββ-**Dibenzoyl*iso*butyric acid.** See Diphenacylacetic acid.

αδ-**Dibenzoyl-*βγ*-diphenyl-butane,** **-butene,** and **-butadiene** and their dioximes (Wislicenus and Lehmann), A., i, 59.

αγ-**Dibenzoyl-*αγ*-diphenylpropane** (Wislicenus and Carpenter), A., i, 60.

αγ-**Dibenzoylglutaric acid,** ethylic salt (Wislicenus and Kuhn), A., i, 60.

Dibenzoylglyceric acid, ethereal salts, densities, specific rotations and molecular volumes of (Frankland), T., 356; (Frankland and Aston), T., 498; P., **1899**, 106.

Dibenzoylhydrocinnamoin (Thiele), A., i, 616.

Dibenzoylmesitylene, preparation of (Mills and Easterfield), P., **1899**, 22.

Dibenzoylmesitylenic acid (Mills and Easterfield), P., **1899**, 23.

Dibenzoylmorphine hydrochloride (Merck), A., i, 649.

Dibenzoylornithine, and its hydrolysis (Schulze and Winterstein), A., i, 107.

Dibenzoyloxy-ββ′-dipyridylene oxide (Sell and Jackson), T., 517, P., **1899**, 98.

Dibenzoylpicrotin (Meyerand Bruger), A., i, 227.

αγ-**Dibenzoylpropane**, and its dioxime and pinacone (WislicenusandKuhn), A., i, 60.

Dibenzoylsuccinic acid, ethylic salt, isomeric forms of (Knorr), A., i, 674.

Dibenzoyltartaric acid, methylic and ethylic salts, molecular volumes of (Frankland), T., 349.

Dibenzoyltrimesic acid (Mills and Easterfield), P., **1899**, 23.

Dibenzoyluvitic acids, isomeric (Mills and Easterfield), P., **1899**, 23.

Dibenzyl, formation of (Moritz and Wolffenstein), A., i, 424; (Weiler), A., i, 491.

cryoscopic behaviour of, in azobenzene solution (Bruni and Gorni), A., ii, 731.

mixtures of, with stilbene, freezing points of; depression of freezing point of, by hydrazobenzene, azobenzene, benzylideneaniline and benzylaniline; cryoscopic behaviour of, in benzylaniline solution (Garelli and Calzolari), A., ii, 732.

action of chromyl chloride on (Weiler), A., i, 519.

Dibenzyl, *o*-*di*amino-, and its diacetyl and dibenzoyl derivatives; *o*-*di*chloro-, and *o*-imino, and its nitroso-derivatives (Thiele and Holzinger), A., i, 438.

Dibenzylamine, cyano-, and action of ammonia and hydrogen sulphide on (Wallach), A., i, 659.

Dibenzylaniline, formation of (Wedekind), A., i, 352.

Dibenzylcyanacetic acid, ethylic salt (Hessler), A., i, 898.

Dibenzyldimethylpiperazine (Uedinck), A., i, 497.

Dibenzylethylenediamine hydrochloride, formation of (Bleier), A., i, 665.

Dibenzylethylenedibenzenesulphonamide, and its hydrolysis (Bleier), A., i, 665.

Dibenzylic disulphide, *di*amino-, its hydrochloride and acetyl derivative (Thiele and Dimroth), A., i, 427.

phenylimidocarbonate, *di*thio- (Fromm and Bloch), A., i, 887.

Dibenzylidene-adonitol, **-dulcitol**, and **-erythritol** (de Bruyn and Alberda van Ekenstein), A., i, 662.

Dibenzylidenegranatonine (Piccinini), A., i, 830.

Dibenzylidene-*l*-idonic acid, specific rotation and solubility of (Alberda van Ekenstein and de Bruyn), A., i, 904.

Dibenzylidenemethylgranatonine (Piccinini), A., i, 829.

Dibenylideneperseitol (de Bruyn and Alberda van Ekenstein), A., i, 662.

Dibenzylidene-*m*-phenylenediamine (Meyer and Gross), A., i, 946.

Dibenzylidenepropionic acid (Thiele), A., i, 216, 609.

dibromide (Thiele and Mayr), A., i, 611.

m-nitro- (Thiele), A., i, 609.

Dibenzylidene-rhamnitol, **-*d*-sorbitol** and **-xylitol** (de Bruyn and Alberda van Ekenstein), A., i, 662.

Dibenzylidene-*l*-xylonic acid, specific rotation and solubility of (Alberda van Ekenstein and de Bruyn), A., i, 904.

Dibenzyl ketone, action of light and of oxygen on (Fortey), T., 871; P., **1899**, 182.

condensation products of, with benzylidene aniline; action of sodium ethoxide on; bromo-, action of ammonia or aniline on (Francis), T., 865; P., **1899**, 181.

Dibenzyl ketone phenylhydrazone (Francis), T., 868; P., **1899**, 182.

Dibenzyl ketoxime (Francis), T., 868; P., **1899**, 182.

Dibenzylmalononitrile (Hessler), A., i, 899.

Dibenzylmesitylene (Mills and Easterfield), P., **1899**, 23.

v-**Dibenzyl-*n*-methylthiourea** (Dixon), T., 374; P., **1899**, 54.

ψ*nv*-**Dibenzylmethylthiourea** (Dixon), T., 375.

Dibenzyl-β-naphthylamine (Morgan), P., **1899**, 10.

Dibenzylpiperazine, and chloride, ethiodide, methiodide, propiodide, and *iso*butobromide (van Rijn), A., i, 77.
Dibenzylthiocarbamide, formation of (Wallach), A., i, 659.
Diborneolic formal. See Borneol, methylenic acetal of.
Di*iso*butenyl (*octinene*), and the action of sulphuric and hydrobromic acids on (Pogorželsky), A., i, 785.
Di*iso*butyl. See Octane.
Di*iso*butylamine, action of nitrosyl chloride on (Solonina), A., i, 473.
tert-**Dibutylbenzene**, formation of, and *di*nitro- (Verley), A., i, 425.
Dibutylcatechol, synthesis of (Gurewitsch), A., i, 880.
Di-*m*-butyldibenzyl (Moritz and Wolffenstein), A., i, 910.
Di*iso*butylhydrazine and its hydrochloride (Franke), A., i, 329.
Di*iso*butylideneethylenediamine and its platinochloride; also its hydrolysis and the action of bromine on it (Kolda), A., i, 328.
tert-**Dibutylpyrogallol**, synthesis of, and triacetyl derivative (Różycki), A., i, 880.
Dibutylquinone, synthesis of (Mencki; Gurewitsch), A., i, 880.
Dibutylquinonephenylhydrazone (Gurewitsch), A., i, 880.
Dibutylresorcinol, synthesis of, and dibutylic ether, and diacetate (Gurewitsch), A., i, 880.
dd- and *rd*-**Dibutylthiocarbamide** (Gadamer), A., i, 534.
ββ-**Dibutyroxydinaphthalene** (Fosse), A., i, 817.
Di*iso*butyryldi-β-naphthylethylenediamide, *di*-α-bromo-, and **Di*iso*butyryldi-*p*-tolyltrimethylenediamide**, *di*bromo- (Bischoff and Tschunkew), A., i, 279.
Dibutyryltartaric and **Di*iso*butyryltartaric acid**, ethereal salts, densities, specific rotations and molecular volumes of (Frankland), T., 361, 362.
Dicamphanepyrazine and **Dicamphenepyrazine** (Duden and Pritzkow), A., i, 779.
Dicampherylic acid, and methylic salts, oxime, phenylhydrazone (Perkin) T., 179; P., **1893**, 110.
  fusion of, with potash (Perkin), T., 185; P., **1895**, 24.
Dicarbethoxycarbamide (Dains), A., i, 594.
Dicarbintetracarboxylic acid. See Ethylenetetracarboxylic acid.
Dicarboxyglutaconic acid (*methenylbismalonic acid*, *propylenetetracarboxylic acid*), ethylic salt, tautomeric forms of (Guthzeit), A., i, 115.
  ethylic salt, diamide of, identity of, with the ammonium salt of ethylic dihydroxynicotinate (Guthzeit), A., i, 450.
αα-**Dicarboxymethoxycarballylic acid**, and methylic salts (Anschütz and Clarke), A., i, 577.
αα-**Dicarboxymethoxy-αα-dimethyltricarballylic acid**, methylic salt (Anschütz and Clarke), A., i, 578.
Di-*m*-carboxyphenylic bisulphide (Gattermann), A., i, 518.
Dicarvelol, and its dihydrobromide, action of phosphoric anhydride on (Harries and Kaiser), A., i, 579.
Dicarvelone, modifications of; phenylhydrazone, diacetyl derivatives, and dioximes (Wallach), A., i, 530.
  reduction of (Harries and Kaiser), A., i, 579.
Dicatecholacetylenic ether (Moureu), A., i, 30, 679.
Di*apo*cinchonine, a mixture of α- and β-*iso*cinchonine (Skraup), A., i, 961.
Dicrotonyl. See Octinene.
Dicrotonylic sulphide (Charon), A., i, 849.
Dicumylene disulphide (Cohen and Skirrow), T., 891; P., **1899**, 183.
Dicyanodiamide, formation of (Montecchi), A., i, 429.
  heats of combustion and formation of (Lemoult), A., ii, 546.
  action of nitric acid on (Thiele and Uhlfelder), A., i, 119.
Dicyanodiamidine, amino- and nitro- (Thiele and Uhlfelder), A., i, 119.
Dicymylene disulphide (Cohen and Skirrow), T., 892; P., **1899**, 183.
Didesyl-*p*-phenylenediamine, and its diacetyl derivative (Japp and Meldrum), T., 1045; P., **1899**, 169.
Didymium nitrate (Wyrouboff and Verneuil), A., ii, 225.
  cerium nitrate and sulphate; oxides and their polymerides (Wyrouboff and Verneuil), A., ii, 424.
  oxide, constitution of (Wyrouboff and Verneuil), A., ii, 598.
    from monazite sands, composition of (Urbain), A., ii, 425.
    influence of, on the solubility of cerosoceric oxide in nitric acid (Wyrouboff and Verneuil), A., ii, 424.
  and lanthanum, separation of, from cerium (Mengel), A., ii, 223.

2 : 5-Diethoxyacetophenone (von Kostanecki, Levi, and Tambor), A., i, 371.

1 : 3-Diethoxybenzene (*resorcinol diethylic ether*), 2-bromo-4 : 6-*di*nitro- (Jackson and Gazzolo), A., i, 744.
5 : 2 : 4-bromo*di*nitro-, and 5 : 6 : 4-bromo*di*nitro- (Jackson and Koch), A., i, 677, 678.

1 : 3-Diethoxybenzylidenebromocoumaranone (Kostanecki, Tambor, and Bednarski), A., i, 892.

Di-*o*- and *p*-ethoxydiphenyl disulphides (Gattermann), A., i, 518.

***p*-Diethoxydiphenyltetrahydroglyoxaline** (Bischoff), A., i, 280.

***o*-Diethoxydiphenyltetrahydropyrone** (Petrenko-Kritschenko), A., i, 440.

***o*-Diethoxydiphenyltetrahydropyroneoxime**, additive products of (Petrenko-Kritschenko and Rosenzweig), A., i, 706.

***o*-Diethoxydiphenyltetrahydropyronedicarboxylic acid** (Petrenko-Kritschenko), A., i, 440.

2 : 4′-Diethoxyflavone (von Kostanecki and Oderfeld), A., i, 705.

3 : 2′-Diethoxyflavone (von Kostanecki and von Salis), A., i, 524.

2 : 5-Diethoxyphenyl styryl ketone (von Kostanecki, Levi, and Tambor), A., i, 371.

Diethoxysuccinic acid, ethylic salt, action of methylcarbamide on, in presence of hydrogen chloride; also the ureine (Geisenheimer and Anschütz), A., i, 575.

***d*-Diethoxysuccinic acid**, and its ethylic, silver, sodium, calcium, barium, acid potassium and acid ammonium salts, and their rotatory powers (Purdie and Pitkeathly), T., 158; P., **1899**, 6.

2 : 4-Diethoxythiobenzanilide (Bamberger), A., i, 695.

Di-*p*-ethoxythiobenzo-dianisidide, and **-*o*-toluidide** (Bamberger), A., i, 697.

Diethylacetoacetic acid, ethylic salt (Conrad and Gast), A., i, 193.
action of *p*-phenetidine on (Foglino), A., i, 132.

Diethylacetoacetic acid, γ-bromo-, ethylic salt (Lawrence), T., 423; P., **1898**, 252; (Conrad and Gast), A., i, 193.
γ-cyano-, ethylic salt (Lawrence), T., 423; P., **1898**, 252.

β-Diethylallene. See Heptinene.

Diethylallylmalonic acid, and ethylic salt (Ipatieff), A., i, 673.

Diethylamine, effect of pressure on melting point curves of (Tammann), A., ii, 636.
action of, on ethylic phenylpropiolate and acetylenedicarboxylate (Ruhemann and Cunnington), T., 956; P., **1899**, 185.
action of hydrogen peroxide on (Dunstan and Goulding), T., 1009; P., **1899**, 124.
action of iodine on (Norris and Franklin), A., i, 663.
cyano-, and action of ammonia and hydrogen sulphide on (Wallach), A., i, 659.

Diethyl-*o*-aminobenzonitrile (Friedländer), A., i, 350.

Diethylaminobenzoyl*tetra*chlorobenzoic acid, methylic and ethylic salts, and mixed acetic anhydride (Haller and Umbgrove), A., i, 814.

Diethylaminocinnamic acid, from action of diethylamine on ethylic phenylpropiolate (Ruhemann and Cunnington), T., 956; P., **1889**, 185.

Diethylaminodiphenylanthrone (Tétry), A., i, 818.

Diethyl*di*aminodi-*o*-tolylmethane (Friedländer), A., i, 350.

Diethylaminomaleic acid, ethylic salt (Ruhemann and Cunnington), T., 957; P., **1899**, 185.

4-Diethylaminophenyl-μ-cyanazomethine-phenyl and **-4′-nitrophenyl** (Ehrlich and Sachs), A., i, 884.

γ-Diethylamino-αβ-propylenic glycol (*diethylpropanediolamine*) and its picrolonate (Knorr and Knorr), A., i, 412.

Diethylaniline, rate of formation of azo-compounds from, and diazobenzenesulphonic acid (Goldschmidt and Bürkle), A., ii, 276.
oxide, and its picrate (Bamberger and Tschirner), A., i, 348.
nitroso-, condensation with benzylic cyanide (Ehrlich and Sachs), A., i, 884.

Diethylaniline-*p*-thionamic acid (Francke), A., i, 46.

Diethylbornylamine, platinochloride (Forster), T., 947; P., **1899**, 72.

Diethylcarbinol. See Amylic alcohol.

Diethylcyanacetic acid, ethylic salt (Hessler), A., i, 898.

Diethyldibenzyl (Moritz and Wolffenstein), A., i, 910.

Diethylenedipiperidyl iodide (Aschan), A., i, 542.

Diethylenetetramethylenetetramine (Bischoff), A., i, 279.

Diethylglycollonitrile (*diethylketocyanhydrin*) and acetate; also action of phosphoric anhydride on the latter (Henry), A., i, 568.

β-**Diethylhydroxylamine**, formation of by action of hydrogen peroxide on diethylamine (Dunstan and Goulding), T., 1009; P., **1899**, 124.
  and its salts; also decomposition and reduction, and the action of ethylic iodide on (Dunstan and Goulding), T., 800; P., **1899**, 59.

Diethylic *di*thiocarbonate, synthesis of (Konowaloff), A., i, 471.

2′ : 2′-Diethylindolenine (Plancher), A., i, 451.

3′ : 3′-Diethylindolenine-2′-carboxylic acid, -2′-nitrile, -2′-formamidoxime, and **-2′-formoxime** and its acetyl derivative (Plancher), A., i, 453, 454.

3′ : 3′-Diethylindolenone, and dibromide (Plancher), A., i, 454.

3′ : 3′-Diethylindolenyl-2′-carboxylic acid (Plancher), A., i, 451.

Diethylketocyanhydrin. See Diethylglycollonitrile.

Diethyl ketone, specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.
  oxidation of, in the organism (Schwarz), A., ii, 40.

Diethyl ketone, amino-, and *iso*nitroso- (Jänecke), A., i, 476.

β-**Diethyllactic acid** (*3-ethyl-2-pentanoloic acid*), from hydrolysis of ethylic γ-acetoxydiethylacetoacetate; also silver salt (Conrad and Gast), A., i, 193.

Diethyllariciresinol (Bamberger and Landsiedl), A., i, 929.

β-**Diethylmalic acid,** from action of baryta water on the monobromo-derivative of ethylic γ-acetoxydiethylacetoacetate (Conrad and Gast), A., i, 193.

iso-**Diethylnitramine**, action of sulphuric acid on (Franchimont and Umbgrove), A., i, 106.

Diethyl-*o*-phenetidine, and **Diethyl-*o*-phenetidineazo-*p*-nitrobenzene** (Friedländer), A., i, 350.

Diethylphenol, and *tri*bromo- and *tri*nitro- (Jannasch and Rathjen), A., i, 878.

Diethylphosphinic acid, ethylic salt (Engler and Weissberg), A., i, 189.

Diethylpipecolylalkinium salts (Ladenberg and Krügel), A., i, 303.

Diethylpiperazine (van Rijn), A., i, 166.

Diethylpropanediolamine. See γ-Diethylamino-αβ-propylenic glycol.

Diethyl*di*thiocarbamic acid, diethylammonium salt, electrolysis of solution of (Schall and Kraszler), A., i, 414.

Diethylthiocarbamide, formation of (Wallach), A., i, 659.

β-**Diethyltrimethylenic** bromide, action of ethylic sodiomalonate on (Ipatieff), A., i, 673.

Diethyl-*m*-xylidine, and its platinochloride (Friedländer and Brand), A., i, 351.

Di-eucarvelone (Wallach), A., i, 531.

Diffusin, from *Platysma diffusum* (Zopf), A., i, 717.

Diffusion :—
  Diffusion of partially dissociated electrolytes (Bose), A., ii, 729.
    of gaseous ions (Townsend), A., ii, 730.
    of gases through animal membranes (Hill), A., ii, 437.
    of gases through caoutchouc (d'Arsonval), A., i, 771.
    of gases through water and through agar jelly, velocity of (Hüfner), A., ii, 9.
  Osmosis of organic liquids across vulcanised caoutchouc (Flusin), A., ii, 204.
  Osmotic pressure (Speyers), A., ii, 9.
    cause of (Barmwater), A., ii, 274.
    theory of (Schreber), A., ii, 273.
    in gases, determination of (Kistiakowski), A., ii, 730.
    and osmotic work, relation between (Dieterici), A., ii, 547.
    osmotic work and vapour pressure (Noyes), A., ii, 357.
    and association of solvents (Reychler), A., ii, 357.
    of dilute solutions of sodium chloride (Ponsot), A., ii, 591.
    and concentration of ethereal solutions (Goodwin and Burgers), A., ii, 273.
    of cane sugar solutions (Ponsot), A., ii, 204, 357.
    and velocity of inversion of cane sugar (Arrhenius), A., ii, 359.
  Osmotic theory of electromotive force and conductivity (Kahlenberg), A., ii, 624.
    of cell (Nernst), A., ii, 345.

2 : 4-Diformamidodiphenyl, 5-bromo- (Jacobson and Grosse), A., i, 274.
  5-chloro- (Jacobson and Strübe), A., i, 273.

2 : 4′-Diformamido-5-hydroxydiphenyl (Jacobson and Tigges), A., i, 275.

Diformohydrazide, and action of heat on (PELLIZZARI), A., i, 858.

4 : 5-Di-α-furfuryloctane-2 : 7-dione, (HARRIES and KAISER), A., i, 578.

Digallacyl, acetyl derivative and osazone (VON GEORGIEVICS), A., i, 803.

Digallic acid, distinction between gallic acid and (GRIGGI), A., ii, 581.

α-Digallic acid (WALDEN), A., i, 212.

Digestion, influence of various antiseptics on (MABERY and GOLDSMITH), A., ii, 164.
  - influence of formaldehyde on (WEDEMEYER), A., ii, 460.
  - influence of certain substances on (SIMONS), A., ii, 164.
  - fractional precipitation of products of, by zinc sulphate (ZUNZ), A., ii, 504.
  - pancreatic, of starch, influence of acids and alkalis on (RACHFORD), A., ii, 567.
    - formation of tyrosine from fibrin by (HARLAY), A., i, 656.
  - peptic and pancreatic, of albumin (HARLAY), A., i, 835.
    - and tryptic, products of (LAWROFF), A., ii, 309.
    - course of (ZUNZ), A., ii, 774.
    - solubility of products of, in alcohol (EFFRONT), A., i, 835.
  - in molluscs (BIEDERMANN and MORITZ), A., ii, 438.
  - of casein, first products of the (SALKOWSKI), A., ii, 567.
  - of cellulose by liver secretion of *Helix pomatia* (BIEDERMANN and MORITZ), A., ii, 166.
  - of lactose in the small intestine (WEINLAND), A., ii, 604.

Digitalein, preparation of, from *Digitalis* seeds (KILIANI and WINDAUS), A., i, 932.

Digitaligenin (KILIANI), A., i, 71, 932.

Digitalin, composition and hydrolytic products of (KILIANI), A., i, 71.
  - detection of (MELZER), A., ii, 193.

"**Digitaline crystallisée**," properties of (KILIANI), A., i, 71.

"*Digitalinum verum*," decomposition products of (KILIANI), A., i, 932.

Digitalis ferment, occurrence and properties (BRISSEMORET and JOANNE), A., ii, 319.

Digitalonic acid and **Digitalose** (KILIANI), A., i, 71.

Digitic acid, molecular weight of (EDINGER), A., i, 377.

Digitogenic acid (EDINGER), A., i, 377; (KILIANI and WINDAUS), A., i, 932.

β-Digitogenic acid, and oxime (KILIANI and WINDAUS), A., i, 933.

Digitogenin (EDINGER), A., i, 377: (KILIANI and WINDAUS), A., i, 932.

Digitoic acid (KILIANI and WINDAUS), A., i, 932.

Digitonin (EDINGER), A., i, 377.

Digitoflavone, and tribenzoate, triacetate, and tribenzenesulphonate; decomposition products (FLEISCHER), A., i, 631.

Digitoxic acid (KILIANI), A., i, 932.

Digitoxigenin (KILIANI), A., i, 70, 932.

Digitoxin (KILIANI), A., i, 70, 71, 932.

Digitoxose, and its oxime (KILIANI), A., i, 70, 932.

Digitoxosecarboxylic acid, calcium salt and lactone (KILIANI), A., i, 70.

αα′-Diglutaric acid, and dimethylic salt (SELL and JACKSON), T., 515; P., **1899**, 98.

Diglycolamic acid, mercury derivative of, constitution of (KIESERITZSKY), A., ii, 395.

Diglycolyl-carbamide and **-dimethylcarbamide**, thio- (FRERICHS), A., i, 796.

Diglycolyl-diethyl-, **-di*iso*butyl-**, and **-diamyl-urethanes**, thio- (FRERICHS), A., i, 796.

Diguaiacylic ethylenic ether (BOSCOGRANDE), A., i, 427.

Diheptylcarbamide (MANUELLI and RICCA-ROSELLINI), A., i, 887.

Dihexoyltartaric acid, ethereal salts, densities, specific rotations, and molecular volumes of (FRANKLAND), T., 362.

Dihydroacenaphthene-*p*-diazine, and *di*bromo-derivative (AMPOLA and RECCHI), A., i, 919.

Dihydrobenzoic acid. See *cyclo*-Hexadienecarboxylic acid.

Dihydro-*cis*-campholytic acid, α-bromo- (NOYES), A., i, 284.

Dihydrocamphoric acid (CROSSLEY), T., 771; P., **1898**, 247.

Dihydrocamphorone, 7-nitroso- (HARRIES and MATFUS), A., i, 629.

Dihydrocarvyldiamine, salts and dibenzyl derivative, diphenylcarbamide, and diphenylthiocarbamide (HARRIES and MAYRHOFER), A., i, 625.

Dihydrocinchenine (*dihydrocinchine*), action of sulphuric acid on (KOENIGS and HÖPPNER), A., i, 88.

Dihydrodicamphenepyrazine, and salts (DUDEN and PRITZKOW), A., i, 779.

Dihydroeucarvylamine, phenylcarbimide and phenylthiocarbimide (WALLACH), A., i, 531.

Dihydro*iso*lauronic acid, and its oxime and semicarbazone (BLANC), A., i, 927.

Dihydro-ψ-lauronolic acid, bromo-, methylic salt (Lees and Perkin), P., **1899**, 24.

Dihydro-β-naphthaquinoneaminoguanidine, hydrochloride (Thiele and Barlow), A., i, 48.

Dihydro-β-naphthylic dimethylaminoethylic ether (Knorr), A., i, 463.

Dihydrophenylacridine, *di*amino- (Meyer and Gross), A., i, 945.

1 : 4-Dihydro-1-phenylnaphthalene (Thiele and Meisenheimer), A., i, 614.

Dihydroquinoneaminoguanidine, hydrochloride (Thiele and Barlow), A., i, 47.

Dihydroquinone-bisaminoguanidine hydrochloride (Thiele and Barlow), A., i, 47.

Dihydroresorcinol, electrical conductivity of (von Schilling and Vorländer), A., i, 879.

oxidation of (Vorländer and Kohlmann), A., i, 679.

derivatives (Vorländer), A., i, 345.

Dihydroterephthalic acid. See *cyclo*-Hexadiene-1 : 4-dicarboxylic acid.

Dihydrotetrazine (*tetrazoline*) (Ruhemann and Stapleton), T., 1133 ; P., **1899**, 191 ; (Pellizari), A., i, 859.

Dihydrothebaine and methiodide (Freund), A., i, 309.

iso-**Dihydrothebaine** and hydriodide and methiodide (Freund), A., i, 309.

Dihydrotolualloxazine (Kühling), A., i, 723.

Dihydrotruxone (Manthey), A., i, 894.

$\Delta^{2,4}$-Dihydrouvitic acid, and salts (Wolff and Heip), A., i, 515.

Dihydroxyacetone, and its molecular weight (Bertrand), A., i, 860.

action of yeast on a mixture of glyceraldehyde with (Emmerling), A., ii, 318.

2 : 4-Dihydroxyacetophenone (*resacetophenone*), monethylic ether of, condensation of, with *o*-ethoxybenzaldehyde (von Kostanecki and von Salis), A., i, 523.

Dihydroxyanhydroecgonine methiodide and its methylic derivative, and methylbetaine (Willstätter), A., i, 651.

Dihydroxybehenic acids, formation of, from oxidation of erucic and brassidic acids (Albitzky), A., i, 862.

2 : 4′-Dihydroxybenzophenonephenylimine, and diacetyl derivatives and salts (Graebe and Keller), A., i, 703.

2 : 2′- Dihydroxybenzophenonimine (Graebe), A., i, 702.

2 : 4-Dihydroxybenzylimine hydrochloride (Gattermann and Köbner), A., i, 363.

Dihydroxybutyric acid, from decomposition of celloxin, and its rotatory power (Faber and Tollens), A., i, 855.

Dihydroxycamphoceanic acid (Jagelki), A., i, 628.

m-**Dihydroxycarbanilide** (Meyer and Sundmacher), A., i, 755.

3 : 4-Dihydroxycinnamic acid, action of sodium on, in alcohol (Kunz-Krause), A., i, 201.

o-**Dihydroxydibenzyl** (Thiele and Holzinger), A., i, 438.

Dihydroxydibenzylmesitylene (Mills and Easterfield), P., **1899**, 23.

$\alpha'\beta$-Dihydroxy-$\alpha\alpha$-diethylglutaric acid, lactone of (Lawrence), T., 423.

Dihydroxydiketonaphthadihydropyrazole, and di- and tri-acetyl derivatives (von Pechmann and Seel), A., i, 948.

Dihydroxydilepidine (Heidrich), A., i, 366.

p-**Dihydroxydimesitylic ether**, *tetra*bromo-, diacetate (Auwers and Allendorff), A., i, 33.

Dihydroxydimethylacetoacetic acid, lactone of (Conrad and Gast), A., i, 114.

$\alpha'\beta$-Dihydroxy-$\alpha\alpha$-dimethylglutaric acid, lactone of, and its methylic and ethylic salts, and its reduction (Lawrence), T., 419.

$\beta\gamma$-Dihydroxy-$\alpha\alpha$-dimethylglutaric acid, and its monolactone (Conrad and Gast), A., i, 258.

2 : 2′-Dihydroxy-6 : 6′-dioxy-5 : 5′-dipyridyl-4′ : 4′-dicarboxylic acid, nitroso- and its hydroxylamine salt (Sell and Jackson), T., 514 ; P., **1899**, 93.

4 : 4′-Dihydroxydiphenyl-3 : 3′-dicarboxylic acid (Bulow and von Reden), A., i, 150.

p-**Dihydroxydiphenylamine**, and its triacetyl derivative (Schneider), A., i, 499.

m-**Dihydroxydiphenyloxamine** (Meyer and Sundmacher), A., i, 755.

Dihydroxy-$\beta\beta'$-dipyridyldi-*p*-quinone, and dioxime and semicarbazone (Sell and Jackson), T., 516 ; P., **1899**, 98.

Dihydroxy-$\beta\beta'$-dipyridylene oxide, *di*chloro- and acetyl and benzoyl derivatives (Sell and Jackson), T., 517 ; P., **1899**, 98.

Dihydroxyethylamine (Chancel), A., i, 411.

Dihydroxyethylaminocamphor (Knorr), A., i, 783.

Dihydroxyethylaminotetrahydro-β-naphthol, conversion of, into 1″-hydroxyethylnaphthalanmorpholine (Knorr), A., i, 782.

2 : 4′-Dihydroxyflavone, and diacetyl derivative (von Kostanecki and Oderfeld), A., i, 705.

3 : 2′-Dihydroxyflavone (von Kostanecki and von Salis), A., i, 524.

3 : 4′-Dihydroxyflavone, and its diacetyl derivative (von Kostanecki and Osius), A., i, 370.

Dihydroxyhexoic acid. See α-Propylglyceric acid.

Dihydroxylamine in reduction of nitrites (Dunstan; Huntly), discussion, P., **1898**, 225.

Dihydroxymaleic acid, preparation of crystalline glycollic aldehyde from (Fenton and Jackson), T., 575; P., **1899**, 119.

Dihydroxymethyl*iso*butylideneacetic acid (Kietreiber), A., i, 331.

Dihydroxymethyldihydrotriazine (Thiele and Bailey), A., i, 169.

βγ-Dihydroxy-αα-methylethylglutaric acid, lactone of (Lawrence), T., 422.

Dihydroxymethyltriazine (Thiele and Bailey), A., i, 169.

Dihydroxynaphthaquinone (iso*naphthazarin*), acetyl and diacetyl derivatives (Zincke and Ossenbeck) A., i, 765.

3′ : 4′-Dihydroxy-α-naphthaquinonediphenylmethane and 3′ : 4′-Dihydroxy-α-naphthaquinonetetramethyl*di*aminodiphenylmethane (Möhlau and Klopfer), A., i, 913.

Dihydroxynicotinic acid, ethylic salt (Guthzeit), A., i, 450.

Dihydroxynonoic acid, γ-lactone of, from hydrolysis of isobutaldol cyanhydrin; also its oxidation, and its acetate (Kohn), A., i, 328.

Dihydroxyphenylacetic acid (Jerdan), T., 817; (Gonnermann), A., ii, 790.

2 : 6-Dihydroxy-4-phenyl-3-benzylpyridine (Ruhemann), T., 249; P., **1899**, 6.

2 : 6-Dihydroxy-4-phenylpyridine-3-carboxylic acid, ethylic salt (Ruhemann), T., 247; P., **1899**, 6.

4 : 6-Dihydroxy-2-picoline, nitroso- (Hess), A., i, 774.

αβ-Dihydroxypropionic acid. See Glyceric acid.

1 : 4-Dihydroxyquinone (Kehrmann and Bahatrian), A., i, 31.

Dihydroxystearic acids, formation of, from oxidation of oleic and elaidic acids (Albitzky), A., i, 862.

Dihydroxysuccinic acid, and its methylic and ethylic salts, ureines of, and the derived diacetyl derivative (Geisenheimer and Anschütz), A., i, 574, 575.

Dihydroxytartarobisaminoguanidine (Thiele and Dralle), A., i, 8.

3 : 6-Dihydroxyterephthalic acid (*quinoldicarboxylic acid*), *di*bromo- and *di*iodo-, ethylic salts (Guinchard), A., i, 700.

1 : 2-Dihydroxy-1 : 2 : 4 : 5-tetraphenyl-*cyclo*hexadiene (*dihydroxytetraphenyldihydrobenzene*) (Wislicenus and Lehmann), A., i, 59.

m-**Dihydroxythiocarbanilide** (Meyer and Sundmacher), A., i, 755.

Dihydroxyvaleric acid. See α-Ethylglutaric acid.

3 : 6-Dihydroxyxanthone, its diacetyl and *tetra*bromo-derivatives (Meyer and Conzetti), A., i, 763.

Di-imide, formed by action of boiling benzene on sulphocarbanilide (Schall), A., i, 280.

Di-indazole, *penta*bromo- (Bamberger), A., i, 722.

Di-isatic acid, and bromo-derivative (Marchlewski and Radcliffe), A., i, 74, 387.

Di-isatin (Marchlewski and Radcliffe), A., i, 387.

Diketobenzobisdihydropyrazole and its salts (von Pechmann and Seel), A., i, 947.

αβ-Diketobutyric acid, α-*m*-nitrophenylhydrazone of ethylic salt (Wedekind), A., i, 690.

Diketodimethyldihexahydrophenyl (Harries and Kaiser), A., i, 579.

4 : 7-Diketoheptanecarboxylic acid (Kehrer and Igler), A., i, 568.

Diketonaphthadihydropyrazole, and salts and monobenzoyl derivative (von Pechmann and Seel), A., i, 948.

Diketonaphthafurazan (Zincke and Ossenbeck), A., i, 766.

1 : 5-Diketophenoheptamethylene, and dioxime and diphenylhydrazone (Dieckmann), A., i, 914.

1 : 5-Diketophenoheptamethylene-2 : 4-dicarboxylic acid, ethylic salt (Dieckmann), A., i, 914.

Diketotetramethyldihexahydrophenyl and its *p*-bromophenylhydrazone (Harries and Kaiser), A., i, 579.

Dill, oil of, composition of (Schimmel and Co.), A., i, 299.

Dilution, influence of, on electric conductivity (Schükareff), A., ii, 722.
of electrolytes (Euler), A., ii 724.

Dilution law. See Affinity, chemical.
Dimalo-diaspartic and **-hexaspartic acids**, salts (Schiff and Sevieri), A., i, 675.
Dimentholic formal. See Menthol, methylenic acetal of.
Dimesityl ketone. See Mesitoylmesitylene.
2 : 4- and 3 : 4-Dimethoxybenzaldehydes (Bouveault), A., i, 288.
2 : 4-, 3 : 4-, and 3 : 6-Dimethoxybenzylideneanilines (Bouveault), A., i, 288.
1 : 3-Dimethoxybenzylidenebromocoumaranone (von Kostanecki, Tambor, and Emilewicz), A., i, 892.
Di-*o*- and -*p*-methoxydiphenyl sulphides (Gattermann), A., i, 518.
Di-*o*-methoxydiphenyldisulphonehydroxylamine (Gattermann), A., i, 517.
o-**Dimethoxydiphenyltetrahydropyrone** oxime (Petrenko-Kritschenko, and Rosenzweig), A., i, 707.
Dimethoxyditolyl *di*sulphide (Gattermann), A., i, 518.
3 : 4-Dimethoxy-3′-ethoxybenzylidenecoumaranone (von Kostanecki and Różycki), A., i, 912.
Dimethoxymethylcampheride (Ciamician and Silber), A., i, 537.
2 : 4-, 3 : 4-, and 3 : 6-Dimethoxyphenylglyoxylic acids and salts (Bouveault), A., i, 288.
o-**Dimethoxyphthalic acid.** See Metahemipinic acid, under Hemipinic acid.
1 : 3-Dimethoxypiperonalbromocoumaranone (Kostanecki, Tambor, and Herstein), A., i, 893.
Dimethoxysuccinic acid, methylic salt, ureine of (Geisenheimer and Anschütz), A., i, 575.
Di-*p*-methoxythiobenzodianisidide (Bamberger), A., i, 697.
Di-*p*-methoxythiobenzo-*o*-tolidide (Bamberger), A., i, 697.
Dimethylacetone, amino- (Conrad and Hock), A., i, 632.
Dimethylacetoacetic acid, ethylic salt, action of hydrochloric acid on a mixture of, with potassium cyanide (Komppa), A., i, 419.
  γ-bromo-, methylic salt, boiling point of (Conrad and Gast), A., i, 114.
  γ-cyano-, methylic salt, and its hydrolysis (Lawrence), T., 418; P., **1898**, 251; (Conrad and Gast), A., i, 258.
Dimethylacetophenone, synthesis of (Nencki; Meissel), A., i, 880.
Dimethyl-aceto- and -diaceto-phenylammonium bromide (Schmidt), A., i, 5.
Dimethylacetylacetone, *hexa*bromo-, *tetra*bromo-, and *tetra*chloro- (Boehm), A., i, 805.
ββ-Dimethylacetylsuccinic acid, ethylic salt, action of methylic iodide on the sodium derivative (Bone and Sprankling), T., 848.
s- and *as*-**Dimethylacetylsuccinic acids,** ethylic salts (Bone and Sprankling), T., 848.
Dimethylacrylic acid. See Pentenoic acid.
β-Dimethylacrylonitrile. See Pentenoic acid, nitrile of.
Dimethylallylmalonic acid (*hexylenedicarboxylic acid*), and its metallic salts; also its ethylic salt and its oxime (Ipatieff), A., i, 481.
Dimethylamine, preparation of (Menschutkin), A., i, 499.
  action of electric glow discharge on mixtures of, with oxygen (Mixter), A., ii, 267.
  action of hydrogen peroxide on (Dunstan and Goulding), T., 1009.
  compounds of, with butylidenecyanhydrin, α-ethylcrotononitrile, α-methylcrotononitrile, and methyl*iso*propylglycollonitrile (Henry), A., i, 568.
  compounds of, with mercuric chloride (Hofmann and Marburg), A., i, 487.
  hydrochloride, action of potassium dichromate and sulphuric acid on (Oechsner de Coninck), A., i, 472.
Dimethylamine, cyano-, and action of ammonia and hydrogen sulphide on (Wallach), A., i, 659.
3-Dimethylamino-2-aminophenyl*iso*naphthaphenazonium salts (Kehrmann and Levy), A., i, 238.
Dimethylaminobenzene, use of, in alkalimetry (Glaser), A., ii, 573.
p-**Dimethylaminobenzophenone** (Limpricht and Seyler), A., i, 815.
Dimethylaminobenzoyl*tetra*chlorobenzoic acid, and methylic and ethylic salts, and mixed acetic anhydride (Haller and Umbgrove), A., i, 814.
Dimethylaminobenzyl*tetra*chlorobenzoic acid (Haller and Umbgrove), A., i, 814.
Dimethylaminoborneol and **Dimethylaminocamphor,** salts (Duden and Pritzkow), A., i, 627.
Dimethyl*tri*aminodiphenyl, picrate, dibenzylidene, disalicylidene, diacetyl, thiophosgene, and thiourethane derivatives (Jacobson and Kunz), A., i, 275.

Dimethylaminodiphenylanthrone (Tétry), A., i, 818.

Dimethylaminodiphenylenethiocarbimide (Jacobson and Kunz), A., i, 275.

Dimethylaminoethylic vinylic ether (Knorr and Matthes), A., i, 462.

p-**Dimethylaminohydrazobenzene**, transformation of (Jacobson and Kunz), A., i, 275.

Dimethylaminohydroxybenzophenone (Limpricht and Seyler), A., i, 815.

2-Dimethylaminonaphthaprasindone sulphate (Kehrmann and Aebi), A., i, 527.

Dimethyl-*o*-aminophenol, and sulphonic acid (Bamberger and Tschirner), A., i, 682.

Dimethyl-*m*-aminophenol-saccharein (Monnet and Koetschet), A., i, 213.

4-Dimethylaminophenyl-μ-cyanazomethinephenyl (Erhlich and Sachs), A., i, 884.

Dimethyl-*o*-aminophenylic vinylic ether, and methiodide and picrolonate (Knorr), A., i, 462.

2-Dimethylaminophenyl*iso*naphthaphenazonium-4′-sulphonic anhydride (Kehrmann and Locher), A., i, 83.

γ-**Dimethylamino-αβ-propylenic glycol** (*dimethylpropanediolamine*) and its methiodide and picrolonate (Knorr and Knorr), A., i, 412.

Dimethyl*di*aminodi-*o*-tolylmethane (Gnehm and Blumer), A., i, 266.

Dimethylaminothiobenzoic acid (Weinmann), A., i, 204.

Dimethylaniline, formation of; and salts (Menschutkin), A., i, 499, 500.

rate of formation of azo-compounds from, and diazobenzenesulphonic acid (Goldschmidt and Bürkle), A., ii, 276.

action of methylic, propylic, *iso*propylic and allylic iodides on (Wedekind), A., i, 351.

action of sulphur on (Möhlau and Klopfer), A., i, 240.

oxide, and its salts (Bamberger and Tschirner), A., i, 348.

hydrochloride, action of formaldehyde on (Bamberger and Tschirner), A., i, 683.

*sesqui*iodide (Bamberger and Tschirner), A., i, 683.

Dimethylaniline, *o*-amino-, and acetyl derivatives (Pinnow), A., i, 684.

and its benzoyl derivative (Bamberger and Tschirner), A., i, 683.

o-chloro- (Friedländer), A., i, 351,

Dimethylaniline, 4-chloro-2-amino-, and its picrate, 4-chloro*di*nitro-, and 4-chloro-3-nitro- (Pinnow), A., i, 203.

m-chloronitroso-, hydrochloride (Jaubert), A., i, 684.

o-nitro- (Pinnow), A., i, 684.

o- and *p*-nitro-, and nitroso- (Bamberger and Tschirner), A., i, 348.

p-nitroso- (Matignon and Deligny), A., i, 127.

condensation with benzylic cyanide (Ehrlich and Sachs), A., i, 884.

Dimethylaniline-*o*- and -*p*-sulphonic acids, *o*- and *p*-nitro-, and *p*-nitroso- (Bamberger and Tschirner), A., i, 682.

Dimethylaniline-*p*-sulphonic acid, action of bromine on (Armstrong; Evans), P., **1899**, 176.

Dimethylaniline-*p*-thionamic acid (Francke), A., i, 46.

Dimethylaniline-*p*-thionamic acid-phenylcarbinol (Francke), A., i, 46.

Dimethylanilinophenylmethane, and hydrochloride and nitroso-derivative (Limpricht and Seyler), A., i, 815.

Dimethylanilinophthaloylic acid, chloride and methylic salt, and nitro-, and salts (Limpricht and Seyler), A., i, 815.

Dimethylanilinetetramethyldiaminodiphenylmethane, *p*-nitroso- (Möhlau), A., i, 61; (Möhlau and Klopfer), A., i, 913.

Dimethylaticonic acid, and its anhydride (Fittig and Petkow), A., i, 335.

2:5-Dimethylbenzaldehyde, and its hydrazone (Bouveault), A., i, 287.

3:5-Dimethylbenzaldehyde, 2-amino-, and its phenylhydrazine derivative; preparation of, from mesitylene; and 2-nitro- (Bamberger and Weiler), A., i, 124.

3:5-Dimethylbenzaldoxime, 2-amino-, its dibenzoyl derivative, and condensation with *m*-nitrobenzaldehyde (Bamberger and Weiler), A., i, 123, 124.

2:4-Dimethylbenzhydrol, *o*-amino-, and its acetyl derivative (Drawert), A., i, 643.

1′:2-Dimethylbenzimidazole, methochloride and methiodide of (Pinnow and Sämann), A., i, 944.

1′:2′-Dimethylbenzimidazole (Pinnow), A., i, 684.

2-chloro-, and its mercurichloride (Pinnow), A., i, 203.

1′ : 3′-Dimethylbenzimidazolone-2-carboxylic acid, and its salts (Pinnow and Sämann), A., i, 943.

2 : 4-Dimethylbenzoic acid, 6-bromo-, iodo-, and 6-iodo- (Noyes), A., i, 285.

2 : 5-Dimethylbenzoic acid (p-*xylic acid*) (Nencki), A., i, 880; (von Baeyer and Villiger), A., i, 922.

2 : 6-Dimethylbenzoic acid, 4-amino-, its hydrochloride, and 4-iodo- (Noyes), A., i, 286.

3 : 5-Dimethylbenzoic acid. See Mesitylenic acid.

2 : 4-Dimethylbenzonitrile (*xylonitrile*), action of cuprous chloride on (Rabaut), A., i, 557.

2 : 4-Dimethylbenzophenone, synthesis of (Meissel), A., i, 880.
  o-amino-, and its benzoyl derivative (Drawert), A., i, 642.

2 : 5-Dimethylbenzylideneaniline (Bouveault), A., i, 287.

Dimethylbornylamine, hydrochloride, platinochloride (Forster), T., 944; P., **1899**, 72.

Dimethylbornylammonium iodide (Forster), T., 951.

Dimethylbrazilein (Herzig), A., i, 381.

Dimethylbrazilin, oxidation product of (Gilbody and Perkin), P., **1899**, 75.

Dimethyl*tetra*bromo*cyclo*hexane-1 : 3 : 5-trione. See Filicic acid, *tetra*bromo-.

Dimethylbutanetricarboxylic acid, and its anhydro-acid, and silver, calcium, and ethylic salts (Perkin and Thorpe), T., 902; P., **1899**, 184.
  cyano-, ethylic salt, and its hydrolysis (Perkin and Thorpe), T., 900; P., **1899**, 184.

Dimethylbutyric acids. See Hexoic acids.

Dimethylcitraconic acid, and **anhydride** (Fittig and Krafft), A., i, 334; (Semenoff), A., i, 793.

γ-Dimethylcrotononitrile. See Hexenoic acid, nitrile of.

Dimethyldianthracene (Orndorff and Megraw), A., i, 819.

2 : 6-Dimethyl-*m*-diazine (*dimethylpyrimidine*), amino-. See Cyanmethine.

4 : 6-Dimethyl-*m*-diazine (Gabriel and Colman), A., i, 639.

4 : 6-Dimethyl-*m*-diazine-2-carboxylic acid (Gabriel and Colman), A., i, 639.

αβ-Dimethyldibenzyl, formation of (Moritz and Wolffenstein), A., i, 424.

Di-*o*-methyldibenzyl and **Di-*p*-methyldibenzyl** (Moritz and Wolffenstein), A., i, 910.

Dimethyldi*tert*butylindigotin, preparation of (Konowaloff), A., i, 891.

1′ : 2′-Dimethyl-3′ : 3′-diethylindoline (Plancher), A., i, 451.

Dimethyldihydroresorcinol, and silver and bromo-derivatives, and ethylic ether (Crossley), T., 772; P., **1898**, 247.
  from action of ethylic sodiomalonate on mesityl oxide (Crossley), P., **1899**, 52.
  electrical conductivity of (von Schilling and Vorländer), A., i, 879.
  oxidation of, by potassium permanganate (Vorländer and Gärtner), A., i, 259.

Dimethyldihydroresorcinol, bromo-, and action of hypobromite on (Komppa), A., i, 574.

Dimethyldihydroresorcylic acid, ethylic salt of (Crossley), T., 772.
  methylic salt, electrical conductivity of (von Schilling and Vorländer), A., i, 879.

Dimethyl diketone (*diacetyl*), *di*bromo-, *tetra*bromo-, and *di*chloro- (Keller and Maas), A., i, 12.

Dimethyleneasparagine and copper salts (Schiff), A., i, 870.

***p*-Dimethyleneditoluidine**, formation of (Löb), A., i, 123.

Dimethylenimine, constitution of (Howard and Marckwald), A., i, 749.

1 : 3 : 5-Dimethylethylbenzene, and *di*nitro-derivative (Gattermann, Fritz, and Beck), A., i, 492.

1 : 3 : 5-Dimethylethylbenzoic acid and amide (Gattermann, Fritz, and Beck), A., i, 492.

Dimethylethylbornylammonium iodide (Forster), T., 947.

Dimethylethylcarbinol. See *tert*-Amylic alcohol.

Dimethylethylcarbinylic cyanide. See Hexonitrile.

Dimethylethylene. See Butylene.

1 : 3 : 5-Dimethylethyl*cyclo*hexane (*β-decanaphthene*), and amino-, bromo-, bromonitro-, chloro-, *di*chloro-, and nitro-derivatives (Markownikoff and Rudewitsch), A., i, 581.

1 : 3-Dimethyl-5-ethyl*cyclo*hexane-4-ol (*β-decanaphthenol*) (Markownikoff and Rudewitsch), A., i, 582.

1′ : 3′-Dimethyl-3′-ethylindolinone, *di*bromo- (Plancher), A., i, 452.

1′ : 3′-Dimethyl-3′-ethyl-2′-methyleneindoline, and benzoyl derivative (Plancher), A., i, 452.

3′:3′-Dimethyl-1′-ethyl-2′-methyleneindoline, and benzoyl derivative (Plancher and Bertinelli), A., i, 455.
s-**Dimethylethylnaphthene,** 1:3:5-Dimethylethyl*cyclo*hexane.
Dimethylethyl-rosinduline, and -*iso*rosinduline (Schaposchnikoff), A., i, 506.
Dimethylfumaric acid. See β-Methylmesaconic acid.
iso-**Dimethylfurfurandicarboxylic acid.** See *iso*-Carbopyrotritaric acid.
Dimethylfurodiazole. See 2:5-Dimethyl-1:3:4-oxdiazole.
αα-**Dimethylglutaconic acid** (Henrich), A., i, 469, 794.
  supposed formation of (Lawrence), P., **1898**, 252.
αγ-**Dimethylglutaconic acid,** from the action of hydriodic acid on hydroxydimethylglutaric acid, and the action of acetic chloride on it (Reformatsky), A., i, 482.
αα-**Dimethylglutaramic acid,** sodium salt, action of alkaline hypobromite and hydrobromic acid on (Blaise), A., i, 480.
ββ-**Dimethylglutar-anil** and **-anilic acid** (Crossley), T., 777.
αγ′-**Dimethylglutaric acids** (*pentanedicarboxylic acids*), formation of (Bone and Sprankling), T., 850.
ββ-**Dimethylglutaric acid** and anhydride (Crossley), T., 777, 778.
  from hydrolysis of ethylic ββ-dimethylpropanetetracarboxylate (Lawrence), P., **1899**, 62.
  preparation of; also dimethylic and diethylic salts (Komppa), A., i, 573.
  ethylic salt, condensation of, with ethylic oxalate (Dieckmann), A., i, 676.
ββ-**Dimethylglutaric acid,** α-bromo-, ethylic, hydrogen ethylic and methylic salts; also action of potash and of diethylaniline on (Perkin and Thorpe), T., 54; P., **1898**, 108.
  αα$_1$-*di*bromo-, methylic salt, properties of (Perkin and Thorpe), P., **1898**, 108.
  α-cyano-, ethylic salt, action of methylic iodide on the sodium derivative of (Perkin and Thorpe), T., 63; P., **1898**, 251.
   ethylic and hydrogen ethylic salts of (Perkin and Thorpe), T., 52.
  γ-cyano-, ethylic salt, condensation of, with ethylic bromacetate (Perkin and Thorpe), T., 900; P., **1899**, 184.
αα-**Dimethylglutaric anhydride,** action of ammonia on (Blaise), A., i, 480.
ββ-**Dimethylglutaric anhydride,** and action of bromine on (Perkin and Thorpe), T., 54; P., **1898**, 107.
ββ-**Dimethylglutarimide** (Perkin and Thorpe), T., 53.
Dimethylglycollonitrile. See α-Hydroxy*iso*butyronitrile.
Dimethylgranatenic acid, dimethylic salt (Piccinini), A., i, 964.
2:6-Dimethylheptan-5-onoic acid, from carvenone: its oxime (Tiemann and Semmler), A., i, 224.
2:6-Dimethyl-2-heptene-6-ol. See Nonenylic alcohols.
Dimethyl*cyclo*hexane (*dimethylhexamethylene, dimethylhexanaphthene*) (Zelinsky and Naumow), A., i, 196.
  action of nitrosulphuric acid on (Markownikoff), A., i, 553.
1:3-Dimethyl*cyclo*hexane-2-carboxylic acid (*hexahydro-xylic acid*) [Me$_2$:COOH = 1:3:2], and α-bromo- and chloride (Noyes), A., i, 749.
Dimethyl*cyclo*hexanediones, two isomerides from ethylic dimethylsuccinylosuccinate (Zelinsky and Naumow), A., i, 196.
1:1-Dimethyl*cyclo*hexanone-3 and semicarbazone (Leser), A., i, 743.
1:3-Dimethyl*cyclo*hexanone-2 (1:3-*Dimethyl-2-ketohexamethylene*) oxime (Noyes), A., i, 284.
1:3-Dimethyl*cyclo*hexanone-4, hydroxylamino-oxime, and nitroso-oxime of (Harries and Matfus), A., i, 583.
γ-**Dimethylhexan-δ-onoic acid** (*γ-acetyldimethylbutyric acid*) (Blaise), A., i, 332; (Blanc), A., i, 536, 630.
1:3-Dimethyl*cyclo*-Δ^1-hexene-2-carboxylic acid (*Δ'-tetrahydro-xylic acid*) (Noyes), A., i, 759.
1:3-Dimethyl-5-*cyclo*hexenone, dimeric form of, and salts (Knoevenagel and Reinecke), A., i, 340.
3:5-Dimethyl-Δ^2-*cyclo*hexenone, reduction of (Harries and Kaiser), A., i, 579.
Dimethylhydrofurfurancarboxylic acid, and salts (Fittig and de Haven-Boyd), A., i, 191.
1:2-Dimethyl-3-hydroxylethylpiperidine (N-*methyl-α-pipecolyl-β-methylalkine*) (Ladenburg and Brandt), A., i, 305.
1:2-Dimethyl-3-hydroxyethyl-Δ_2-tetrahydropyridine (N-*methyl-α-pipecoleyl-β-methylalkine*) (Ladenburg and Brandt), A., i, 305.

Dimethyliminazolonenaphthaphenazine, (Kehrmann and Zimmerli), A., i, 80.

1 : 3-Dimethylindazole, and 3-chloroderivative (Bamberger), A., i, 543, 544.
  3′-amino- and its benzylidene derivative, thiocarbamide, and benzenesulphonamide (Bamberger), A., i, 544.

Dimethylindazoleazo-β-naphthol (Bamberger), A., i, 545.

1 : 3-Dimethylindazoletriazolen (Bamberger), A., i, 722.

Dimethylindazolylazo-β-naphthol anhydride (Bamberger), A., i, 722.

Dimethylindazoneoxime (Bamberger and Weiler), A., i, 124.

Dimethylindigotin, preparation of (Konowaloff), A., i, 891.

3′ : 3′-Dimethylindolenine-2-′formonitrile and **-2-formoxime** (Plancher and Bettinelli), A., i, 543.

3′ : 3′-Dimethylindolinone (Plancher and Bettinelli), A., i, 543.

Dimethylitaconic acid. See Teraconic acid.

Dimethylketohexamethylene. See Dimethyl*cyclo*hexanone.

4 : 4-Dimethyl-3-keto-5-pyrrolidone, and its monoxime and phenylhydrazone (Conrad and Hock), A., i, 632.

Dimethylævulic acid, preparation of (Blaise), A., i, 332.

Dimethyllariciresinol (Bamberger and Landsiedl), A., i, 929.

Dimethylmaleic acid. See Pyrocinchonic acid.

Dimethylmesaconic acid (Fittig and Krafft), A., i, 334; (Semenoff), A., i, 792, 793.

3-Dimethyl-4-methylpentane-2:5-olidoic acid, and bromo-derivative (Balbiano), A., i, 867).

2 : 3′-Dimethylnaphthalene and **2 : 3′-Dimethyl-α-naphthaquinone** (von Baeyer and Villiger), A., i, 922.

2 : 3′-Dimethyl-α-naphthoic acid and its *tri*bromo-derivative (von Baeyer and Villiger), A., i, 922.

Dimethylnitramine, constitution of (Lachmann), A., i, 588.

Dimethyl-*o*-nitraniline (Friedländer), A., i, 350.

βμ-Dimethyloxazoline (Uedinck), A., i, 498.

2 : 5-Dimethyl-1 : 3 : 4-oxdiazole (*dimethylfurodiazole*) (Stollé), A., i, 457.

Dimethyl*iso*paraconic acid. See *iso*-Terebic acid.

Dimethyl*cyclo*pentane (*dimethylpentamethylene*), action of nitrosulphuric acid on (Markownikoff), A., i, 553.

Dimethyl*cyclo*pentanonecarboxylic acid, cyano-, ethylic salt (Noyes), A., i, 929.

2 : 2-Dimethyl*cyclo*pentane-4 : 5-dione-1 : 3-dicarboxylic acid, ethylic and methylic salts, and phenazine derivatives (Dieckmann), A., i, 676.

Dimethylphenomorpholinium iodide (Knorr), A., i, 462.

Dimethylphenylosotriazole, oxidation of (Ponzio), A., i, 718.

Dimethylphloroglucinol, obtained from filicic acid (Boehm), A., i, 32.
  chloro-, and its triacetyl derivative (Schneider), A., i, 680.

3 : 5-Dimethylphthalic acid and **anhydride** (Noyes), A., i, 286.

Dimethylpiperazine phosphate (Morel), A., i, 493.

2 : 6-Dimethylpiperidine, and salts (Marcuse and Wolffenstein), A., i, 937.

1 : 1-Dimethyl*cyclo*propane (1 : 1-*dimethyltrimethylene* (Gustavson and Popper), A., i, 263.

Dimethyl*cyclo*propane-1 : 2-dicarboxylic acid. See Caronic acid.

Dimethylpropanediolamine. See γ-Dimethylamino-αβ-propylenic glycol.

ββ-Dimethylpropanetetracarboxylic acid, ethylic salt (Lawrence), P., **1899**, 62.

ββ-Dimethylpropanetricarboxylic acid, from hydrolysis of ethylic ββ-dimethylpropanetetracarboxylate (Lawrence), P., **1899**, 62.

Dimethylpropionic acid. See Valeric acid.

β-Dimethylpropylamine. See Amylamine.

Dimethylpropylammonium iodide (Forster), T., 949.

3′ : 3′-Dimethyl-2′-*iso*propylindolenine (Plancher), A., i, 455.

Dimethylpropylmethane. See Hexane.

3 : 5-Dimethylpyrazole-1-carbonamidine nitrate (Thiele and Dralle), A., i, 8.

2 : 6-Dimethylpyridine, reduction of (Marcuse and Wolffenstein), A., i, 937.

2 : 6-Dimethylpyridine-4-hydrazine (4-*lutidylhydrazine*) (Marckwald), A., i, 72.

Dimethylpyrimidine. See Dimethyl-*m*-diazine.

2 : 6-Dimethylpyrone, and salts (Collie and Tickle), T., 712; P., **1899**, 148.
  hydrochloride and oxalate, electrical conductivities of (Collie and Tickle), T., 710; P., **1899**, 148.

Dimethylpyrrodiazole. See 2 : 5-Dimethyl-1 : 3 : 4-triazole.

3 : 3-Dimethylpyrrolidone, formation of, from salts of γ-amino-α-dimethylbutyric acid (Blaise), A., i, 480.

Dimethylquinitol, *di*bromo-, and *di*iodo- (Zelinsky and Naumow), A., i, 196.

Dimethylrosinduline (Schaposchnikoff), A., i, 432.

Dimethyl*apo*saffranine (Schaposchnikoff), A., i, 432.

Dimethylsalicyl-aldehyde, and its oxime (Bamberger and Weiler), A., i, 124.

αα-Dimethylsuccinic acid (*isobutanedicarboxylic acid*), formation of (Bone), P., **1899**, 5.

and anhydride, anilic acid, and calcium salt (Bone and Sprankling), T., 848.

αα-Dimethylsuccinic acid, cyano-, action of heat on; also action of heat on its monethylic salt (Blaise), A., i, 480.

ethylic salt, formation and hydrolysis of; also the action of methylic iodide on its sodium derivative (Bone), P., **1899**, 5.

cis- and *trans*-**αβ-Dimethylsuccinic acids**, and anhydrides, anilic acids, and calcium salts (Bone and Sprankling), T., 848.

αβ- and ββ-Dimethylsuccinic acids, cyano-, ethylic salts; hydrolysis; also action of ethylic iodide on the latter (Bone and Sprankling), T., 853.

as-**Dimethylsuccinimide**, formation of (Blaise), A., i, 480.

Dimethyltartaric acid, *di*bromo-, amide (Keller and Maas), A., i, 12.

2 : 6-Dimethylterephthalic acid, 4-methylic salt and amic acid (Noyes), A., i, 286.

2 : 3-Dimethyltetrahydropyridine, and salts (Sachs), A., i, 302.

Dimethyltetrahydroresorcinol, bromo- (Crossley), T., 776.

Dimethyltetramethylene, 1:3-disulphide, and 1 : 3-disulphone (Autenrieth and Wolff), A., i, 580.

Dimethyltetrazoline, from action of heat on acetylhydrazine (Pellizzari), A., i, 858.

2 : 4- and 3 : 4-Dimethylthiobenzanilides (Bamberger), A., i, 694.

Dimethylthiocarbamide, formation of (Wallach), A., i, 659.

2: 5-Dimethyl-1 : 3 : 4-thiodiazole (Stollé), A., i, 457.

Dimethyltolueneazammonium, silver iodides of (Frankforter and Keller), A., i, 781.

Dimethyl-*o*-toluidine, 4-nitro- (Gnehm and Blumer), A., i, 266.

Dimethyl-*o*- and *p*-toluidine oxides (Bamberger and Tschirner), A., i, 348.

Dimethyl-*p*-toluidine, formation of (Löb), A., i, 123.

*di*amino-, its salts and diacetyl derivative; *m*-*di*nitro-; *m*-*di*amino-, its salts and diacetyl derivative (Pinnow and Matcovitch), A., i, 49.

2 : 5-Dimethyl-1 : 3 : 4-triazole (*dimethylpyrrodiazole*) (Stollé), A., i, 457.

Dimethyltricarballylic acid, from campholeenic acid (Jagelki), A., i, 629.

Dimethyltrimethylene. See Dimethyl*cyclo*propane.

β-Dimethyltrimethylene. See Amylene.

Dimethylurazole (Cuneo), A., i, 9.

1 : 9-Dimethyluric acid (Fischer and Ach), A., i, 393.

3 : 9 Dimethyluric acid (*α-dimethyluric acid*) (Fischer), A., i, 394.

Dimethyl-*m*-xylidine (Friedländer and Brand), A., i, 351.

Dimorphine, ethylenic ether (Merck), A., i, 649.

Dinaphthaphenylsaffranine (Fischer and Hepp), A., i, 79.

Dinaphthaprasindone and acetyl derivative and salts (Kehrmann and Sutherst), A., i, 528.

Dinaphthaquinone, from *di*bromo-α-naphthol (Liebermann and Schlossberg), A., i, 372.

oxime (Meldola), A., i, 372.

ββ-Dinaphthol, constitution of, and its butyrate, phthalate, and propionate, and *di*bromo-derivative (Fosse), A., i, 817, 818.

α- and αβ-Dinaphthylbenzidine (Merz and Strasser), A., i, 917, 918.

α- and β-Dinaphthylcarbamides (Walther and Wlodkowski), A., i, 591.

Dinaphthylenic oxide, *di*chloro- (Fosse), A., i, 818.

Dinaphthylic di*iso*propylic ether and ethylidenic ether (Fosse), A., i, 818.

ββ-Dinaphthylic benzylidenic ether (Fosse), A., i, 818.

methylenic and ethylenic ethers, diacetyl derivative (Fosse), A., i, 529.

Di-β-naphthylsulphonehydrazide (Curtius and Lorenzen), A., i, 149.

1 : 1- and 2 : 2-Dinaphthylthiosemicarbazides (Marckwald), A., i, 505.

1 : 2-Dinaphthylthiosemicarbazide, and the thiobiazolone (Marckwald), A., i, 505.

Dionine. See Morphine ethylic ether.

Diopside (*salite*) from Mexico (Lenk), A., ii, 305.

as a weathering product of olivine (Brauns), A., ii, 36.

Diorite-laterite from the Seychelles (Bauer), A., ii, 565.

6 : 8-Dioxy-1 : 9-dimethylpurine, and 2-chloro-derivative (Fischer and Ach), A., i, 393.

6 : 8-Dioxy-7 : 9-dimethylpurine, 2-chloro- (Fischer and Ach), A., i, 393.

Dioxymethylene. See Diformaldehyde.

6 : 8-Dioxy-9-methylpurine, and 3-amino-, and 2-chloro-derivatives (Fischer and Ach), A., i, 393.

Dioxysuccinic acid, ethylic salt, action of carbamide and thiocarbamide on; also the thioureine (Geisenheimer and Anschütz), A., i, 574.

6 : 8 Dioxy-1 : 7 : 9-trimethylpurine, 2-chloro- (Fischer and Ach), A., i, 393.

Dipentadecyl-carbamide and **-thiocarbamide** (Jeffreys), A., i, 730.

Dipentamethenyl (Meiser), A., i, 742.

Dipentamethenylpinacolin and oxime (Meiser), A., i, 742.

Dipentamethenylpinacone, and its anhydride (Meiser), A., i, 742.

Dipentene, from lemon-grass oil (Stiehl), A., i, 66.
  from *l*-linalool (Stephan), A., i, 68.
  behaviour of, towards formaldehyde (Kriewitz), A., i, 298.

Diphenaceto-*o*-phenylene diamide (Walther and Pulawski), A., i, 640.

Diphenacyl, chloro-, two isomeric forms of; iodo- (Paal and Stern), A., i, 367, 368.

Diphenacylacetic acid (*ββ-dibenzoylisobutyric acid*) (Klobb), A., i, 114.

Diphenacylcyanacetic acid (*ββ-dibenzoylcyanisobutyric acid*), propylic salt (Klobb), A., i, 113.

9 : 10-Diphenacyldihydrophenanthrene, 9 : 10-*di*amino-, hydrolysis of (Japp and Meldrum), T., 1032; P., **1899,** 166.

Diphenamide (Mathews), A., i, 57.

p-**Diphenetoilcarbamide,** formation of (Foglino), A., i, 132.

Diphenetylacetic acid, and its salts (Fritsch and Feldmann), A., i, 601.

Diphenetyl-*tri*chlorethane and **-*di*chlorethylene** (Fritsch and Feldmann), A., i, 600.

Diphenimide, formation of (Mathews), A., i, 57.

αε-, αζ, and βε-**Diphenoxyhexanes,** formation of (Solonina), A., i, 561, 663, 681, 682.

αι-**Diphenoxynonane,** and action of hydrobromic and hydrochloric acids on (Solonina), A., i, 562.

αα-**Diphenoxyoctane,** formation of (Solonina), A., i, 663.

αη- and αθ-**Diphenoxyoctane** (Solonina), A., i, 562.

αδ-**Diphenoxypentane,** and αγ-**Diphenoxypropane** (Solonina), A., i, 681.

Diphenyl, condensation of, with ethylic chloroglyoxylate (Rousset), A., i, 292.
  5 : 2 : 4′-bromo*di*amino-, salicylidene, diformyl, and diacetyl derivatives (Jacobson and Grosse), A., i, 274.
  5 : 2 : 4′-chloro*di*amino-, disalicylidene, dibenzylidene, diacetyl, and diformyl derivatives (Jacobson and Strübe), A., i, 273.
  2 : 5 : 4′-*tri*iodo- (Jacobson, Fertsch, and Heubach), A., i, 274.
  5 : 2 : 4′-iodo*di*amino-, dihydrochloride, salicylidene, and *p*-nitrobenzylidene derivatives (Jacobson, Fertsch, and Heubach), A., i, 274.

Diphenylacetic acid, preparation of, from benzimidoxydiphenylacetic acid and from triphenyloxazolone (Japp and Findlay), T., 1030; P., **1899,** 165.
  ethylic salt, velocity of formation of (Sudborough and Lloyd), T., 478; P., **1899,** 3.

Diphenylaceto-α-pyrone (Ruhemann), T., 416; P., **1899,** 15.

Diphenylamidine (Wheeler and Johnson), A., i, 354.
  amino- (Muttelet), A., i, 500.

Diphenylamidinoxanilide, crystalline form of (Anschütz and Stiepel), A., i, 573.

Diphenylamine, molecular depressions in, and latent heat of fusion of (Stillman and Swain), A., ii, 728.
  cryoscopic behaviour of, in diphenylmethane solution (Bruni and Gorni), A., ii, 731.
  osmotic pressure of ethereal solutions of (Goodwin and Burgers), A., ii, 274.
  equilibrium between benzene, naphthalene, and (Bruni), A., ii, 406.
  hydrochloride, action of chromic acid on (Oechsner de Coninck and Combe), A., i, 244.
  preparation of potassium derivative of (Häussermann), A., i, 126.

Diphenylamine, *p*-bromo-*p*-amino- (Jacobson and Grosse), A., i, 274.
  5 : 2-bromamino-, hydrochloride, azimide, methenyl, and salicylidene derivatives (Jacobson and Grosse), A., i, 273.
  5 : 2-bromonitro- (Jacobson and Grosse), A., i, 274.

Diphenylamine, *p*-chloro-*p*-amino-, salicylidene, benzylidene, acetyl, and diformyl derivatives, also the thiocarbamide (Jacobson and Strübe), A., i, 273.
  5 : 2-iodoamino-; stilbazonium base, methenyl derivative ; 5 : 2-iodonitro- (Jacobson, Fertsch, and Heubach), A., i, 274.
  p-nitronitroso-, *p*-*di*nitro-*o*-*p*-*di*nitro-, and *tri*nitro- (Stoermer and Hoffmann), A., i, 44.
Diphenylamine-blue, formation of (Wedekind and Gonswa), A., i, 806.
Diphenylamine-*o*-carboxylic acid, nitroso- (König and Reissert), A., i, 458.
Diphenylaminotriazine, and its acetyl derivative (Thiele and Bihan), A., i, 47.
Diphenylanthrone (Haller and Guyot), A., i, 221.
p-**Diphenylbenzamide** (Gattermann and Kjellbom), A., i, 510.
Diphenylbenzenyl-amidine and -methylamidine, and their *di*amino-derivative, as colouring matters (Noelting and Kuntz), A., i, 354.
ac-**Diphenyl-*c*-benzylthiobiuret** (Dixon), T., 407 ; P., **1899**, 64.
Diphenylbistrimethylenediimine (Scholtz), A., i, 881.
Diphenyl*di*bromodihydrofurfuran (Thiele and Rössner), A., i, 613.
Diphenylbutadiene, preparation of (Thiele and Schleussner), A., i, 612.
1 : 1-Diphenylbutene-1-one, and its oxime (Klages and Fanto), A., i, 616.
αδ-**Diphenylbuteninecarboxylic acid** (Thiele and Rössner), A., i, 613.
βγ-**Diphenylbutyrolactoneacetic acid,** *β*-bromo- (Stobbe and Russwurm), A., i, 903.
Diphenylcarbamic acid, potassium salt (Häussermann), A., i, 126.
Diphenylcarbamide (*carbanilide*), formation of (Jouve), A., i, 420.
  oxidation of (Oechsner de Coninck), A., i, 421.
Diphenylcarbamide, *m*- and *p*-*di*bromo- (Curtius and Portner), A., i, 136.
  β-*p*-chloro-, *β*-*m*-bromo-, and *β*-*o*- and *m*-nitro- (Manuelli and Comanducci), A., i, 887.
  o-, *m*-, and *p*-*di*chloro-, *o*-, *m*-, and *p*-*di*bromo-, and *p*-*di*iodo- (Vittenet), A., i, 693.
  di-*m*-nitro-, three crystalline forms of (Offret and Vittenet), A., i, 886.
  di-*p*-nitro-, *di*-*p*-amino-, and hydrochloride ; *di*-*m*-nitro-, *di*-*m*-amino-, and stannochloride ; *di*-*o*-nitro-, and *di*-*o*-amino- (Vittenet), A., i, 692.
Diphenylcarbamidedicarboxylic acid (Erdmann), A., i, 940.
Diphenylcarbamideoxime (Stollé), A., i, 885.
α-**Diphenylcarbamyl-*β*-phenylthiosemicarbazide** (Dixon), T., 399 ; P., **1899**, 63.
Diphenylcarbamylthiocarbimide (Dixon), T., 393 ; P., **1899**, 63.
n-**Diphenylcarbamylthiourantoin** (Dixon), T., 398 ; P., **1899**, 63.
Diphenylcarbinol, preparation of (Bodroux), A., i, 678.
p-**Diphenylcarboxylic acid,** formation of (Collet), A., i, 56.
Diphenylcrotonolactone, two isomeric forms of (Thiele), A., i, 217, 612.
γ-**Diphenylcrotonolactone** (Stobbe and Noetzel), A., i, 901.
βγ-**Diphenylcrotonolactoneacetic acid,** and salts (Stobbe and Russwurm), A., i, 903.
γ-**Diphenylcrotonolactonecarboxylic acid,** and salts (Stobbe and Noetzel), A., i, 901.
Diphenyldiacetamide, formation of (Mathews), A., i, 57.
Diphenyldianilinobutene (Thiele and Rössner), A., i, 614.
Diphenyldiazoxole, from action of heat on dibenzoylhydrazine (Pellizzari), A., i, 858.
Diphenyldibenzyldihydropyrazine (Francis), T., 870.
Diphenyldibenzylketodimethylamine (Francis), T., 870.
4 : 3′-Diphenyldicarboxylic acid, and methylic salt (Weiler), A., i, 491.
4 : 4′-Diphenyldicarboxylic acid (Weiler), A., i, 491.
Diphenyl-4 : 4′-dihydrazine-3 : 3-dicarboxylic acid (Bülow and von Reden), A., i, 150.
Diphenyldihydrazoneacetylacetone (Favrel), A., i, 438.
Diphenyldihydrazonecyanoacetic acid, ethylic and methylic salts (Favrel), A., i, 58.
Diphenyldihydrazonemalonic acid, methylic and ethylic salts (Favrel), A., i, 521.
Diphenyldihydrodicarbolutidinic acid, ethylic salt (Bertini), A., i, 897.
Diphenyldihydrofurfuran (Thiele and Rössner), A., i, 612.
Diphenyl-1 : 4-dihydroxynaphthylmethane (Möhlau and Klopfer) A., i, 913.
1 : 2-Diphenyl-4 : 5-diketotetrahydropyrroline, 4-anil of (Garzarolli-Thurnlackh), A., i, 823.

Diphenyldimethylethylenediamine (Bischoff), A., i, 279.
1 : 3-Diphenyl-4 : 5-dimethyl-5-pyrazolineacetic acid (Bossi), A., i, 522.
Diphenyl*iso*dithiodiazolone (Busch and Becker), A., i, 953.
Diphenylene disulphide, preparation of (Genvresse), A., i, 147.
  and disulphone (Cohen and Skirrow), T., 888 ; P., **1899**, 183.
iso-**Diphenylene** disulphone (Genvresse), A., i, 147.
Diphenylethylenediamine, *di*nitroso- (Bischoff), A., i, 280.
Diphenylethylenehydrazine (Freer), A., i, 358.
a-*c*-**Diphenyl**-*c*-**ethylthiobiuret** (Dixon), T., 405 ; P., **1899**, 64.
e-**Diphenyl**-*a*-**ethylthiobiuret** (Dixon), T., 396 ; P., **1899**, 63.
Diphenylfluorindine, isomeride of, and salts (Kehrmann and Duret), A., i, 84.
Diphenylfurfuran, *p*-*di*bromo-, *tri*bromo-, and *penta*bromo- (Thiele and Rössner), A., i, 613.
Diphenylglyoxylic acid, and ethylic salt, and phenylimide (Rousset), A., i, 222.
Diphenylhexahydropyrimidine (Scholtz), A., i, 881.
1 : 6-Diphenylhexatriene-3-carboxylic acid (Thiele), A., i, 216.
Diphenylhydrazine, monohydrobromide, and monohydrochloride (Le Canu), A., i, 808.
Diphenylhydroxyethylamines, stereoisomeric, preparation of, and hydrochlorides (Erlenmeyer), A., i, 760.
iso-**Diphenylhydroxyethylamine,** and hydrochloride (Erlenmeyer), A., i, 760.
  d-, and *l*-, and tartrates, specific rotations of (Erlenmeyer), A., i, 882.
2′ : 4′-Diphenylimino-3′-phenyltetrahydroquinazoline (McCoy), A., i, 360.
Diphenyliodonium hydroxide, conductivity and hydrolysing power of (Sullivan), A., ii, 398.
Diphenylitaconic acid, and salts (Stobbe), A., i, 900.
γ-**Diphenylitaconic anhydride** (Stobbe and Kohlmann), A., i, 901.
Diphenylmethane, preparation of (Verley), A., i, 207.
  from condensation of *di*chlorotrioxymethylene and methylene chlorhydrin with benzene (Grassi-Cristaldi and Maselli), A., i, 410.
Diphenylmethane, action of chromyl chloride on (Weiler), A., i, 519.
  nitration of (Konowaloff), A., i, 844.
Diphenylmethane, *p*-*di*amino- (Bamberger and Tschirner), A., i, 348.
Diphenylmethylamine, action of methylic iodide on (Wedekind), A., i, 351.
Diphenylmethyleneaniline, preparation of (Nägeli), A., i, 910.
1 : 4-Diphenyl-3-methyl-5-pyrazolone (Beckh), A., i, 212.
1 : 5-Diphenyl-3-methylpyrrolone (Klobb), A., i, 511.
ac-**Diphenyl**-*e*-**methylthiobiuret** (Dixon), T., 401 ; P., **1899**, 64.
e-**Diphenyl**-*a*-**methylthiobiuret** (Dixon), T., 396, 492 ; P., **1899**, 63, 64.
Diphenylnitrosamine, heat of combustion of (Matignon and Deligny), A., i, 127.
  action of zinc ethyl on (Lachmann), A., i, 588.
γ-**Diphenylparaconic acid,** β-bromo-, ethylic salt (Stobbe), A., i, 901.
1 : 2-Diphenyl*cyclo*pentane (Wislicenus and Kuhn), A., i, 60.
αδ-**Diphenyl**-αγ-**pentanolide** (Thiele and Meisenheimer), A., i, 615.
αδ-**Diphenyl**-Δ^{α}-**pentenoic acid** (Thiele and Meisenheimer), A., i, 615.
αδ-**Diphenyl**-Δ^{β}-**pentenoic acid,** and salts (Thiele and Meisenheimer), A., i, 614, 615.
  αδ-dibromo-, and its methylic salt (Thiele and Rössner), A., i, 612.
1 : 3-Diphenylpyrazoline, 5-imino-, and its salts, acetyl derivative, and nitrosoderivative (Seidel), A., i, 138.
1 : 3-Diphenylpyrazolone, 4-*iso*nitroso-, (Seidel), A., i, 138.
4 : 6-Diphenyl-2-pyrone-5-carboxylic acid, ethylic salt (Ruhemann) T., 253 ; P., **1899**, 6.
  action of alcoholic ammonia on (Ruhemann), T., 414 ; P., **1899**, 55.
  p-nitro-, ethylic salt (Ruhemann and Cunnington), T., 782 ; P., **1899**, 169.
γ-**Diphenylpyrotartaric acid,** and salts (Stobbe and Kohlmann), A., i, 901.
Diphenylstibine chloride (Hasenbäumer), A., i, 209.
Diphenylsulphone, iodiodoso-, and *di*iodoxy- (Willgerodt and Waldeyer), A., i, 606.
Diphenyltetrahydroglyoxaline (Bischoff), A., i, 279.
Diphenyltetrahydropyrone oxime (Petrenko-Kritschenko and Rosenzweig), A., i, 707.

Diphenyltetramethylene disulphide and disulphone (Autenrieth and Wolff), A., i, 580.

a-**Diphenyl-**β**-thioallophanic acid,** benzylic salt of (Dixon), T., 400; P., **1899**, 64.

c-**Diphenylthiobiuret** (Dixon), T., 397; P., **1899**, 63.

Diphenylthiocarbamide, oxidation of (Oechsner de Coninck), A., i, 421.

Diphenylthiocarbazide, electrolytic preparation of (Schall and Kraszler), A., i, 414.

2:5-Diphenyl-1:3:4-thiodiazole(Stollé), A., i, 457.

Diphenylthiofluorescein (Gattermann and Ridder), A., i, 513.

Diphenylthiomaleuric acid, and its salts (Dunlap), A., i, 697.

Diphenylthiosemicarbazide, the imidodiazolone and thiodiazolone from (Marckwald), A., i, 504.

4-bromo-, the imidodiazolone and thiodiazolone from (Marckwald), A., i, 504.

3-bromo- and 2:4:5-*tri*bromo- (Marckwald), A., i, 505.

2-chloro- and 3-chloro-, and the thiodiazolones from (Marckwald), A., i, 505.

4-chloro- and 4:4-*di*chloro- and the imidodiazolones and thiodiazolones from (Marckwald), A., i, 504.

3:3-*di*chloro- (Marckwald), A., i, 505.

2-nitro-, and 4-nitro- (Marckwald), A., i, 504, 505.

3-nitro-, and the thiodiazolone from (Marckwald), A., i, 505.

Diphenyl-*o*-toluidine, and nitro- (Haeussermann and Bauer), A., i, 204.

a-**Diphenyl-*c*-*o*-tolylbiuret** (Dixon), T., 396; P., **1899**, 63.

Diphenyltolylmethane-*o*-carboxylic acid. See Phenyltolyl-*o*-toluic acid.

Diphenyltolylpyrroline (von Miller and Plöchl), A., i, 159.

c-**Diphenyl-*a*-*o*-tolylthiobiuret** (Dixon), T., 395; P., **1899**, 63.

c-**Diphenyl-*a*-*p*-tolylthiobiuret** (Dixon), T., 396; P., **1899**, 63.

3:5-Diphenyltriazole, from action of heat on dibenzoylhydrazine (Pellizzari), A., i, 858.

1:5-Diphenyltriazoline, 3-imino-, and its diacetyl and dibenzoyl derivatives (Cuneo), A., i, 549.

Diphenyltrimethylenediamine, and salts (Scholtz), A., i, 881.

Diphthalidedimethyl ketone and **ketoxime** (Hamburger), A., i, 142.

Diphthalimidoacetone-ethylmercaptole (Posner), A., i, 605.

Diphthalimidoepihydrin (Posner), A., i, 606.

Diphthalimidosulphonal (Posner), A., i, 605.

Diphthalyl, *di*thio- (Gabriel and Leupold), A., i, 122.

Diphthalylic acid, formation of (Gabriel and Leupold), A., i, 122.

*di*thio-, tetramethylic derivative of (Gabriel and Leupold), A., i, 122.

Diphtheria, causes of antagonism of toxins and antitoxins of (Martin and Cherry), A., ii, 234.

Diphtheria-toxin, action of the pancreas on (Charrin and Levaditi), A., ii, 441.

influence of, on metabolism (Noël-Paton, Dunlop, and MacAdam), A., ii, 602.

Dipiperidoquinonedicarboxylic acid, ethylic salt (Guinchard), A., i, 700.

Dipiperidylbutylic alcohol, nitro-, formation of (Henry), A., i, 729.

Dipropanediolamine, formation of (Knorr and Knorr), A., i, 411.

Dipropenylic glycol (*crotonaldehyde pinacone*), *tetra*bromo-, and its acetyl derivative (Charon), A., i, 849.

*di*chlorhydrin, and its tetracetyl derivative (Charon), A., i, 849.

ββ-**Dipropionoxydinaphthalene** (Fosse), A., i, 817.

Dipropionyldi-*p*-tolyltrimethylenediamide, *di*bromo- (Bischoff and Tschunkew), A., i, 279.

Dipropionyltartaric acid, ethereal salts, density, specific rotation, and molecular volume of (Frankland), T., 361.

Di*iso*propoxysuccinic acid, and its barium, calcium, magnesium, and *iso*propylic salts (Purdie and Pitkeathly), T., 156; P., **1899**, 6.

Dipropylamine, from reduction of β-dipropylhydroxylamine, and its hydrochloride and platinochloride (Dunstan and Goulding), T., 804.

action of hydrogen peroxide on (Dunstan and Goulding), T., 1010.

action of nitrosyl chloride on (Solonina), A., i, 473.

Dipropylamine, cyano-, and action of ammonia and hydrogen sulphide on (Wallach), A., i, 659.

Di*iso*propylamine, from reduction of β-di*iso*propylhydroxylamine, and hydrochloride and platinochloride (Dunstan and Goulding), T., 805.

Di*iso*propylaniline, action of methylic iodide on (Wedekind), A., i, 351.

Dipropylarsinic acid (*propylcacodylic acid*) (Partheil, Amort, and Gronover), A., i, 474.

Di*iso*propylbutenedicarboxylic acids, stereoisomeric (Barbier and Grignard), A., i, 113.

β-**Dipropylhydroxylamine**, formation of, by action of hydrogen peroxide on dipropylamine (Dunstan and Goulding), T., 1010.
  and its acid oxalate, also its reduction (Dunstan and Goulding), T., 803; P., **1899**, 60.

β-**Di*iso*propylhydroxylamine**, and reduction (Dunstan and Goulding), T., 804; P., **1899**, 60.

Di*iso*propylic phosphite and its silver salt (Milobendski), A., i, 659.

Dipropyl ketone, specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.

Dipropyl-*p*-nitraniline (Nagornoff), A., i, 425.

Dipropyloxamide, *di*nitro-, and action of ammonia on (Umbgrove and Franchimont), A., i, 105.

Di*iso*propylpiperazine and salts (Conrad and Hock), A., i, 632.

s-**Di*iso*propylsuccinic acid**, isomeric forms of, and the anhydrides and calcium salts; also the dissociation constants (Bone and Sprankling), P., **1899**, 149.

Dipropylthiocarbamide, formation of (Wallach), A., i, 659.

Dipulvic acid, probable identity of stictaurin with (Zopf), A., i, 716.

Di-β-pyridylcarbamide (Curtius and Mohr), A., i, 73.

Dipyridyl-2:2′:6:6′-tetracarboxylic acid and salts (Huth), A., i, 934.

Dipyridylthiocarbamide (O. Fischer, Hoerger, and Jaeger), A., i, 634.

Disalicylphthalide and methylic and ethylic salts (Limpricht), A., i, 293.

Disalicyl-*o*-toluic acid (Limpricht), A., i, 293.

Disazo-dyes of the benzene series (Bülow and Wolfs), A., i, 135.

Dissociable system, discussion of a (Colson), A., ii, 205.

Dissociated compounds, dilution law for (Barmwater), A., ii, 274.

Dissociation of a substance into two products, equilibrium in (Bancroft), A., ii, 411.
  of gases at constant pressure (Wegscheider), A., ii, 590.

Dissociation of ammonium double chlorides, entropy change in (Matignon), A., ii, 273.
  of ammonium fluoromolybdate and fluosilicate (Miolati and Alvisi), A., ii, 350.
  of chlorine, nitric peroxide, and acetic acid vapour (Leduc), A., ii, 729.
  of diammoniomercuric iodide (François), A., ii, 657.
  of mercuric oxide (Pélabon), A., ii, 423.
  of nitric peroxide (Pochettino), A., ii, 729.
  of oleates (Dennhardt), A., ii, 351.
  of phosphorus *penta*bromide, in organic solvents (Kastle and Beatty), A., ii, 481.
  of phosphorus *penta*chloride and of methylic ether hydrochloride (Wegscheider), A., ii, 590, 591.
  of rubidium tartrate (Rimbach), A., ii, 345.
  of silver nitrate, in fused sodium or potassium nitrates (Gordon), A., ii, 347.

Dissociation constants of isomeric *s*-di*iso*propylsuccinic acids (Bone and Sprankling), P., **1899**, 149.
  of the methyl-substituted succinic acids (Bone and Sprankling), T., 862.
  of β-*iso*propylglutaric acid (Howles and Thorpe), P., **1899**, 104.

Dissociation pressures of gaseous hydrates, molecular weights deduced from (Rosset), A., ii, 548.
  of ammoniacal cadmium chlorides (Lang and Rigout), T., 883; P., **1899**, 182.
  of silver ammoniochlorides, bromides, and iodides, and of silver methyl ammoniobromide and iodides (Jarry), A., ii, 738.
  of silver suboxide (Guntz), A., ii, 418.

Dissociative power of solvents, cause of (Brühl), A., ii, 10.

Distearyl-salicyl glyceride, fate of, in the living body (Humnicki), A., ii, 781.

Distillation, fractional, forms of still-head for (Young), T., 679; P., **1899**, 147.
  under reduced pressure, vacuum regulator for (Auger), A., ii, 474; (Hausser), A., ii, 645.

Dithiondisulphides, electrolytic preparation of (Schall and Kraszler), A., i, 414.

Di-*p*-toluenesulphobistrimethylenediimide (Marckwald and Droste-Huelshoff), A., i, 290.

Di-*p*-toluenesulphotrimethylenediamide (Howard and Marckwald), A., i, 750.

Di-*p*-toluidino-oxalic acid, methylic salt, and the action of ammonia on it; also its platinochloride (Anschütz and Stiepel), A., i, 573.

α-δ-Di-*o*-toluidinopentane, and its picrate (Scholtz and Friemehlt), A., i, 541.

o-, *m*-, and *p*-**Ditoluoylglyceric acids**, methylic and ethylic salts, specific rotations of, and in solution (Frankland and Aston), T., 493; P., **1899**, 105.

Ditoluoyltartaric acids, *o*-, *m*-, and *p*-, methylic and ethylic salts, molecular volumes of (Frankland), T., 349.

4 : 3′-Ditolyl, 4 : 4′-Ditolyl (Weiler), A., i, 490.

p-**Ditolyl**, action of chromyl chloride on, chloro- and *di*chloro-derivatives (Weiler), A., i, 519.

Ditolylacetic acid, and its salts (Fritsch and Feldmann), A., i, 600.

Di-*p*-tolylamidine (Wheeler and Johnson), A., i, 354.

Di-*p*-tolylamidinoxalo-*p*-toluidide, crystalline form of (Anschütz and Stiepel), A., i, 573.

Ditolylanthrone (Guyot), A., i, 295.

Ditolylcarbamide (Dains), A., i, 593.

Ditolylcarbamides, isomeric *di*nitro-, amino-, and *di*amino- (Vittenet), A., i, 810.

Ditolyl-4 : 4′-dicarboxylic acid, dimethylic salt (Weiler), A., i, 491.

Di-*o*-tolyldihydrazoneacetylacetone (Favrel), A., i, 438.

Di-*o*-tolyldihydrazonecyanoacetic acid, ethylic and methylic salts (Favrel), A., i, 58.

Di-*o*-tolyldihydrazonemalonic acid, methylic and ethylic salts (Favrel), A., i, 521.

Di-*p*-tolyldimethylenediamine, and a polymeride and its isomeride (Bischoff), A., i, 279.

Di-*p*-tolyldisulphone (Kohler and MacDonald), A., i, 904.

Ditolylene, disulphide and disulphone (Cohen and Skirrow), T., 890; P., **1899**, 83.

Di-*p*-tolylidenehydrazone, and *di-m* nitro- (Hanzlik and Bianchi), A., i, 597.

Di-*p*-tolylmethenylamidine (Wheeler and Johnson), A., i, 269.

Ditolyl-3-methylanthrone (Guyot), A., i, 295.

Ditolylphthalide (Guyot), A., i, 293.

Di-*o*-tolylthiofluorescein (Gattermann and Berendes), A., i, 514.

2 : 2-, 2 : 4-, and **4 : 4-Ditolylthiosemicarbazides** (Marckwald), A., i, 504, 505.

Di-*o*-tolyltrimethylenediamine, and its sulphate (Scholtz), A., i, 881.

Di-*p*-tolyltrimethylenediamine (Bischoff and Tschunkew), A., i, 279.

Di-*p*-tolyltrimethylenediaminecarbonyl chloride (Scholtz), A., i, 881.

Di*iso*tropylcarbamide (Willstätter and Müller), A., i, 178.

Diuretin, composition of (Sztankay), A., i, 240.

Divaleric acid. See Decoic acid.

Di*iso*valeryl-di-*o*- and -*p*-tolyldiamide and -di-β-naphthyldiamide *di-α*-bromo- (Bischoff and Päpke), A., i, 278, 279.

Di*iso*valerylethylenediphenyldiamide, *di-α*-bromo- (Bischoff and Päpke), A., i, 278.

Divaleryltartaric and **Di*iso*valeryltartaric acids**, ethereal salts, densities, specific rotations and molecular volumes of (Frankland), T., 362.

Divicin, formula, and oxidation of (Ritthausen), A., i, 715.

Divinyl. See Butinene.

Dixgenic acid (Kiliani), A., i, 932.

Dixylylene, disulphide (Cohen and Skirrow), T., 870; P., **1899**, 183.

Dixylylmethane, *di*amino-, and its diacetate (Friedländer and Brand), A., i, 351.

Dixylylthiocarbamide (Busch), A., i, 496.

n-**Dodecoic acid**, amylic salt, density, specific rotation and molecular volume of (Frankland), T., 358.

Dodecoic acid *di*iso*amylacetic acid*), and amide (Fournier), A., i, 735.

Dodecoic acid. See also Lauric acid.

Dolomite, formation of, in the Alps (Philippi), A., ii, 306.

Dolomitic limestone from Sweden (Sjögren), A., ii, 760.

Domingite, artificial (Sommerlad), A., ii, 217.

Dotriacontane, boiling point of, in a vacuum (Krafft), A., ii, 465.

Drying oils. See Oils.

Drying oven, electric (Richards), A., ii, 592.

Duboisia myoporoides, the alkaloids of (Merck), A., i, 91.

Duboisine, chemistry of (Pinner), A., i, 178.

Dufrenoysite from Switzerland (GUILLEMAIN), A., ii, 757.
  artificial (SOMMERLAD), A., ii, 218.
Dulcitol, action of hydrogen peroxide on, in presence, and in absence of iron (FENTON and JACKSON), T., 9; P., **1898**, 240.
  condensation of benzaldehyde with (DE BRUYN and ALBERDA VAN EKENSTEIN), A., i, 662.
Dung. See Agricultural chemistry.
Dunite from Massachusetts (MARTIN), A., ii, 112.
Durene and *iso*-**Durene**, formation of (KLAGES and LICKROTH), A., i, 598.
Durenecarboxylic acid, synthesis of (GATTERMANN and PRENTICE), A., i, 510.
iso-**Durene-6-carboxylic acid**, and amide (GATTERMANN and PRENTICE), A., i, 509.
Dust, fall of, in Victoria (STEEL), A., ii, 674.
Dyer's broom, colouring matters and dyeing properties of (PERKIN and NEWBURY), T., 830; P., **1899**, 179.
Dynamite, ammonium perchlorate in (ALVISI), A., ii, 748.
  analysis of (SMITH), A., ii, 528.

E.

Earth-nut. See *Arachis*.
Earth-nut oil, estimation of arachidic and lignoceric acids in (ARCHBUTT), A., ii, 260.
  estimation of, in presence of other oils (JEAN), A., ii, 260.
Ecgonine, constitution of (WILLSTÄTTER and MÜLLER), A., i, 178.
  methiodide and its ethylic methylbetaine derivatives (WILLSTÄTTER), A., i, 651.
  methochloride, ethylic, aurichloride of (WILLSTÄTTER), A., i, 651.
Echidnase, digestive action of, on snake-venom (PHISALIX), A., ii, 782.
Edestin, composition and solubility of, and its *mono*- and *di*-hydrochlorides (OSBORNE), A., i, 836.
Eels, presence of a toxalbumin in the flesh of (BÉNECH), A., ii, 439.
  serum of, immunity of some animals to the action of (CAMUS and GLEY), A., ii, 783.
Elaidic acid, molecular weight of, in stearic acid (BRUNI and GORNI), A., ii, 731.
  boiling point of, in a vacuum (KRAFFT), A., ii, 464.
Elaidic acid and sodium salt, melting points of, and temperature of solidification of solutions of (KRAFFT), A., ii, 471.
  and oleic acid, isomerism of (ALBITZKY), A., i, 862.
  separation of, from other unsaturated acids (FARNSTEINER), A., ii, 705.
Elaidic anhydride and amide (EMELJANOFF and ALBITZKY), A., i, 864.
Elaidodistearin and its chloriodo-compound (HENRIQUES and KÜNNE), A., i, 331.
Elderberry juice, detection of, in ergot extract (CEPPELINI), A., ii, 135.
ELECTROCHEMISTRY:—
  Anode, iron, solution of, in electrolysis of sodium acetate and acetic acid (ARTH), A., ii, 723.
  Cathodes, metallic, pulverisation of, during electrolysis (BREDIG and HABER), A., ii, 78.
  Cell, osmotic theory of (NERNST), A., ii, 345.
    concentration, E.M.F. of (BANCROFT; TREVOR), A., ii, 395.
    Borchers', continuous current from (HOEPER), A., ii, 541.
    Bunsen's, modified; use of potassium ferricyanide in (PETERSEN), A., ii, 346.
    Clark or Daniell, application of phase rule to (BANCROFT), A., ii, 394.
    Daniell's, with magnesium chloride in place of zinc sulphate (PETERSEN), A., ii, 346.
    oxygen-hydrogen gas, formation of water in (GLASER), A., ii, 78.
    with carbon and lead peroxide in sodium chloride (TOMMASI), A., ii, 199.
    Clark and cadmium, E.M.F. of (KAHLE), A., ii, 348.
    Clark's or Weston's, internal resistance of (COHEN), A., ii, 462.
  Conductivity, apparatus for (GOLDSCHMIDT and REYCHLER), A., ii, 463.
    calculated from ionic velocities (KOHLRAUSCH), A., ii, 201.
    influence of dilution on (SCHÜKAREFF), A., ii, 722.
    osmotic theory of (KAHLENBERG), A., ii, 624.
    of flames containing vaporised salts (SMITHELLS, DAWSON, and WILSON), A., ii, 722.
    of gases, induced by Röntgen rays (TOWNSEND), A., ii, 730.
    of glass (GRAY and DOBBIE), A., ii, 541.

ELECTROCHEMISTRY :—
Conductivity of complex fluorides and oxyfluorides (Miolati and Alvisi), A., ii, 350.
  of fused zinc chloride (Czepinski), A., ii, 268; (Schultze), A., ii, 623.
  of solutions, effect of pressure on (Bogojawlensky and Tammann), A., ii, 137.
  of mixed solutions (Hoffmeister), A., ii, 6.
  of solutions of two or more electrolytes (Barmwater), A., ii, 396.
  of solutions containing two electrolytes with a common ion, and of double salt solutions, calculability of (MacGregor and Archibald), A., ii, 201.
  of electrolytes and dilution (Muller), A., ii, 396.
  of electrolytes in organic solvents (Dutoit and Friderich), A., ii, 350.
  of ammonium and potassium salts, and of oleic acid and salts (Dennhardt), A., ii, 351.
  of solutions of boric acid (Blyth), T., 724; P., **1899**, 51.
  of solutions of chlorine in water (Jakowkin), A., ii, 736.
  of aqueous solutions of double chlorides (Jones and Ota), A., ii, 587.
  of *iso*cyanoform and its sodium salt (Hantzsch and Osswald), A., i, 405.
  molecular, of diazonium hydroxide and salts, and diazotates (Davidson and Hantzsch), A., ii, 6.
  of diphenyliodonium hydroxide, rubidium iodochloride, and iodine chloride (Sullivan), A., ii, 398.
  of solutions of ferric chloride and auric chloride in alcoholic ether, temperature coefficient of (Cattaneo), A., ii, 355.
  of δ-ketonic acids, and of hydroresorcinol derivatives (von Schilling and Vorländer), A., i, 878.
  of *iso*nitracetophenone, *isodi*nitromethane, and bromo*di*nitromethane (Hantzsch and Veit), A., i, 403.
  of salts of nitroform and *di*nitroethane alcoholate (Hantzsch and Rinckenberger), A., i, 404.
  of *l*-phenylmethoxyacetic acid (McKenzie), T., 767.

ELECTROCHEMISTRY :—
Conductivity of solutions of potassium chloride and iodide, and of sodium bromide and iodide, in nitrobenzene, benzonitrile, or furfuran (Euler), A., ii, 462.
  of mixed solutions of potassium and ammonium chlorides, and of double chlorides and bromides (Jones and Knight), A., ii, 628.
  of salts of complex oxalic acids (Rosenheim and Koppel), A., i, 741.
  of soap solutions (Kahlenberg and Schreiner), A., ii, 203.
  of solutions of uranyl salts (Dittrich), A., ii, 629.
  of animal fluids (Röth), A., ii, 311.
  of muscle extracts (Stewart), A., ii, 680.
Current density, electrodes for uniform distribution of (Riban), A., ii, 543.
Dielectric constant of alcohols, temperature coefficient of (Abegg and Seitz), A., ii, 623.
Dilution law and ionic velocities in electrolytic solutions (Hoffmeister; Jahn), A., ii, 6.
Electric discharge, glow, action of, on mixtures of gases (Mixter), A., ii, 267.
  silent, chemical action of, on carbon compounds (Berthelot), A., i, 657.
    effect of, on mixtures of carbon disulphide with hydrogen, nitrogen, argon, or carbon monoxide (Berthelot), A., ii, 648.
    action of, on mercury phenyl and mercury methyl in presence of argon and nitrogen (Berthelot), A., i, 871.
  in organic compounds, spectra produced by (Wiedemann and Schmidt), A., ii, 5.
Electric lamp, incandescent, as a source of heat (Hopkins), A., ii, 645.
Electrical absorption and dispersion of some ethereal salts, alcohols, and glass (Löwe), A., ii, 201.
Electrical oscillations, absorption of, by organic compounds (Kauffmann), A., ii, 464.
Electrical resistance, internal, of Clark's or Weston's cell (Cohen), A., ii, 462.
  of glass (Gray and Dobbie), A., ii, 541.

ELECTROCHEMISTRY :—
- **Electro-affinity** of the elements, and the solubility and dissociation of salts (Abegg and Bodländer), A., ii, 542.
- **Electrochemical equivalent** of silver (Kahle), A., ii, 348.
- **Electrodes** for obtaining uniform distribution of current density (Riban), A., ii, 544.
  - reversible (Luther), A., ii, 5.
  - of aluminium, in solutions of alums (Wilson), A., ii, 540.
  - mercury dropping, change of concentration of mercurous nitrate solution in (Palmaer), A., ii, 347.
  - of platinum gauze, electrolytic precipitation of metals on (Winkler), A., ii, 723.
- **Electro-deposition** of vanadium and palladium (Cowper-Coles), A., ii, 755.
- **Electrolysis** of aqueous solutions, E.M.F. required for (Glaser), A., ii, 79.
  - of salt solutions, with copper ferrocyanide membrane (Schreber), A., ii, 273.
  - of alkali chlorides (Winteler), A., ii, 212.
  - of ammonium thiosulphate (Pierron), A., ii, 587.
  - of solutions of calcium chloride (Oettel), A., ii, 219; (Foerster and Yorre), A., ii, 280.
  - of *tri*chlorobutyric acid (Troeger and Ewers), A., i, 667.
  - of copper and silver nitrates, potassium chlorate, or hydrogen peroxide, application of principle of maximum work to (Tommasi), A., ii, 413.
  - of copper and zinc cyanides (Baker), A., ii, 749.
  - of solutions of gold or platinum chlorides (Hittorf and Salkowski), A., ii, 398.
  - of dilute nitric, with cathodes of various metals (Freer and Higley), A., ii, 480.
  - of solutions of platinic or stannic chlorides (Dittenberger and Dietz), A., ii, 629.
  - of solution of potassium cuprotartrate (Masson and Steele), T., 725; P., **1899**, 120.
  - of sodium salts of halogen-substituted fatty acids (Troeger and Ewers), A., i, 12.
  - of fused zinc chloride (Schultze), A., ii, 657.

ELECTROCHEMISTRY :—
- **Electrolysis** of solutions of zinc chloride (Foerster and Günther), A., ii, 220.
- **Electrolytes**, conductivity and dilution of (Muller), A., ii, 396.
  - conductivity of, in organic solvents (Dutoit and Friderich), A., ii, 350.
  - fused electrolysis of (Czepinski), A., ii, 267.
  - heat of dilution and dissociation of (Noyes), A., ii, 401.
  - of two ions, influence of, on solubility of one of three ions (Noyes and Chapin), A., ii, 405.
  - dissolution of platinum or gold in (Margueles), A., ii, 200.
  - strong, dilution and dissociation of (Euler), A., ii, 724.
  - dissociated, diffusion of (Bose), A., ii, 729.
  - dissociation of, in aqueous alcohol (Cohen), A., ii, 275.
- **Electrolytic dissociation** and electro-affinity (Abegg and Bodländer), A., ii, 543.
  - effects of pressure on (Bogojawlensky and Tammann), A., ii, 138.
  - and dilution of strong electrolytes (Euler), A., ii, 724.
  - of strong acids and bases, and heat of neutralisation (Vaubel), A., ii, 728.
  - of metallic salts of organic acids (Calame), A., ii, 145.
  - of acetic acid, influence of dissolved acetates on (Bamberger), A., ii, 548.
  - of chlorine in water, and influence of chlorides on (Jakowkin), A., ii, 736.
  - of *iso*cyanoform (Hantzsch and Osswald), A., i, 405.
  - of *l*-phenylmethoxyacetic acid, and of *d*-mandelic acid (McKenzie), T., 768.
  - of nitroform and *di*nitroethane alcoholate (Hantzsch and Rinckenberger), A., i, 404.
  - constants of β-hydroxy-$\alpha\alpha_1$-dimethylglutaric acid and β-acetoxy-$\alpha\alpha_1$-dimethylglutaric acid (Reformatsky), A., i, 481.
  - constants of β-hydroxytetramethylglutaric and β-acetoxytetramethylglutaric acids (Michailenko), A., i, 482.
  - constants of *iso*nitracetophenone and *isodi*nitromethane (Hantzsch and Veit), A., i, 403.

- ELECTROCHEMISTRY :—
  - **Electrolytic reduction** of aliphatic nitro-derivatives (Pierron), A., i, 844.
  - **Electrolytic resistance**, a method of measuring (McIlhiney), A., ii, 6.
  - **Electromotive force**, increase of, accompanying dilution of electrolytes (Bose), A., ii, 349.
    - between amalgams (Cady; Bancroft), A., ii, 394, 395.
    - between ammonium amalgam and copper in various salt solutions (Pocklington), A., ii, 200.
    - osmotic theory of (Kahlenberg), A., ii, 624.
    - of polarisation, and temperature coefficient of fused electrolytes (Czepinski), A., ii, 268.
    - of cells with mercury electrodes in solutions of mercurous nitrate (Ogg), A., ii, 14.

  - **Kations**, velocity of, influence of a dividing membrane on (Bein), A., ii, 399.
  - **Polarisation**, E.M.F. of, in solutions of sodium, lithium, or ammonium sulphates (Jahn), A., ii, 542.
    - in cells containing copper sulphate or silver nitrate, determination of (Heim), A., ii, 77.
  - **Potential**, electrolytic (Schükareff), A., ii, 722.
    - single differences of (Carveth), A., ii, 137.

ELECTROCHEMISTRY :—
  Potential difference between amalgams of different concentrations, and between amalgams and solutions (SCHOELLER), A., ii, 346.
    between a metal and a solution; between mercury electrodes in mercurous sulphate, and silver electrodes in dilute hydrochloric acid (NERNST), A., ii, 345.
    between metals and non-aqueous solutions of their salts (KAHLENBERG), A., ii, 624.
    of lead electrodes in solution of a calcium salt (LUTHER), A., ii, 5.
    between platinum charged with carbonic oxide, or oxygen, and normal hydrochloric acid; and between platinum and cuprous chloride, with and without carbonic oxide (HOEPER), A., ii, 541.
    between benzene iododichloride and chlorine (SULLIVAN), A., ii, 398.
  Specific inductive capacity of azoxyanisoil (ABEGG and SEITZ), A., ii, 623.
    of glass (GRAY and DOBBIE), A., ii, 541.
  Transference number for hydrogen (MCINTOSH), A., ii, 137; (BANCROFT), A., ii, 398.
  Voltameter, silver, deposition of silver in (KAHLE), A., ii, 347.
Elements, scheme of the (CROOKES), A., ii, 552.
  magnetic properties of the (MEYER), A., ii, 587.
  atomic weights of the, table of (LANDOLT, OSTWALD, and SEUBERT), A., ii, 86.
Embolite from Sardinia (TRAVERSO), A., ii, 759.
Emery from Virginia (MILLER), A., ii, 759.
Emetine, *oct*iodide of (GORDIN and PRESCOTT), A., i, 651.
Emplectite from Saxony (GUILLEMAIN), A., ii, 757.
Enargite from Montana (HILLEBRAND), A., ii, 302.
  from Peru and Colorado (GUILLEMAIN), A., ii, 757.
Endocarpon miniatum, constituents of (HESSE), A., i, 382.
Energy, total and free, in electrolysis of fused electrolytes (CZEPINSKI), A., ii, 267.
Enstatite from North Carolina (LEWIS), A., ii, 561.
  from the Transvaal (HENDERSON), A., ii, 111.
  artificial (MOROZEWICZ), A., ii, 763.
"**Enteque,**" composition of the pulmonary ossifications in (PORCHER), A., ii, 568.
Entropy. See Thermochemistry.
Enzyme in animal tissues which reduces nitrates (ABELOUS and GERARD), A., ii, 680.
  oxidising, presence of, in beer-yeast (EFFRONT), A., ii, 118.
Enzymes, proteolytic, presence of, in extracts of *Sarcina rosea*, and *Bacillus typhosus* and *tuberculosus* (GERET and HAHN), A., i, 95.
  relation of, to animal oxidation (SACHAROFF), A., ii, 787.
  secretion of (DIENERT), A., ii, 683.

Eosin, iodo-, use of, in alkalimetry (GLASER), A., ii, 573.
Epiboulangerite from Silesia (GUILLEMAIN), A., ii, 757.
Epichlorhydrin, action of, on ethylic sodiomalonate (TRAUBE and LEHMANN), A., i, 417.
  action of hydrocyanic acid on (LESPIEAU), A., i, 243.
  action of potash on, in presence of alcohols (ZUNINO), A., i, 410.
  and epibromhydrin, action of potassium thiocyanate on (ENGLE), A., i, 3.
Epidote from Scotland (HEDDLE), A., ii, 497.
Epiguanine, constitution of; identity of, with Fischer's 7-methylguanine, and conversion into heteroxanthine (KRÜGER and SALOMON), A., i, 306.
Epihydrindimethylsulphine iodide, from action of methylic iodide on epithiocyanhydrin (ENGLE), A., i, 4.
Epinephrine, preparation of, and salts (ABEL), A., i, 395.

Epithiocyanhydrin, from action of potassium thiocyanate on epichlorhydrin and epibromhydrin, and action of ethylic iodide on (Engle), A., i, 3.

Epsomite from Canada (Hoffmann), A., ii, 110.

Equation, van der Waals', modification of (Boltzmann and Mache), A., ii, 635.

Equilibrium :—

Phase rule, mathematical demonstration of (Saurel), A., ii, 406.

Equilibrium of stereoisomerides (Bancroft), A., ii, 145, 411.

of isomorphous mixtures (Bruni), A., ii, 407.

conditions of, in heterogeneous systems (Le Chatelier), A., ii, 740.

between a dissociating substance and two products of dissociation (Bancroft), A., ii, 411.

between ammonium thiocyanate and thiocarbamide (Waddell), A., ii, 410.

between α- and β-benzaldoxime (Cameron), A., ii, 411.

between *d*- and *l*-pinene and solutions in methylic or ethylic alcohols (Kipping and Pope), T., 1123; P., **1899**, 200.

between sodium sulphate, potassium chloride, and sodium potassium sulphate (Meyerhoffer and Saunders), A., ii, 410.

between water, alcohol, and potassium nitrate; temperatures at which two liquid phases appear (Dodge and Gratton), A., ii, 408.

in solutions of chlorine in water (Jakowkin), A., ii, 736.

in the systems, ammonium sulphate, or sodium sulphate, ethylic alcohol, water; potassium carbonate, methylic or ethylic alcohol, water (de Bruyn), A., ii, 591.

in the systems, benzene, naphthalene, diphenylamine; ethylenic bromide, picric acid, β-naphthol; benzene, naphthalene, β-naphthol; and benzene, phenanthrene, carbazole (Bruni), A., ii, 406.

in the systems, hydrogen, oxygen, water; and oxygen, carbon monoxide and dioxide (Hélier), A., ii, 85.

in the system, mercuric oxide, mercury, oxygen (Pélabon), A., ii, 423.

Equilibrium :—

Equilibrium in the systems, potassium chloride, water, acetone; sodium chloride, water, succinonitrile; potassium carbonate, water, alcohol; and naphthalene, water, acetone (Snell), A., ii, 407, 408.

in systems containing water, ammonium chloride and ferric chloride (Mohr), A., ii, 15.

in the system, water, phenol, aniline (Schreinemakers), A., ii, 739.

Velocity of solidification of supercooled liquids and solutions (Wildermann), P., **1899**, 175.

chemical. See Affinity, chemical.

Erbium in monazite sands (Schützenberger and Boudouard), A., ii, 367.

bands, in spectrum of didymium from monazite sands (Urbain), A., ii, 425.

separation of holmium from, by the ethylic sulphate method (Urbain), A., ii, 28.

Ergot of Rye, evaluation of (Keller; Beckurts and Grothe), A., ii, 389.

extract, detection of elderberry juice in (Ceppellini), A., ii, 135.

Erubescite from the Caucasus (Jereméeff), A., ii, 108.

Erucic acid, isomerism of, with brassic acid (Albitzky), A., i, 862.

action of acetic anhydride on; also anhydride (Albitzky), A., i, 862.

and sodium salt, melting points of, and temperature of solidification of solutions of (Krafft), A., ii, 471.

sodium or potassium salts, boiling point of solutions of (Krafft), A., ii, 471.

Eryobothrya Japonica embryo, presence of hydrocyanic acid in (Hébert), A., ii, 378.

Erythrite from Sicily (La Valle), A., ii, 495.

Erythritol, velocity of crystallisation of (Bogojawlensky), A., ii, 206.

condensation of benzaldehyde with (de Bruyn and Alberda van Ekenstein), A., i, 662.

action of hydrogen peroxide on, in presence and in absence of iron (Fenton and Jackson), T., 7; P., **1898**, 240.

oxidation of, by atmospheric oxygen in sunlight in presence of iron (Fenton and Jackson), T., 10; P., **1898**, 240.

Erythrolaccin (Tschirch and Farner), A., i, 447.

Essonite. See Hessonite.

Estragole (Klages), A., i, 586.
from oil of basil (Dupont and Guerlain), A., i, 441.

l-**Ethoxypropionic acid**, and methylic, ethylic, and metallic salts, specific rotations of (Purdie and Irvine), T., 486; P., **1899**, 74.

Ethoxyquinone, formation of (Kietaibl), A., i, 345.

Ethoxysuccinic acid, preparation of, by the action of ethylic iodide on ethylic malate in presence of silver oxide; also its acid ammonium salt, and their rotatory powers (Purdie and Pitkeathly), T., 157; P., **1899**, **6**.

Ethoxysuccinic acid, ethereal salts, specific rotations and molecular volumes of (FRANKLAND), T., 353.
  ethylic salt, preparation of, by action of ethylic iodide on silver malate (PURDIE and PITKEATHLY), T., 154.

4-Ethoxythiobenzanilide, 3-chloro-, (BAMBERGER), A., i, 695.

p-**Ethoxythiobenzo-*p*-anisidide**, -*m*-**bromanilide**, -*p*-**chloranilide**, -*α*- and -*β*-**naphthalides**, -*p*-**phenetidide**, -*o*-, -*m*-, and -*p*-**toluidides**, and -*m*-**xylidides** (BAMBERGER), A., i, 695, 696, 697.

1- and **2-Ethoxythionaphthanilides** (BAMBERGER), A., i, 695.

4-Ethoxythionaphth-anilide-, -*m*-**bromanilide**, -*p*-**chloranilide**, and -*α*-**naphthalide** (BAMBERGER), A., i, 695, 966, 967.

o- and *p*-**Ethoxythiophenols** and their ethylic ethers (GATTERMANN), A., i, 518.

Ethoxy-*p*-xylic acid [Me:Me:COOH:OEt = 1:2:4:6], ethylic salt (PERKIN), T., 193.

Ethyl-*o*-acetamidobenzonitrile (FRIEDLÄNDER), A., i, 350.

N-**Ethylacetamidophenol**, and acetate (HINSBERG), A., i, 496.

Ethylacetoacetic acid, ethylic salt, action of ethylic thiocyanate on sodium derivative of (KOHLER), A., i, 738.
  *di*bromo-, ethylic salt, formation of methylmesaconic acid from (SEMENOFF), A., i, 792.
  cyano- and thiocyano-, ethylic salts (KOHLER), A., i, 738.

Ethylacetonetriethyltrisulphone, *iso*nitroso- (POSNER), A., i, 605.

Ethylacrylic acid. See Pentenoic acid.

β-**Ethylacrylonitrile**. See *γ*-Methylcrotononitrile.

Ethylamine, direct formation of, by reduction of acetamide (GUERBET), A., i, 795.
  boiling point and melting point of (LADENBURG and KRÜGEL), A., ii, 545.
  action of nitrosyl chloride on (SOLONINA), A., i, 473.
  hydrochloride, action of chromic acid on (OECHSNER DE CONINCK and COMBE), A., i, 244.
  compounds of, with metallic salts (MATTHEWS), A., ii, 296.
  compounds of, with mercuric chloride (HOFMANN and MARBURG), A., i, 487.

Ethylamine, bromo-, hydrobromide, condensation of, with salicylaldehyde (GABRIEL and LEUPOLD), A., i, 104.

Ethyl-*o*-aminobenzonitrile, and its acetyl derivative (FRIEDLÄNDER), A., i, 350.

Ethyl-*m*-aminophenolsaccharein and its acetyl derivative (MONNET and KOETSCHET), A., i, 213.

γ-**Ethylamino-*αβ*-propylenic glycol** (*ethylpropanediolamine*) (CHIARI), A., i, 325; KNORR and KNORR), A., i, 412.

Ethyl amyl ketone, and *iso***amyl ketone**, oxidation of, by nitric acid (FILETI and PONZIO), A., i, 111.
  and their *iso*nitroso-derivatives (PONZIO) and DE GASPARI), A., i, 252.

Ethylaniline, formation of (BAILLIE and TAFEL), A., i, 268.
  m-chloro-, and *m*-chloronitroso-, *m*-chloronitronitroso-, *m*-chloronitro-, 2:4-*di*nitro-, *p*-nitronitroso-, and 2:4-*di*nitronitroso- (STOERMER and HOFFMANN), A., i, 43.

Ethylanilinoquinonedicarboxylic acid, ethylic salt (GUINCHARD), A., i, 701.

Ethylbenzamide, formation of (WHEELER and JOHNSON), A., i, 431.

Ethylbenzene (*phenylethane*), boiling point, and melting point of (LADENBERG and KRÜGEL), A., ii, 545.
  nitration of (KONOWALOFF), A., i, 844.

Ethylbenzene, *di*chloro- (RADZIEWANOWSKI and SCHRAMM), A., i, 198.
  *tri*cyano-, from action of benzylic iodide on silver cyanoform, and its hydrolysis (HANTZSCH and OSSWALD), A., i, 406.

Ethylbornylamine, hydrochloride, hydriodide, nitrite, platinochloride, nitrosamine, acetyl and benzoyl derivatives (FORSTER), T., 945; P., **1899**, 72.

Ethyl*iso*butylamine, and its nitroso-compound; also the action of sodium methylic sulphate on it (MARCKWALD and DROSTE-HUELSHOFF), A., i, 326.

Ethyl butyl ketone, oxidation of by nitric acid (FILETI and PONZIO), A., i, 111.
  *iso*nitroso-derivatives of, from action of nitrous acid on it (PONZIO and DE GASPARI), A., i, 252.

Ethyl butyl diketone (*propionyl valeryl*) and its dioxime and osazone (FILETI and PONZIO), A., i, 111.

Ethylchlorophosphine, and action of water, chlorine and sulphur on (GUICHARD), A., i, 563.

Ethylcitraconic acid, and its anhydride; also its conversion into ethylitaconic and ethylmesaconic acids, its reduction, and the action of hydrogen bromide on it (FITTIG and GLASER), A., i, 333.

- **Ethylcitraconic anhydride,** action of hydrobromic acid on (Semenoff), A., i, 866.
- **Ethylcitrapyrotartaric acid,** bromo- (Fittig and Glaser), A., i, 334.
- α-**Ethylcrotononitrile,** and dimethylamine derivative (Henry), A., i, 568.
- **Ethylcyanacetic acid,** ethylic salt (Hessler), A., i, 898.
- **Ethylcymene** [Me : Et : Prβ=1 : 2 : 4] (Verley), A., i, 207; (Bouveault), A., i, 287.
- *r*- and *l*-**Ethyldesmotroposantonins** (Andreocci and Bertolo), A., i, 301.
- **Ethyldinaphthaposafranine,** and hydrochloride (Fischer and Hepp), A., i, 79.
- **Ethylene,** boiling point of (Ladenburg and Krügel), A., ii, 545.
  - liquid (Ladenburg and Krügel), A., ii, 208.
    - density of (Ladenburg and Krügel), A., ii, 467.
  - compressed, solution of solids and liquids in (Villard), A., ii, 143.
  - viscosity of (Breitenbach), A., ii, 403.
  - action of ozone on (Otto), A., ii, 282.
  - action of nitric anhydride and peroxide on (Demjanoff), A., i, 845.
- **Ethylene,** αβ-*di*bromo- (*acetylene dibromide*) (Elbs and Newmann), A., i, 98; (Swarts), A., i, 734.
  - *tri*bromo- (Crossley), P., **1898**, 248; (Elbs and Newmann), A., i, 98.
    - action of antimony pentachloride on (Swarts), A., i, 725.
  - *tetra*bromo- (Swarts), A., i, 734.
  - *tri*bromonitro-, from action of nitrous anhydride on *tri*bromethylene (Elbs and Newmann), A., i, 98.
  - α-*di*chloro-, formation of (Jocitsch and Faworsky), A., i, 786.
  - *tetra*chloro-, action of hypochlorous acid on (Henry and Aschmann), A., i, 258.
    - oxidation of (Swarts), A., i, 734.
  - chloro*tri*bromo- (Elbs and Newmann), A., i, 98.
  - αβ-*di*chloro-α-bromo- (Swarts), A., i, 725.
  - αβ-*di*chloro-αβ-*di*bromo- (Swarts), A., i, 725, 734.
  - *di*fluoro*di*bromo-, fluoro*tri*bromo-, and fluoro*di*bromo-, oxidation of (Swarts), A., i, 734.
  - *di*iodo- (*acetylene di-iodide*), stereoisomeric modifications of (Keiser), A., i, 398.
- **Ethyleneacetonitrile** (*cyclopropanecarboxylonitrile*) (Henry), A., i, 676.
- 5 : 5-**Ethylene-bisimino-1-phenyltriazoline** and its picrate (Cuneo), A., i, 549.
- **Ethylenediamine,** and its hydrate and dihydrochloride, thermochemistry of (Berthelot), A., ii, 726.
  - compounds of, with salts of nickel, copper, zinc, cadmium, and cobalt (Werner, Megerle, Pastor, and Spruck), A., i, 856.
  - action of, on *iso*butaldehyde, *iso*valeraldehyde, acetaldehyde, and glyoxal (Kolda), A., i, 328.
  - action of nitrosyl chloride on (Solonina), A., i, 561.
  - action of trimethylenic bromide and benzenesulphonic chloride on (Bleier), A., i, 664.
- **Ethylenedibenzenesulphonamide,** action of trimethylenic bromide and benzylic chloride on (Bleier), A., i, 664.
- **Ethylenedibenzimidazole** and salts (Walther and Pulawski), A., i, 640.
- **Ethylenedipiperidyl** methiodide and dimethiodide (Aschan), A., i, 542.
- **Ethylene-*p*-toluenesulphonamide** (Howard and Marckwald), A., i, 750.
- **Ethylenelactic acid,** nitrile of. See β-Hydroxypropionitrile.
- **Ethylenepropylenedipiperidyl** bromide (Aschan), A., i, 542.
- **Ethylenesulphonic acid** (Kohler), A., i, 19.
  - bromo-, and its chloride (Kohler), A., i, 20, 488.
- **Ethylenetetracarboxylic acid** (*dicarbintetracarboxylic acid*), ethylic salt, preparation of (Blank and Samson), A., i, 484.
- **Ethylenethiolcarbamic acid** (Wheeler and Barnes), A., i, 798.
- **Ethylene-ψ-thiocarbamide,** action of nitrous acid on, and its constitution; also its nitro-derivative (Gabriel and Leupold), A., i, 104.
- **Ethylenetrimethylenediimine** (Howard and Marckwald), A., i, 750.
- **Ethylenetrimethylenedi-*p*-toluenesulphonimide** (Howard and Marckwald), A., i, 750.
- **Ethylenic** bromide, from action of aluminium bromide on ethylic bromide, and action of aluminium bromide on (Mouneyrat), A., i, 1.
  - effect of pressure on melting point curves of (Tammann), A., ii, 636.
  - equilibrium between picric acid, β-naphthol and (Bruni), A., ii, 406.
  - deposition of ferrous salts from (Thomas), A., ii, 426.

- **Ethylenic** bromide, action of solution of aluminium bromide in carbon disulphide on (Konowaloff), A., i, 470.
    - action of chlorine on, in presence of aluminium chloride (Mouneyrat), A., i, 241.
  - chloride, combination of, with aluminium chloride and carbon disulphide (Konowaloff), A., i, 471.
  - chlorobromide and cyanide, molecular weights of, in ethylenic bromide solution (Bruni and Gorni), A., ii, 731.
- **Ethylenic glycol,** preparation of (Henry), A., i, 660.
  - specific heat, and heat of vaporisation of (Luginin), A., ii, 269.
  - melting point of (Ladenburg and Krügel), A., ii, 545.
  - action of hydrobromic and hypobromous acids on (Mokiewsky), A., i, 729.
  - action of hydrogen peroxide on, in presence and in absence of iron (Fenton and Jackson), T., 2; P., **1898**, 240.
  - action of ozone on (Otto), A., ii, 282.
  - oxidation of, by atmospheric oxygen in sunlight in presence of iron (Fenton and Jackson), T., 10; P., **1898**, 240.
  - aluminium derivative, preparation of (Tistschenko), A., i, 408.
  - chlorhydrin, action of ammonia on (Chancel), A., i, 411.
  - methylene, ethylidene, and *iso*butylidene derivatives (Verley), A., i, 665.
- **Ethylenic** nitrosite and nitrate, and their reduction (Demjanoff), A., i, 845.
  - oxide, action of, on ethylic sodiomalonate (Traube and Lehmann), A., i, 417.
    - condensation of, with ammonia and amines (Knorr), A., i, 461.
  - *di*thiocarbonate, synthesis of (Konowaloff), A., i, 470.
- **1-Ethyl-2 : 3-ethylenepiperidine,** and its salts (Ladenburg and Krügel), A., i, 303.
- **α-Ethylglyceric acid** (*dihydroxyvaleric acid*), and lead salt; also oxidation (Semenoff), A., i, 866.
- **Ethyl heptadecyl ketone,** action of nitric acid on; also oxime (Ponzio and Gaspari), A., i, 861.
  - *iso*nitroso-, and action of hydroxylamine on (Ponzio and Gaspari), A., i, 861.
- **Ethyl *iso*hexyl ketone,** oxidation of, by nitric acid (Fileti and Ponzio), A., i, 111.
- **Ethyl *iso*hexyl ketone** and its *iso*nitroso-derivative (Ponzio and de Gaspari), A., i, 253.
- **Ethylhydroxyamylthiocarbamide,** and the action of hydrochloric acid on it (Jänecke), A., i, 477.
- **Ethylic alcohol,** synthesis of (Wood), A., i, 182; (Berthelot), A., i, 471.
  - manufacture of, from sawdust (Simonsen), A., i, 471.
  - denatured, regeneration of, by means of bleaching powder (Buisine), A., i, 728.
  - dielectric constant of, temperature coefficient of (Abegg and Seitz), A., ii, 623.
  - copper | zinc cell with hydrochloric or *tri*chloracetic acid, E.M.F. of (Salvadori), A., ii, 721.
  - specific heat and latent heat of vaporisation of (Luginin), A., ii, 269.
  - critical temperature of mixtures of, with ethane (Kuenen and Robson), A., ii, 356.
  - melting point of (Ladenburg and Krügel), A., ii, 545.
  - boiling points of mixtures of, with benzene (Thayer), A., ii, 140.
  - boiling points of mixtures of, with acetone or chloroform (Thayer), A., ii, 402.
  - vapour pressures of solutions of, in benzene (Lehfeldt), A., ii, 633.
  - vapour pressures of mixtures of, with benzene, toluene, or carbon *tetra*chloride (Lehfeldt), A., ii, 11.
  - depression of freezing point of water by (Raoult), A., ii, 203.
  - polymerisation of, in benzene or toluene (Speyers), A., ii, 468.
  - aqueous, dissociation of electrolytes and inversion of sugar in (Cohen), A., ii, 275.
  - equilibrium between ammonium or sodium sulphates, or potassium carbonate, water and (de Bruyn), A., ii, 591.
  - equilibrium between potassium nitrate, water and, temperatures at which two liquid phases appear (Dodge and Gratton), A., ii, 408.
  - equilibrium between water, potassium carbonate and (Snell), A., ii, 408.
  - velocity of reaction between ethylic benzenesulphonate and (Sagrebin), A., ii, 735.
  - sodium derivative, action of, on ethylic salts of α-bromo-fatty acids (Bischoff), A., i, 669.

Ethylic alcohol, action of hydrogen peroxide on, in presence and in absence of iron (Fenton and Jackson), T., 2; P., **1898**, 240.
- action of mercuric chloride on, in presence of sodium ethoxide and sodium acetate (Hofmann), A., i, 485.
- action of phosphorus tribromide on (Menschutkin), A., i, 937.
- action of ozone on (Otto), A., ii, 282.
- flash points of aqueous solutions of (Raikow), A., i, 847.
- compound of, with carbon *di*oxide and water (Hempel and Seidel), A., ii, 152.
- influence of, on human respiration (Wendlestadt), A., ii, 602.
- analysis of aqueous (Curtis), A., ii, 184.
- detection of, in ether (Lassar-Cohn), A., ii, 528.
- estimation of, in presence of light petroleum (Richmond), A., ii, 698.
- estimation of methylic alcohol in (Trillat), A., ii, 130.

Ethylic alcohol, bromo-, and action of zinc dust on (Mokiewsky), A., i, 729.
- ββ-bromonitro-, and its nitrate and acetate; also action of formaldehyde and acetaldehyde on (Maas), A., i, 322.
- α- and β-cyano-. See α- and β-Hydroxypropionitriles.
- β-nitro-, action of phosphorus *penta*chloride, formaldehyde, and piperidine on; also acetate and sodium derivative (Henry), A., i, 728.

Ethylic allylic ether, compound of, with sulphur *di*oxide (Solonina), A., i, 682.
- amylic ether (Peter), A., i, 558.
  - density, specific rotation and molecular volume of (Frankland), T., 360.
  - sulphide, specific rotation of (Brjuchonenko), A., ii, 265.
- *n*- and *iso*-amylic sulphides, specific rotation of, and the action of methylic iodide on (Brjuchonenko), A., i, 189.
- bromide, melting point of (Ladenburg and Krügel), A., ii, 545.
  - viscosity coefficient of (Guye and Friderich), A., ii, 358.
  - velocity of reaction of, with triethylamine (Hemptinne and Bekaert), A., ii, 359.
  - action of aluminium bromide on (Mouneyrat), A., i, 1; (Konowaloff), A., i, 471.

Ethylic βγ-*di*bromobutylic ether (Charon), A., i, 849.
- α-bromopropylic ether (Wolkoff and Menschutkin), A., i, 196.
- carbonate, specific heat, and heat of vaporisation of (Luginin), A., ii, 269.
  - heat of combustion of (Zouboff), A., ii, 589.
- chloride, solution of, in compressed methane (Villard), A., ii, 143.
- crotonylic ether (Charon), A., i, 848.
- β-diethylallylic ether (Ipatieff), A., i, 658.
- dimetaphosphate (Tanatar), A., ii, 417.

Ethylic ether, influence of water on the velocity of formation of (de Bruyn and Steger), A., i, 849.
- melting point of (Ladenburg and Krügel), A., ii, 545.
- critical temperature of mixtures of, with water (Kuenen and Robson), A., ii, 356.
- depression of the freezing point of a mixture of acetone and water by (Waddell), A., ii, 403.
- specific volume of (Leduc), A., ii, 729.
- diffusion coefficient of, across vulcanised caoutchouc (Flusin), A., ii, 205.
- mutual solubilities of water and (Herz), A., ii, 83.
- compound of, with carbon *di*oxide and water (Hempel and Seidel), A., ii, 152.
- action of liquid hydrogen iodide on (Cottrell and Rogers), A., i, 323.
- extraction of liquids with, apparatus for (Baum), A., ii, 802.
- detection of alcohol in (Lassar-Cohn), A., ii, 528.
- estimation of, in presence of light petroleum (Richmond), A., ii, 698.

Ethylic ether, *tri*chloro-, from action of chlorine on triethylic borate (Copaux), A., i, 183.
- nitro- (Henry), A., i, 729.

Ethylic hexylenic ether (Ipatieff), A., i, 658.
- hydrogen carbonate (Hempel and Seidel), A., ii, 152.
- hyponitrite (Divers), T., 121.
- iodide, viscosity coefficient of (Guye and Friderich), A., ii, 358.
  - combination of, with aluminium iodide and carbon *di*sulphide (Konowaloff), A., i, 471.
- mercaptan, condensation of, with vinyldiacetonamine and triacetonamine (Pauly), A., i, 228.

Ethylic mercaptan, amino-, from action of hydrochloric acid on mercaptothiazoline (GABRIEL and LEUPOLD), A., i, 104.
metaborate, non-existence of (COPAUX), A., i, 847.
β-methylethylallylic ether (IPATIEFF), A., i, 658.
phosphate, from oxidation of triethylphosphine (ENGLER and WEISSBERG), A., i, 189.
velocity of hydrolysis of (CAVALIER), A., ii, 14.
*di*sulphide, *di*thiocyano- (KOHLER), A., i, 737.
trimetaphosphate (TANATAR), A., ii, 417.

Ethylideneacetone, preparation of (CLAISEN), A., i, 667.
*tri*chloro-, and action of hydroxylamine and potash on (SALKIND), A., i, 733.

Ethylideneaminoguanidine, and its *mono-* and *tri*chloro-derivatives, salts of (THIELE and DRALLE), A., i, 7.

Ethylideneazine (CURTIUS and ZINKEISEN), A., i, 166.

Ethylidenebismalonic acid. See Butanetetracarboxylic acid.

Ethylidenechlorodiphenamines, chloro-derivatives of (EIBNER), A., i, 42.

Ethylidenediacetic acid. See *β*-Methylglutaric acid.

Ethylidenediacetoacetic acid, ethylic salt, desmotropic forms of (RABE), A., i, 289.

Ethylidenediphenamine, *di*chloro- and *di-p*-chloro-, *tri*chloro-, and *di-p*-nitro- (EIBNER), A., i, 41, 42.

Ethylidene-*p*-ditolamine, *tri*chloro- (EIBNER), A., i, 42.

Ethylidenehydroxybutylenethylenediamine (KOLDA), A., i, 328.

Ethylideneimine, constitution of; also the action of hydrogen sulphide on it (DELÉPINE), A., i, 326.
from aldehyde-ammonia (DE FORCRAND), A., i, 109.
*tri*chloro-, from the action of sodium hypochlorite on aldehyde-ammonia in presence of acetic acid (DELÉPINE), A., i, 327.

Ethylidenemalonic acid (*propylidenedicarboxylic acid*, ethylic salt, formation of (KNOEVENAGEL), A., i, 116.

Ethylidene-*p*-nitrodiphenamine, *tri*chloro- (EIBNER), A., i, 42.

Ethylidenephthalide, preparation of (GOTTLIEB), A., i, 511.

Ethylidenephthalimidylacetic acid, and its silver salt (GOTTLIEB), A., i, 512.

Ethylitaconic acid and its reduction, and the action of bromine and hydrogen bromide on it (FITTIG and GLASER), A., i, 333.

Ethylitapyrotartaric acid, bromo- and *di*bromo- (FITTIG and GLASER), A., i, 334.

Ethyl-laurotetanine and its hydriodide (FILIPPO), A., i, 313.

Ethylmalonic acid, potassium salt, heat of formation of (MASSOL), A., ii, 204.
l-amylic salt, molecular rotation of (WALDEN), A., ii, 622.

Ethylmalononitrile (HESSLER), A., i, 899.

Ethylmesaconic acid, preparation of, from ethylic *di*bromopropylacetoacetate (SEMENOFF), A., i, 792.
and its reduction (FITTIG and GLASER), A., i, 334.

iso-**Ethylmethylnitramine**, action of sulphuric acid on (FRANCHIMONT and UMBGROVE), A., i, 106.

Ethylmorphine hydrochloride (*dionine*), and its detection and therapeutic uses (HESSE), A., i, 724.

1″-Ethylnaphthalanmorpholine salts and methiodide (KNORR), A., i, 783.

Ethylnaphthaphenazonium, and amino-derivative (SCHAPOSCHNIKOFF), A., i, 505, 506.
salts, chloro- (FISCHER and HEPP), A., i, 78.

Ethylnaphthaphenosaffranine, platinochloride (SCHAPOSCHNIKOFF), A., i, 506.

Ethylnaphthindolinonequinonecarboxylic acid, ethylic salt (LIEBERMANN), A., i, 523.

Ethylnitramine and its metallic derivative, action of sulphuric acid and of propylic iodide on (FRANCHIMONT and UMBGROVE), A., i, 106.

Ethylnitrolic acid, erythro- and leuco-salts of; constitution; action of alkalis, sodium amalgam and bromine on; also ethers (GRAUL and HANTZSCH), A., i, 187.

Ethyloxalic chloride. See Glyoxylic acid, chloro-, ethylic salt.

Ethyloxychlorophosphine (GUICHARD), A., i, 564.

Ethylparaconic acid, ethylic salt, and its conversion into ethylitaconic acid (FITTIG and GLASER), A., i, 333.

Ethyl pentadecyl ketone, *iso*nitroso-, and action of hydroxylamine on (PONZIO and GASPARI), A., i, 860.

γ-**Ethylpentane,** *αγ*-*di*bromo-. See Heptane, *di*bromo-.

γ-**Ethylpentylene,** *α*-bromo-. See Heptylene, bromo-.

Ethylpentylene-ψ-thiocarbamide (Jänecke), A., i, 477.
N-**Ethylphenacetine** (Hinsberg), A., i, 495.
Ethyl-*o*-phenetidine (Friedländer), A., i, 350.
p-**Ethylphenol**, synthesis of (Meissel), A., i, 880.
Ethylphosphinic acid (Guichard), A., i, 564.
  diethylic salt, from oxidation of triethylphosphine (Engler and Weissberg), A., i, 189.
Ethylphosphinous acid (Guichard), A., i, 564.
1′-Ethylphthalazine, salts, and 4′-chloro-, and 4′-iodo-derivatives (Paul), A., i, 777.
3′-Ethylphthalazone (Paul), A., i, 778.
Ethylphthalide, and nitro- (Gottlieb), A., i, 512.
1-Ethyl-2-pipecoline (Ladenburg and Krügel), A., i, 303.
N-**Ethyl-α-pipecoleyl-β-alkine.** See 2-Methyl-3-hydroxymethyl-1-ethyl-Δ^2-tetrahydropyridine.
N-**Ethyl-α-pipecoleyl-β-methylalkine.** See 2-Methyl-1-ethyl-3-hydroxyethyl-Δ^2-tetrahydropyridine.
1-Ethyl-2-pipecoleine (Ladenburg and Krügel), A., i, 303.
  rotation of (Hohenemser and Wolffenstein), A., i, 937.
N-**Ethyl-α-pipecolyl-β-alkine.** See 2-Methyl-3-hydroxymethyl-1-ethylpiperidine.
N-**Ethyl-α-pipecolyl-β-methylalkine.** See 2-Methyl-1-ethyl-3-hydroxyethylpiperidine.
Ethylpropanediolamine. See γ-Ethylamino-αβ-propylenic glycol.
1-Ethyl-2 : 3-propylenepiperidine (Ladenburg and Rosenzweig), A., i, 304.
Ethyl propyl diketone (*propionylbutyryl*), and its dioxime (Fileti and Ponzio), A., i, 111.
Ethyl propyl ketone, *iso*nitroso-derivatives of, from action of nitrous acid on it (Ponzio and de Gaspari), A., i, 252.
Ethylpropylnitramine, and *iso*-**Ethylpropylnitramine** (Franchimont and Umbgrove), A., i, 105, 106.
1 : 3-Ethylpropylpiperidine, and **1 : 3-Ethyl*iso*propylpiperidine** (Ladenburg and Rosenzweig), A., i, 304.
2-Ethylpyridine, mercurichloride (Ladenburg), A., i, 387.
4-Ethylpyridine (*β-lutidine*), action of potassium dichromate and sulphuric acid on (Oechsner de Coninck), A., i, 472.
Ethylrosindone (Schaposchnikoff), A., i, 506.
Ethylrosinduline, nitrate (Schaposchnikoff), A., i, 506.
d-**Ethylsantonous acid**, from reduction of *l*-ethyldesmotroposantonin (Andreocci and Bertolo), A., i, 301.
Ethylstrychnine (Moufang and Tafel), A., i, 310.
Ethylsuccinic acid, β-bromo- (Semenoff), A., i, 866, 867.
Ethyltetraethyl-*m*-aminophenolsaccharein (Monnet and Kœtschet), A., i, 214.
1′-Ethyltetrahydrophthalazine, and dibenzoyl derivative (Paul), A., i, 777.
Ethyltetrahydroquinoline (Baillie and Tafel), A., i, 268.
2-Ethyltetramethylene disulphide and disulphone (Autenrieth and Wolff), A., i, 580.
Ethyltheobromines (Brunner), A., i, 306.
Ethylthiocarbimide, action of, on sodium acetanilide (Dixon), T., 384.
Ethyl*tri*thiocarbonic acid, potassium salt, electrolysis of solution of (Schall and Kraszler), A., i, 414.
Ethylthiochlorophosphine (Guichard), A., i, 564.
Ethyl-*o*-toluidine (Baillie and Tafel), A., i, 268; (Friedländer), A., i, 350.
Ethylurethane, nitroso-, behaviour of, towards alcoholic potash (von Pechmann), A., i, 134.
Ethyl-*m*-xylidine (Friedländer and Brand), A., i, 351.
Eucaine, detection of (Vulpius), A., ii, 392.
Eucaine-B, physiological action of (Vinci), A., ii, 316.
Eucalyptus capitellata, *E. dextropinea*, *E. eugenoides*, *E. lævopinea*, and *E. macrorrhyncha*, oils of (Schimmel and Co.), A., i, 923.
  obliqua, *E. resinifera*, *E. rostrata*, oils of (Schimmel and Co.), A., i, 299.
Eucarvone (Wallach), A., i, 531.
Euchroic acid, and **Paraeuchroic acid** (Mathews), A., i, 58.
Eugenol, action of sodium on, in alcohol (Kunz-Krause), A., i, 200.
iso-**Eugenol**, action of ozone on (Otto), A., ii, 282.
Eutropic series (Linck), A., ii, 415.
Euxenite-like mineral from Swaziland (Prior), A., ii, 434.
Evansite from Moravia (Kovář), A., ii, 672.
Everninic acid, presence of, in *Physcia ciliaris* (Hesse), A., i, 382.

Excretion of iron in the guinea pig (SWIRSKI), A., ii, 373.

Expansion, thermal, of ordinary and Jena glass (LADENBURG and KRÜGEL), A., ii, 467.

Extraction apparatus (FOERSTER), A., i, 121.

F.

Fabianaglucotannoid (KUNZ-KRAUSE), A., i, 201, 448.

Fabianaresen, and its bromo-, acetyl and benzoyl derivatives and reduction product (KUNZ-KRAUSE), A., i, 449.

Fabianol (KUNZ-KRAUSE), A., i, 448.

Fæces, estimation of phosphoric acid in (NEUMANN), A., ii, 54.

Fahlerz. See Tetrahedrite.

Farmyard manure. See Agricultural chemistry.

Fat, determination of melting point of (LE SUEUR and CROSSLEY), A., ii, 271; (DOWZARD), A., ii, 725.
  supposed conversion of, into glycogen in the living body (PFLÜGER), A., ii, 604.
  formation of, from proteid in the living body (CREMER), A., ii, 775.
  formation of, in liver in cases of gastroenteritis (THIEMICH), A., ii, 233.
  formation of, in poisoning by phloridzin and phosphorus (RAY, MCDERMOTT, and LUSK), A., ii, 783.
  formation of supposed, in phosphorus poisoning (ATHANASIU), A., ii, 441.
  oxidation of, by means of ozone (HANRIOT), A., i, 190.
  oxidation of, separation of the dibasic acids formed by (BOUVEAULT), A., i, 480.
  rancidity of (SCALA), A., i, 478.
  source of, in the fœtus (THIEMICH), A., ii, 775.
  analysis of (BÖMER), A., ii, 191.
  refraction constants of (PROCTER), A., ii, 258.
  saponification of, apparatus for (ANNAN), A., ii, 343.
  detection of phytosterol and cholesterol in (KREIS and WOLF), A., ii, 343.
  estimation of, in animal tissues and fluids (NERKING), A., ii, 191; (KNOPFELMACHER), A., ii, 821.
  estimation of, in food stuffs (METHNER), A., ii, 821.
  estimation of, in milk (KÜHN), A., ii, 582; (RICHMOND and ROSIER; RICHMOND and O'SHAUGHNESSY), A., ii, 708; (SONN), A., ii, 709; (BONNEMA; TIMPE; WINDISCH), A., ii, 822.

Fat, estimation of free phosphorus in (LOUÏSE), A., ii, 807.

Fats. See also:—
  Butter.
  Cacao butter.
  Lard.
  Margarine.
  Tallow.

Fatigue, muscular, causes of (LEE), A., ii, 312.

"**Favas**" from Brazil (HUSSAK), A., ii, 432.

Fehling's solution (BULLNHEIMER and SEITZ), A., i, 868.
  the blue salt of (MASSON and STEELE), T., 725; P., **1899**, 120.

Felspar from Russia, &c. (LOEWINSON-LESSING), A., ii, 766.
  artificial (MOROZEWICZ), A., ii, 762.
  action of water on (CLARKE), A., ii, 109.
  pelitisation of (LOEWINSON-LESSING), A., ii, 767.
  decomposition of, by roots (SESTINI), A., ii, 798.
  See also Anorthoclase, Oligoclase, Orthoclase, Plagioclase.

Fenchene, behaviour of, towards glacial acetic and sulphuric acids (SCHIMMEL and Co.), A., i, 299.

d- and *l*-**Fenchene** (WALLACH and HERTZ), A., i, 66.

Dd- and *Dl*-**Fenchocamphorone**, oxime, semicarbazone (WALLACH and HERTZ), A., i, 66.

α-**Fencholenic acid**, and salts, nitrile (COCKBURN), T., 506; P., **1899**, 106.

β-**Fencholenic acid**, and salts, amide and nitrile (COCKBURN), T., 503; P., **1899**, 106.

Fenchone, behaviour of, towards sulphuric acid (MARSH), T., 1058; P., **1899**, 196.

l-**Fenchone**, reconversion of, into *d*-fenchylic alcohol (BOUCHARDAT and LAFONT), A., i, 157.

Dl-**Fenchylic alcohol**, behaviour of, towards phosphorus pentachloride (WALLACH and HERTZ), A., i, 65.

Fergusonite (?) from Swaziland (PRIOR), A., ii, 434.
  an endothermic mineral (RAMSAY and TRAVERS), A., ii, 35.

Ferment, proteolytic, presence of a, in fungi (BOURQUELOT and HÉRISSEY), A., i, 313.
  cellulose-digesting, in *Helix pomatia* (BIEDERMANN and MORITZ), A., ii, 166.

Ferments, secretion of (DIENERT), A., ii, 683.
  diastatic, action of, on inulin (CHITTENDEN and SIVITER), A., ii, 310.

- **Ferments.** See also :—
  - Enzymes.
  - Yeast.
- **Fermentation,** by yeast-, influence of oxygen and mechanical shaking on (BUCHNER and RAPP), A., ii, 169.
  - of galactose by yeasts, influence of various carbohydrates on (DIENERT), A., ii, 442.
  - of sugars by yeasts and moulds and influence of nitrogenous matter thereon (DUBOURG), A., ii, 376.
  - alcoholic, of Barbary figs (ROLANTS), A., ii, 784.
    - action of pancreas on (LÉPINE and MARTZ), A., ii, 442.
    - the formation of glycerol in, and influence of various conditions on (LABORDE), A., ii, 784.
    - production of aromatic substances from vine leaves (JACQUEMIN), A., ii, 377.
    - influence of various poisons on (WEHMER), A., ii, 786.
    - by yeast, relation of, to food supply (STERN), T., 205 ; P., **1898**, 183.
    - without yeast cells (BUCHNER and RAPP), A., ii, 236, 606.
  - lactic (CLAFLIN), A., i, 12.
  - schizomycetic (EMMERLING), A., ii, 570.
- **Ferns,** chlorophylls and other constituents of (ÉTARD), A., ii, 792.
- **Ferric** compounds. See under Iron.
- β-**Ferricyanides** (LOCKE and EDWARDS), A., i, 407.
- **Ferrocyanides,** estimation of (MULLER), A., ii, 616.
  - estimation of, in spent gas purifying material (DONATH and MARGOSCHES), A., ii, 527.
- **Ferrous** compounds. See under Iron.
- **Ferulic acid,** presence of, in opoponax (TSCHIRCH and KNITL), A., i, 714.
- **Fescue.** See Agricultural chemistry.
- **Fever,** composition of the urine in (VON MORACZEWSKI), A., ii, 441.
  - excretion of chlorides in (HUTCHISON), A., ii, 168.
- **Fibre,** estimation of, in fodders and foods (KÖNIG), A., ii, 68.
- **Fibrin,** chemical process in the formation of, from fibrinogen (HAMMARSTEN), A., ii, 776.
  - crystallisation of (MAILLARD), A., i, 466.
  - crystalline, nature of so-called (DZIERZGOWSKI), A., ii, 777.
  - solution of, by bacteria, in presence of chloroform (SALKOWSKI), A., i, 724.
  - ultimate action of proteolytic ferments on (HARLAY), A., i, 656.
- **Fibrinogen,** origin of, in the living body (MATHEWS), A., ii, 777.
- **Fibroin,** action of acids on (WETZEL), A., i, 466.
- **Fibrolite,** from Aberdeenshire (HEDDLE), A., ii, 497.
- *Ficus macrophylla, F. elastica, F. nitida, F. lævigata,* caoutchouc from (LINDET), A., ii, 508.
- **Fiedlerite,** from Laurion, Greece (SMITH and PRIOR), A., ii, 433.
- **Fig.** See Agricultural chemistry.
- **Filicic acid,** and its diacetate, dichloride, *mono-*, *di-*, *tri-*, and *tetra*bromo-, and *tetra*chloro-derivatives, methyl, ethyl, and diethyl ethers (BOEHM), A., i, 804.
- **Filtering medium,** new form of (SARGENT and FAUST), A., ii, 516.
- **Filters,** asbestos (LOHSE), A., ii, 801.
- **Filtration** of small quantities of liquid (WINKLER), A., ii, 277.
  - rate of, of water or alcohol through various media, and of organic liquids (HAUSSER), A., ii, 277.
- **Fisetin,** potassium derivative of, and Schmid's disodium derivative (PERKIN), T., 441 ; P., **1899**, 65.
- **Fish,** digestibility of (SCHULZE), A., ii, 509.
- **Fishes,** metabolism of (KNAUTHE), A., ii, 310.
- **Fish oils,** saponification value of (FAHRION), A., ii, 711.
- **Flames,** containing vaporised salts, electric conductivity and luminosity of (SMITHELLS, DAWSON, and WILSON), A., ii, 722.
- **Flash points** of organic compounds (RAIKOW), A., i, 847.
- **Flavaniline** (4-*amino*-2′-*phenyl*-3′-*methylquinoline*), formation of (BRÄUTIGAM), A., i, 754.
- **Flavescin,** use of, in alkalimetry (GLASER), A., ii, 573.
- **Flavinduline,** condensation of, with deoxybenzoin (SACHS), A., i, 239.
- **Flavone,** 2-bromo- (VON KOSTANECKI, and LUDWIG), A., i, 220.
- **Flavone-group,** syntheses in (VON KOSTANECKI), A., i, 368.
  - of colouring matters, salts of, and their acidic and basic properties and structure (PERKIN), T., 436, 450 ; P., **1899**, 65.
- **Flour,** detection of sawdust in (LE ROY), A., ii, 453.
- **Fluoran,** amino-, *i*-*di*amino-, nitro-, and *i*-*di*nitro- (MEYER and FRIEDLAND), A., i, 764.
- **Fluorescein** as an indicator (WADDELL), A., ii, 83 ; (GLASER), A., ii, 573.

Fluorescein, derivative ($C_{20}H_{15}O_2N_3$) and ethylic salt, and hydrochloride (MEYER and GROSS), A., i, 946.
hydrochloride (GATTERMANN and OEHMICHEN), A., i, 514.
phenylhydrazide, and dichloride, and dimethylic and diethylic ethers (GATTERMANN and GANZERT), A., i, 514.
Fluorescein, thio- (GATTERMANN and GANZERT), A., i, 513.
Fluorescence, production of, by bacteria (JORDAN), A., ii, 318.
Fluorine in mineral waters (CARLES), A., ii, 308; (PARMENTIER), A., ii, 501, 675; (LEPIERRE), A., ii, 602.
preparation of, in copper vessels (MOISSAN), A., ii, 593.
detection of, in wine (PARIS), A., ii, 804.
estimation of (HEMPEL and SCHEFFLER), A., ii, 380.
Fluorides, physiological action of (BALDWIN), A., ii, 605.
Fluor spar, decomposition of, by oxalic or tartaric acid (PATERNÒ and ALVISI), A., ii, 17.
Fodder, estimation of fibre in (KÖNIG), A., ii, 68.
estimation of sugar in (FOERSTER), A., ii, 818.
Fœtus, human, inorganic salts and iron in the (HUGOUNENQ), A., ii, 503.
Food, proteid, digestibility of certain (SCHULZE), A., ii, 509.
artificial digestion of constituents of (WEDEMEYER), A., ii, 460.
organic, effect of, on inorganic metabolism (PUGLIESE), A., ii, 40.
detection of formaldehyde in (JEAN), A., ii, 704.
detection of metals in, by Kjeldahl's process (HALENKE), A., ii, 696.
detection of "saccharin" in (HASTERLIK), A., ii, 819.
estimation of fat in (METHNER), A., ii, 821.
estimation of fibre in (KÖNIG), A., ii, 68.
tinned, estimation of lead in (CARLES), A., ii, 183.
Forest fires. See Agricultural chemistry.
Formaldehyde, hydrate of (DELÉPINE), A., ii, 143.
action of, on ethylenic glycol and glyceryl chlorhydrin in presence of phosphoric acid (VERLEY), A., i, 665.
action of hydrogen peroxide on (HARDEN), P., **1899**, 158; (BLANK and FINKENBEINER) A., ii, 188, 820; (KASTLE and LOEVENHART), A., i, 565.
Formaldehyde, action of mercuric sulphate on (DENIGÈS), A., i, 414.
formation of morfose from (LOEW), A., i, 850.
action of, on derivatives of β-naphthylamine (MORGAN), P., **1899**, 9.
action of, on nitric acid (VANINO), A., ii, 479.
action of oxygen on solutions of; alone and in presence of potash and platinum sponge (DELÉPINE), A., i, 246.
action of, on proteids (LEPIERRE), A., i, 654.
condensation of, with quinaldine (KOENIGS), A., i, 389.
condensation of, with semicarbazide (THIELE and BAILEY), A., i, 109.
action of, on silver haloids and thiocyanate (VANINO), A., ii, 249.
combination of, with terpenes (KRIEWITZ), A., i, 298.
action of, on digestion (WEDEMEYER), A., ii, 460.
action of, on beet-root seeds (JODIN), A., ii, 44.
detection of (LEONARD and SMITH), A., ii, 454; (NEUBERG), A., ii, 580; (VANINO), A., ii, 703.
detection of, in milk (LEYS), A., ii, 819.
detection of, in food stuffs (JEAN), A., ii, 704.
estimation of (BLANK and FINKENBEINER), A., ii, 188, 820; (NEUBERG), A., ii, 580.
estimation of small quantities of (NICLOUX), A., ii, 253.
examination of (SMITH), A., ii, 188.
Diformaldehyde (*dioxymethylene*), formation of (GRASSI-CRISTALDI and MASELLI), A., i, 409.
Metaformaldehyde, heat of formation of (DELÉPINE), A., ii, 142.
Paraformaldehyde (*trioxymethylene*), heat of formation of (DELÉPINE), A., ii, 142.
acetates and hydrate of (GRASSI-CRISTALDI and MASELLI), A., i, 409.
*di*chloro- (*dichloromethylal*), and the action of sodium acetate on it; also its condensation with benzene (GRASSI-CRISTALDI and MASELLI), A., i, 409.
Formaldehyde-*p*-nitrophenylhydrazone (BAMBERGER), A., i, 666.
Formaltetrazylhydrazone, *di*bromo- (THIELE), A., i, 170.
Formamide, oxidation of (ŒCHSNER DE CONINCK), A., i, 509.
p-**Formamidodiphenylamine,** *p*-chloro- (JACOBSON and STRÜBE), A., i, 273.

- **Formamidoguanidine**, nitrate (Thiele and Manchot), A., i, 167.
- **Formamido-orcinol** (Heinrich), A., i, 173.
- **Formanilide**, oxidation of (Œchsner de Coninck), A., i, 509.
  - *p*-chloro-, formation of (Chattaway and Orton), T., 1049; P., **1899**, 153.
- **Formazyl**, nitro-, conversion of, into diphenyloxytetrazolium hydroxide (Bamberger), A., i, 355.
- **Formethylanilide** (Wheeler and Johnson), A., i, 354, 431.
- **Formhydroxamic acid** and its ethers (Nef), A., i, 109.
- **Formic acetic anhydride** (Béhal), A., i, 734.
- **Formic acid**, surface tension of, aqueous solutions of (Forch), A., ii, 641.
  - diffusion velocity and association of (Hüfner), A., ii, 9.
  - influence of, on formation of azo-compounds (Goldschmidt and Bürkle), A., ii, 276.
  - behaviour of, towards cyclic ketones (Klages), A., i, 624.
  - presence of, in plants and production from cane sugar (Lieben), A., ii, 45.
  - estimation of small quantities of (Nicloux), A., ii, 253.
  - estimation of, in presence of acetic acid (Leys), A., ii, 132.
  - separation of acetic, propionic, and butyric acids from (Haberland), A., ii, 531.
  - separation of, from other fatty acids (Holzmann), A., ii, 68.
- **Formic acid**, isomorphous calcium, barium, strontium, and lead salts of (Plathan), A., i, 253.
  - potassium salt, boiling point of solutions of, in alcohol (Krafft), A., ii, 471.
  - sodium salt, solubility of benzoic acid in solutions of (Noyes and Chapin), A., ii, 274.
    - reaction between silver acetate and (Noyes and Cottle), A., ii, 205.
  - zinc salt, dissociation of solutions of (Calame), A., ii, 145.
  - amylic salt, density, specific rotation and molecular volume of (Frankland), T., 358.
    - action of, on ethylic sodiocyanacetate (Bollemont), A., i, 736.
  - orthethylic and orthomethylic salts, action of, on amylic cyanacetate in presence of acetic anhydride (Bollemont), A., i, 736.
  - methylic salt, boiling point and melting point of (Ladenburg and Krügel), A. ii, 545.
- **Formic acid**, cyano-, ethylic salt, condensation of, with ethylic sodiomalonate (Ruhemann and Cunnington), T., 786; P., **1899**, 169.
- **Formobenzyl-*m*-** and **-*p*-nitranilides**, and **-anisidide**, *p*-nitro- (Paal and Benker), A., i, 587.
- **Formoguanamine**, identity of, with diaminocyanuric hydride (Diels), A., i, 558.
- **β-Formo-*p*-nitrophenylhydrazide** (Hyde), A., i, 688.
- **Formophenylhydrazide**, preparation of (Leighton), A., i, 50.
- **Formose**, preparation of, by means of amorphous lead hydroxide (de Bruyn and Alberda van Ekenstein), A., i, 850.
- **Formylcyanacetic acid**, amylic salt, and its sodium, barium, and silver derivatives (Bollemont), A., i, 736.
- **Formylphenylnitrogen chloride** (*formylchloraminobenzene*), and *p*-chloro-, and 2 : 4-*di*chloro- (Chattaway and Orton), T., 1049; P., **1899**, 153.
- **Formyl-*m*-xylidide** (Busch), A., i, 496.
- **Forsterite** from Inverness-shire (Clough and Pollard), A., ii, 667.
- **Freezing point**, determination of (Shukoff), A., ii, 588.
  - of dilute solutions of sodium mellitate (Taylor), A., ii, 7.
  - of mixtures of acetic acid and water (de Coppet), A., ii, 546.
  - of mixtures of acetone and water, containing salicylic acid, phenol, *p*-nitrophenol, quinol, or ether (Waddell), A., ii, 403.
  - of mixtures of dibenzyl and stilbene (Garelli and Calzolari), A., ii, 732.
  - of mixtures of naphthalene and chloroacetic acid (Cady), A., ii, 405.
  - of mixtures of naphthalene and β-naphthol (Bruni), A., ii, 356.
  - of thymol, depression of, by amylic propionate (Schall), A., ii, 640.
  - of water, depression of, by dissolved substances (Raoult), A., ii, 203.
- **Friedelin** (Istrati and Ostrogovich), A., i, 772.
- **Fructose**. See Lævulose.
- **Fulminic acid**, mercury salt, constitution of (Ley and Kissel), A., ii, 486.
    - as a detonator (Alvisi), A., ii, 647.
- **Fumaric acid**, equilibrium between maleic acid and, in presence of ammonia (Bancroft), A., ii, 411.
  - compound of, with sulphuric acid (Hoogewerff and van Dorp), A., i, 672.

- **Fumaric acid**, magnesium salt, dissociation of, in solution (Calame), A., ii, 145.
  - ethylic salt, action of hypochlorous acid on (Henry and Aschmann), A., i, 258.
  - methylic salt, molecular weight of, in methylic succinate (Bruni and Gorni), A., ii, 731.
- **Fungi.** See Agricultural chemistry.
- **Fungin,** preparation of, from fungi (Tanret), A., ii, 171.
- **Fungoses**, preparation and properties of (Tanret), A., ii, 171.
- **Funnel**, separating (Kahlbaum), A., ii, 277 ; (Stober), A., ii, 552.
- **Furfuraldehyde** (*furfurol*), formation of, from starch, dextrin and gums (Sestini), A., i, 103.
  - oxidation of, with hydrogen peroxide (Cross, Bevan, and Heiberg), T., 747 ; P., **1899**, 130.
  - condensation of, with 2-acetyl-1-naphthol (Keller and von Kostanecki), A., i, 525.
  - action of, on argon (Berthelot), A., ii, 653.
  - action of bromine and chlorine on (Simonis), A., i, 741.
  - condensation of, with malonic acid and aniline (Knoevenagel), A., i, 145.
- **Furfuraldime**, hydrochloride of (Busch and Wolff), A., i, 950.
- **Furfuran** (*furan*), preparation of (Freundler), A., i, 120.
  - conductivity of solutions of potassium chloride and iodide, and of sodium bromide and iodide in (Euler), A., ii, 462.
  - derivatives from benzoin and phenols (Japp and Meldrum), T., 1035 ; P., **1899**, 167.
- **Furfuroids** in sugar-beet (Stoklasa), A., ii, 792.
- α-**Furfurylbutanone** (Harries and Kaiser), A., i, 578.
- **Furfurylcarbinol** (*furfurylic alcohol*), physical constants of (André), A., i, 578.
- β-**Furfuryl**-α-**dimethylenelactic acid**, ethylic salt (Daïn), A., i, 421.
- **Furfurylhydroresorcinol**, electrical conductivity of (von Schilling and Vorländer), A., i, 879.
- **2-Furfurylideneaceto-1-naphthol** and its acetyl derivative (Keller and von Kostanecki), A., i, 525.
- **Furfurylideneacetone**, action of hydrochloric acid on (Kehrer and Igler), A., i, 568.
  - reduction of (Harries and Kaiser), A., i, 578.
- **Furfurylideneacetophenone**, action of hydrogen chloride on (Kehrer and Igler), A., i, 569.
- **Furfurylidenediacetoacetic acid**, ethylic salt (Knoevenagel and Wedemeyer), A., i, 215.
- **Furfurylidenemalonic acid**, ethylic salt (Knoevenagel and Giese), A., i, 117.
- **3-Furfuryl-1-methyl-5-*cyclo*hexenone** and its oxime (Knoevenagel and Wedemeyer), A., i, 215.
- **3-Furfuryl-1-methyl-5-*cyclo*hexenonecarboxylic acid**, ethylic salt (Knoevenagel and Wedemeyer), A., i, 215.

G.

- **Gabbro,** amphibole-, from Sierra Nevada, U.S.A. (Turner and others), A., ii, 498.
- **Gahnite** (*kreittonite*) from N. Carolina (Hidden and Pratt), A., ii, 300.
- **Galactose**, fermentation of (Dienert), A., ii, 442.
  - fermentation of, by yeasts and moulds, in presence of nitrogenous matter (Dubourg), A., ii, 376.
  - oxidation of, by hydrogen peroxide ; methylphenylhydrazone (Morrell and Crofts), T., 790 ; P., **1899**, 100.
  - oxidation of, by sorbose bacterium (Bertrand), A., ii, 170.
  - fate of, after injection into the circulation (Pavy), A., ii, 677.
  - detection of (Gawalowski), A., ii, 255.
  - estimation of mannose in presence of (Bourquelot and Hérissey), A., ii, 817.
- **Galanga root,** crystalline constituents of (Ciamician and Silber), A., i, 537.
- **Galbanic acid,** sublimation product of (Tschirch and Knitl), A., i, 714.
- **Galbanum resin,** non-conversion of, into galbanic acid (Tschirch and Knitl), A., i, 714.
- **Galena** from Servia (Raušar), A., ii, 667.
  - zinciferous, from Utah (Miers and Hartley), A., ii, 432.
  - estimation of lead in (Moldenhauer), A., ii, 58 ; (Schneider), A., ii, 250.
- **Galipene,** from oil of Angostura bark (Beckurts and Troeger), A., i, 64.
- **Gallacetophenone** (*trihydroxyacetophenone*), action of potassium acetate on (Perkin), T., 443 ; P., **1899**, 65.
  - condensation of, with benzaldehyde (Rupe and Leontéeff), A., i, 371.

Gallein, use of, in alkalimetry (Glaser), A., ii, 573.

Gallic acid (3 : 4 : 5-*trihydroxybenzoic acid*), action of sodium on, in alcohol (Kunz-Krause), A., i, 200.
  detection of (Todeschini), A., ii, 341; (Griggi), A., ii, 581.
  separation from tannin (Vignon), A., ii, 135.

Gallotannic acid, optical activity of (Rosenheim and Schidrowitz), P., **1899**, 67.
  analysis of (Heinemann), A., ii, 455.

Ganglia, sympathetic, physiological action of extracts of (Cleghorn), A., ii, 569.

Garnet from Mexico (Lenk), A., ii, 305.
  from the Urals (Worobéeff), A., ii, 671.
  pseudomorphous, from the Urals (von Jereméeff), A., ii, 671.
  optical anomalies of (Karnojitsky), A., ii, 37.
  soda-, artificial (Morozewicz), A., ii, 764.
  See also Hessonite.

Gas, inflammable, in metalliferous mines (Nordenström), A., ii, 370.
  natural, from Point Abino, Canada, hydrogen sulphide in (Phillips), A., ii, 35.

Gas analysis, absorption of nitric oxide in (Divers), T., 82; P., **1898**, 221.
  estimation of sulphur (Phillips), A., ii, 35.

Gases evolved on heating minerals, &c., origin of (Travers), A., ii, 769.
  of the argon-helium type (Brauner), A., ii, 360.
  unknown, in the corona (Lockyer), A., ii, 717.
  physical properties of (Leduc), A., ii, 354.
  specific heats of, and mechanical equivalent of heat (Leduc), A., ii, 725.
  heat of solution of (Schiller), A., ii, 357.
  mixing of, increase of pressure caused by, and compressibility of the mixture (Berthelot), A., ii, 466.
  osmotic pressure in, determination of (Kistiakowski), A., ii, 730.
  compressed, volatilisation of solids and liquids in (Villard), A., ii, 143.
  solution of iodine in (Brown), P., **1898**, 244.
  solution of, in liquids, invasion and evasion coefficients in (Bohr), A., ii, 641.
  velocity of explosion of (Chapman), A., ii, 591.
  hydrates of (Villard), A., ii, 151.

Gases, measurement of (Bleier), A., ii, 51.

Gas-generator (Jäger), A., ii, 87.

Gas-oil, products of destructive distillation of (Müller), A., i, 27.

Gas-washing apparatus (Foerster), A., ii, 805.

Gaseous currents, synchronous apparatus for obtaining (Marboutin and Pécoul), A., ii, 517.

Gaseous reactions, dynamics of (Bodenstein), A., ii, 548.

Gastric juice, composition of human (Schüle), A., ii, 40.
  detection of hydrochloric acid in (Raikow), A., ii, 52.

Gastro-enteritis, fat in the liver of infants suffering from (Thiemich), A., ii, 233.

Gelatin, absorption spectrum of (Blyth), T., 1166; P., **1899**, 175.
  detection of (Gnezda), A., ii, 715.
  detection of, in albumin (Bonnema), A., ii, 196.
  detection of, in chocolate (Onfroy), A., ii, 76
  estimation of, in gums and foods (Trillat), A., ii, 196

Gelatin-dynamite, analysis of (Smith), A., ii, 528.

Gelsemic acid, identity of, with β-methylæsculetin; and reduction product (Schmidt), A., i, 72.

Genistein and its triacetyl and *tetra*bromo-derivatives, dimethyl ether, decomposition products and dyeing properties (Perkin and Newbury), T., 832, P., **1899**, 179.

Genista tinctoria, colouring matters and dyeing properties of (Perkin and Newbury), T., 830; P., **1899**, 179.

Gentian root, hydrolysis of constituents of (Bourquelot and Hérissey), A., i, 93, 840.

Geocronite from Sweden (Guillemain), A., ii, 757.

Geranial, identity of, with citral (Semmler), A., i, 223.
  from lemon-grass oil (Stiehl), A., i, 67.

Geranic acid, conversion of, into citronellic acid (Tiemann), A., i, 190.

Geraniol (*lemonol*) from *l*-linalool (Stephan), A., i, 68.
  in oils of neroli and petit grain (Charabot and Pillet), A., i, 620.
  in oil of petit grain (Passy), A., i, 65.
  action of alcoholic potash on (Tiemann), A., i, 184.
  behaviour towards formic and acetic acids, phthalic anhydride, and sulphuric acid (Stephan), A., i, 920.

Geraniol, conversion into terpineol (Stephan), A., i, 920.
  *tetra*bromide (Flatau and Labbé), A., i, 409.
iso-**Geraniolene** *tetra*bromides, reduction (von Baeyer and Villiger), A., i, 921.
Geranium oil, composition of (Schimmel and Co.), A., i, 299; (Flatau and Labbé), A., i, 534.
Geranylidene-acetone. See ψ-Ionone.
Gerhardtite, formation of (Bourgeois), A., ii, 157.
Germanium, discovery of (Winkler), A., ii, 297.
Germination. See Agricultural chemistry.
Gilsonite. See Uintahite.
Gismondite, vapour pressure of (Tammann), A., ii, 8.
Gland, submaxillary, metabolism in during secretion (Henderson), A., ii, 774.
Glass resembling moldavite (John), A., ii, 768.
  composition and electrical properties of (Gray and Dobbie), A., ii, 541.
  electrical absorption and dispersion of (Löwe), A., ii, 201.
  heat conductivity of (Winkelmann), A., ii, 399.
  ordinary and Jena, coefficient of expansion of (Ladenburg and Krügel), A., ii, 467.
  gradual change in volume of (Marchis), A., ii, 545.
Glauber salt. See Mirabilite.
Glaucamphiboles (Rosenbuch), A., ii, 601.
Glauconite from Russia (Glinka), A., ii, 112.
  action of reagents on (Glinka), A., ii, 112.
Glaucophane-rocks, origin of (Rosenbusch), A., ii, 601.
Globin, reactions of (Bang), A., i, 836.
Globulin, egg-, crystalline, and its hydrochloride (Panormoff), A., ii, 654.
  of blood-serum, different varieties of (de Kerckhof), A., ii, 231.
Glomelliferin from *Parmelia glomellifera* (Zopf), A., i, 716.
Gluconasturtiin (Gadamer), A., i, 930.
Gluconic acid, oxidation of; phenylhydrazide (Ruff), A., i, 869.
  oxidation of, by a bacterium (Boutroux), A., i, 259.
d-**Gluconic acid**, calcium salt, oxidation of, by means of hydrogen peroxide (Ruff), A., i, 324.
Glucoproteid from ox-blood (Zaneth), A., i, 180.
Glucosamine (*chitosamine*) (de Bruyn), A., i, 5.
  free, preparation and decomposition of; pentacetyl derivatives (de Bruyn and Alberda van Ekenstein), A., i, 732.
  from ovimucoid (Seeman), A., i, 465.
  hydrochloride, α- and β-modifications and their rotatory power (Tanret), A., i, 246.
  chloride, fate of, in the animal body (Fabian), A., ii, 503.
d-**Glucosamine**, action of methylic alcohol on (Sjollema), A., i, 732.
Glucose, commercial, estimation of total carbohydrate in (Rolfe and Faxon), A., ii, 188.
d-**Glucose**. See Dextrose.
Glucoside, presence of a, in cotton flowers, and dyeing properties of (Perkin), T., 825; P., **1899**, 161.
  synthetical preparation of (Ryan), T., 1054; P., **1899**, 196.
  yielding caffeine and theobromine on decomposition (Schweitzer), A., i, 300.
  action of moulds on (Puriewitsch), A., ii, 683.
  in vine-leaves, influence of, on yeasts in the must (Jacquemin), A., ii, 377.

Solanin.
Strophanthin.
o- and *p*-Tolylglucoside.
Vicin.
Violaquercitrin.
Xanthorhamnin.
Glucosines, α- and β- (Tanret), A., i, 246.
Glucotropæolin, from oil of *Tropæolum majus* (Gadamer), A., i, 535, 930.
Glutaconic acid (*propylenedicarboxylic acid*), ethylic salt, action of ethylic formate on (Pechmann), A., i, 869.
and its sodium derivative ; also the action of methylic iodide on it (Henrich), A., i, 794.
*iso*nitroso-, ethylic salt (Henrich), A., i, 794.
Glutamic acid, presence of, in yeast extract (Wróblewski), A., ii, 170.
d-**Glutamic acid**, rotatory power of (Fischer), A., i, 889.
Glutamine, formation of, in plants (Schulze), A., ii, 240.
Glutaric acid, formation of (Bone and Sprankling), T., 850.
potassium salt, heat of formation of (Massol), A., ii, 80.
l-amylic salt, molecular rotation of (Walden), A., ii, 622.
ethylic salt, condensation of, with ethylic phthalate (Dieckmann), A., i, 914.
Glutaric acid, β-bromo-, and action of soda on (Wislicenus), A., i, 736.
Gluten, wheat-, proteids of (Ritthausen), A., i, 724 ; (Morishima), A., i, 466.
Glutolin from blood-serum, and its decomposition (Faust), A., i, 466.
Glyceraldehyde, from action of water on *di*bromopropaldehyde (de Bruyn), A., i, 110.
from oxidation of glycerol by hydrogen peroxide in presence of iron (Fenton and Jackson), T., 4 ; P., **1898**, 240.
action of yeast on admixed dihydroxyacetone and (Emmerling), A., ii, 318.
r-**Glyceraldehyde**, synthesis and properties of (Wohl), A., i, 11.
Glyceric acid (*$\alpha\beta$-dihydroxypropionic acid*), preparation of (Zinno), A., i, 13.
copper salt, dissociation of, in solution (Calame), A., ii, 145.
ethereal salts, densities, specific rotations and molecular volumes of (Frankland), T., 354.
Glycerides, detection of, in fatty mixtures (Cochenhausen), A., i, 251.
Glycerol (*glycerin*), presence of, in yeast-extract (Wróblewski), A., ii, 170.
influence of various conditions on formation of, in alcoholic fermentation (Laborde), A., ii, 784.
heat conductivity of (Aubel), A., ii, 354.
molecular depression of vapour pressure of aqueous solutions of (Dieterici), A., ii, 403.
action of hydrogen peroxide on, in presence, and in absence, of iron (Fenton and Jackson), T., 4 ; P., **1898**, 240.
action of ozone on (Otto), A., ii, 282.
oxidation of, by atmospheric oxygen in sunlight in presence of iron (Fenton and Jackson), T., 10 ; P., **1898**, 240.
oxidation of, with platinum black (Emmerling), A., ii, 318.
formation of morfosazone and lycerosazone from (Loew), A., i, 850.
nitration of, with nitrous acid (Auzenat), A., ii, 132.
nitrate, the heat test for (Auzenat), A., ii, 132.
diallylic, di*iso*amylic, diethylic, dimethylic, and dipropylic ethers of (Zunino), A., i, 410.
detection of (Grünhut), A., ii, 253 ; (Gawalowski), A., ii, 255.
estimation of (Richardson and Jaffé), A., ii, 64
estimation of, in fermented liquids (Laborde), A., ii, 816.
estimation of, in sweet wines (Fabris), A., ii, 131.
estimation of arsenic in (Bennett), A., ii, 519.
estimation of dry substance in (Benz), A., ii, 816.
Glycerophosphoric acid, velocity of decomposition of (Cavalier and Pouget), A., i, 660.
Glyceryl chlorhydrin, methylene derivative (Verley), A., i, 666.
Glycide, action of ammonia and amines on (Knorr and Knorr), A., i, 411.
Glycidic acids, formation of, from oleic, *iso*oleic, and elaidic acids (Albitzky), A., i, 863.
Glycine. See Glycocine.
Glycineaminoether, dihydrochloride of, and the action of nitrous acid on it (Curtius), A., i, 9.
Glycocholic acid, detection of (Vitali), A., ii, 342 ; (Gnezda), A., ii, 715.

Glycocine (*glycocoll, aminoacetic acid*), synthesis of (Bourcet), A., i, 563.
  preparation of (Auger), A., i, 667.
  as a decomposition product of proteids (Spiro), A., ii, 777.
  oxidation of (Coninck), A., i, 509.
  mercury compound of, constitution of (Kieseritzky), A., ii, 395; (Ley and Kissel), A., ii, 485.
  formation of, in the body (Wiener), A., ii, 164.
Glycocoll. See Glycocine.
Glycogen, formation of, in yeast-extract (Kayser and Boullanger), A., ii, 236; (Cremer), A., ii, 606.
  action of nucleo-proteids on (Bottazzi), A., i, 839.
  of liver, causes of conversion of, into dextrose (Noël Paton), A., ii, 312.
  fate of, after injection into the circulation (Pavy), A., ii, 677.
  in the animal body, influence of inanition on (Pflüger), A., ii, 604.
  influence of experimental jaundice on the formation of (von Reusz), A., ii, 168.
  amount of, in the frog at different seasons (Athanasiu), A., ii, 438.
  storage of, in the liver of molluscs (Biedermann and Moritz), A., ii, 438.
  estimation of (Weidenbaum; Pflüger), A., ii, 529; (Pflüger and Nerking), A., ii, 819.
  estimation of, in meat extracts (Lebbin), A., ii, 256.
Glycol. See Ethylenic glycol.
Glycollamine, heat of formation of (Berthelot and André), A., ii, 400.
Glycollic acid, presence of, in sugar-cane and its effects (Shorey), A., ii, 507.
  solutions, solid and liquid of, in naphthalene (Cady), A., ii, 405.
  phenylurethane, and its ethylic salt (Lambling), A., i, 52.
  mercury salt, dissociation and conductivity of (Ley and Kissel), A., ii, 486.
  l-amylic salt, molecular rotation of (Walden), A., ii, 622.
  ethylic salt, chlorocarbonate, carbamate, and nitrocarbamate of, and its silver and potassium derivatives (Thiele and Dent), A., i, 15.
Glycollic acid, *di*amino- (*diaminooxalic acid*), hydrochloride, and the action of methylic alcohol on it (Anschütz and Stiepel), A., i, 572.
  imino- (*iminooxalic acid*), formation of, and the action of methylic alcohol on it (Anschütz and Stiepel), A., i, 572.
Glycollic aldehyde, from oxidation of ethylenic glycol by hydrogen peroxide in presence of iron (Fenton and Jackson), T., 2; P., **1898**, 240.
  crystalline, and its osazone and cupric reducing power (Fenton and Jackson), T., 575; P., **1899**, 119.
Glycollonitrile, heats of combustion, formation, solution and hydrolysis of (Berthelot and André), A., ii, 400.
  action of cuprous chloride on (Rabaut), A., i, 557.
Glycollonitrilephenylurethane (Lambling), A., i, 52.
Glycosuria, causes of pancreatic (Tuckett), A., ii, 676.
  phloridzin, source of sugar in (Kumagawa and Miura), A., ii, 776.
Glycosyl-dihydroxycinnamic acid, action of sodium on, in alcohol (Kunz-Krause), A., i, 201.
Glycuronic acid, action of *p*-bromophenylhydrazine on (Neuberg), A., i, 933.
  conjugation of, with thymol in the body (Katsuyama and Hata), A., ii, 117.
Glycyrrhizin, detection of (Gawalowski), A., ii, 255.
Glyoxal, action of ethylenediamine on (Kolda), A., i, 328.
Glyoxalbisaminoguanidine, and its salts (Thiele and Dralle), A., i, 8.
Glyoxylic acid, chloro-, ethylic salt (*ethyloxalic chloride*), condensation of, with diphenyl (Rousset), A., i, 292.
    behaviour of, towards *α*-ethoxynaphthalene (Rousset), A., i, 297.
    action of, on ethylic sodiomalonate (Bouveault), A., i, 416.
Gmelinite, vapour pressure of (Tammann, A., ii, 8.
Gold from N. Carolina (Hidden and Pratt), A., ii, 301.
  presence of, in sediment from copper refining (Hollard), A., ii, 452.
  colloidal solutions of, coagulation of, by zinc chloride (Stark), A., ii, 644.
  dissolution of, in electrolytes (Margueles), A., ii, 200.
  solubility of, in solutions of alkali cyanides, influence of oxidising agents on (Noelting and Forel), A., ii, 755.
Gold salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.

Gold salts, reduction of, by calcium carbide; alloys with calcium (TARUGI), A., ii, 749.
Gold solutions, action of antimony trioxide on (HARDING), A., ii, 490.
  electrolysis of; aurous and auric chlorides in electrolytic solutions of (WOHLWILL), A., ii, 105, 106.
Gold chloride (*auric chloride*), action of light on solutions of (SONSTADT), P., **1898**, 179.
  conductivity of, temperature coefficient of, in alcoholic ether (CATTANEO), A., ii, 355.
  hydrated, electrolysis and constitution of (HITTORF and SALKOWSKI), A., ii, 398.
  influence of, on the reaction between potassium permanganate and hydrochloric acid (WAGNER), A., ii, 275.
  Auri-chloride, and **-bromide** of praseodymium (SCHEELE), A., ii, 99.
  Auroazoimide of sodium (CURTIUS and RISSOM), A., ii, 92.
  telluride from Colorado (HOBBS), A., ii, 493.
Gold, estimation and separation of:—
  estimation of (VANINO and SEEMANN), A., ii, 579.
  estimation of, volumetrically (PETERSON), A., ii, 253.
  estimation of, in presence of platinum, palladium, copper, zinc, nickel, or cobalt (KOLLOCK), A., ii, 811.
  estimation of, in telluride ores (FULTON), A., ii, 63.
  separation of platinum and iridium from (VANINO and SEEMANN), A., ii, 579.
Goldschmidtite from Colorado (HOBBS), A., ii, 493.
Gooseberry. See Agricultural chemistry.
Goslarite from Aachen (GRÄFF), A., ii, 303.
  cupriferous, from Kansas (ROGERS), A., ii, 667.
Gossypetin, and salts, hexacetyl and monopotassium derivatives, and dyeing properties (PERKIN), T., 825; P., **1899**, 161.
Gossypium herbaceum flowers, the colouring matter of (PERKIN), T., 441, 825; P., **1899**, 66, 161.
Gossypol, from cotton seeds (MARCHLEWSKI), A., i, 821.
Grains of Paradise, oil of (SCHIMMEL and Co.), A., i, 63.
Granatic acid (PICCININI), A., i, 829.
Granatoline, oxidation of (PICCININI), A., i, 829.
Granatonine, and salts, and nitroso-, and substitution derivatives (PICCININI), A., i, 829.
Granite, from British Columbia (GWILLIM and JOHNSON), A., ii, 498.
  from the Riesengebirge (MILCH), A., ii, 112.
  from Sierra Nevada, U.S.A. (TURNER and others), A., ii, 498.
Granite-laterite from the Seychelles (BAUER), A., ii, 565.
Grape cure, effects of, on human metabolism (LAQUER), A., ii, 773.
Grapes, French, progressive development, and changes in the constituents of; nature of the phlobaphen in (GIRARD and LINDET), A., ii, 445.
  detection of malic acid in (GIRARD and LINDET), A., ii, 454.
  estimation of copper and mercury in (VIGNON and BARRILLOT), A., ii, 452.
Graphite from Austria (JOHN and EICHLEITER), A., ii, 493.
  from Ceylon (DIERSCHE), A., ii, 500.
  from Moravia, minerals associated with (KOVÁŘ), A., ii, 671.
  action of sulphuric acid on (BERTHELOT), A., ii, 286.
Graphitic acid, preparation of (STAUDENMAIER), A., ii, 481.
Grass. See Agricultural chemistry.
Guaiacol, action of sodium on, in alcohol (KUNZ-KRAUSE), A., i, 200.
  picrate (BOUVEAULT), A., i, 264; (BOSCOGRANDE), A., i, 427.
  detection of (FONZES-DIACON), A., ii, 388.
Guaiacol, *tri*chloro-, *di*bromo-, and *tetra*bromo- (COUSIN), A., i, 200.
  nitro-, *di*nitro-, and acetate (KOMPPA), A., i, 347.
Guaiacum tincture, use of, in alkalimetry (GLASER), A., ii, 573.
Guaiacylic carbamate, and phenylcarbamate (MOREL), A., i, 876, 877.
  carbonate, oxidation of (CAZENEUVE), A., i, 296.
  chlorocarbonate (BARRAL and MOREL), A., i, 747, 802.
  methylic, ethylic, propylic, *iso*butylic, *iso*amylic, benzylic and *p*-tolylic carbonates (MOREL), A., i, 586, 876.
Guanazylmethane, *m*-nitro- (WEDEKIND and BRONSTEIN), A., i, 828.
Guanidine, silver derivative of (THIELE), A., i, 7.
  amino-, preparation of, and its hydrogen carbonate (THIELE), A., i, 7.

Guanidine, amino-, condensation of, with aliphatic aldehydes and ketones (Thiele and Dralle), A., i, 7.
  nitroso- (Hantzsch, Schümann, and Engler), A., i, 686.
Guanidinecarboxylazide, hydrochloride of, and action of alcohol on (Thiele and Uhlfelder), A., i, 119.
Guanidineglyoxylic acid, amino- (Thiele and Dralle), A., i, 7.
Guanidinepyruvic acid, amino-, and salts (Wedekind and Bronstein), A., i, 828.
Guano. See Agricultural chemistry.
Guanylic acid, its osazone and decomposition products (Bang), A., i, 179.
Guejarite, artificial (Sommerlad), A., ii, 216.
Guitermanite, artificial (Sommerlad), A., ii, 218.
Gum, from opoponax (Tschirch and Knitl), A., i, 714.
  thickness of layers of, required to protect wax from the action of carbon *di*sulphide (Müller-Erzbach), A., ii, 412.
  formation of furfuraldehyde from (Sestini), A., i, 103.
  detection of, in albumin (Bonnema), A., ii, 196.
  estimation of gelatin in (Trillat), A., ii, 196.
Gun-cotton, non-explosive decomposition, and determination of the stability of (Hoitsema), A., i, 243.
Gyalolechia aurella, stictaurin from (Zopf), A., i, 716.
Gyrophora polyphylla, constituents of (Hesse), A., i, 382.
Gyrophoric acid, presence of, in *Umbilicaria pustulata*, *Blastenia arenaria var. teich.* (?), and decomposition product (Hesse), A., i, 382.
"**Gytje**" (*mud*) from Sandefjord, Norway (Bödtker), A., ii, 39.

H.

Hadromal (Czapek), A., i, 560.
Hæmatein, *mono*-sodium, and -potassium derivatives of (Perkin), T., 443; P., **1899**, 66.
Hæmatic acid, dibasic-, and its identity with biliverdic acid (Küster), A., i, 468.
Hæmatic acid, tribasic-, anhydride of, and reduction product (Küster), A., i, 468.
Hæmatin from blood of different animals (Cazeneuve and Breteau), A., ii, 440.
Hæmatin, formation of, from hæmoglobin by certain bacteria (Hugounenq and Doyon), A., i, 377.
  relation of, to bilirubin (Küster), A., i, 314.
Hæmatins, oxidation of, by water (Cazeneuve and Breteau), A., i, 840.
Hæmatoporphyrinuria, description of a case of (Nebelthau), A., ii, 568.
Hæmatoxylin, constitution of (Herzig), A., i, 821.
  oxidation products of, and its constitution (Gilbody and Perkin), P., **1899**, 28; P., **1899**, 76.
  use of, in alkalimetry (Glaser), A., ii, 573.
Hæmoglobin, constitution of (Lawroff), A., ii, 231; (Pröscher), A., i, 653.
  amount of, in human blood at different ages (Schwinge), A., ii, 166.
  influence of zinc and copper salts on the formation of (Wolf), A., ii, 231.
  derivatives, absorption spectra of (Schunck), A., ii, 540.
  action of certain bacteria on, to form hæmatin (Hugounenq and Doyon), A., ii, 377.
  action of hydrogen sulphide on, and its sulpho-derivative (Harnack), A., i, 467.
  fate of, in the organism (Schurig), A., ii, 167.
  Carboxyhæmoglobin, action of hydrogen sulphide on (Salkowski), A., i, 784.
  Oxyhæmoglobin, action of nucleoproteids on (Bottazzi), A., i, 839.
Halogens, detection of, in organic substances (Raikow), A., ii, 52.
Hancornia speciosa, caoutchouc from (Lindet), A., ii, 508.
"**Hardness**," softening agent required for, in water (Vignon and Meunier; Giorges and Feliciani), A., ii, 453.
Hardystonite, from New Jersey (Wolff), A., ii, 435.
Haricot. See Agricultural chemistry.
Hatherlitē, from the Transvaal (Henderson), A., ii, 111.
Haüynite, artificial (Morozewicz), A., ii, 764.
Hay. See Agricultural chemistry.
Heart, influence of inorganic salts on the (Howell), A., ii, 114.
  influence of serum and various solutions on the (Greene), A., ii, 114.
  action of suprarenal extract on the (Wallace and Mogk), A., ii, 310.
  action of various tissue extracts on the (Cleghorn), A., ii, 310.
  frog's, effect of various solutions on the activity of the (Walden), A., ii, 781.

Heat of combustion, evaporation, fusion, &c. See Thermochemistry.

Heating sealed tubes at a constant temperature, apparatus for (SUDBOROUGH), A., ii, 552.

Heat-rigor of muscle (VERNON), A., ii, 567.

Heather, dyeing and tanning properties of, and presence of quercetin in (PERKIN and NEWBURY), T., 837; P., **1899**, 179.

Hederidin (HOUDAS), A., i, 772.

Hederin, and its hydrolytic products (HOUDAS), A., i, 772.
  physiological action of (JOANIN), A., ii, 605.

Hederose (HOUDAS), A., i, 773.

Helicin, action of moulds on (PURIEWITSCH), A., ii, 683.

Helium in a cerium mineral and coal, from Caucasus (TSCHERNIK), A., ii, 669.
  in fergusonite (RAMSAY and TRAVERS), A., ii, 35.
  in thalénite (BENEDICKS), A., ii, 765.
  nature of (BRAUNER), A., ii, 360.
  place of, in periodic system (CROOKES), A., ii, 552; (HOWE), A., ii, 740.
  preparation and refraction of (RAMSAY and TRAVERS), A., ii, 746.
  spectrum of (LOCKYER), A., ii, 4.
  spectrum of, in high vacua obtained by freezing air (DEWAR), A., ii, 741.
  fractional diffusion of (RAMSAY and TRAVERS), A., ii, 22.

Helix pomatia, agglutinating action of the albuminous gland of (CAMUS), A., ii, 779.

Hellebore, presence of an oxydase in, and composition of ash (VADAM), A., ii, 683.

Hemimellitic acid and *α*-**Hemimellithylic acid**, from *iso*geraniolene (VON BAEYER and VILLIGER), A., i, 922.

Hemipeptone, hydrolysis of, to form pigment (CHITTENDEN and ALBRO), A., i, 468.

Hemipinic acids, from corydaline (DOBBIE and LAUDER), T., 676; P., **1899**, 129.
  Metahemipinic acid (*o-Dimethoxybenzoic acid*) (DOBBIE and LAUDER), T., 678; P., **1899**, 129.

Hendecane. See Undecane.

Heptadecylcarbamic acid, methylic salt (JEFFREYS), A., i, 731.

Heptamethylene. See *cyclo*-Heptane.

Heptamethylenediamine, action of nitrosyl chloride on (SOLONINA), A., i, 561.

Heptamethylenic chloride. See Heptane, *di*chloro-.

n-**Heptane**, action of chlorosulphonic acid on (YOUNG), T., 173.
  action of sulphuric acid on (WORSTALL), A., i, 19.
  action of sulphur chloride on, in presence of aluminium-mercury couple (COHEN and SKIRROW), T., 893; P., **1899**, 183.

n-**Heptane**, *tetra*bromo- (COHEN and DAKIN), T., 896; P., **1899**, 184.
  *di*chloro- (*heptamethylenic chloride*), formation of; also its diphenoxy-derivative (SOLONINA), A., i, 561.
  nitro- and bromonitro- (WORSTALL), A., i, 399.
    action of sulphuric acid on (WORSTALL), A., i, 787.

Heptane, (*γ-ethylpentane*), *αγ-di*bromo-, and action of potash on (IPATIEFF), A., i, 658.

cyclo-**Heptane** (*heptamethylene*), action of nitrosulphuric acid on (MARKOWNIKOFF), A., i, 553.

cyclo-**Heptanecarboxylic acid** (WILLSTÄTTER), A., i, 26.

Heptanedicarboxylic acids. See:—
  iso-Amylsuccinic acid.
  β-*iso*-Butylglutaric acid.

n-**Heptane-sulphonic acid** and **-disulphonic acid** (WORSTALL), A., i, 19.
  nitro- (WORSTALL), A., i, 787.

Heptanetetracarboxylic acid. See *iso*-Amylidenebismalonic acid.

δ- and *γ*-*cyclo*-**Heptatrienecarboxylic acids**, specific conductivities of (WILLSTÄTTER), A., i, 651.

Δ′-*cyclo*-**Heptenecarboxylic acid**, identity of, with *Δ′*-ethyl*cyclo*pentanecarboxylic acid (WILLSTÄTTER), A., i, 26.
  comparison of, with suberenecarboxylic acid (BUCHNER), A., i, 423.
  specific conductivity of (WILLSTÄTTER), A., i, 651.

Heptenoic acid (*methylisobutylideneacetic acid*), and its calcium and silver salts, and dibromide (KIETREIBER), A., i, 331.

Heptenoic acid (*2-methyl-2-hexenoic acid*), and its ethylic salt (BARBIER and LESER), A., i, 111, 414.

Heptinene (*β-diethylallene*), and the action of hydrogen bromide on it (IPATIEFF), A., i, 658.

iso-**Heptodilactone** (FITTIG and PETKOW), A., i, 335.

n-**Heptoic acid** (*œnanthoic acid*), amylic salt, density, specific rotation and molecular volume of (FRANKLAND), T., 358.
  amide of, preparation of (ASCHAN), A., i, 14.

n-**Heptoic acid** (*œnanthoic acid*), sodium or potassium salt, boiling point of solutions of, in alcohol (KRAFFT), A., ii, 471.

Heptoic acid (iso*amylacetic acid*), α-bromo-, ethylic salt, and condensation with ethylic sodiocyanacetate (LAWRENCE), P., **1899**, 163.

Heptoic acid (*β*-iso*propylbutyric acid*), γ-cyano-, ethylic salt (HOWLES and THORPE), P., **1899**, 104.

iso-**Heptoic** chloride (iso*amylacetic chloride*), action of zinc ethyl on (PONZIO and DE GASPARI), A., i, 253.

Heptophenylhydrazide, preparation of (LEIGHTON), A., i, 51.

Heptylic alcohol, heat of combustion of (ZOUBOFF), A., ii, 589.

Heptylic bromide (COHEN and DAKIN), T., 894; P., **1899**, 184.

Heptylamine, action of nitrosyl chloride on (SOLONINA), A., i, 473.

Heptylene (*γ-ethylpentylene*), α-bromo- (IPATIEFF), A., i, 658.

Heptylenedicarboxylic acids. See :—
Butylaticonic acid.
Butylcitraconic acid.
Butylitaconic acid.
Butylmesaconic acid.

Heptylidenebismalonic acid (*œnanthylidenebismalonic acid, nonanetetracarboxylic acid*), ethylic salt (KNOEVENAGEL), A., i, 116.

Heptylidene cyanhydrin. See α-Hydroxyoctonitrile.

Heptylsuccinic acid (*nonanedicarboxylic acid*), from reduction of hexylitaconic acid and its isomerides (FITTIG and HOEFFKEN), A., i, 339.

Heracleum sphondylium, oil of (SCHIMMEL and Co.), A., i, 923.

Heroine. See Diacetoxymorphine.

Hesperidin, action of moulds on (PURIEWITSCH), A., ii, 683.

Hesperitin, compounds of, with sodium and potassium acetate (PERKIN), T., 444.

Hessonite from the Urals (KARNOJITSKY), A., ii, 37; (WOROBÉEFF), A., ii, 671.

Heteromorphite from Westphalia (SPENCER and PRIOR), A., ii, 431; (GUILLEMAIN), A., ii, 757.

Heteroxanthine (*7-methylxanthine*), formation from epiguanine (7-methylguanine) (KRÜGER and SALOMON), A., i, 306.

Heulandite from Mexico (LENK), A., ii, 306.

Hexa-acetyldigallacyl (VON GEORGIEVICS), A., i, 803.

Hexa-acetylgossypetin (PERKIN), T., 827; P., **1899**, 161.

Hexa-allyldiarsonium salts (PARTHEIL, AMORT, and GRONOVER), A., i, 474.

Hexabenzoyloxy-*ββ'*-**dipyridyl** (SELL and JACKSON), T., 517; P., **1899**, 98.

Hexabenzyldiarsonium and **Hexa**-*n*-**butyldiarsonium** salts (PARTHEIL, AMORT, and GRONOVER), A., i, 474.

Hexadecane, boiling point of, in a vacuum (KRAFFT), A., ii, 465.

Hexadecylamine hydrochloride, melting point of, and crystallisation of solutions of (KRAFFT), A., ii, 472.

cyclo-**Hexadiene** (*hexaterpene*), isomeric forms of (MARKOWNIKOFF), A., i, 26.

cyclo-**Hexadienecarboxylic acid** (*dihydrobenzoic acid*), presence of a, in Peru balsam (THOMS), A., i, 715.

cyclo-**Hexadiene-1 : 4-dicarboxylic acid** (*dihydroterephthalic acid*), *di*chloro-, aniline salt (GRAEBE and BUENZOD), A., i, 763.

Hexa-ethyldiarsonium salts (PARTHEIL, AMORT, and GRONOVER), A., i, 474.

Hexahydrotoluic acids. See Methyl*cyclo*hexanecarboxylic acids.

Hexahydroxy-*ββ'*-**dipyridyl**, and benzoyl derivative (SELL and JACKSON), T., 517; P., **1899**, 98.

Hexahydro-xylic acid. See Dimethyl*cyclo*hexanecarboxylic acid.

Hexaldoses, action of hydrogen bromide on (FENTON and GOSTLING), T., 423; P., **1899**, 57.

Hexamethyl*tetra*aminotriphenylmethane (MÖHLAU and KLOPFER), A., i, 914.

Hexamethyldiarsonium salts (PARTHEIL, AMORT, and GRONOVER), A., i, 474.

Hexamethylenamine. See Hexamethylenetetramine.

Hexamethylene. See *cyclo*-Hexane.

Hexamethylene 1 : 5-disulphide and -disulphone (AUTENRIETH and WOLFF), A., i, 581.

Hexamethylenediamine, action of aqua regia on salts of (SOLONINA), A., i, 663.
  action of nitrosyl chloride on (SOLONINA), A., i, 561.

Hexamethylene ketone. See *cyclo*-Hexanone.

Hexamethylenetetramine (*hexamethyleneamine, urotropine*), constitution of; also its reduction (GRASSI-CRISTALDI and MOTTA), A., i, 473.
  thermochemical data and stability of (DELÉPINE), A., i, 187.
  and its hydrobromide, hydriodide, arsenate, and various compounds with metallic salts (GRÜTZNER), A., i, 6.
  action of ethylic chloracetate on (BOURCET), A., i, 563.

Hexamethylenetetramine (*hexamethyleneamine, urotropine*), action of potassium chloracetate on (Auger), A., i, 667.

Hexamethyl-*p*-leucaniline, formation of (Weinmann), A., i, 204.

Hexamethylphloroglucinol, preparation of (Reisch), A., i, 803.

Hexanaphthene. See *cyclo*-Hexane.

Hexanaphthenecarboxylic acid, identity of, with 1-methyl*cyclo*pentane-2-carboxylic acid (Markownikoff), A., i, 800.

Hexanaphthene ketone. See *cyclo*-Hexanone.

Hexanaphthenol. See *cyclo*-Hexanol.

Hexanaphthylene. See *cyclo*-Hexene.

n-**Hexane**, physical constants of (Young and Fortey), T., 880.
  viscosity coefficient of (Guye and Friderich), A., ii, 358.
  action of chlorosulphonic acid on (Young), T., 173.
  action of sulphuric acid on (Worstall), A., i, 18.
  decomposition of, by aluminium chloride (Friedel and Gorgeu), A., i, 181.

n-**Hexane**, nitro- and *di*nitro- (Worstall), A., i, 399.

iso-**Hexane** (*dimethylpropylmethane*), *di*bromo- (*trimethyltrimethylenic dibromide*), action of potash on (Ipatieff), A., i, 658.
  *tri*nitro- (Markownikoff), A., i, 553.
  action of chlorosulphonic acid on (Young), T., 173.

Hexane (? *iso*-Hexane), synthesis of, by action of *iso*butylic iodide on zinc ethyl iodide (Simonowitsch), A., i, 871.

Hexane (*γ-methylpentane*) *αγ-di*bromo-, and action of potash on (Ipatieff), A., i, 658.

Hexane (*trimethylethylmethane*) from Caucasian naphtha; also its nitro-derivative and its reduction (Markownikoff), A., i, 554.
  action of nitric acid on (Markownikoff), A., i, 553.

cyclo-**Hexane** (*hexamethylene, hexanaphthene*), from Galician petroleum, action of chlorosulphonic acid on (Young), T., 174.
  heat of combustion of (Zouboff), A., ii, 589.
  vapour pressures, specific volumes and critical constants of (Young and Fortey), T., 873; P., **1899**, 182.
  action of nitrosulphuric acid on (Markownikoff), A., i, 553.

cyclo-**Hexane**, amino-, and salts (Markownikoff), A., i, 24.
  chloro-, *di*chloro-, iodo-, and nitro- (Markownikoff), A., i, 22.
  nitro-, action of stannous chloride on (Konowaloff), A., i, 733.

Hexanedicarboxylic acids. See :—
  iso-Butylsuccinic acid.
  β-iso-Propylglutaric acid.
  Trimethylglutaric acid.

n-**Hexane-sulphonic** and **-disulphonic acids** (Worstall), A., i, 18.

Hexanetetracarboxylic acid. See *iso*-Butylidenebismalonic acid.

Hexanetricarboxylic acids. See :—
  iso-Butylethanetricarboxylic acid.
  Dimethylbutanetricarboxylic acid.

cyclo-**Hexanol** (Markownikoff), A., i, 24.

cyclo-**Hexanone** (*hexamethylene ketone*), and its oxime, formation of, from nitrohexamethylene (Markownikoff), A., i, 23; (Konowaloff), A., i, 733.

Hexa-propyl- and **-*iso*propyl-diarsonium** hydroxide, and salts (Partheil, Amort, and Gronover), A., i, 474.

Hexaterpene (cyclo*hexadiene*), two isomerides of (Markownikoff), A., i, 24.

cyclo-**Hexene**, and its chloro- and *di*chloro-derivatives (Markownikoff), A., i, 23, 24.

Hexenoic acids (n- and *α*-iso-*propylacrylic acids*), salts and oxidation (Semenoff), A., i, 866.

Hexenoic acid (*β-isopropylacrylic acid, γ-dimethylcrotonic acid*), and its oxidation; also its ethylic and silver salts (Crossley and Le Sueur), T., 168; P., **1898**, 219.
  ethylic salt, and condensation with ethylic sodiocyanacetate (Howles and Thorpe), P., **1899**, 104.
  nitrile of (Henry), A., i, 257.

Hexenoic acid (*hydrosorbic acid*), bromo- (Fittig and Glaser), A., i, 334.

cyclo-**Hexenylglycol** (Markownikoff), A., i, 24.

n-**Hexoic acid** (*caproic acid*), physical constants of (Scheij), A., i, 668.
  separation of, from other fatty acids (Holzmann), A., ii, 68.
  amylic salt, density, specific rotation, and molecular volume of (Frankland), T., 358.
  rosaniline salt, influence of, on the boiling point of water (Krafft), A., ii, 473.

n-**Hexoic acid**, *α*-amino-. See Leucine.
  ε-amino-, and its hydrobromide, lactam, and aurichloride (Gabriel and Maass), A., i, 595.

iso-**Hexoic acid** (iso*butylacetic acid*), preparation and bromination of (Crossley and Le Sueur), T., 167 ; P., **1898**, 219.
action of chlorine on (Montemartini), A., i, 330.
α-bromo-, ethylic salt, action of quinoline and of diethylaniline on (Crossley and Le Sueur), T., 168 ; P., **1898**, 219.
Hexoic acid (*αα-dimethylbutyric acid*), γ-amino-, ethylic salt, and its hydrochloride, hydrobromide, and sulphate (Blaise), A., i, 480.
Hexoic acid (*ββ-dimethylbutyric acid*), γ-cyano-, ethylic salt, from decomposition of ethylic hydrogen α-cyano-ββ-dimethylglutarate (Perkin and Thorpe), T., 53.
Hexon bases in relation to albumin (Kossel), A., i, 833.
n-**Hexonitrile** (*capronitrile*), specific heat and heat of vaporisation of (Luginin), A., ii, 354.
iso-**Hexonitrile** (iso*butylacetonitrile* iso*capronitrile*), α-chloro- (Henry), A., i, 256.
Hexonitrile (*dimethylethylcarbinylic cyanide*), *iso*nitroso-, reduction of (Trasciatti), A., i, 855.
iso-**Hexophenylhydrazide**, preparation of (Leighton), A., i, 51.
Hexose, formation of, from egg-albumin; also its osazone (Mayer), A., i, 787.
Hexoses, estimation of (Warnier), A., ii, 339.
Hexyl*iso*aconic acid, and its reduction (Fittig and Stuber), A., i, 417.
Hexylamine, from reduction of nitrotrimethylethylmethane (Markownikoff), A., i, 554.
Hexylaticonic acid, and the action of bromine on it (Fittig and Stuber), A., i, 417.
Hexylcitraconic acid, and its anhydride also its conversion into hexylitaconic acid, and the action of bromine on it (Fittig and Hoeffken), A., i, 339.
n-**Hexylene**, heat of combustion of (Zouboff), A., ii, 589.
Hexylene (*tetramethylethylene*) (Solonina), A., i, 681.
action of nitric anhydride and peroxide on (Demjanoff), A., i, 845.
bromo- (Solonina), A., i, 681.
Hexylenedicarboxylic acids. See :—
Dimethylallylmalonic acid.
Propylcitraconic acid.
Propylitaconic acid.
Propylmesaconic acid.
iso-Propylcitraconic acid.
iso-Propylitaconic acid.
Hexylenedicarboxylic acid. See :—
iso-Propylmesaconic acid.
Hexylenic *di*bromide (*tetramethylethylenic dibromide*), action of alcoholic potash on (Kondakoff), A., i, 556.
nitrate, and its reduction (Demjanoff), A., i, 845.
oxide, action of nitric anhydride on (Demjanoff), A., i, 845.
β-**Hexylglutaric acid** (*nonanedicarboxylic acid*) (Knoevenagel), A., i, 116.
Hexylic nitrate, nitro- and nitroso- (Demjanoff), A., i, 845.
Hexylitaconic acid, and salts ; also its conversion into hexylparaconic acid (Fittig and Hoeffken), A., i, 339.
*di*bromide of (Fittig and Stuber), A., i, 418.
Hexylmesaconic acid, and salts; also its conversion into hexylitaconic acid (Fittig and Hoeffken), A., i, 339.
Hexylparaconic acid, ethylic salt, and the action of sodium ethoxide on it (Fittig and Hoeffken), A., i, 339.
Hexyl*iso*paraconic acid, and its bromoderivative (Fittig and Stuber), A., i, 417.
Hippuric acid (*benzamidoacetic acid*), stability of, towards alkalis relative to that of benzoylmethylamide (Fischer), A., i, 262.
and potassium salt, solubility of mixtures of (Hoitsema), A., ii, 10.
mercury derivative of, constitution of (Kieseritzky), A., ii, 395.
maximum production of, in rabbits (Parker and Lusk), A., ii, 312.
Histon, detection of, in sections of animal organs (Saint-Hilaire), A., ii, 133.
Histons, reactions of (Bang), A., i, 836.
Holmium in monazite sands (Schützenberger and Boudouard), A., ii, 367.
in thalénite (Benedicks), A., ii, 765.
separation of erbium from by the ethylic sulphate method (Urbain), A., ii, 28.
Homocamphoronanilic acid (Lapworth and Chapman), T., 999 ; P., **1899**, 160.
Homocamphoronic acid, from derivatives of bromocamphorenic acid (Lapworth), T., 1137 ; P., **1899**, 203.
silver, barium, lead, copper salts (Lapworth and Chapman), T., 995 ; P., **1899**, 160.
Homocamphorono-*p*-tolilic acid (Lapworth and Chapman), T., 999 ; P., **1899**, 160.

Homocinchonine, identity of, with cinchonine (SKRAUP), A., i, 961.
Homogentisic acid, separation of, from urine (GARROD), A., ii, 314.
  detection of, in urine (HUPPERT), A., ii, 706.
Homonataloin, and its acetyl and tri- and tetra-benzoyl derivatives (LÉGER), A., i, 821.
Homophthalic acid. See *o*-Carboxyphenylacetic acid.
Homopiperilenedicarboxylic acid (PICCININI), A., i, 964.
Homopiperonylic acid and **nitrile** (MOUREU), A., i, 494.
Honey, analyses of (HOITSEMA), A., ii, 818.
  polarisation of (FRÜHLING), A., ii, 186.
Hops, estimation of bitter principles of (LINTNER), A., ii, 264.
  valuation of, by chemical methods (RÉMY), A., ii, 796.
Hop-resins, estimation of (RÉMY), A., ii, 796.
Horn, decomposition products of (COHN), A., i, 315.
Hornblende, from Burma (KRENNER), A., ii, 673.
  and augite, intergrowth of, from Colorado (EAKINS), A., ii, 564.
  from North Carolina (LEWIS), A., ii, 561.
  from Philipstad, Sweden (DALY), A., ii, 436.
  from Sierra Nevada, U.S.A. (TURNER and others), A., ii, 498.
  vanadium in (HILLEBRAND), A., ii, 113.
Hornfels, from the Seychelles (BAUER), A., ii, 565.
Horn meal. See Agricultural chemistry.
Horse. See Agricultural chemistry.
Horse-hair, melanins from, and their oxidation products (JONES), A., i, 396.
Hübl's reagent, preservation of (BOLLING), A., ii, 822.
Humic acid in moorland waters (ACKROYD), T., 200; P., **1899,** 2.
  production of furfuraldehyde from (SESTINI), A., ii, 121.
Humic lignite (BERTRAND), A., ii, 430.
Humin (BERTRAND), A., ii, 430.
Humulene, nitrosochloride, nitrosate, nitrosite, *iso*nitrosite, nitrolbenzylamine, and nitrolpiperidine (KREMERS, SCHREINER, and JAMES), A., i, 620.
Humus. See Agricultural chemistry.
Huronite, from Canada (BARLOW), A., ii, 565.
Hyacinth bulbs, variation in the reserve materials of (DU SABLON), A., ii, 444.
Hyalite, vapour pressure of (TAMMANN), A., ii, 8.
Hydracetylacetone, preparation of (CLAISEN), A., i, 667.
Hydracrylic acid, nitrile of. See *β*-Hydroxypropionitrile.
Hydralcellulose, and action of soda on; phenylhydrazone (BUMCKE and WOLFFENSTEIN), A., i, 853.
Hydrargillite, in laterite (BAUER), A., ii, 565.
Hydrastine, in rhizome and fluid extract of *Hydrastis* (LINDE), A., i, 395.
  action of bromacetophenone on (SCHMIDT), A., i, 5.
  estimation of (GORDIN and PRESCOTT), A., ii, 826.
Hydrastis, composition of precipitate from fluid extract of (LINDE), A., i, 395.
Hydrastis canadensis, estimation of berberine and hydrastine in (GORDIN and PRESCOTT), A., ii, 826.
Hydrates, constitution of (BUSNIKOFF), A., ii, 362.
Hydratropic acid. See *α*-Phenylpropionic acid.
Hydrazides, *sec.*-acid, action of dehydrating agents, alcoholic ammonia and phosphorous *penta*sulphide on (STOLLÉ), A., i, 456.
Hydrazidicarbonanilide, *tetra*bromo-derivative (CURTIUS and BURKHARDT), A., i, 137.
Hydrazine, action of acetic anhydride on (STOLLÉ), A., i, 413.
  action of sodium, phosphorus, phosgene, sulphur *di*oxide, carbon *di*oxide, or nitrous oxide on (DE BRUYN), A., ii, 745.
  compound of, with cupric nitrate (HOFMANN and MARBURG), A., i, 488.
  estimation of (RIMINI), A., ii, 576.
Hydrazine azoimide (CURTIUS and RISSOM), A., ii, 91.
  *di*thionate, amidosulphonates, and ammonium hypophosphate (SABANÉEFF), A., ii, 364.
  hydrate, behaviour of, towards bromanilic acid (DESCOMPS), A., i, 690.
    reaction of, with phenols (HOFFMANN), A., i, 221.
  hydrochloride, compound of, with mercuric chloride (HOFMANN and MARBURG), A., i, 488.
  nitrate, and acid nitrate (SABANÉEFF and DENGIN), A., ii, 365.
  pyrosulphite (SABANÉEFF and SPERANSKY), A., ii, 364.

Hydrazine sulphate, action of benzoyl chloride, acetic anhydride, and sodium formate on (Pellizzari), A., i, 858.
  action of mercuric chloride on, and the action of acetic anhydride on the product (Hofmann and Marburg), A., i, 487.
o-**Hydrazoanisoil** (Starke), A., i, 589.
Hydrazobenzene, cryoscopic behaviour of, in azobenzene solution (Bruni and Gorni), A., ii, 731.
  depression of freezing point of dibenzyl by (Garelli and Calzolari), A., ii, 732.
Hydrazobenzene, *p*-bromo-, transformation of (Jacobson and Grosse), A., i, 273.
  p-chloro-, transformation of (Jacobson and Strübe), A., i, 273.
  p-iodo-, transformation of (Jacobson, Fertsch, and Heubach), A., i, 274.
Hydrazobenzene-*p*-carboxylic acid, transformation of, and methylic salt (Jacobson and Steinbrenk), A., i, 276.
Hydrazo-compounds substituted in the para-position, transformation of (Jacobson), A., i, 272.
Hydrazoic acid (*azoimide*), strychnine, brucine, quinine, and codeine salts of (Pommerehne), A., i, 88.
  See also Azoimide.
Hydrazophthalaldehydic acid, ethiodide of (Paul), A., i, 778.
Hydrazopropionic acid, ethylic and methylic salts (Thiele and Bailey), A., i, 170.
o-**Hydrazotoluene**, *m-di*amino- (Elbs and Schwarz), A., i, 271.
Hydrazotriazole hydrochloride (Thiele and Manchot), A., i, 168.
α-**Hydrindamine**, two isomeric bromocamphorsulphonates of, and *cis*-π-camphanates (Kipping), P., **1899**, 172.
Hydrindeneglycol, formation of, and monomethylic ether (Heusler and Schieffer), A., i, 365.
β-**Hydrindone**, formation of, and *di-iso*nitroso-, and 4-nitro-derivatives (Heusler and Schieffer), A., i, 365.
Hydroanemonin, Hanriot's, composition of (Meyer), A., i, 930.
Hydrobenzamide, chlorination product of (Delépine), A., i, 694.
  oxidation of, with chromic acid (Oechsner de Coninck and Combe), A., i, 347.
Hydrocarbon, C_3H_4, from decomposition of barium pyromucate, and its *di*bromide and *tetra*bromide (Freundler), A., i, 98.
Hydrocarbon, C_8H_{14}, from *iso*lauronolic acid (Blanc), A., i, 630.
  $C_{10}H_{14}$, from dihydrocarvyldiamine (Harries and Mayrhofer), A., i, 625.
  $C_{10}H_{16}$, from oil of thyme (Labbé), A., i, 621.
  $C_{10}H_{18}$, from action of sodium on bromamylene (Wassiléef), A., i, 786.
  $C_{14}H_{18}$, from phenyldihydro*iso*lauronolic chloride (Blanc), A., i, 927.
  $C_{16}H_{18}$, and its picrate (Oehler), A., i, 817.
  $C_{17}H_{22}$, from benzyldihydrocarvol and phosphoric anhydride (Wallach), A., i, 532.
  $C_{17}H_{22}$, from benzylpulegol and phosphoric anhydride (Wallach), A., i, 532.
  $C_{20}H_{36}$, from menthol and sulphuric acid (Tolloczko), A., i, 440.
Hydrocarbons, electrolytic formation of (Schall), A., i, 364.
  and their halogen substitution products, conductivity of salt solutions in (Kahlenberg and Lincoln), A., ii, 397.
  picrates of, cryoscopic behaviour of (Bruni and Carpené), A., ii, 8.
  saturated, action of nitric acid on (Konowaloff), A., i, 844.
    action of nitric and nitrosulphuric acids on (Markownikoff), A., i, 553.

Hydrochloric acid. See under Chlorine.

Hydrocinnamoin and its diacetyl and dibenzoyl derivatives (**Thiele**), A., i, 616.

Hydrocyanic acid. See under Cyanogen.

Hydrodigitoic acid, molecular weight of (**Edinger**), A., i, 377.

Hydroecgonidine, ethylic salts, conversion of, into amide (**Willstätter** and **Müller**), A., i, 178.

Hydroecgonidineamide, and conversion into *iso*tropylamine (WILLSTÄTTER and MÜLLER), A., i, 178.

Hydroferrocyanic acid, and potassium salt, electric conductivity of solutions of, at high pressures (BOGOJAWLENSKY and TAMMANN), A., ii, 138.

Hydrofluoranic acid, 2 : 7-*di*nitro- (MEYER and FRIEDLAND), A., i, 764.

Hydrofurfurancarboxylic acids, transformation of unsaturated α-hydroxy-acids into (FITTIG), A., i, 191.

Hydrogen in atmospheric air (GAUTIER), A., ii, 149 ; (DEWAR), A., ii, 742.
atomic weight of (DEWAR), P., **1898**, 175 ; (LANDOLT, OSTWALD, and SEUBERT), A., ii, 87 ; (LEDUC), A., ii, 475, 729.
spectrum of (HUTTON), A., ii, 3 ; (RICHARDS), A., ii, 266.
colour of flame of, due to selenium (SCHLAGDENHAUFFEN and PAGEL), A., ii, 475.
ionic charges produced in, by Röntgen rays (TOWNSEND), A., ii, 730.
transference number for (MCINTOSH), A., ii, 137 ; (BANCROFT), A., ii, 398.
solidification of ; liquid, specific gravity of, and use of, in production of high vacua ; melting and boiling points of (DEWAR), A., ii, 741.
boiling point of (DEWAR), P., **1899**, 70 ; A., ii, 741.
liquid, molecular complexity, density and critical pressure of (VAUBEL), A., ii, 475.
compressibilty of mixture of, with oxygen (BERTHELOT and SACERDOTE), A., ii, 404.
viscosity of (BREITENBACH), A., ii, 403.
velocity of diffusion of, through water and through agar jelly (HÜFNER), A., ii, 9.
solubility of, in amylic alcohol (FRIEDEL and GORGEU), A., i, 182.
compressed, solution of bromine in (VILLARD), A., ii, 143.
action of electric glow discharge on mixtures of, with oxygen (MIXTER), A., ii, 267.
explosibility of mixtures of acetylene with (BERTHELOT and VIEILLE), A., ii, 412.
chemical equilibrium between carbon oxides and (BERTHELOT), A., ii, 286.
combination of, with carbon *di*sulphide (BERTHELOT), A., ii, 648.
inflammability of mixtures of, with chlorine (EMICH), A., ii, 12.
action of, on mercury salts (COLSON), A., ii, 485.

Hydrogen, non-explosive combination of, with oxygen (BODENSTEIN), A., ii, 733.
combination of, with oxygen, at different temperatures (HÉLIER), A., ii, 85.
combination of, with oxygen, heat developed in (PLATNER), A., ii, 628.
oxidation of, by chromic acid (REESE), A., ii, 647.
existence of a compound of, with platinum (HEMPTINNE), A., ii, 146.
combination of, with sulphur (KONOWALOFF), A., ii, 415.
action of, on sulphuric acid (ADIE), P., **1899**, 133.
estimation of, by combustion (DENNIS and HOPKINS), A., ii, 332.
estimation of, in organic substances containing nitrogen (TOWER), A., ii, 694.
estimation of, in presence of methane and nitrogen (JAEGER), A., ii, 526.

Hydrogen salts, absorption of Röntgen rays by (HÉBERT and REYNAUD), A., ii, 586.

Hydrogen chloride. See Chlorine ; Hydrochloric acid.
nitride. See Azoimide. Hydrazoic acid.

Hydrogen peroxide, electrolytic formation of (HABER and GRINBERG), A., ii, 17.
electrolysis of, solution of, application of principle of maximum work to (TOMMASI), A., ii, 413.
comparison of, with hydroxylamine (WAGNER), A., ii, 650.
action of, on secondary and tertiary aliphatic amines (DUNSTAN and GOULDING), T., 1004 ; P., **1899**, 124.
action of, on carbohydrates, in presence of ferrous salts (MORRELL and CROFTS), T., 786 ; P., **1899**, 99.
action of, on formaldehyde (HARDEN), P., **1899**, 158 ; (BLANK and FINKENBEINER), A., ii, 188, 820 ; (KASTLE and LOEVENHART), A., i, 565.
action of, on periodic or bromic acids (TANATAR), A., ii, 414.
action of periodates on (PÉCHARD), A., ii, 478.
action of, on photographic plates (RUSSELL), A., ii, 720.
decomposition of, by neutral or ammoniacal silver oxide or silver nitrate (BERTHELOT), A., ii, 149.
physiological action of (NENCKI and ZALESKI), A., ii, 676.
detection of (BARRALET), A., ii, 803.
distinction between ozone, nitrous acid, and (ERLWEIN and WEYL), A., ii, 179.

- **Hydrogen phosphide**, absorption of, in presence of alkali chlorides (Göttig), A., i, 657.
  - action of, on copper, and copper oxides and salts (Rubénovitch), A., ii, 102, 652, 750.
  - estimation of, in gaseous mixtures (Riban; Joannis), A. ii, 612.
- **Hydrogen selenide**, velocity of formation and decomposition of (Bodenstein), A., ii, 548, 639.
- **Hydrogen sulphide** in natural gas from Point Abino, Canada (Phillips), A., ii, 35.
  - formation and false equilibrium of; absorption of, by liquid sulphur (Duhem), A., ii, 739.
  - velocity of formation of, from its elements (Bodenstein), A., ii, 638.
  - generator for (Bradley), A., ii, 413.
  - action of, on carboxyhæmoglobin (Salkowski), A., i, 784.
  - equilibrium between, and hydrocyanic acid, in combination with potassium (Berthelot), A., ii, 737.
  - action of, on metallic salts dissolved in organic solvents (Naumann), A., ii, 423.
  - oxidation of (Hartley), A., ii, 437.
  - equilibrium between silver potassium cyanide, hydrogen cyanide, and (Berthelot), A., ii, 422.
  - action of, on silicates (Didier), A., ii, 596.
  - action of sodium on, heat developed in (de Forcrand), A., ii, 589.
  - action of sulphuric acid on (Berthelot), A., ii, 283.
  - separation of sulphur from, by sulphur-bacteria (Hartley), A., ii, 437.
  - as a reagent (Graebe), A., ii, 178.
  - estimation of, in air (Lehmann), A., ii, 53.
- **Hydrogiobertite** (?) from Lombardy (Brugnatelli), A., ii, 372.
- **Hydroilmenite** from Bahia (Hussak), A., ii, 494.
- **Hydroketole**, 3-nitro- (Stoermer and Dragendorff), A., i, 46.
- **Hydrolysis.** See Affinity, chemical.
- **Hydrometer**, Baumé's, specific gravities corresponding with degrees on (Emery), A., ii, 466.
- **Hydrometer scales**, correct values of empirically divided (Fuchs), A., ii, 692.
- **Hydromethylmorphimethine**, constitution of, and methiodide (Vongerichten), A., i, 551.
- **Hydromica** from New Jersey (Clarke and Darton), A., ii, 496.
- **Hydroquinolines** from indoles, constitution of (Piccinini), A., i, 76.
- **Hydrosorbic acid.** See Hexenoic acid.
- **Hydrotropilidinecarboxylic acid**, reduction of (Willstätter), A., i, 26.
- *o*-**Hydroxyacetophenone**, oxime and bromo-derivative (Dunstan and Henry), T., 67; P., **1898**, 220.
- *p*-**Hydroxyacetophenone** (Verley), A., i, 426.
- α-**Hydroxy-acids**, unsaturated, transformation of, into hydrofurfurancarboxylic acids (Fittig), A., i, 191.
- **Hydroxy-ψ-allylcarbamide** (Rundqvist), A., i, 17.
- **2′-Hydroxy-3-aminophenyl-4′-methylquinoline** (Heidrich), A., i, 367.
- β-**Hydroxy**-α-*iso***amylbutyric acid.** See Hydroxynonoic acid.
- α-**Hydroxy**-β-*iso***amyl***iso***butyric acid.** See Hydroxynonoic acid.

- **Hydroxyazobenzene**, potassium derivative, action of hydrochloric acid on (Hantzsch), A., i, 400.
- **Hydroxybehenic acids**, chloro-, formation of, from erucic, *iso*erucic and brassic acids, and action of potash on (Albitzky), A., i, 862.
- **Hydroxybenzalazine**, formation of (Cajar), A., i, 146.
- *o*-**Hydroxybenzaldehyde.** See Salicylaldehyde.
- *m*-**Hydroxybenzaldehyde**, 2 : 4 : 6-*tri*bromo- and 2 : 4 : 6-*tri*chloro- (Krause), A., i, 281.
- *p*-**Hydroxybenzaldehyde**, thermochemistry of (Delépine and Rivals), A., ii, 727.
- *m*-**Hydroxybenzaldoxime**, 2 : 4 : 6-*tri*bromo- and 2 : 4 : 6-*tri*chloro- (Krause), A., i, 281.
- *o*-**Hydroxybenzamide**, hydrolysis of (Reid), A., i, 508.
- *p*-**Hydroxy**-α-**benzamidocinnamic acid** (Erlenmeyer and Halsey), A., i, 761.
- *o*-**Hydroxybenzhydrylamine**, reduction of (Cohn), A., i, 295.
- *m*-**Hydroxybenzodiphenylfurfuran**, and acetyl derivative (Japp and Meldrum), T., 1041; P., **1899**, 167.
- *p*-**Hydroxybenzodiphenylfurfuran**, and acetyl derivative (Japp and Meldrum), T., 1041; P., **1899**, 167.
- *o*-**Hydroxybenzoic acid.** See Salicylic acid.
- *m*-**Hydroxybenzoic acid**, sodium salt, heat of formation of (Massol), A., ii, 353.
  - 2 : 4 : 6-*tri*bromo- and methylic salt (Krause), A., ii, 281.

m-**Hydroxybenzoic acid,** 6-chloro-, methylic salt; and (?) chloro-, and its salts (Mazzara), A., i, 811.

p-**Hydroxybenzoic acid,** sodium salt, heat of formation of (Massol), A., ii, 353.

  ethylic salt, benzoyl derivative of (Limpricht), A., i, 292.

  methylic salt, stability of, towards alkalis, relative to that of methylic anisate (Fischer), A., i, 262.

p-**Hydroxybenzoic acid,** 3-chloro-, and 3 : 5-*di*chloro-, and methylic and ethylic salts (Mazzara), A., i, 811.

  3 : 5-*di*chloro- (Bertozzi), A., i, 877.

m-**Hydroxybenzonitrile,** 2 : 4 : 6-*tri*bromo-, 2 : 4 : 6-*tri*chloro, and acetates (Krause), A., i, 281.

o-**Hydroxybenzophenonephenylimine,** and acetyl derivative (Graebe and Keller), A., i, 703.

o-**Hydroxybenzylacetanilide** (Paal and Hartel), A., i, 749.

o-**Hydroxybenzylic** ethylic and methylic ethers (Thiele and Dimroth), A., i, 426.

p-**Hydroxybenzylideneaminoguanidine,** (Wedekind), A., i, 51.

o- and *p*-**Hydroxybenzylideneaminoguanidines** (Thiele and Bihan), A., i, 46.

o-**Hydroxybenzylideneazine** (Thiele and Bihan), A., i, 46.

o- and *p*-**Hydroxybenzylidenebornylamines** (Forster), T., 1154; P., **1899**, 194.

o-**Hydroxybenzylidene-*m*-bromobenzhydrazide** (Curtius and Portner), A., i, 136.

o-**Hydroxybenzylidenebromoethylamine,** from condensation of bromoethylamine hydrobromide with salicylaldehyde (Gabriel and Leupold), A., i, 104.

o-**Hydroxybenzylidene-1:3:2-*m*-xylidine** (Busch), A., i, 496.

o-**Hydroxybenzyl-*m*-nitracetanilide** (Paal and Härtel), A., i, 749.

o-**Hydroxybenzyl-*o*- and -*p*-nitranilines** (Paal and Härtel), A., i, 748, 749.

1 : 8-Hydroxybromotetrahydrocarvone (von Baeyer and Baumgärtel), A., i, 223.

Hydroxybutanedicarboxylic acid. See β-Hydroxyethylsuccinic acid.

α-**Hydroxybutenoic acid.** See Vinylglycollic acid.

α-**Hydroxy*iso*butyramidoazobenzene** (Bischoff and Sobolewski), A., i, 232.

α-**Hydroxy*iso*butyranilide,** formation of (Lambling), A., i, 53.

α-**Hydroxybutyric acid,** *l*-amylic salt, molecular rotation of (Walden), A., ii, 622.

β-**Hydroxybutyric acid,** phenylurethane, ethylic salt (Lambling), A., i, 53.

  γ-chloro-, ethylic salt and nitrile of (Lespieau), A., i, 243.

α-**Hydroxy*iso*butyric acid,** formation of (Daïn), A., i, 436.

  phenylurethane, and ethylic salt (Lambling), A., i, 53.

  l-amylic salt, molecular rotation of (Walden), A., ii, 622.

α-**Hydroxybutyronitrile** (*α-cyanopropylic alcohol*), and acetyl derivative (Henry), A., i, 182.

β-**Hydroxybutyronitrile** (*β-cyanoisopropylic alcohol*), and its acetate and ethoxy-derivative (Henry), A., i, 182.

  γ-chloro-, from action of potassium cyanide on epichlorhydrin (Lespieau), A., i, 790.

γ-**Hydroxybutyronitrile** (*γ-cyanopropylic alcohol*), and its acetate and ethoxy-derivative (Henry), A., i, 183.

α-**Hydroxy*iso*butyronitrile** (*dimethylglycollonitrile, acetonecyanhydrin*), and its acetyl derivative; also the action of phosphoric anhydride and phosphorus pentachloride on it (Henry), A., i, 256.

β-**Hydroxy*iso*butyronitrile** (*α-methyllactonitrile*) (Henry), A., i, 255.

α-, β-, and γ-**Hydroxybutyronitriles,** action of phosphoric anhydride on (Henry), A., i, 257.

Hydroxy-*cis*-π-camphanic acid (Kipping), T., 143; P., **1898**, 250.

Hydroxycamphoceanolactone (Jagelki), A., i, 629.

m-**Hydroxycarbanilide** (Meyer and Sundmacher), A., i, 755.

Hydroxycarone, oxime, semicarbazone, phenylurethane (von Baeyer and Baumgärtel), A., i, 224.

2, 2′, 3, 3′, 4, and 4′-Hydroxychalkones (*hydroxybenzylideneacetophenones*) and acetyl derivatives (von Kostanecki and Tambor), A., i, 704.

p-**Hydroxy-ψ-cumylaniline,** bromo- (Auwers and Ercklentz), A., i, 35.

o-**Hydroxy-ψ-cumylic alcohol** (Auwers and de Rovaart), A., i, 34.

p-**Hydroxy-ψ-cumylic alcohol,** and its ether, thio-ether, methylic ether, bromo-derivatives, diacetate, and acetate*iso*butyrate (Auwers and Ercklentz), A., i, 35, 36.

p-**Hydroxy-ψ-cumylpiperidine,** bromo- (Auwers and Ercklentz), A., i, 35.

2′-Hydroxy-4′ : 6′-diethoxychalkone, and its acetate (von Kostanecki, Tambor, and Bednarski), A., i, 892.

γ-Hydroxydiethylacetoacetic acid, lactone of, from decomposition of ethylic γ-acetoxydiethylacetoacetate (Conrad and Gast), A., i, 193.

4-Hydroxy-2 : 6-diethylbenzaldehyde (Jannasch and Rathjen), A., i, 878.

β-Hydroxy-αα-diethylglutaconic acid, supposed formation of (Lawrence), P., **1898**, 252.

α-Hydroxydihydro*cis*campholytic acid (Noyes), A., i, 928.

Hydroxydimercuracetic acid. See under Mercury.

2′-Hydroxy-4′ : 6′-dimethoxychalkone, and its acetyl derivatives (von Kostanecki, Tambor, and Emilewicz), A., i, 892.

2′-Hydroxy-3 : 4-dimethoxy-4′-ethoxychalkone, and its acetyl derivative and dibromide (von Kostanecki and Różycki), A., i, 911.

2′-Hydroxy-4′ : 6′-dimethoxy-3 : 4-methylenedioxychalkone, and acetyl derivative (von Kostanecki, Tambor, and Herstein), A., i, 893.

γ-Hydroxydimethylacetoacetic acid, lactone of, and its bromo- and oximido-derivatives, and phenylhydrazone; also action of aniline on (Conrad and Gast), A., i, 114.

4-Hydroxy-2 : 6-dimethylbenzoic acid, and ethylic salt (Noyes), A., i, 284.

3-Hydroxy-1 : 2′-dimethylbenzoxazole, and acetyl and benzoyl derivatives (Heinrich), A., i, 172.

β-Hydroxy-αα-dimethylglutaconic acid and its salts and derivatives, supposed formation of (Lawrence), T., 417; P., **1898**, 252.

α′-Hydroxy-αα-dimethylglutaric acid, lactone of, and its methylic salt (Lawrence), T., 421.

β-Hydroxy-$\alpha\alpha_1$-dimethylglutaric acid and its ethylic salts; also its dissociation constant, and the action of acetic chloride and hydriodic acid on (Reformatsky), A., i, 481.

  α′-chloro-, ethylic salt, and its hydrolysis and reduction (Lawrence), T., 419; P., **1898**, 251.

γ-Hydroxy-αα-dimethylglutaric acid, lactone of (Conrad and Gast), A., i, 259.

α-Hydroxy-ββ-dimethylglutaric acid, lactone of (Perkin and Thorpe), T., 56.

4′-Hydroxy-1 : 3-dimethyl-β-phenotriazine (Bamberger), A., i, 545.

5-Hydroxydiphenyl, 2 : 4′-*di*amino-, salicylidene, anisylidene, *p*-nitrobenzylidene, diformyl, diacetyl, and tribenzoyl derivatives (Jacobson and Tigges), A., i, 274.

o-Hydroxydiphenylacetamidoacetolactone (Cramer), A., i, 153.

o-Hydroxydiphenylacetic acid, ethylic salt, amide, anilide, and methylamide (Cramer), A., i, 153.

α-Hydroxydiphenylacetic acid. See Benzilic acid.

p-Hydroxydiphenylamine, *p*-amino-, dihydrochloride (Schneider), A., i, 499.

m-Hydroxydiphenylamine-saccharein (Monnet and Kœtschet), A., i, 213.

o-Hydroxydiphenylaminoacetamide (Cramer), A., i, 153.

β-Hydroxy-βγ-diphenylbutyrolactone-acetic acid lactone (Stobbe and Russwurm), A., i, 903.

Hydroxydiphenylene ketone, acetyl and benzoyl derivatives of; benzylic, methylic, and ethylic ethers of (Heyl), A., i, 216, 701.

o-Hydroxydiphenylglycocine hydrochloride (Cramer), A., i, 153.

Hydroxydiphenyline. See 5-Hydroxydiphenyl, 2 : 4′-*di*amino-.

4-Hydroxydiphenylmethane-2′-carboxylic acid (Bistrzycki and de Schepper), A., i, 151.

2-Hydroxy-4 : 6-diphenylpyridine-5-carboxylic acid, ethylic salt of (Ruhemann), T., 414; P., **1899**, 55.

β-Hydroxyethanesulphonic acid, α-bromo-, and its constitution; action of phosphorus pentachloride on its potassium salt (Kohler), A., i, 488.

Hydroxyethanetricarboxylic acid (Durand), A., i, 741.

2-Hydroxy-5-ethoxyacetophenone (von Kostanecki, Levi, and Tambor), A., i, 370.

Hydroxyethylamine (Chancel), A., i, 411.

Hydroxyethylaminotetrahydro-β-naphthol (Knorr), A., i, 463.

Hydroxyethylcamphenemorpholine (Knorr), A., i, 783.

Hydroxyethylmalonamide, formation of (Traube and Lehmann), A., i, 417.

1″-Hydroxyethylnaphthalanmorpholine (Knorr), A., i, 782.

Hydroxyethyl-p-nitraniline, *tri*chloro- (Eibner), A., i, 42.

Hydroxyethylquinoline. See Quinolylethanol.

Hydroxyethylsarcosine and copper salt (Knorr) A., i, 784.

β-**Hydroxyethylsuccinic acid** (*hydroxybutanedicarboxylic acid*) and its calcium salt (Semenoff), A., i, 867.

Hydroxyethylsulphonic acid (*isethionic acid*), from reduction of ethylenesulphonic acid, and its potassium salt (Kohler), A., i, 20.

Hydroxyethyl-*p*-**toluidine**, *tri*chloro- (Eibner), A., i, 42.

Dd-, *Dl*-, *Ld*-, and *r*-**Hydroxyfenchenic acids** (Wallach and Hertz), A., i, 66.

2-**Hydroxyflavone** and acetyl derivative (von Kostanecki, Levi, and Tambor), A., i, 371.

Hydroxyfluorene alcohol (Heyl), A., i, 216.

Hydroxyfurfuraldehyde, derivatives of (Cross, Bevan, and Heiberg), T., 751; P., **1899**, 130.

Hydroxygluconic acid (Ruff), A., i, 869.
  from oxidation of gluconic acid by a bacterium, and its oxidation and constitution (Boutroux), A., i, 259.

β-**Hydroxyglutaric acid**, decomposition of, on distillation (Fichter and Krafft), A., i, 255.
  action of hydrobromic acid on (Wislicenus), A., i, 736.

o-**Hydroxyguanazylbenzene** (Wedekind), A., i, 51.

2-**Hydroxyhexahydro**-*o*-**toluic acid** (1-*hydroxy-2-methyl*cyclo*hexane-1-carboxylic acid*) (Sernoff), A., i, 584.

Hydroxyhexamethylene. See *cyclo*-Hexanol.

Hydroxyhexoic acid, lactone of (*isocaprolactone*) (Semenoff), A., i, 793.

α-**Hydroxy***iso***hexonitrile** (*isovalerylcyanhydrin, amylidenecyanhydrin*), action of phosphoric anhydride and phosphorus pentachloride on; also its acetyl derivative (Henry), A., i, 256.

Hydroxyhexylamine (Demjanoff), A., i, 845.

2-**Hydroxy**-$\Delta^{2:4}$-**hydropyridone-3-carboxylic acid**, and ethylic salt; action of bromine on it; amide (Guthzeit and Laska), A., i, 261.

Hydroxylamine (Tanatar), A., ii, 285.
  from action of sodium amalgam on sodium nitrite or nitrate (Divers), T., 87, 89; P., **1898**, 222.
  constitution of (Brühl), A., ii, 285.
  synthesis of (Jouve), A., ii, 364.
  comparison of, with hydrogen peroxide (Wagner), A., ii, 650.
  oxidising action of (Marino), A., ii, 553.
  action of chromic acid and potassium dichromate on (Oechsner de Coninck), A., i, 243.

Hydroxylamine, action of methylic, ethylic, and *n*- and *iso*-propylic iodides on (Dunstan and Goulding), T., 792; P., **1899**, 58.
  action of sulphurous anhydride on (Raschig), A., ii, 285; (Tanatar), A., ii, 285, 415.
  orthophosphate and arsenate (Kohlschütter and Hofmann), A., ii, 652.
  nickel sulphate compound of (Uhlenhuth), A., ii, 661.
  potassio- and sodio-uranates (Kohlschütter and Hofmann), A., ii, 651.
  detection of (Bamberger), A., ii, 576.
  detection of, in presence of hydroxyamidosulphonate (Divers and Haga), T., 79.

Hydroxylaminocarvoxime, dibenzoyl derivative, diphenylcarbamide, diphenylthiocarbimide (Harries and Mayrhofer), A., i, 624.

Hydroxylaminomolybdic acid, and potassium derivative (Kohlschütter and Hofmann), A., ii, 651.

Hydroxyl compounds, taste of (Höber and Kiesow), A., ii, 207.

Hydroxymenthylic acid, isomeride of (Léser), A., i, 479.

p-**Hydroxymesityl-aniline** and **-piperidine**, *di*bromo-, and phenylurethane (Auwers and Allendorff), A., i, 33.

p-**Hydroxymesitylic alcohol** and **ethylic ether**, *di*bromo-, and acetates of (Auwers and Allendorff), A., i, 32, 33.

2′-**Hydroxy-3-methoxy-4 : 4′-diethoxychalkone**, and acetyl derivative and dibromide (von Kostanecki and Różycki), A., i, 912.

3 : 4-**Hydroxymethoxyphenylglyoxylic acid** (Bouveault), A., i, 288.

α-**Hydroxy**-α-**methyl**-β-*iso***amylsuccinic acid**, and amide, imide and silver salt (Auden, Perkin, and Rose), T., 914; P., **1899**, 162.

2-**Hydroxy-4-methylanthranol** and **-anthraquinone**, and diacetyl derivative of former (Bistrzycki and de Schepper), A., i, 151.

o-**Hydroxy**-*m*-**methylbenzophenoneoxime**, transformation of (Auwers and Czerny), A., i, 131.

3-**Hydroxy-1-methylbenzoxazole** (Heinrich), A., i, 173.

α- and β-**Hydroxy-2′-methyldibenzyl-2-carboxylic acids** (Bethmann), A., i, 520, 521.

4-**Hydroxy-2-methyldiphenylmethane-2-carboxylic acid** (Bistrzycki and de Schepper), A., i, 151.

Hydroxymethylenecyanacetic acid, methylic, ethylic, and amylic salts (BOLLEMONT), A., i, 791.

β-**Hydroxy-αα-methylethylglutaconic acid,** supposed formation of (LAWRENCE), P., **1898**, 252.

1-Hydroxy-2-methyl*cyclo***hexane-1-carboxylic acid** (SERNOFF), A., i, 584.

1- and **3-Hydroxy-1-methyl***cyclo***pentanes** (MARKOWNIKOFF), A., i, 799, 800.

4-Hydroxy-3-methyl-β-phenotriazine (BAMBERGER and VON GOLDBERGER), A., i, 547.

Hydroxymethylphthalimide, and its acetate (SACHS), A., i, 280.

α-**Hydroxy-α′-methyl-α-***iso***propyladipic acid,** from carvenone (TIEMANN and SEMMLER), A., i, 224.

ω-**Hydroxymethylpyromucic acid** (FENTON and GOSTLING), T., 429; P., **1899**, 57.

Hydroxymethylsuccinic acid (*hydroxypyrotartaric acid, hydroxypropanedicarboxylic acid*) (SEMENOFF), A., i, 867.

Hydroxymethylterephthalic acid (PERKIN), T., 195; P., **1893**, 111.

4′-Hydroxy-α-naphthaflavone (KELLER and VON KOSTANECKI), A., i, 524.

1:4- and **2:1-Hydroxynaphthaldehydes,** imide-hydrochlorides, aniline derivatives, azine, and phenylhydrazones (GATTERMANN and VON HORLACHER), A., i, 373.

5-Hydroxynaphthaphenazine (KEHRMANN and ZIMMERLI), A., i, 80.

2-Hydroxy-1 : 4-naphthaquinone, 1′-amino-, diacetyl derivative (KEHRMANN and HABERKANT), A., i, 62.

3-Hydroxynaphthaquinone, 2-bromo- (LIEBERMANN and SCHLOSSBERG), A., i, 765.

1-Hydroxy-1 : 2-naphthaquinone-3 : 3-disulphonic acid, sodium salt (HANTOWER and TÄUBER), A., i, 63.

Hydroxynaphthaquinoneimidesulphonic acid (GAESS), A., i, 375.

2-Hydroxy-1 : 4-naphthaquinone-2′-sulphonic acid, and *o*-phenylenediamine derivative (GAESS), A., i, 375.

1:4′- and **2:2′-Hydroxynaphthoic acids,** ethylic salt (FRIEDLÄNDER, HEILPERN, and SPIELFOGEL), A., i, 709.

β-**Hydroxynaphthyl-1-mercuric** acetate (BAMBERGER), A., i, 156.

4-Hydroxynaphthylphthalide (BISTRZYCKI and DE SCHEPPER), A., i, 152.

o-**Hydroxy-***m***-nitraniline** (PAAL and HÄRTEL), A., i, 748.

Hydroxynonoic acid (*β-hydroxy-α-*iso-*amylbutyric acid*), and **β-**cyano-derivative (AUDEN, PERKIN, and ROSE), T., 918; P., **1899**, 163.

Hydroxynonoic acid (*α-hydroxy-β-*iso-*amylisobutyric acid*) (AUDEN, PERKIN, and ROSE), T., 920; P., **1899**, 163.

Hydroxyoctenoic acid, from the action of water on cineolic acid (RUPE), A., i, 340.

α-**Hydroxyoctonitrile** (*heptylidenecyanhydrin, œnanthylidenecyanhydrin*), action of phosphorus pentachloride on; also its acetyl derivative (HENRY), A., i, 256.

Hydroxyparaconic acid, and its calcium, barium, and silver salts (FITTIG and KÖHL), A., i, 418.

4-Hydroxy-1 : 2 : 2 : 6 : 6-pentamethylpiperidine hydrobromide, perbromide (SAMTLEBEN), A., i, 542.

Hydroxypentanedicarboxylic acids. See β-Hydroxypropylsuccinic acids.

9-Hydroxy-9-phenacylphenanthrone (JAPP and MELDRUM), T., 1034; P., **1899**, 166.

4′-Hydroxy-β-phenotriazine (*benzazimide*) (BAMBERGER and VON GOLDBERGER), A., i, 170, 546.

o-**Hydroxyphenoxyacetic acid,** and its lactone and phenylhydrazone (MOUREU), A., i, 125, 138, 679, 700.

o-**Hydroxyphenoxyacetone,** and its acetate, oxime, phenylhydrazone, and ethylacetal (MOUREU), A., i, 433.

α-**Hydroxyphenylacetic acid.** See Mandelic acid.

p-**Hydroxyphenyl-α-aminopropionic acid.** See Tyrosine.

3-Hydroxy-2′-phenylbenzoxazole (HEINRICH), A., i, 171.

β-**Hydroxy-γ-phenyl-β-benzylbutyrolactoneacetic acid lactone** (STOBBE, RUSSWURM, and SCHULTZ), A., i, 904.

β-**Hydroxy-δ-phenylbutyrolactoneacetic acid lactone** (STOBBE and HEUN), A., i, 902.

m-**Hydroxyphenylcarbamide** (MEYER and SUNDMACHER), A., i, 755.

2-Hydroxyphenyl-4 : 6-dimethylpyrimidine (GABRIEL and COLMAN), A., i, 638.

4-Hydroxyphenyl*iso***dinaphthazonium** chloride, and the nitrate (KEHRMANN and SUTHERST), A., i, 528.

4-Hydroxy-*o***-phenylenediamine,** and its hydrochloride and triacetyl derivative (KEHRMANN and GAUHE), A., i, 28.

o-**Hydroxyphenyl-***p***-ethoxystyryl ketone.** See 4-Ethoxybenzylidene-2-acetophenone.

p-**Hydroxyphenylethylurethane** ethylic carbonate (HINSBERG), A., i, 496.

p-**Hydroxyphenylglyoxylic acid,** and ethylic salt (Bouveault), A., i, 228, 437.
Hydroxyphenylmercuric salts (Dimroth), A., i, 54, 428; (Grützner), A., i, 198.
o-**Hydroxyphenyl-*p*-methoxystyryl ketone.** See Anisylidene-2-hydroxyacetophenone.
3-Hydroxy-2′-phenyl-1-methylbenzoxazole, 2:4-*di*nitro- (Heinrich), A., i, 171.
2-Hydroxy-4-phenyl-6-methylpyridine-5-carboxylic acid, ethylic salt (Ruhemann), T., 412; P., **1899**, 55.
2-Hydroxyphenyl-4-methylpyrimidone (Gabriel and Colman), A., i, 638.
3′-Hydroxyphenyl*iso*naphthaphenazonium sulphate, 2-amino- (Kehrmann and Aebi), A., i, 527.
m-**Hydroxyphenyloxamic acid,** and ethylic salt and amide (Meyer and Sundmacher), A., i, 755.
o-**Hydroxyphenylphosphoric acid** (Genvresse), A., i, 342.
p-**Hydroxyphenylphthalazone** (Meyer), A., i, 707.
4-*p*-Hydroxyphenylphthalide (Meyer), A., i, 707.
  3-amino-, 3:5-*di*nitro- (Bistrzycki and de Schepper), A., i, 152.
o-**Hydroxyphenyl piperonalmethyl ketone.** See Piperonal-2′-hydroxyacetophenone.
3-Hydroxy-1-phenyl-5-pyrazolone (Michaelis and Röhmer), A., i, 233.
3-*p*-Hydroxyphenylpyridazine and (?) **Hydroxyphenylpyridazine** (Gabriel and Colman), A., i, 391, 392.
2-Hydroxyphenyl*apo*saffranonequinone (Kehrmann and Duret), A., i, 83.
2:1-Hydroxyphenyl-*ac*-tetrahydronaphthalene-3-carboxylic acid (Thiele and Meisenheimer), A., i, 614.
m-**Hydroxyphenylthiocarbamide** (Meyer and Sundmacher), A., i, 755.
p-**Hydroxyphenylurethane ethylic carbonate** (Hinsberg), A., i, 496.
m-**Hydroxyphthalamic acid** (Meyer and Sundmacher), A., i, 756.
4-Hydroxyphthalic acid, aniline salt, and anil of (Graebe and Buenzod), A., i, 762.
1-Hydroxypiperidiniumacetic acid, action of *Penicillium glaucum* on (Wedekind), A., i, 449.
Hydroxypropanedicarboxylic acid. See Hydroxymethylsuccinic acid.
a-**Hydroxypropionitrile** (*lactonitrile, a-cyanethylic alcohol*), action of phosphorus pentachloride on (Henry), A., i, 183.
  heats of combustion, formation, solution, and hydrolysis of (Berthelot and André), A., ii, 400.
a-**Hydroxypropionitrilephenylurethane,** *tri*chloro- (Lambling), A., i, 52.
β-**Hydroxypropionitrile** (*hydracrylic nitrile, ethylenelactonitrile, β-cyanethylic alcohol*), action of phosphorus pentachloride on (Henry), A., i, 183.
Hydroxypropylacetone, chloro-, from action of hypochlorous acid on allylacetone (Henry and Aschmann), A., i, 258.
β-**Hydroxypropylbenzamide** (Uedinck), A., i, 497.
Hydroxypropylmalonamide, chloro- (Traube and Lehmann), A., i, 417.
β-**Hydroxypropylsuccinic acid** and *β*-**Hydroxy*iso*propylsuccinic acid** (*hydroxypentanedicarboxylic acids*) (Semenoff), A., i, 867.
Hydroxypyrotartaric acid. See Hydroxymethylsuccinic acid.
Hydroxypyruvic acid, osazone of, from action of phenylhydrazine on the product of the action of potash on oxynitrocellulose (Vignon), A., i, 242.
2′-Hydroxyrosindone (?) (Kehrmann and Locher), A., i, 83.
s-**Hydroxyrosindone.** See Naphthasaffranol.
Hydroxystearic acids, chloro-, formation of, from oleic, *iso*oleic, and elaidic acids, and action of potash on (Albitzky), A., i, 862.
p-**Hydroxystilbene,** action of chlorine on (Zincke), A., i, 617.
Hydroxysuccinic acid (*a-isomalic acid*), preparation of, from pyruvic acid (Pommerehne), A., i, 574.
Hydroxy*iso*terebic acid, and the action of alkalis on it (Fittig and Petkow), A., i, 335.
Hydroxyterpenylic acid, from limonene; dilactone (Godlewsky), A., i, 920.
β-**Hydroxytetramethylglutaric acid,** synthesis of; also its dissociation constant, and the action of acetic chloride on it (Michailenko), A., i, 482.
4-Hydroxy-2:2:6:6-tetramethylpiperidine, 1-bromo- (Samtleben), A., i, 542.
m-**Hydroxythiocarbanilide** (Meyer and Sundmacher), A., i, 755.
5-Hydroxythiodiazole-2-sulphonic acid (Busch and Ziegele), A., i, 826.

4-Hydroxy-*m*-toluic acid anilide, and its hydrogen phosphate (Auwers and Czerny), A., i, 132.

3-Hydroxytriazole and **3-Hydroxytriazole-5-carboxylic acid** (Manchot), A., i, 84.

Hydroxytrimethylgallic acid and its methylic salt (Hamburg), A., i, 365.

Hydroxytrimethylsuccinic acid, and its ethylic salt; also its anil and paratolil (Komppa), A., i, 419.

Hydroxyvaleric acid, chloro- (Henry and Aschmann), A., i, 258.

α-Hydroxy-*n*-valeronitrile (*n-butylidenecyanhydrin*), and the action of phosphorus pentachloride, acetic chloride, and dimethylamine on (Henry), A., i, 567.

α-Hydroxy*iso*valeronitrile (*isobutylidenecyanhydrin*) and its acetyl derivative; also the action of phosphorus pentachloride and phosphoric anhydride on it (Henry), A., i, 256.

m-**Hydroxy-*p*-xylic acid**, from dicampherylic acid, methylic and ethylic salts, and acetyl derivative (Perkin), T., 187; P., **1893**, 110.

*di*bromo- (Perkin), T., 191; P., **1893**, 111.

*di*nitro-, silver salt (Perkin), T., 190; P., **1893**, 111.

p-**Hydroxy-*o*-xylyl-aniline** and -piperidine, *tri*bromo- (Auwers and de Rovaart), A., i, 34.

p-**Hydroxy-*o*-xylylic** bromide and methylic ether, *tri*bromo-, acetate (Auwers and de Rovaart), A., i, 34.

Hydrozincite from Belgium (Cesàro), A., ii, 433.

Hydurinephosphoric acid (Fischer), A., i, 174.

Hyoscine (*scopolamine*), presence of, in *Solanaceæ* (Pinner), A., i, 178.

formula and properties of (Hesse), A., i, 312.

(Merck's), identity of, with scopolamine (Merck), A., i, 91.

Hyoscyamine, presence of, in *Solanaceæ* (Pinner), A., i, 178.

amount of, in Indian *Hyoscyamus muticus*, and its extraction (Dunstan and Brown), T., 72; P., **1898**, 240.

ψ-Hyoscyamine, isolation of, from *Duboisia myoporoides* (Merck), A., i, 91.

Hyoscyamus muticus, Egyptian, the alkaloids of (Gadamer), A., i, 395.

Indian, alkaloid of (Dunstan and Brown) T., 72; P., **1898**, 240.

Hypersthene from the Transvaal (Henderson), A., ii, 111.

Hyponitrosoacetic acid, constitution of (Divers) T., 118.

Hypoxanthine from egg-albumin, action of yeast-extract on (Geret and Hahn), A., i, 94.

from uric acid (Sundvik), A., i, 174.

I.

l-**Iditol**, condensation of benzaldehyde with (de Bruyn and Alberda van Ekenstein), A., i, 662.

Idocrase, alteration of, to garnet (Jereméeff), A., ii, 671.

Ilicic alcohol, probable presence of, in oleo-resin of *Dacryodes hexandra* (More), T., 719; P., **1899**, 151.

Ilmenite from Russia (Kovář), A., ii, 668.

alteration of (Hussak), A., ii, 494.

Imidocarbonic acid, dioxime of, from action of nitric *per*oxide on mercurydimethyl (Bamberger), A., i, 263.

Immunity, effect of administration of inorganic salts in producing (Charrin, Guillemonat, and Levaditi), A., ii, 781.

of certain animals to eels' serum (Camus and Gley), A., ii, 783.

Inanition, metabolism during (Schulz), A., ii, 773.

Indazole, 3-amino-, and its diacetyl, dibenzoyl, and *p*-nitrobenzylidene derivatives (Bamberger and von Goldberger), A., i, 545.

bromo-, *di*bromo-, and iodo- (Bamberger), A., i, 721.

3-chloro- (Bamberger and von Goldberger), A., i, 546.

Indazoleazo-β-naphthol (Bamberger and von Goldberger), A., i, 546.

anhydride (Bamberger), A., i, 722.

Indazoletriazolen and salts (Bamberger), A., i, 720.

Indazolylazo-dimethylaniline and **-β-naphthol** (Bamberger), A., i, 721.

Indiarubber. See Caoutchouc.

Indican, constitution of (Marchlewski and Radcliffe), A., i, 386.

amount of, in human urine (Bouma) A., ii, 568.

estimation of, in urine (Obermayer), A., ii, 263; (Wang), A., ii, 458.

Indicators, dissociation of, in different liquids (Waddell), A., ii, 83.

Indigo, formation of (Bréaudat), A., i, 232.

fermentation, action of various reagents on (Bréaudat), A., i, 832.

Java, a yellow compound in (Rawson), A., ii, 620

Indigo, assay of (Grossmann), A., ii, 74; (Brylinski), A., ii, 194; (Holtschmidt), A., ii, 535; (Rawson), A., ii, 620.
  estimation of indigo-blue and -red in (Koppeschaar), A., ii, 263.
Indigotin, derivatives of, and constitution of (Marchlewski and Radcliffe), A., i, 386.
  solubility of, in nitrobenzene (Gerland), A., ii, 74.
Indigotinsubsulphonic acids (Gerland), A., i, 717.
Indium in tungsten minerals and zinc blende (Atkinson), A., ii, 600.
Indole, heats of combustion and formation of (Berthelot and André), A., ii, 400.
  results of administration of (Wang), A., ii, 678.
Indoles, 3-nitroso-, constitution of (Angeli and Spica), A., i, 938.
  picrates of, cryoscopic behaviour of (Bruni and Carpené), A., ii, 8.
Indole bases, detection of (Gnezda), A., ii, 715.
Indone, bromo-, of Meldola and Hughes, identity with β-bromo-α-naphthaquinone (Liebermann and Schlossberg), A., i, 764.
  bromo- and *di*bromo- (Lanser), A., i, 894.
Indones, colour reactions of, with malonic acid derivatives (Liebermann), A., i, 219.
  condensation of, with ethylic cyanoacetate and with ethylic malonate (Liebermann), A., i, 219, 373, 522.
Indonecyanacetic acid, chloro-, and bromo-, ethylic salts (Liebermann), A., i, 522.
Indonedicyanacetic acid, diethylic salt (Liebermann), A., i, 522.
Indonemalonic acid, chloro-, ethylic salt (Liebermann), A., i, 373.
Indonemalononitrile, bromo- (Liebermann), A., i, 373.
Indoneresorcinol ether, chloro-, and acetyl derivative (Liebermann), A., i, 523.
Indophenol, formation of (Schneider), A., i, 499.
Indoxylsulphuric acid, estimation of, in urine (Obermayer), A., ii, 458.
Induline, constitution of (Schaposchnikoff), A., i, 431.
Infants, relation of ash of, to ash of human milk (Hugounenq), A., i, 682.
  metabolism of normal and atrophic (Rubner and Heubner), A., ii, 775.
Inorganic compounds, constitution of (Werner), A., ii, 278.
r-**Inositol**, action of *Aspergillus niger* on (Tanret), A., ii, 171.
Intestinal juice, properties of (Krüger), A., ii, 164.
Intestine, causes of absorption by the (Reid), A., ii, 775.
  absorption of proteids by the (Mendel), A., ii, 230; (Levene and Levin), A., ii, 309.
  absorption of salts by the (Höber), A., ii, 372.
  large, influence on metabolism of removal of (Harley), A., ii, 774.
Inulin from different plants, solubility of (Parkin), A., ii, 790.
  action of diastatic ferments on (Chittenden and Siviter), A., ii, 310.
Invertase, precipitation of, by magnesium sulphate (Sykes and Hussey), A., i, 313.
Invertin, purification, composition, and hydrolytic product of (Osborne), A., i, 967.
Iodine in atmosphere (Gautier), A., ii, 593.
  and iodides, absence of, from the atmosphere of Toulouse (Garrigou), A., ii, 414
  in copper ores (Autenrieth; Dieseldorff; Ochsenius), A., ii, 760.
  in Vesuvian products (Matteucci), A., ii, 600.
  in mineral waters from Royat (Duboin), A., ii, 602.
  in sea water, and in algæ, lichens, and fungi (Gautier), A., ii, 649.
  position of, in periodic system (Wilde), A., ii, 148.
  recovery of, from waste products (Chattaway and Orton), A., ii, 650.
  atomic refraction of, in some compounds (Sullivan), A., ii, 398.
  vapour, colour of, in gases at atmospheric pressure and in a vacuum; vapour pressure of, and molecular latent heat of solid and liquid (Dewar), P., **1898**, 241.
  solution of, in gases (Brown), P., **1898**, 244.
  solution of, in compressed gases (Villard), A., ii, 143.
  solubility of, in dilute solutions of potassium iodide (Noyes and Seidenstraker), A., ii, 11.
  solubility of, in water (Dietze), A., ii, 150.
  action of, on sodium hydroxide solution (Péchard), A., ii, 593.

Iodine, action of, on sulphur (Prunier), A., ii, 650.
action of, on sulphuric acid (Adie), P., **1899**, 133.
rate of absorption of, in man (Rösel), A., ii, 775.
and iodides, physiological action of (Heinz), A., ii, 440.
nature of compound of, in the thyroid gland (Blum), A., ii, 164.
presence of, in certain tissues after administration of iodides (Levene), A., ii, 312.
organic, supposed presence of, in urine (Vitali), A., ii, 116.
Iodine compounds, colour and stability of (Kastle), A., ii, 476.
Hydriodic acid, pure, preparation of (Vandenberghe), A., ii, 150.
preparation, and heats of formation, vaporisation and solution of (Cottrell), A., ii, 401.
heat of formation, and velocities of formation and decomposition of (Bodenstein), A., ii, 637.
decomposition of, by action of light (Berthelot), A., ii, 2.
Iodides, absorption of, by the skin, and deposition in different organs (Gallard), A., ii, 503.
separation of chlorides and bromides from (Baubigny), A., ii, 328.
Iodic acid, constitution of, and salts (Rosenheim and Liebknecht), A., ii, 743.
and anhydride, decomposition of (Berthelot), A., ii, 197.
decomposition of, by action of light (Berthelot), A., ii, 2.
salts of, estimation of, by oxalic acid (Péchard), A., ii, 477.
estimation of, and its use in analysis (Jörgensen), A., ii, 248.
Iodates, electrolytic formation of (Vaubel), A., ii, 88.
detection of chlorates and bromates in presence of (Vitali), A., ii, 803.
Di-iodates, action of, on acidified iodides (Wagner), A., ii, 326.
Periodic acid, constitution of, and salts (Rosenheim and Liebknecht), A., ii, 743.
action of hydrogen peroxide on (Tanatar), A., ii, 414.
Iodine, estimation and separation of:—
estimation of (Bougault), A., ii, 193, 803.
estimation of, by thiosulphate (Anderson and Smith), A., ii, 574.
estimation of, in bismuthic iodides (Spindler), A., ii, 245.
Iodine, estimation and separation of:—
estimation of, in presence of bromine and chlorine (Baubigny), A., ii, 244.
estimation of, in organic substances (Longhi), A., ii, 328.
estimation of traces of, in organic matters colorimetrically (Bourcet), A., ii, 516.
estimation of traces of, in ores (Autenrieth), A., ii, 804.
estimation of, in periodides of alkaloids, and assay of opium by (Prescott), A., i, 90.
estimation of, in sea water (Gautier), A., ii, 477.
separation of chlorine and bromine from (Swinton), A., ii, 122; (Specketer), A., ii, 123; (Baubigny), A., ii, 328.
Iodoform, crystallography of (Pope), T., 46; P., **1898**, 219.
action of, on silver nitrate; also its detection, and the action of light on it (Stubenrauch), A., i, 398.
decomposition of, by light (Kremers and Koske), A., i, 397.
decomposition of ethereal solution of (Bougault), A., i, 1.
assay of (Meillère), A., ii, 184.
Iodometry (Wagner), A., ii, 326.
Iodothyrin, nature of (Blum), A., ii, 164.
as the active substance of the thyroid gland (Roos), A., ii, 779.
ψ-Ionone (Stiehl), A., i, 67.
Ipomic acid. See Sebacic acid.
Iridium in meteoric iron (Davison), A., ii, 308.
commercial, purity of (Mylius and Dietz), A., ii, 160.
Iridium bases:
Iridiopentammine chloride (Mylius and Dietz), A., ii, 160.
Iridium, estimation and separation of:—
estimation of, in platinum (Bergsöe), A., i, 321.
separation of gold from (Vanino and Seemann), A., ii, 579.
separation of, from ruthenium and osmium (Leidié), A., ii, 664.
Iron, potential difference between, and solutions of ferric chloride in water or organic solvents (Kahlenberg), A., ii, 624.
anode, solution of, in electrolysis of sodium acetate and acetic acid (Arth), A., ii, 723.
heat of combustion of (Ditte), A., ii, 426.
action of, on nitric acid (Freer and Higley), A., ii, 480.

Iron, action of liquid sulphur dioxide on (Harpf; Lange), A., ii, 594.
action of, on sulphuric acid (Adie), P., **1899**, 133.
action of sulphuric and sulphurous acids on (Berthelot), A., ii, 283.
action of tartaric and citric acids on (Ulsch), A., i, 868.
action of water and saline solutions on (Meldrum), A., ii, 103.
action of a hard water on (Howe and Morrison), A., ii, 475.
action of water containing carbon dioxide on (Kröhnke), A., ii, 752.
absorption and excretion of, in the guinea-pig (Swirski), A., ii, 373.
amount of, in blood plasma and leucocytes (Häusermann), A., ii, 231.
amount of, in the human fœtus (Hugounenq), A., ii, 503.
diminution of, in the spleen during pregnancy (Charrin), A., ii, 773.
Iron alloys with nickel, magnetic behaviour of (Osmond), A., ii, 352.
Iron compounds as colouring matter in natural waters (Spring), A., ii, 228.
Iron salts, diffusion of light by solutions of (Spring), A., ii, 585.
absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
influence of, on the oxidation of iodide by bromic acid (Schiloff), A., ii, 147.
action of pyrogallol on (Hirsch), A., ii, 817.
Iron chromium, and iron molybdenum carbides (Williams), A., ii, 157.
tungsten, iron molybdenum, and iron manganese carbides (Carnot and Goutal), A., ii, 293.
tungsten carbide (Williams), A., ii, 104.
oxides, reduction of, by aluminium (Franck), A., ii, 103.
silicides (Le Chatelier), A., ii, 219; (Lebeau), A., ii, 427; (Chalmot), A., ii, 488.
Ferric arsenate, ortharsenate, and basic arsenates (Metzke), A., ii, 293.
bromide, hydrate of (Bolschakoff), A., ii, 428.
chloride, solutions of, in water or organic solvents, potential difference between iron and (Kahlenberg), A., ii, 624.
conductivity of, temperature coefficient of, in alcoholic ether, (Cattaneo), A., ii, 355.

Iron:
Ferric chloride, solutions of, in various solvents, conductivity of; molecular weight of, in nitrobenzene (Kahlenberg and Lincoln), A., ii, 397.
equilibrium in systems containing water, ammonium chloride and (Mohr), A., ii, 15.
action of antimony trioxide on (Harding), A., ii, 490.
action of aqueous azoimide on (Curtius and Rissom), A., ii, 92.
chlorination by means of (Thomas), A., i, 676.
use of, in organic syntheses; compound of, with benzophenone and benzoic chloride (Nencki), A., i, 879.
ammonium chlorides (Mohr), A., ii, 15.
hydroxide, colloidal solution of (Krafft), A., ii, 473.
colloidal, coagulation of (Linebarger), A., ii, 12.
gelatinous, composition of (van Bemmelen), A., ii, 599.
nitrate, hydrates of (Funk), A., ii, 210.
oxide, amount of, in Egyptian porcelain (Le Chatelier), A., ii, 751.
decomposition of carbon monoxide in presence of (Boudouard), A., ii, 417, 595.
hydrogel of (Bemmelen), A., ii, 487.
influence of, on formation of sodium sulphate (Krutwig and Dernoncourt), A., ii, 214.
estimation of, in phosphates (Blattner and Brasseur), A., ii, 128.
sulphate, electrolytic reduction of (Tommasi), A., ii, 138.
action of sulphurous acid on (Antony and Manasse), A., ii, 753.
action of, on micro-organisms (Müller), A., ii, 506.
ammonium, potassium, rubidium, and cæsium alums (Howe and O'Neal), A., ii, 103.
Ferrous salts, absorption of nitric oxide by solutions of (Thomas), A., ii, 368, 426.
reduction by, in volumetric analysis (Job), A., ii, 51.
Ferrous thioantimonite (Pouget), A., ii, 663.
arsenite (Reichard), A., ii, 23.
chloride, hydrates of (Kuznetzoff), A., ii, 658.

Iron:—
Ferrous dithionate, formation of, from ferric sulphate, by action of sulphurous acid (ANTONY and MANASSE), A., ii, 753.
lead iodide (MOSNIER), A., ii, 222.
lead thallium nitrite (PRZIBYLLA), A., ii, 223.
sulphate, crystallisation of, in a magnetic field (WRIGHT and KREIDER), A., ii, 265.
thermal change on diluting a saturated solution of (POLLOK), P., **1899**, 8.
loss of water by, and oxidation of (SCHARIZER), A., ii, 30.
electrolytic oxidation of (TOMMASI), A., ii, 138.
action of aqueous azoimide on (CURTIUS and RISSOM), A., ii, 92.
action of iodates and periodates on (PÉCHARD), A., ii, 478.
potassium sulphate, hydrates of, and their solubilities and transition temperatures (KÜSTER and THIEL), A., ii, 753.
sulphide, relation of magnetic pyrites and troilite to (LINCK), A., ii, 416.
Iron organic compounds:—
Ferrous pyridine salts (REITZENSTEIN), A., i, 162.
Ferric thiocyanate as the colouring matter of the amethyst (NABL), A., ii, 561.
Iron ores from Alba (TOSO), A., ii, 600.
analysis of (WETZKE), A., ii, 61.
estimation of iron in (LEHNKERING), A., ii, 251.
estimation of sulphur in (MEINEKE), A., ii, 518.
Iron products, estimation of carbon in (CARNOT and GOUTAL), A., ii, 809.
Iron:—
Cast iron, heat of solution of, influence of silicon on (CAMPBELL and HARTMAN), A., ii, 29.
detection of phosphorus in, by spectrum (DE GRAMONT), A., ii, 345.
estimation of carbon in (WDOWISZEWSKI), A., ii, 181.
estimation of sulphur in, volumetrically (THILL), A., ii, 693.
Galvanised iron, action of water on (DAVIES), A., ii, 555.
Steel, effect of low temperatures on magnetic properties of (OSMOND), A., ii, 630.
estimation of carbon in (WDOWISZEWSKI), A., ii, 181.
estimation of nickel in (LUCAS), A., ii, 614.
Iron:—
Steel, estimation of nickel in, volumetrically (GIORGIS), A., ii, 452.
estimation of sulphur in, volumetrically (THILL), A., ii, 693.
estimation of tungsten in (AUCHY), A., ii, 524.
Iron (in general), **detection, estimation, and separation of**:—
analysis of, preparation of pure metal for use in (SCHRÖDER), A., ii, 814.
detection of cobalt in presence of (BETTINK), A., ii, 815.
detection of ferrous and ferric iron in silicates (PENFIELD and FOOTE), A., ii, 305.
detection of phosphorus in (GRAMONT), A., ii, 345.
estimation of, colorimetrically (AVERY and DALES), A., ii, 252.
estimation of, electrolytically (AVERY and DALES), A., ii, 251, 814; (VERWER and GROLL), A., ii, 386.
estimation of, volumetrically (NORTON), A., ii, 613.
estimation of, volumetrically, in hydrochloric acid solution (WILLENZ), A., ii, 696.
estimation of carbon in (WDOWISZEWSKI), A., ii, 181; (SPÜLLER), A., ii, 809.
estimation of, in iron ores (LEHNKERING), A., ii, 251.
estimation of nickel in (LUCAS), A., ii, 614; (GIORGIS), A., ii, 452.
estimation of nickel in presence of (NEUMANN), A., ii, 386.
estimation of, in organic matter (RÖHMANN and STEINITZ), A., ii, 814.
estimation of, in phosphates (BLATTNER and BRASSEUR), A., ii, 128.
estimation of silver and mercury in presence of (KOLLOCK), A., ii, 811.
estimation of sulphur in (THILL), A., ii, 693; (HERTING), A., ii, 804.
estimation of sulphuric acid in presence of (KÜSTER and THIEL), A., ii, 247, 611; (LUNGE) A., ii, 805.
estimation of tungsten in (AUCHY), A., ii, 524.
estimation of, in water (SEYDA), A., ii, 341.
separation of cadmium from (STORTENBEKER), A., ii, 126.
separation of cobalt, copper, manganese, nickel, and zinc from (BREARLEY), A., ii, 815.
separation of copper, lead, tin, and zinc from (LANGMUIR), A., ii, 522.
separation of phosphates from (ANTONY and MONDOLFO), A., ii, 330.

Iron (in general), **separation of**:—
separation of zirconium from (Matthews), A., ii, 335.
Iron-boracite containing iodide (Allaire), A., ii, 156.
Isatin, absorption spectra and constitution of (Hartley and Dobbie), T., 647; P., **1899**, 48.
heat of formation of (Berthelot and André), A., ii, 400.
Isatis alpina leaves, action of various reagents on the fermentative process in (Bréaudat), A., i, 832.
Isatoic acid, methylic hydrogen and dimethylic salts and anhydride (Erdmann), A., i, 939.
Isomerism, dynamic (Lowry), T., 235; P., **1899**, 25, 76.
in inorganic compounds (Hantzsch), A., ii, 207.
optical, and triboluminescence (Andreocci), A., ii, 719.
position, and rotatory power (Guye and Babel), A., ii, 718, 719.
Isomorphism, mass effect of complex radicles in (Penfield and Foote), A., ii, 305.
Isomorphous mixtures, equilibrium of (Bruni), A., ii, 407.
of saturated and unsaturated open-chain compounds (Bruni and Gorni), A., ii, 731.
Isoprene. See Pentinene.
Isoprene-erythritol, chlorhydrin, and action of water on (Mokiewsky), A., i, 726.
Itaconic acid, synthesis of, by the action of pyruvic acid on malonic acid (Garzarolli-Thurnlackh), A., i, 790.
and its conversion into mesaconic acid, also its reduction (Fittig and Langworthy), A., i, 332.
oxidation of (Fittig and Köhl), A., i, 418.
Ivy, presence of hederin in (Houdas), A., i, 772.
physiological action of active principle of (Joanin), A., ii, 605.

J.

Jaborandi leaf, oil of (Schimmel and Co.), A., i, 924.
Jadeite from Burma (Krenner), A., ii, 672.
Jamesonite from Saxony, the Harz, and Westphalia (Guillemain), A., ii, 757.
artificial (Sommerlad) A., ii, 217.
Jasmal, from jasmine blossoms (Verley), A., i, 376.
Jasmine, oil of (Schimmel and Co.), A., i, 923.
blossoms, oil of (Verley), A., i, 376; (Hesse and Müller), A., i, 377, 441.
Jasper from Colorado (Hillebrand), A., ii, 564.
Jaundice, experimental, influence of, on the metabolism of sugar (von Reusz), A., ii, 168.
Jeffersonite from Franklin furnace (Hillebrand), A., ii, 301.
Jordanite from Switzerland (Guillemain), A., ii, 757.
artificial (Sommerlad), A., ii, 218.
Juniper, empyreaumatic oil of (Cathelineau and Hausser), A., i, 536, 711.

K.

Kainite. See Agricultural chemistry.
Kainosite from Sweden (Sjögren), A., ii, 36.
Kamacite from the Magura meteorite (Cohen), A., ii, 674.
from the Meuselbach meteorite (Linck), A., ii, 566.
Kaolinite from Bohemia (Kasai), A., ii, 435.
from Brazil (Derby), A., ii, 501.
from Colorado (Eakins), A., ii, 564.
from Moravia (Kovář), A., ii, 671.
from Russia (Zemjatschensky), A., ii, 110.
from Schneeberg (Morozewicz), A., ii, 765.
so-called colloidal (Kasai), A., ii, 435.
action of reagents on (Zemjatschensky), A., ii, 110.
rate of filtration of water or alcohol through (Hausser), A., ii, 277.
α-Ketobutenoic acid. See Propionylformic acid.
Ketocoumaran, preparation of (Friedländer), A., i, 675.
Ketocoumarancarboxylic acid, and methylic and ethylic salts (Friedländer), A., i, 675.
Ketodihydrobenzene, *hexa*chloro-, hylotropic-isomeric forms of (Schaum), A., ii, 733.
Ketohexamethylene. See *cyclo*-Hexanone.
Ketohexoses, action of hydrogen bromide on (Fenton and Gostling), T., 423; P., **1899**, 57.
Ketolactone, $C_{10}H_{16}O_3$, from *l*-terpineol and menthanetriol (Godlewsky), A., i, 920.

Ketone, $C_8H_{14}O$, from α-hydroxydihydro-*cis*-campholytic acid, oxime (Noyes), A., i, 928.
  from *cis*-campholytic acid (Noyes), A., i, 284.
  $C_{16}H_{14}O$, two isomeric, and a dibromide (Goldschmiedt and Knöpfer), A., i, 140.
  $C_{22}H_{18}O_2N_2$, two isomeric, formed by the action of phenylhydrazine on phenyl phthalidemethyl ketone (Hamburger), A., i, 143.
Ketones, conductivity of salt solutions in (Kahlenberg and Lincoln), A., ii, 397.
  reduction of (Kauffmann), A., i, 152.
  detection of (Lumière, Lumière and Seyewetz), A., i, 415.
  detection and isolation of (Bamberger), A., i, 666.
  aliphatic, action of nitrous acid on (Ponzio and de Gaspari), A., i, 252.
    oxidation of, in the organism (Schwarz), A., ii, 40.
  cyclic, new series of, from wood tar (Béhal), A., i, 121.
  hydroaromatic, polymerisation of (Knoevenagel and Reinecke), A., i, 340.
  unsaturated, reactions of (Harries), A., i, 578.

Quinoneaminoguanidine.
Quinonebisdiphenylmethane.
Quinonebistetramethyl*di*aminodiphenylmethane.
Santonin.
Δ^4-Terpeneone.
Tetrahydro-β-oxazole diketones.
Tetrahydroxybenzophenone.

Ketones and Quinones See :—
  Tetraketohydronaphthalene.
  Thymolphenolquinone.
  Thylmoquinone.
  Toluquinone.
  Tolyl anilinomethyl ketone.
  Tolyl ethyl ketone.
  p-Tolylideneacetone.
  p-Tolylideneacetophenone.
  Tolyl methyl ketone.
  Triacetylpentaphenylpentane.
  Triethylbenzophenone.
  Trihydroxybenzophenone (*alizarin yellow A.*).
  Triketomethyl*cyclo*hexene.
  Trimethoxyanthraquinone.
  Trimethoxybenzoylacetophenone.
  Trimethoxydihydroanthrone.
  Trimethylbenzimidazolone.
  Trimethyldeoxybenzoin.
  Triphenyloxazolone.
  Tuberone.
  Xyloquinone.
  Xylyl methyl ketone.
  Xylylquinazolone.
  Xylyltetrahydroketoquinazoline.
Ketonic bases (Schmidt), A., i, 4.
Ketoterpin, and sodium derivative, oxime, semicarbazone, phenylhydrazone (von Baeyer and Baumgärtel), A., i, 224.
a-**Ketotetrahydronaphthalene**, conversion of oxime, into tetrahydro-*a*-naphthylamine (Kipping and Hill), T., 152 ; P., **1899**, 5.
  semicarbazone, phenylhydrazone, *p*-bromophenylhydrazone, oxime (Kipping and Hill), T., 148 ; P., **1899**, 4.
Ketovalerolactonecarboxylic acid, from action of sulphuric acid on barium parapyruvate, and the action of alkalis on it (Wolff), A., i, 483.
Kickxia Africana, caoutchouc from (Lindet), A., ii, 508.
Kidney, influence of the, on metabolism (Bradford), A., ii, 310.
Kinetic theory of liquids (Jäger), A., ii, 404.
Kola, estimation of caffeine in (Gadamer), A., ii, 390.
Kola nuts, constituents and derivatives of (Schweitzer), A., i, 300.
Kolanin, preparation of caffeine and theobromine from, and its composition (Schweitzer), A., i, 301.
Kosin and its oxidation, triacetyl, and tribenzoyl derivatives (Daccomo and Malagnini), A., i, 158.
Kreittonite. See Gahnite.
Krypton, discovery of (Ramsay), A., ii, 212.
Krypton, position of, in the scheme of elements (Crookes), A., ii, 552 ; (Howe), A., ii, 740.
Kyanite from Scotland (Heddle), A., ii, 497.
Kyanite-schist from Brazil (Derby), A., ii, 501.
Kyschtymite from the Urals (Morozewicz), A., ii, 763.
Kynurenic acid, origin of, in the organism (Mendel and Jackson), A., ii, 117.

L.

Laben. See Agricultural chemistry.
Lac, stick- and bleached, constituents of (Tschirch and Farner), A., i, 446.
Laccase (Bertrand), A., i, 313 ; (Roux), A., ii, 444.
Lacmoid as an indicator (Waddell), A., ii, 83 ; (Glaser), A., ii, 573.
Lactase, presence of, in the small intestine (Weinland), A., ii, 604.
  isolation of, from lactose-fermenting yeasts (Dienert), A., ii, 442.
Lactic acid (i-*ethylidenelactic acid*, *a-hydroxypropionic acid*), manufacture and purification of (Claflin), A., i, 12.
  electrical dispersion of (Löwe), A., ii, 201.
  estimation of (Ulsch), A., ii, 802.
Lactic acid, alkali salts, action of molybdic oxide on (Henderson, Orr, and Whitehead), T., 553 ; P., **1899**, 108.
  ethereal salts, densities, specific rotations, and molecular volumes of (Frankland), T., 357.
  ethylic salt, chlorocarbonate, carbamate and nitrocarbamate of (Thiele and Dent), A., i, 16.
  phenylurethane, sodium, and ethylic salts of, and *tri*chloro- (Lambling), A., i, 52.
Lactic acid, *tri*chloro-, velocity of crystallisation of (Bogojawlensky). A., ii, 206.
d-**Lactic acid**, methylic and ethylic salts, preparation and specific rotation of (Purdie and Irvine), T., 484 ; P., **1899**, 74.
Lactone, $C_{12}H_{10}O_7$, obtained in condensation of ethylic acetonedicarboxylate (Jerdan), T., 810.
  $C_{15}H_{14}O_2$, from benzaldehyde and pyrocinchonic anhydride (Thiele), A., i, 216.
  $C_{15}H_{16}O_6$, from oxidation of trimethylbrazilin (Gilbody and Perkin), P., **1899**, 28.

Lactone, $C_{16}H_{12}O_2$, from desylacetic acid and acetic anhydride (THIELE), A., i, 217.
$C_{17}H_{12}O_2$, from benzaldehyde and phthalic anhydride (THIELE), A., i, 216.
$C_{17}H_{12}O_2$, from dibenzylidenepropionic acid and bromine (THIELE), A., i, 217.
$C_{17}H_{14}O_2$, from phenacylhydrocinnamic acid and acetic anhydride (THIELE), A., i, 217.
$C_{20}H_{12}O_6$, from condensation of oxalic acid and resorcinol, its triacetyl and *di*nitro-derivatives (HEWITT and PITT), T., 522; P., **1899**, 100.
$C_{20}H_{14}O_6$, tetracetyl derivative, from condensation of oxalic acid and resorcinol (HEWITT and PITT), T., 523; P., **1899**, 101.
Lactones, picrates of, cryoscopic behaviour of (BRUNI and CARPENÈ), A., ii, 8.
Lactones. See also:—
Acetoxyhydroxydimethylglutaric lactone.
2-Acetylangelicalactone, α- and β-.
Acid-cellulose lactone.
d- and *r*-Arabonic lactones.

Phenyl-*m*-cresylbromacetolactone.
Phenyl-*p*-cresylbromacetolactone.
Phenylcresylethoxyacetolactone.
Phenylhydroxynaphthylbenzyloxyacetolactone.
Phenyl-β-hydroxynaphthylbromacetolactone.
Phenylhydroxynaphthylethoxyacetolactone.
Phenylhydroxynaphthylmethoxyacetolactone.
Phenylorcylacetolactone.
Phenylresorcylacetolactone.
Phenylxylylketoximecarboxylic oximidolactone.
Propylparaconic and *iso*-Propylparaconic acids.
iso-Propyl*iso*paraconic acid.
iso-Saccharin.
iso-Terebic acid.
Undecodilactone.
Lactonic acid, $C_{10}H_{16}O_4$, from hydroxymethyl*iso*propyladipic acid (TIEMANN and SEMMLER), A., i, 225.
Lactonitrile. See α-Hydroxypropionitrile.

Lactose (*milk sugar*), action of alkalis on (de Bruyn and Alberda van Ekenstein), A., i, 661.
  action of yeast enzymes on (Kalanthar), A., i, 102.
  digestion of, in the small intestine (Weinland), A., ii, 604.
  fate of, after injection into the circulation (Pavy), A., ii, 677.
  detection of (Gawalowski), A., ii, 255.
  estimation of sucrose in presence of (Dowzard), T., 371 ; P., **1899**, 9.
Lævulic acid (*β-acetylpropionic acid*), synthesis of ; also its semicarbazone (Blase), A., i, 793.
  influence of, on formation of azo-compounds (Goldschmidt and Bürkle), A., ii, 276.
  bromo-, ethylic salt, action of, on the sodium derivatives of ethylic acetate and benzoate (Kehrer and Igler), A., i, 569.
Lævulose (*fructose*), action of methyl-alcoholic ammonia on (de Bruyn), A., i, 732.
  oxidation of, by hydrogen peroxide (Morrell and Crofts), T., 789 ; P., **1899**, 99.
  action of yeast-extract and Munich bottom-yeast on (Buchner and Rapp), A., ii, 606.
  fate of, after injection into the circulation (Pavy), A., ii, 677.
  detection of (Gawalowski), A., ii, 255.
  estimation of, as osazones (Lintner and Krober), A., ii, 66.
  estimation of, in brewing sugars (Morris), A. ii, 187.
Lagoriolite, artificial (Morozewicz), A., ii, 764.
Lanarkite, artificial (Schulten), A., ii, 161.
Lanthanum nitrate (Wyrouboff and Verneuil), A., ii, 225.
  cerium nitrate, and sulphate ; oxides and their polymerides (Wyrouboff and Verneuil), A., ii, 424.
  oxide, constitution of (Wyrouboff and Verneuil), A., ii, 598.
    influence of, on the solubility of cerosoceric oxide in nitric acid (Wyrouboff and Verneuil), A., ii, 424.
  *per*oxide (Melikoff and Pissarjewsky), A., ii, 598.
Lanthanum, separation of:—
  separation of cerite metals from (Schéele), A., ii, 291.
  separation of, from cerium (Mengel), A., ii, 223.
Larch-resin, and acetyl derivatives and isomeride (Bamberger and Landsiedl), A., i, 929.
Lard, rancidity of (Scala), A., i, 478.
  detection of cotton-seed oil in (Bömer), A., ii, 259.
  estimation of fatty acids in (Twitchell), A., ii, 69.
Lariciresinol and acetyl derivatives and isomeride (Bamberger and Landsiedl), A., i, 929.
Latebraric acid and **Latebride** from *Pulveraria latebrarum* (Hesse), A., i, 385.
Laterite from the Seychelles (Bauer), A., ii, 565.
Laumontite from Minnesota (Berkey), A., ii, 371.
  vapour pressure of (Tammann), A. ii, 8.
Lauramide, action of bromine on, in presence of sodium methoxide (Jeffreys), A., i, 731.
Lauric acid (*dodecoic acid*), physical constants of (Scheij), A., i, 668.
  boiling point of, in a vacuum (Krafft), A., ii, 465.
  and sodium salt, melting points of, and temperatures of solidification of solutions of (Krafft), A., ii, 471.
  sodium salt, boiling point of solutions of, in alcohol (Krafft), A., ii, 471.
  separation of, from other fatty acids (Holzmann), A., ii, 68.
Laurionite from Laurion, Greece (Smith and Prior), A., ii, 433.
iso-**Lauronic acid**, reduction of ; constitution (Blanc), A., i, 927.
iso-**Lauronolic acid** and amide from camphoroxime (Forster), T., 1142, 1148 ; P., **1899**, 193.
  constitution of (Blanc), A., i, 537, 630, 925.
  salts, ethers, o- and *p*-toluidides, α- and β-naphthalides (Blanc), A., i, 925.
  oxidation of (Blanc), A., i, 443, 927.
ψ-**Lauronolic acid**, methylic salt (Lees and Perkin), P., **1899**, 24.
iso-**Lauronolic alcohol**, acetyl derivative (Blanc), A., i, 925.
iso-**Lauronolic aldehyde**, semicarbazone, semioxamazone ; cinchonic acid from (Blanc), A., i, 925.
iso-**Lauronolide** (Blanc), A., i, 927.
Laurotetanine and salts, phenylthiocarbamide and dibenzoyl derivatives, and physiological action (Filippo), A., i, 312.
Laurylundecylcarbamide (Jeffreys), A., i, 731.
Lautarite, artificial (Schulten), A., ii, 161.

Lavendula pedunculata, oil of, composition of (Schimmel and Co.), A., i, 299.

Lead, crystals of (Miers and Hartley), ii, 432.
cathodes, pulverisation of, during electrolysis (Bredig and Haber), A., ii, 78.
potential difference between, and solutions of its salts in organic solvents (Kahlenberg), A., ii, 624.
mixtures of, with zinc, partition of tin or silver in (Bancroft), A., ii, 470.
action of, on nitric acid (Freer and Higley), A., ii, 480.
action of, on sulphuric acid (Adie), P., **1899**, 133; (Berthelot), A., ii, 283.
action of water on (Meldrum), A., ii, 100.
action of waters containing dissolved salts on (Antony), A., ii, 290.

Lead alloys, with antimony; lead antimonide (Stead), A., ii, 32.
with calcium (Tarugi), A., ii, 749.

Lead amalgams, of different concentrations, E.M.F. between (Cady), A., ii, 395.

Lead salts, diffusion of light by solutions of (Spring), A., ii, 585.
action of magnesium on solutions of (Bryant), A., ii, 289.
reduction of, by calcium carbide (Tarugi), A., ii, 749.

Lead antimonate (Senderens), A., ii, 557.
and lead potassium thioantimonites (Pouget), A., ii, 663.
ortharsenite, formation of (Reichard), A., ii, 23.
haloid salts of, solubility of, in alcohols (Rohland), A., ii, 144.
bromide and iodide, colour of (Kastle), A., ii, 476.
chloride or bromide, latent heats of fusion of, and melting and boiling points of bromide (Weber), A., ii, 724.
fused, dissociation coefficient in (Lorenz), A., ii, 269.
or iodide, electrolysis and heat of formation of (Czepinski), A., ii, 268.
*tetra*chloride, compounds of, with amines (Matthews), A., ii, 295, 296.
chlorobromides, chloriodides and bromiodide (Thomas), A., ii 420, 421, 484, 597.

Lead, lithium, sodium rubidium, ammonium, calcium, strontium, barium, magnesium, zinc, cadmium, iron, manganese, chromium, nickel, cobalt, phosphorus, arsenic, antimony, stannous, aluminium, and beryllium iodides (Mosnier), A., ii, 222.
oxychlorides from Laurion, Greece (Smith and Prior), A., ii, 432.
nitrate, decomposition of, by heat (Divers), T., 84.
thermal change on diluting a saturated solution of (Pollok), P., **1899**, 8.
copper thallium, nickel thallium, and iron thallium nitrites (Przibylla), A., ii, 223.
hyponitrite (Divers), T., 121; P., **1898**, 224.
oxide, reduction of, by aluminium (Franck), A., ii, 103.
and carbonate, reduction of, by hydrogen (Hélier), A., ii, 555.
Minium dissociation of (Le Chatelier), A., ii, 221.
*di*oxide, estimation of, volumetrically (Reichard), A., ii, 333.
*per*oxide, or *super*oxide (Kassner), A., ii, 657.
phosphate (Caven and Hill), A., ii, 29.
sulphate, solubility of, in aqueous ammonium acetate (Long), A., ii, 812.
basic sulphate (*lanarkite*) crystalline (Schulten), A., ii, 161.
sulphide, action of sulphuric acid on (Berthelot), A., ii, 283.
separation of the sulphides of arsenic, antimony, and bismuth from (Moyer), A., ii, 697.

Lead organic compound :—
Lead pyridine chloride (Reitzenstein), A., i, 163.

Lead, estimation and separation of :—
estimation of, electrolytically (Hollard), A., ii, 523.
estimation of, in ores (Moldenhauer), A., ii, 57; (Schneider), A., ii, 250.
estimation of, in tin plate and "tinned" foods (Carles), A., ii, 183.
estimation of traces of, in water (Liebrich), A., ii, 58.
separation of antimony and arsenic from (Atkinson), A., ii, 615.
separation of copper, iron, tin, and zinc from (Langmuir), A., ii, 522.
separation of mercury from (Jannasch and Devin), A., ii, 59.

Leather. See Agricultural chemistry.

Leaves. See Agricultural chemistry.

Lecanora sordida, vars. *glaucoma* and *Swartzii*, constituents of (Hesse), A., i, 383.
Lecanoric acid, from various lichens, and identity with parmelialic acid (Zopf), A., i, 716.
  presence of, in various lichens (Hesse), A., i, 382.
Lecasteric acid, **Lecasteride**, and ethylic salts (Hesse), A., i, 383.
Lecidea confluens, and *L. sudetica*, constituents of (Zopf), A., i, 717.
Lecidic acid and **Lecidol**, from *Lecidea cineroatra* (Hesse), A., i, 384.
Lecithin and myelin substances in the brain and egg-yolk (Zuelzer), A., ii, 504.
Lees, estimation of mercury and copper in (Vignon and Barrillot), A., ii, 452.
Leguminosæ. See Agricultural chemistry.
allo-**Lemonal**, from lemon-grass oil (Stiehl), A., i, 66.
  composition of (Doebner), A., i, 223.
Lemon-grass oil (Stiehl), A., i, 66; (Semmler and Doebner), A., i, 223; (Schimmel and Co.), A., i, 299; (Tiemann), A., i, 623; (Labbé), A., i, 710, 711; (Bouveault; Flatau; Stiehl), A., i, 711.
Lemonol. See Geraniol.
allo-**Lemonylidene-acetone** (Stiehl), A., i, 67.
Lentil. See Agricultural chemistry.
Leonhardite, vapour pressure of (Tammann), A., ii, 8.
Lepidine. See 4′-Methylquinoline.
Lepidinealkine. See 4′-Quinolylethanol.
Lepidium sativum, glucoside and essential oil of (Gadamer), A., i, 930.
Lepidomelane from Thuringia, alteration of (Zschimmer), A., ii, 768.
Lepra candelaris, constituents of (Hesse), A., i, 385.
Lepraric acid, from *Pulveraria chlorina* (Hesse), A., i, 385.
Leucæmia, excretion of phosphates and alloxuric substances in (White and Hopkins), A., ii, 316.
Leucine (*α-amino-n-hexoic acid*), presence of, in fungi (Winterstein), A., ii, 240.
  presence of, in the broad-bean (Bourquelot and Hérissey), A., ii, 324.
  presence of, in yeast-extract (Wróblewski), A., ii, 170.
  crude, purification of (Röhmann), A., i, 96.
  viscosity of undercooled (Tammann), A., ii, 272.
  as a source of sugar in the living body (Cohn), A., ii, 776.
Leucocytes, action of, on bacilli (Hardy), A., ii, 165.
Leucomaines. See Ptomaines.
Lianas, African, caoutchouc from (Lindet), A., ii, 508.
Licareol, action of acetic anhydride on (Barbier and Léser), A., i, 100.
l-**Licarhodal**. See *allo*Lemonal.
Licarhodol, and its oxidation (Barbier and Léser), A., i, 101.
Lichenostearic acid, from *Platysma cucullatum* (Zopf), A., i, 717.
  and its methylic and ethylic salts (Sinnhold), A., i, 13.
Lichenosterylic acid (Sinnhold), A., i, 13.
Lichens, constituents of (Hesse), A., i, 381; (Zopf), A., i, 716.
  iodine in (Gautier), A., ii, 649.
Light, monochromatic, source of (Fabry and Perot), A., ii, 461.
  yellow, for polarimeter (Dupont), A., ii, 77.
  influence of, in dissipating an electrostatic charge (Knoblauch), A., ii, 622.
  diffusion of, by solutions (Spring), A., ii, 585.
  ultra-violet, influence of, in nitrogen-assimilation by plants (Laurent, Marchal, and Carpiaux), A., ii, 173.
  See also Photochemistry.
Lignin, formation and variation of lignin in wood of conifers (Cieslar), A., ii, 447.
Lignin reaction of wood, the so-called (Czapek), A., i, 560.
Lignite, formation of (Bertrand), A., ii, 430.
Lignite tar, constituents of (Oehler), A., i, 816.
Lignoceric acid, estimation of, in earth nut oil (Archbutt), A., ii, 260.
Legumin, absorption spectrum of (Blyth), T., 1164; P., **1899**, 175.
Lily bulbs, variation in the reserve materials of (du Sablon), A., ii, 445.
Lime. See Calcium oxide, and also Agricultural chemistry.
Limestone, metamorphic, minerals in (Clough and Pollard), A., ii, 667.
  silicified, from Antarctic regions (Prior), A., ii, 436.
  estimation of carbonic anhydride in (Schenke), A., ii, 809.
Limestone, magnesian, weathering of (Philippi), A., ii, 306.
Limonene from oil of mandarins (Flatau and Labbé), A., i, 442.
  from limonene bromide (Godlewsky and Roshanowitsch), A., i, 920.

Limonene, behaviour of, towards formaldehyde (Kriewitz), A., i, 298.
oxidation of (Godlewsky), A., i, 920.
α-Limonene, from lemon-grass oil (Stiehl), A., i, 66.
Linalool in oils of neroli and petit grain (Charabot and Pillet), A., i, 620.
from oil of thyme (Labbé), A., i, 621.
action of alcoholic potash on (Tiemann), A., i, 184; (Charabot), A., i, 767.
and acetate, estimation of (Hesse and Müller), A., i, 441.
***l*-Linalool**, behaviour towards acetic anhydride, formic acid, and acetic acid (Stephan), A., i, 68.
Linoleic acid, estimation of (Farnsteiner), A., ii, 705.
Linseed cake and meal. See Agricultural chemistry.
Linseed oil, cements made from lime and (Dörner), A., ii, 554.
constants of (Gill and Lamb), A., ii, 533.
examination of (Hehner and Mitchell), A., ii, 190.
iodine number of (Wijs), A., ii, 711.
Liparite magmas, crystallisation of (Morozewicz), A., ii, 764.
Lippia citriodora, oil of (Barbier), A., i, 769.
Liquids, kinetic theory of (Jäger), A., ii, 404.
molecular weights of (Speyers), A., ii, 145.
hydrates of (Villard), A., ii, 151.
crystalline-, dielectric behaviour of (Abegg and Seitz), A., ii, 623.
extraction of, with ether, apparatus for (Foerster), A., ii, 121; (Baum), A., ii, 802.
non-miscible, distribution of a consolute liquid between two (Bancroft), A., ii, 469.
racemic, characterisation of (Kipping and Pope), T., 1119; P., **1899**, 200.
nature of (Roozeboom; Kipping and Pope), A., ii, 733.
supercooled, velocity of solidification of (Wildermann), P., **1899**, 175.
weighing corrosive or fuming (Schwartz), A., ii, 802.
Lithium, spectrum of, in its fused salts (Gramont), A., ii, 198.
ion velocity of, in flames (Wilson), A., ii, 723.
absorption of nitrogen by mixtures of magnesium, lime and (Hempel), A., ii, 594.
Lithium amalgams, specific volumes of (Maly), A., ii, 547.
Lithium salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
Lithamide (Moissan), A., ii, 152, 153.
Lithium ammonia (Moissan), A., ii, 152.
arsenide, preparation of (Lebeau), A., ii, 655.
azoimide (Curtius and Rissom), A., ii, 92.
cupric bromide (Kurnakoff and Sementschenko), A., ii, 287.
carbide, formation of (Moissan), A., i, 241.
preparation and heat of formation of; action of, on fused lithium chloride (Guntz), A., ii, 24.
carbonate, reduction of, by aluminium (Franck), A., ii, 102.
chloride, spark-spectrum of (Gramont), A., ii, 137.
transference ratio of, with various septa (Bein), A., ii, 399.
heat of dilution of (Dunnington and Hoggard), A., ii, 728.
surface tension of solutions of (Linebarger), A., ii, 469.
contraction of aqueous solutions of, on dilution (Wade), T., 270; P., **1899**, 8.
densities and refractive indices of solutions of (Conroy), A., ii, 717.
density of aqueous solutions of (de Coppet), A., ii, 590.
combination of, with methylamine (Bonnefoi), A., i, 185.
ammonium chloride, dissociation of, change of entropy in (Matignon), A., ii, 273.
chlorides, ammoniacal, preparation of, and heats of formation and solution (Bonnefoi), A., ii, 96.
uranium chlorides and bromides (Aloy), A., ii, 555.
lead iodide (Mosnier), A., ii, 222.
nitrate, mixtures of, with sodium and potassium nitrates, melting points of (Carveth), A., ii, 141.
oxide, heat of formation of (Moissan), A., ii, 352.
phosphiodate and molybdiodate (Chrétien), A., ii, 363.
silicate, hydrolysis of, in alkaline solution (Kahlenberg and Lincoln), A., ii, 95.
sulphate, galvanic polarisation in solutions of (Jahn), A., ii, 542.
tungsten tungstate (Hallopeau), A., ii, 159.
*per*uranate, action of aluminium hydroxide on (Melikoff and Pissarjewsky), A., ii, 31.

Lithium organic compounds :—
  Lithium acetylide, ammonio-compound of (Moissan), A., i, 241.
  Lithiummethyl ammonium (Moissan), A., i, 410.
Litmus, use of, in alkalimetry (Glaser), A., ii, 573.
Liver, oxidising ferment of the (Jacoby), A., ii, 778.
Liver of molluscs, physiology of the (Biedermann and Moritz), A., A., ii, 438.
Liver of sulphur, estimation of silver and alkalis in (Barthe), A., ii, 329.
Lonchidite. See Marcasite.
Lophophorine, physiological action of (Dixon), A., ii, 681.
Lornskite, from Finland (Melnikoff ; Nikolaéeff), A., ii, 669.
Lubricants for glass stopcocks (Phillips), A., ii, 16.
Lucerne. See Agricultural chemistry.
Luminescence of organic compounds in the state of vapour (Kauffmann), A., ii, 464.
Luminosity of flames containing vaporised salts (Smithells, Dawson, and Wilson), A., ii, 722.
Luminous phenomena produced by ammonium salts and fused potassium nitrate (Tommasi), A., ii, 483.
Lung, diffusion of gases through (Hill), A., ii, 437.
  cause of respiratory exchange in the (Harley), A., ii, 675.
Lupetidine. See 2 : 6-Dimethylpiperidine.
iso-**Lupetidine**, and salts (Marcuse and Wolffenstein), A., i, 937.
Lupin. See Agricultural chemistry.
Lupulin, estimation of, in hops (Lintner), A., ii, 264.
Lussatite from Moravia (Bavíř), A., ii, 671.
Luteolin, potassium derivative of (Perkin), T., 441 ; P., **1899**, 65.
  presence of, in *Genista tinctoria* and its tetracetyl compound and properties (Perkin and Newbury), T., 831 ; P., **1899**, 179.
Lutidine. See 2 : 6-Dimethylpyridine.
β-Lutidine. See 4-Ethylpyridine.
4-Lutidylhydrazine. See 2 : 6-Dimethylpyridine-4-hydrazine.
Lycerosazone (Loew), A., i, 851.
Lycorine, from *Lycoris radiata*, and its physiological action (Morishima), A., i, 92.
Lymph, properties and formation of (Asher), A., ii, 165.
Lysine, preparation of (Kossel), A., i, 833.

M.

Maclurin (*pentahydroxybenzophenone*), action of potassium acetate on (Perkin), T., 442 ; P., 1899, 66.
  action of sodium on, in alcohol (Kunz-Krause), A., i, 201.
Magmas, formation of minerals in (Morozewicz), A., ii, 762.
Magnesium, potential difference between, and solutions of its salts in organic solvents (Kahlenberg), A., ii, 624.
  absorption of nitrogen by mixtures of, with lime and sodium or lithium (Hempel), A., ii, 594.
  action of, on nitrogenous compounds, especially cyanides (Eidmann), A., i, 317.
  action of, on solutions of its salts (Lemoine), A., ii, 656.
  action of sulphur on (Franck), A., ii, 28.
  action of, on sulphuric acid (Adie), P., **1899**, 133.
  action of, on solutions of zinc, lead, or silver salts (Bryant), A., ii, 289.
Magnesium alloy with calcium (Moissan), A., ii, 154.
Magnesium salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
  taste of (Höber and Kiesow), A., ii, 207.
Magnesium azoimide (Curtius and Rissom), A., ii, 92.
  carbide, formation of (Moissan), A., ii, 554.
  carbonate, hydrated from Lombardy (Brugnatelli), A., ii, 372.
  hydrogen carbonate (Kippenberger ; Treadwell), A., ii, 220.
  chloride, heat of dilution of (Dunnington and Hoggard), A., ii, 728.
    partition of water between sulphuric acid and (Busnikoff), A., ii, 361.
    hydrates of (Bogorodsky), A., ii, 656.
    absorption of water by, and hydrates of (Busnikoff), A., ii, 409.
  ammonium or potassium chlorides, conductivities of solutions of (Jones and Knight), A., ii, 628.
  ammonium chloride, dissociation of, change of entropy in (Matignon), A., ii, 273.
  hydroxide, electrolysis of aqueous solutions of (Glaser), A., ii, 79.
  lead iodide (Mosnier), A., ii, 222.
  molybdiodate (Chrétien), A., ii, 363.

Magnesium nitrate, heat of dilution of (Dunnington and Hoggard), A., ii, 728.
  hydrates of (Funk), A., i, 209.
 oxide (*magnesia*), heat of formation of (Moissan), A., ii, 352.
  stability of, at high temperatures (Richards), A., ii, 101.
  agents for removing, from natural waters (Griffin), A., ii, 655.
  See Agricultural chemistry.
 ammonium phosphate, ignition of (Mastbaum), A., ii, 55.
 pyrophosphate, and sodium and ammonium pyrophosphates (Berthelot and André), A., ii, 156.
 pentametaphosphimate (Stokes), A., ii, 93.
 phosphide (Gautier), A., ii, 484.
 sulphate, thermal change on diluting a saturated solution of (Pollock), P., **1899**, 8.
  and nitrate, densities of, solutions of (Barnes and Scott), A., ii, 406.
  hydrated (van't Hoff and Dawson), A., ii, 759.
 sulphide, amorphous and crystalline (Mourlot), A., ii, 27.
 ammonium sulphide (Franklin and Kraus), A., ii, 284.
 potassium *para*tungstate (Hallopeau), A., ii, 159.
Magnesium, estimation and separation of:—
 estimation of, in ashes (Haywood), A., ii, 612.
 separation of manganese and alkaline earths from (Villiers), A., ii, 523.
Magnesium-boracite containing iodide (Allaire), A., ii, 156.
Magnetic behaviour of iron-nickel alloys (Osmond), A., ii, 352.
 field, influence of, on crystallisation (Wright and Kreider), A., ii, 265.
 properties of the elements (Meyer), A., ii, 587.
 properties of steel, effect of low temperatures on (Osmond), A., ii, 630.
 rotation. See Photochemistry.
 susceptibility and permeability of liquid oxygen, and of manganous sulphate (Fleming and Dewar), A., ii, 544.
Magnetite from Lombardy (Brugnatelli), A., ii, 372.
 nickeliferous, from Ontario (Miller), A., ii, 109.
Magnet-radiometer (Teclu), A., ii, 77.
Magnochromite from North Carolina (Pratt), A., ii, 495.
Maize and **maize cake.** See Agricultural chemistry.
Maize oil (*corn oil*), composition and properties of (Hopkins), A., ii, 608.
 analytical results of (Archbutt), A., ii, 711.
 iodine number of (Zega and Majstorović), A., ii, 820.
Malachite from Adamello mountains (Riva), A., ii, 38.
 iodine in (Autenrieth; Dieseldorff; Ochsenius), A., ii, 760.
 estimation of traces of iodine in (Autenrieth), A., ii, 804.
Malachite-green-*o*-sulphonic acid, (Suais), A., i, 439.
Maleamic acid, methylic salt, formation of (Hoogewerff and van Dorp), A., i, 870.
Maleic acid, equilibrium between fumaric acid and, in presence of ammonia (Bancroft), A., ii, 411.
 magnesium salt, dissociation of, in solution (Calame), A., ii, 145.
 *di*bromo-, ethylic salt, hydrolysis; also action of ethylic sodiomalonate on (Ruhemann and Cunnington), T., 961; P., **1899**, 185.
Maleimide, action of methylic alcohol on (Hoogewerff and van Dorp), A., i, 870.
Malic acid, reduction of, by *Bacillus lactis aërogenes* (Emmerling), A., ii, 569.
 optical behaviour of derivatives of (Walden), A., ii, 539.
Malic acid, salts, composition and crystalline form of (Traube), A., i, 484.
 mono-alkali salts, action of molybdic, tungstic, titanic, and stannic oxides on (Henderson, Orr, and Whitehead), T., 548; P., **1899**, 107.
 copper salt, dissociation of, in solution (Calame), A., ii, 145.
 silver salt, action of ethylic, *iso*butylic and *sec*butylic iodides on (Purdie and Pitkeathly), T., 154; P., **1899**, 6.
 ethereal salts, specific rotations and molecular volumes of (Frankland), T., 348, 349.
 ethylic salt, action of ethylic iodide on, in the presence of lead oxide, of mercuric oxide, and of silver oxide (Purdie and Pitkeathly), T., 157; P., **1899**, 6.
 methylic salt, cryoscopic behaviour of, in dimethylic succinate (Bruni and Gorni), A., ii, 731.

Malic acid, methylic and ethylic salts, preparation and specific rotations of (Frankland and Wharton), T., 338 ; P., **1899**, 26.
  detection of, in grapes (Girard and Lindet), A., ii, 454.
  estimation of, in presence of oxalic and citric acids (Kissling), A., ii, 821.
Malic acid, chloro-, optical isomerism of (Walden), A., ii, 393.
Malonamide, mercury compound of, constitution of (Kieseritzky), A., ii, 395.
  *di*chloro-, from action of ammonia on ethylic *tetra*chloracetonedicarboxylate (Dootson), T., 171 ; P., **1899**, 9.
Malonic acid, action of pyruvic acid on (Garzarolli-Thurnlackh), A., i, 790.
  condensation of sodium derivative of, with ethylic *iso*propylenemalonate (Lawrence), P., **1899**, 62.
Malonic acid, potassium salt, heat of formation of (Massol), A., ii, 80.
  l-amylic salt, molecular rotation of (Walden), A., ii, 622.
  ethylic salt, determination of the molecular weight of the sodium derivative of (Vorländer and Schilling), A., i, 672.
    action of acetylene *tetra*bromide on, in presence of sodium ethoxide (Crossley), P., **1898**, 248.
    condensation of, with aldehydes under the influence of ammonia and organic amines (Knoevenagel), A., i, 116.
    action of aluminium amalgam on (Tistschenko), A., i, 408.
    action of bromacetal on the sodium derivative of (Perkin and Sprankling), T., 13 ; P., **1898**, 112.
    action of *di*bromo-β-dimethyltrimethylene, *di*bromotrimethylethylene and *di*bromo*iso*butylene on the sodium derivative of (Ipatieff), A., i, 481.
    action of cyanogen on (Traube), A., i, 193.
    action of diethylamine and formaldehyde on (Komppa), A., i, 416.
    action of β-diethyltrimethylenic bromide on the sodium derivative of (Ipatieff), A., i, 673.
    action of ethylenic oxide and epichlorhydrin on the sodium derivative of (Traube and Lehmann), A., i, 417.
Malonic acid, ethylic salt, action of ethylic brom*iso*butyrate on the sodium derivative of (Bone), P., **1899**, 5.
    condensation of ethylic bromopropionate and brom*iso*butyrate with the sodium derivative of (Bone and Sprankling), T., 849.
    condensation of, with ethylic *iso*butylideneacetoacetate (Barbier and Grignard), A., i, 112.
    action of ethylic chloroglyoxylate on the sodium derivative of (Bouveault), A., i, 416.
    condensation of, with ethylic β-chlor*iso*valerate (Montemartini), A., i, 420.
    condensation of the sodium compound with ethylic cyanoformate (Ruhemann and Cunnington), T., 786 ; P., **1899**, 169.
    action of sodium derivative on ethylic *di*bromomaleate and *di*bromocinnamate (Ruhemann and Cunnington), T., 961 ; P., **1899**, 185.
    condensation of, with indones and with quinones (Liebermann), A., i, 522.
    action of mesityl oxide on the sodium derivative of (Crossley), P., **1898**, 247 ; P., **1899**, 52.
    action of phorone, pulegone, and methyl*cyclo*hexenone on the sodium derivative of (Vorländer and Gärtner), A., i, 259.
    action of sodium on (Willstätter), A., i, 576.
  methylic salt, action of methylic dichloroxalate on the sodium derivative of (Anschütz and Clarke), A., i, 577.
    and ethylic salt, action of bisdiazochlorides of benzidine, *o*-tolidine and dianisidine on (Favrel), A., i, 521.
Malonic acid, bromo- and chloro-, ethylic salts, action of potassium carbonate on (Blank and Samson), A., i, 484.
  *di*chloro-, potassium salt, from action of potash on ethylic *tetra*chloracetonedicarboxylate (Dootson), T., 170 ; P., **1899**, 9.
  *di*cyano- (*cyanimino*iso*succinic acid*), ethylic salt (Traube), A., i, 193.
  imino-, ethylic salt (Hessler), A., i, 900.
Malonic acids, substituted, melting points of (Solonina), A., ii, 633.
  solubility of (Massol and Lamouroux), A., i, 479.

Malonic aldehyde, nitro-, and its aniloxime (Hill and Torrey), A., i, 788, 789.
Malonic dialdoxime, nitro-, sodium and silver derivatives (Hill and Torrey), A., i, 789.
Malonimide, formation of (Mathews), A., i, 56.
Malonodiethylamide, from action of ethylamine on ethylic *iso*aconitate (Guthzeit and Laska), A., i, 260.
Malonyl-phenetidide and **-diphenetidide** (Bischoff), A., i, 280.
Malt. See Agricultural chemistry.
Maltobionic acid, hydrolysis of, with oxalic acid (Brown and Millar), T., 307; P., **1899**, 12.
Maltodextrin and its oxidation products and constitution (Brown and Millar), T., 286; P., **1899**, 11.
nitration and attempted recovery of (Brown and Millar), T., 312; P., **1899**, 13.
Maltodextrinic acids, A- and B-, and their hydrolysis; also their calcium salts (Brown and Millar), T., 296; P., **1899**, 12.
Maltose, from action of diastase on dextrinic acid (Brown and Millar), T., 330; P., **1899**, 14.
from diastasic hydrolysis of maltodextrinic acid A; also its hydrolysis (Brown and Millar), T., 297; P., **1899**, 12.
formation of, by takadiastase (Stone and Wright), A., i, 95.
conversion of dextrin into (Petit), A., i, 559.
velocity of hydrolysis of, by different acids (Sigmond), A., ii, 146.
action of alkalis on (de Bruyn and Alberda van Ekenstein), A., i, 661.
action of yeast enzymes on (Kalanthar), A., i, 102.
nitration and attempted recovery of (Brown and Millar), T., 313.
detection of (Gawalowski), A., ii, 255.
estimation of, in brewing sugars (Morris), A., ii, 187.
estimation of mannose in presence of (Bourquelot and Hérissey), A., ii, 817.
Malyl-anilide, and *-o-*, *-m-*, and *-p-***toluides**, specific rotations of (Guye and Babel), A., ii, 719.
Mandarins, oil of, composition of (Flatau and Labbé), A., i, 442.
Mandelamide, synthesis of (Minovici), A., i, 890.
Mandelanilide, formation of (Lambling), A., i, 52.
Mandelic acid (*a-hydroxyphenylacetic acid; phenylglycollic acid*), and its sodium salt, influence of dilution on rotatory power of (Rimbach), A., ii, 345.
resolution of, and alkaloidal and metallic salts (McKenzie), T., 964; P., **1899**, 186.
phenylurethane, and its ethylic salt (Lambling), A., i, 52.
p-bromo-, and *p*-chloro- (Collet), A., i, 699.
d-**Mandelic acid**, and sodium salt, solutions of, specific rotation and dissociation of (McKenzie), T., 768; P., **1899**, 150.
action of boiling potash, and of hydrochloric acid on (Holleman), A., i, 282.
l-**Mandelic acid**, specific rotation of (McKenzie), T., 757.
i-**Mandelic acid**, ethylic salt, preparation of (McKenzie), T., 755.
d- and *l*-**Mandelic acids**, and cinchonine salts, specific rotations of (Rimbach), A., i, 895.
r-, *l*-, and *d*-**Mandelic acids**, etherification of, by *l*-menthol (Marckwald and McKenzie), A., ii, 733.
Mandelonitrile phenylurethane (Lambling), A., i, 53.
condensation of, with phenols (Bistrzycki and Simonis), A., i, 153.
Manganese, presence of, in animals and plants (Pichard), A., ii, 40.
influence of, on the phosphorescence of strontium sulphide (Mourelo), A., ii, 484.
action of, on sulphuric acid (Adie), P., **1899**, 133.
Manganese salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
Manganese antimonate (Senderens), A., ii, 557.
and manganese potassium thioantimonites (Pouget), A., ii, 663.
arsenite (Reichard), A., ii, 23.
azoimide, basic (Curtius and Rissom), A., ii, 92.
iron carbides (Carnot and Goutal), A., ii, 293.
carbonate in oceanic deposits (Hartley), A., ii, 437.
chloride, transition temperature of (Richards and Briggs), A., ii, 355.
molecular weight of, in urethane (Castoro), A., ii, 360.

Manganese chloride, hydrates of (Kuznetzoff), A., ii, 658.
hydroxide, equilibrium between ammonium salts and (Herz), A., ii, 752.
*tetr*iodate, compounds of, with potassium, ammonium, and barium iodates, and manganosomanganic iodate (Berg), A., ii, 426.
lead iodide (Mosnier), A., ii, 222.
molybdiodate (Chrétien), A., ii, 363.
nitrate, hydrates of (Funk), A., ii, 210.
oxide, reduction of, by aluminium (Franck), A., ii, 103.
Manganates, estimation of manganese in (Reichard), A., ii, 813.
Permanganate, estimation of nitrite by (Darbon), A., ii, 745.
dihydrogen phosphate, decomposition of, by water (Viard), A., ii, 752.
silicide (Warren), A., ii, 158.
silico-carbonates from the Hautes Pyrénées (Lienau), A., ii, 761.
sulphate, magnetic and paramagnetic susceptibility of (Fleming and Dewar), A., ii, 544.
action of periodates on (Péchard), A , ii, 477.
cæsium alum (Piccini), A., ii, 367.
potassium *para*tungstate (Hallopeau), A., ii, 160.
Manganese organic compounds :—
Manganese dithionate phenylhydrazine (Moitessier), A., i, 688.
dipyridine, and diquinoline chlorides (Reitzenstein), A., i, 163.
Manganese, estimation and separation of :—
estimation of (Murmann), A., ii, 126; (Vitali), A., ii, 251.
estimation of, by arsenious acid (Reichard), A., ii, 813.
estimation of, by permanganate (Daw; Brearley), A., ii, 334.
estimation as pyrophosphate (Gooch and Austin), A., ii, 128.
estimation of, in ores (Lehnkering), A., ii, 251.
separation of iron from (Brearley), A., ii, 815.
separation of magnesium and the alkaline earths from (Villiers), A., ii, 523.
separation of mercury from (Jannasch and Alffers), A., ii, 60.
Manganese-boracite containing iodide (Allaire), A., ii, 156.
Manganese-steel, effect of low temperatures on magnetic properties of (Osmond), A., ii, 630.
Manganosite from Sweden, origin of (Sjögren), A., ii, 760.
Mangelwurzel. See Agricultural chemistry.
Mannitol, velocity of crystallisation of (Bogojawlensky), A., ii, 206.
condensation of, with benzaldehyde (de Bruyn and Alberda van Ekenstein), A., i, 662.
action of hydrogen dioxide on, in presence and absence of iron (Fenton and Jackson), T., 8; P., **1898**, 240.
Mannose, preparation of, by action of hydrogen peroxide on mannitol, in presence of iron (Fenton and Jackson), T., 9; P., **1898**, 240.
estimation of, in presence of galactose, arabinose, maltose, or dextrin (Bourquelot and Hérissey), A., ii, 817.
Manures, estimation of nitrates in (Ackermann), A., ii, 329.
estimation of phosphoric acid in (Vignon; Lasne), A., ii, 54; (Littman), A., ii, 330.
estimation of citrate soluble phosphoric acid in (Böttcher), A., ii, 55.
estimation of potassium in (Eggertz and Nilson), A., ii, 384; (Bell), A., ii, 809.
See also Agricultural chemistry.
Marcasite (*lonchidite*) from Olkusch (Antipoff), A., ii, 109.
from Poland (Antipoff), A., ii, 667.
Marcs, estimation of mercury and copper in (Vignon and Barrillot), A., ii, 452.
Marekanite-obsidian from Nicaragua (Petersen), A., ii, 38.
Margarine, adulteration of, by paraffin (Geisler), A., ii, 710.
detection of sesamé oil in (Soltsien), A., ii, 71.
examination of, cryoscopically (Pouret), A., ii, 710.
Mariposite from California (Turner), A., ii, 37.
Marl from New South Wales (Mingaye), A., ii, 670.
estimation of calcium carbonate in (Mayer), A., ii, 385.
estimation of carbonic anhydride in (Schenke), A., ii, 809.
Maté, composition of (Polenske and Busse), A., ii, 608.
Matico oils, composition of (Schimmel and Co.), A., i, 299.
Meat, estimation of phosphoric acid in (Neumann), A., ii, 54.
estimation of sugar in (Polenske), A., ii, 186.
Meat extracts, estimation of glycogen in (Lebbin), A., ii, 256.

- **Meconic acid** and **Meconine**, detection of (Seyda), A., ii, 344.
- **Melanin**, of the retina, constitution of (Landolt), A., ii, 777.
  - from horse-hair, and its oxidation products (Jones), A., i, 396.
- **Melanins** (Jones), A., ii, 439.
  - formation of, from proteids by hydrolysis (Chittenden and Albro), A., i, 468.
- **Melanurenic acid.** See Ammelide.
- **Meldola's blue**, chloro- (Jaubert), A., i, 684.
- **Melibiose**, action of alkalis on (de Bruyn and Alberda van Ekenstein), A., i, 661.
  - action of yeast enzymes on (Kalanthar), A., i, 102.
- **Melicitose**, action of yeast enzymes on (Kalanthar), A., i, 102.
- **Melissa oil** (Flatau and Labbé), A., i, 534.
- **Melitriose.** See Raffinose.
- **Mellitic acid**, sodium salt, freezing point of aqueous solutions of (Taylor), A., ii, 7.
- **Melting point**, determination of, by Holborn and Wien's method (Ladenburg and Krügel), A., ii, 545.
  - effect of pressure on (Hulett), A., ii, 469; (Tammann), A., ii, 635.
  - of organic substances and number of carbon atoms in molecule, relationship between (Solonina), A., ii, 633.
  - of racemic compounds, pseudoracemic mixtures, and inactive conglomerates (Roozeboom), A., ii, 401.
  - of fats, determination of (Le Sueur and Crossley), A., ii, 271.
  - of fats and waxes, determination of (Dowzard), A., ii, 725.
- **Melting point curves** of mixtures of two indifferent compounds, and of optical isomerides (Centnerszwer), A., ii, 725.
  - of racemic compounds (Roozeboom), A., ii, 276.
  - of mixtures of tautomeric compounds (Roozeboom), A., ii, 355.
- **Membranes**, semi-permeable, utility of (Moritz), A., ii, 721.
- *cis*-**Menthane-6 : 8-diol**, 1 : 2-*di*chloro- (Wagner and Slawinski), A., i, 767.

  - action of, on sulphuric acid (Adie), P., **1899**, 133.
  - aluminium couple, use of, as a condensing agent (Cohen and Skirrow), T., 887; P., **1899**, 183.
  - solution of barium in (Schoeller), A., ii, 347.
  - metallic, solubility of, in the body juices (Chittenden), A., ii, 311.
- **Mercury alloys** (*amalgams*) of different concentration, potential difference between (Schoeller), A., ii, 346.
  - with calcium (Moissan), A., ii, 154; (Ferée), A., ii, 155.
  - with lithium, sodium, or potassium, specific volumes of (Maey), A., ii, 547.

- **Mercurammonium** chlorides, and their constitution (Hofmann and Marburg), A., i, 486; (Pesci), A., ii, 750.
  - Diammoniomercuric iodide, dissociation of, and Tetrammoniotrimercuric iodide (François), A., ii, 657.
  - Dihydroxymercuriammonium hydroxide, and the action of light and ammonia on it; also its nitrate, bromide, and chloride, and its dehydration (Hofmann and Marburg), A., i, 487.
- **Mercury salts**, diffusion of light by solutions of (Spring), A., ii, 585.
  - absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
  - haloid, solubility of, in alcohols (Rohland), A., ii, 144.
  - action of antimony *tri*oxide on (Harding), A., ii, 490.
  - action of hydrogen on (Colson), A., ii, 485.
  - reduction of, by calcium carbide (Tarugi), A., ii, 749.
  - estimation of, by alkalimetry (Lescœur), A., ii, 183.
- **Mercuric salts**, solutions of, action of potassium thioantimonite on (Pouget), A., ii, 663.
- **Mercuric** antimonate (Senderens), A., ii, 557.
  - arsenide and *mono-*, *di-*, and *tri*-chloro-mercurarsine (Partheil and Amort), A., ii, 417.
  - arsenite (Reichard), A., ii, 23.
  - *per*chlorate and nitrate, solutions of (Ley and Kissel), A., ii, 486.
  - chloride, molecular weight of, in urethane (Castoro), A., ii, 360.
    - solutions of, in various solvents, conductivity of (Kahlenberg and Lincoln), A., ii, 397.
    - distribution ratio of, between water and toluene (Brown), A., ii, 83.
    - reactions of, in organic solvents (Naumann), A., ii, 423.
    - action of ammonia on, in presence and absence of ammonium chloride (Hofmann and Marburg), A., i, 486.
    - double compound of, with ammonium nitrate (Hofmann and Marburg), A., i, 487.
    - compounds of, with mercuric phosphide (Göttig), A., i, 657.
  - ammonium chloride, conductivity of aqueous solutions of (Jones and Ota), A., ii, 587.
  - magnesium, strontium, and barium chlorides (Swan), A., i, 39.
- **Mercuric** oxychloride, hydrated (Rây), P., **1899**, 103.
  - iodide, sublimation of (Gernez), A., ii, 597.
    - equilibrium between mercury, mercurous iodide, and (François), A., ii, 751.
  - ammonium and potassium double iodides, action of water on (François), A., ii, 597.
  - nitrate, action of acetylene on (Erdmann and Köthner), A., i, 21; (Hofmann), A., i, 97.
  - nitrite, action of sodium or silver nitrite on (Rây), P., **1899**, 103.
  - hyponitrite (Divers), T., 119; P., **1898**, 224.
  - oxide, dissociation of (Pélabon), A., ii, 423.
    - decomposition of, by action of light (Berthelot), A., ii, 2.
    - yellow, action of ammonia on (Hofmann and Marburg), A., i, 487.
    - action of chlorine on, in water (Foerster and Yorre), A., ii, 281.
  - phosphide, compounds of, with mercuric chloride (Göttig), A., i, 657.
  - sulphide, red, formation of, in the wet way (Alvisi), A., ii, 486.
- **Mercurous salts**, structure of (Ogg), A., ii, 14.
- **Mercurous** iodide, action of potassium iodide on, and formation of, from mercuric iodide in potassium iodide (François), A., ii, 751.
  - nitrate, solution of, change of concentration of, in mercury dropping electrode (Palmaer), A., ii, 347.
    - equilibrium in systems containing silver nitrate, silver amalgam, and; or mercury, mercuric nitrate and (Ogg), A., ii, 14.
  - nitrite, action of sodium or silver nitrite on (Rây), P., **1899**, 103.
  - hyponitrite (Divers), T., 120; P., **1898**, 224.
  - oxide, decomposition of, by action of light (Berthelot), A., ii, 2.
- **Mercury organic compounds**:—
  - Mercury, compounds of, with organic bases (Pesci), A., i, 430.
  - Dimercuracetic acid, trimercuracetic acid, and hydroxydimercuracetic acid (Hofmann), A., i, 486.
  - Dimercurioacetanilide, di-, tri-, and tetra-mercuriobenzene hydroxides and acetates (Pesci), A., i, 908.
  - Mercury dimethyl, action of the silent electric discharge on, in presence of argon and nitrogen (Berthelot), A., i, 871.

Mercury organic compounds :—
- Mercurydimethyl, action of nitrogen peroxide on (BAMBERGER), A., i, 263.
  - *o*-diphenetyl (DIMROTH), A., i, 429.
  - diphenyl, action of the silent electric discharge on, in presence of argon (BERTHELOT), A., i, 871.
- **Mercuric** chloride, compounds of, with diazobenzenesulphonic acid, ethylamine, dimethylamine, trimethylamine, and hydrazine (HOFMANN and MARBURG), A., i, 487.
  - cyanide, action of ammonia on, and double ammonio-compounds of, with zinc chloride and bromide, cupric chloride and bromide, and cadmium bromide and iodide (VARET), A., i, 99.
    - compound of, with diazobenzenesulphonic acid (HOFMANN and MARBURG), A., i, 487.
    - double salts of, with mercuric chloride, bromide, nitrate, and acetate; also the action of caustic alkali on it, and its estimation (PRUSSIA), A., i, 318.
    - distinction between oxycyanide and (VON PIEVERLING), A., ii, 698.
  - chlorocyanide, action of ammonia on (VARET), A., i, 99.
  - potassium cyanide, action of hydrogen sulphide or sodium sulphide on (BERTHELOT), A., ii, 422.
  - fulminate detonators, ammonium perchlorate in (ALVISI), A., ii, 748.
  - sulphate, compound of, with acetone (DENIGÈS, A., i, 22; (OPPENHEIMER), A., i, 475.
- Mercurio-α-acetnaphthalide (PRUSSIA), A., i, 361.
- *p*-Mercuriodiphenylamine (PRUSSIA), A., i, 361.
- *p*-Mercuriodiphenylenediphenyldimethylmercuriodiammonium hydroxide, and acetate (GARBARINI), A., i, 362.
- *p*-Mercuriodiphenylenediphenylmercuriodiammonium hydroxide, and its salts (PRUSSIA), A., i, 361.
- Mercuriomethacetin (PRUSSIA), A., i, 361.
- Mercuriphenylsulphide, thiocarbonate and thiosulphate (PESCI), A., i, 816.
- Mercurocarbide nitrate, from the action of acetylene on mercuric nitrate (ERDMAN and KÖTHNER), A., i, 21; (HOFMANN), A., i, 97.
- Phenylenedimercuric diacetate (DIMROTH), A., i, 428.
- Phenylmercuric acetate (DIMROTH), A., i, 54, 428.

Mercury organic compounds :—
- o-Phenylmercuric oxide (DIMROTH), A., i, 429.
- Phenylmercurargon (BERTHELOT), A., ii, 653.
- **Substance,** $C_2HO_2Cl_3HgK_2$, from action of mercuric oxide on potassium chloracetate (HOFMANN), A., i, 486.
  - $C_2HO_5NHg_2$, from action of nitric acid on substance $(C_2Hg_2O_3H_2)_x$, and on hydroxydimercuracetic acid (HOFMANN), A., i, 486.
  - $(C_2H_2O_3Hg_2)_x$, from action of mercuric oxide and alkali on sodium acetate (HOFMANN), A., i, 486.
  - $C_2H_2O_2Cl_2Hg_2$, from action of hydrochloric acid on hydroxydimercuracetic acid (HOFMANN), A., i, 486.
  - $C_2Cl_4Hg_3$, from action of acetylene on a solution of mercuric and sodium chlorides (HOFMANN), A., i, 486.
  - $C_2HO_3IHg_3$, from action of mercuric iodide on sodium acetate in presence of alkali, and its sodium salt (HOFMANN), A., i, 486.
  - $C_2H_3O_7NHg_3$, from action of silver nitrate on substance $C_2Hg_3IO_3H$ (HOFMANN), A., i, 486.
  - $C_2H_4O_7SHg_3$, from action of mercuric sulphate on acetaldehyde (DENIGÈS), A., i, 414.
  - $C_2Cl_4Hg_4$, from action of mercuric chloride on alcohol in presence of sodium ethoxide or sodium acetate (HOFMANN), A., i, 485.
  - $C_2H_2O_4Hg_6$, from action of mercuric oxide and alkali on substance $C_2Cl_4Hg_4$ (HOFMANN), A., i, 486.

Mercury, estimation and separation of :—
- assay of (CHISM), A., ii, 813.
- estimation of, by sodium arsenite (REICHARD), A., ii, 183.
- estimation of, in presence of cadmium or iron (KOLLOCK), A., ii, 811.
- estimation of, in grapes, wines, lees, and marcs (VIGNON and BARRILLOT), A., ii, 452.
- estimation of, in organic liquids (GAYON and LABORDE), A., ii, 385.
- estimation of, in presence of platinum, copper, zinc, nickel, or cobalt (KOBLOCK), A., ii, 811.
- separation of aluminium, chromium, cobalt, manganese, molybdenum, nickel, and tungsten from (JANNASCH and ALFFERS), A., ii, 59.

Mercury, separation of:—
  separation of antimony, arsenic, bismuth, cadmium, copper, lead, antimony, and tin from (Jannasch and Devin), A., ii, 59.
  separation of copper from (Revay), A., ii, 127.
Mesaconic acid, formation of, from ethylic γ-*di*bromo-α-methylacetoacetate (Conrad), A., i, 481.
  and its conversion into itaconic acid (Fittig and Langworthy), A., i, 332.
  oxidation of (Fittig and Köhl), A., i, 418.
  compound of, with sulphuric acid (Hoogewerff and van Dorp), A., i, 672.
Mesitoyl chloride (Weiler), A., i, 704.
Mesitoylmesitylene, reduction of (Weiler), A., i, 703.
Mesitylaldehyde, formation of, from ω-nitromesitylene (Konowaloff), A., i, 874, 891.
ω-**Mesitylamine**, and salts (Konowaloff), A., i, 874.
3′-Mesitylazo-1 : 3-dimethylindazole (Bamberger), A., i, 544.
Mesityl chloromethyl ketone (Collet), A., i, 56.
Mesitylene (1 : 3 : 5-*trimethylbenzene*), formation of (Klages and Lickroth), A., i, 598.
  boiling point, and melting point of (Ladenburg and Krügel), A., ii, 545.
  ω-nitro-, and metallic derivatives; ω : 2-*di*nitro-, and *tri*nitro-, and heats of combustion (Konowaloff), A., i, 874.
Mesitylenic acid (3 : 5-*dimethylbenzoic acid*), formation of (Bamberger and Weiler), A., i, 124.
  and *o*-nitro-, formation of, from ω-nitromesitylene (Konowaloff), A., i, 874.
Mesitylglyoxylic acid, formation of (Noyes), A., i, 286.
Mesitylnitrimine and action of hydrochloric acid on it (Harries and Gley), A., i, 567.
Mesitylol carbanilate (Auwers), A., i, 343.
Mesityl oxide (*methyl* iso*butenyl ketone*, iso*propylideneacetone*), specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  action of ethylic sodiomalonate on (Crossley), P., **1898**, 247; P., **1899**, 52.
  condensation of, with ethylic malonate (Vorländer), A., i, 345.
Mesityl oxide (*methyl* iso*butenyl ketone*, iso*propylideneacetone*), action of sodium hydrogen sulphite on (Harries), A., i, 566.
  semicarbazone of, an isomeric form of (Harries and Kaiser), A., i, 638.
Mesityloxidoxalic acid, ethylic salt, velocity of isodynamic change of, in different solvents (Brühl), A., ii, 735.
Mesityloximes, stereoisomeric, and action of phosphorus pentachloride, water, potash, and *iso*amylic nitrite on; also the hydrobromides, sodium, acetyl and benzoyl derivatives and benzylic ethers (Harries and Gley), A., i, 566.
Mesoxalic acid, methylamide, and phenylhydrazone, preparation of, from *allo*caffuric acid (Torrey), A., i, 86.
Metabolism, influence of diphtheria toxin on (Noël-Paton, Dunlop, and MacAdam), A., ii, 602.
  during inanition (Schulz), A., ii, 773.
  influence of removal of the large intestine on (Harley), A., ii, 774.
  influence of the kidney on (Bradford), A., ii, 310.
  inorganic, effect of organic foods on (Pugliese), A., ii, 40.
  of phosphorus (Zadik), A., ii, 774.
  during pregnancy (Charrin and Guillemonat), A., ii, 773.
  of the submaxillary gland (Henderson), A., ii, 774.
  of fishes (Knauthe), A., ii, 310.
  human, influence of alcohol on (Wendlestadt), A., ii, 602.
    effects of the grape cure on (Laquer), A., ii, 773.
  of normal and atrophic infants (Rubner and Heubner), A., ii, 775.
Metal, Rose's, cathodes, pulverisation of, during electrolysis (Bredig and Haber), A., ii, 78.
Metallic chlorides, bromides, iodides, sulphides, chromates, and borates, precipitation of, in liquid ammonia (Franklin and Kraus), A., ii, 284.
  halogen salts (Thomas), A., ii, 278; (Tassilly), A., ii, 747.
  hydroxides, "condensed" (Schlumberger), A., ii, 596.
  phosphides (Granger), A., ii, 286.
  sulphides (Mourlot), A., ii, 747.
  thiophosphates (Ferrand), A., ii, 747.
Metals, detection of, in foods by Kjeldahl's process (Halenke), A., ii, 696.
  estimation of arsenic in (Ducru), A., ii, 124.
Metargon (Ramsay), A., ii, 211.
  preparation of (Ramsay and Travers), A., ii, 746.

Metargon, position of, in periodic system (Crookes), A., ii, 552; (Howe), A., ii, 740.

Meteoric iron, analysis of (Sjöström), A., ii, 674.

Meteoric minerals. See Bronzite, Cohenite, Kamacite, Taenite.

Meteorite from Beaconsfield, Victoria (Cohen), A., ii, 113.
  from Campo del Cielo, Argentina (Cohen), A., ii, 307.
  from Chesterville, South Carolina (Cohen), A., ii, 307.
  from Coahuila, Mexico (Davison), A., ii, 308.
  from Iquique, Peru (Cohen), A., ii, 307.
  from Kokomo, Indiana (Cohen), A., ii, 307.
  from Linnville mountain, North Carolina (Cohen), A., ii, 307.
  from Long Creek, Tennessee (Cohen), A., ii, 307.
  from Magura, Hungary (Cohen), A., ii, 674.
  from Meuselbach, Thuringia (Linck), A., ii, 566.
  from Mighei, Russia (Melikoff and Krschischanowsky), A., ii, 770.
  from Migheja (Melikoff and Krschischanowsky), A., ii, 230.
  from Rasgata, Colombia, South America (Cohen), A., ii, 307.
  from San Cristobal, Chili (Cohen), A., ii, 113.
  from Santa Rosa, Colombia, South America (Cohen), A., ii, 307.
  from Shingle Springs, California (Cohen), A., ii, 674.
  from Siratik, West Africa (Cohen), A., ii, 307.
  from Tocavita, Colombia, South America (Cohen), A., ii, 307.
  from Toluca, Mexico (Davison), A., ii, 308.
  from Tombigbee River, Alabama (Foote), A., 771.
  from Zavid, Bosnia (Hödlmoser), A., ii, 674.
  from Zmjenj, Russia (Melikoff), A., ii, 771.

Meteorites, origin of gases evolved on heating (Travers), A., ii, 769.
  platinum and iridium in (Davison), A., ii, 308.

Methane in metalliferous mines (Nordenström), A., ii, 370.
  boiling point of (Ladenburg and Krügel), A., ii, 545.
  compressed, solution of solids and liquids in (Villard), A., ii, 143.

Methane, solubility of, in amylic alcohol (Friedel and Gorgeu), A., ii, 182.
  inflammability of mixtures of, with oxygen (Emich), A., ii, 13.
  action of ozone on (Otto), A., ii, 282.
  absorption of, by fuming sulphuric acid (Worstall), A., ii, 527.
  estimation of, by combustion (Dennis and Hopkins), A., ii, 332.
  estimation of, in presence of hydrogen and nitrogen (Jaeger), A., ii, 526.

Methane, bromonitro-, condensation of, with formaldehyde, acetaldehyde, and piperidylcarbinol (Maas), A., i, 322.
  bromo*iso*nitro-, brom*iso*-*di*nitro-, and *di*bromo*iso*nitro- (Hantzsch and Veit), A., i, 401, 403.
  *tetra*chloro-. See Carbon tetrachloride.
  fluoro*di*bromo-, from decomposition of fluoro*di*bromacetic acid (Swarts), A., i, 254.
  nitro-, electrolytic reduction of (Pierron), A., i, 844.
  *iso*nitro- (Hantszch and Veit), A., i, 401.
  iso-*di*nitro-, molecular conductivity and dissociation constant of; also its potassium salt (Hantzsch and Veit), A., i, 403.
  tri- and *tetra*-nitro-, action of potash on (Hantzsch and Rinckenberger), A., i, 404.
  *di*thiocyano- (*methylene thiocyanate*), action of, on ethylic cupracetoacetate (Kohler), A., i, 737.

Methanedisulphonic acid, from action of sulphuric acid on acetamide (Bagnall), T., **1899**, 279.
  bromo-, barium salt, formation of (Kohler), A., i, 489.

Methanepropylic alcohol *di*sulphide, imino-, hydrochloride of, from reduction of $\alpha\beta$-*di*thiocyanhydrin (Engle), A., i, 3.

Methanetricarboxylic acid, ethylic salt, formation of (Bouveault), A., i, 416.

Methanetrisulphonic acid, and metallic and aniline salts (Bagnall), T., **1899**, 278; P., **1898**, 182.

Methebenine (*thebenine methylic ether*), properties of; its diacetyl, and methinemethiodide derivatives (Freund), A., i, 307.

Methebenol (Freund), A., i, 308.

o-**Methenylaminophenol**, chloro- and bromo-, and its salts (McCoy; Stieglitz), A., i, 359.

Methenyl-β-*o*-**aminophenyl-benzimidazole**, and -*m*(*p*)-**tolimidazole** (von Niementowski), A., i, 645.

Methenyl-β-*o*-amino-*p*-tolyl-benzimidazole, and **-*m*(*p*)-tolimidazole** (von Niementowski), A., i, 646.

Methenylbismalonic acid. See Dicarboxyglutaconic acid.

Methoximidoxazolone, change of, into methylglyoximecarboxylic acid (Guinchard), A., i, 780.

p-**Methoxyallylbenzene,** formation of (Moureu), A., i, 495.

Methoxyaminopropane-*αββ*-triethylsulphone (Posner), A., i, 605.

Methoxyamino-*αββ*-*tri*thioethylpropane (Posner), A., i, 605.

m-**Methoxybenzaldehydehydrazone** (Bouveault), A., i, 288.

o-**Methoxybenzamide,** hydrolysis of (Reid), A., i, 508.

o- and *p*-**Methoxybenzeneazophenols** (Krause), A., ii, 272.

p-**Methoxybenzeneazo-3-phenyl-1-methylbenzoxazole** (Heinrich), A., i, 172.

Methoxybenzene-*p*-sulphonic acid, action of bromine on (Armstrong), P., **1899,** 177.

o-**Methoxybenzoic acid,** *di*chloro- (Martini), A., i, 877.

m-**Methoxybenzoic acid,** 6-chloro-, methylic salt, and (?) chloro-, methylic salt (Mazzara), A., i, 811.

p-**Methoxybenzoic acid,** 3-chloro-, methylic salt (Mazzara), A., i, 811.

o-**Methoxybenzonitrile** (Ringer), A., i, 893.

p-**Methoxybenzonitrile** (Reinders and Ringer), A., i, 893.

o-**Methoxybenzophenonephenylimine** (Graebe and Keller), A., i, 703.

p-**Methoxybenzoylpropionic acid** (Gabriel and Colman), A., i, 391.

m- and *p*-**Methoxybenzylcamphors** (Haller), A., i, 770.

m- and *p*-**Methoxybenzylidenecamphor** (Haller), A., i, 770.

δ-**Methoxybutylamine** and its salts (Schlinck), A., i, 539.

γ-**Methoxybutyronitrile** (Schlinck), A., i, 539.

Methoxy*di*chloroacetic acid, methylic salt (*methylic* di*chloroxalate*), action of ammonia, *p*-toluidine, and phenylhydrazine on (Anschütz and Stiepel), A., i, 572.

  methylic salt, action of methylic sodiomalonate on (Anschütz and Clarke), A., i, 577.

p-**Methoxycinnamic acid,** formation of (Knoevenagel), A., i, 145.

  and its ethylic salt and dibromide (Reychler), A., i, 54.

o-**Methoxycoumaraldehyde,** action of sodium on, in alcohol (Kunz-Krause), A., i, 201.

exo-**Methoxy-ψ-cumenol,** *di*bromo- (Auwers), A., i, 343.

p-**Methoxy-ψ-cumylic methylic ether** (Auwers and Ercklentz), A., i, 35.

3′-Methoxy-3 : 4-diethoxybenzylidenecoumaranone (von Kostanecki and Różycki), A., i, 912.

4-Methoxy-2′ : 5′-diethoxychalkone (von Kostanecki and Oderfeld), A., i, 705.

Methoxydiphenylanthrone (Tétry), A., i, 818.

Methoxydiphenylcarboxylic acid. See Phenylmethylsalicylic acid.

Methyldithiodiazolonesulphonic acid (Busch and Ziegele), A., i, 827.

3-Methyldithiodiazolonethiol and methylic salt and benzoyl derivative (Busch and Ziegele), A., i, 827.

4′-Methoxy-2-ethoxyflavanone, and *mono*bromo-derivative (von Kostanecki and Oderfeld), A., i, 705.

4′-Methoxy-2-ethoxyflavone (von Kostanecki and Oderfeld), A., i, 705.

Methoxyethylene, *tri*chloro-, oxidation of (Henry), A., i, 660.

3-Methoxyflavone (Emilewicz and von Kostanecki), A., i, 369.

3-Methoxygallic acid (Vogl), A., i, 698.

4-Methoxy-2-hydroxyphenyl-*p*-methoxystyryl ketone. See Anisylidenepaeonol.

4-Methoxy-2-hydroxyphenyl piperonalmethyl ketone. See Piperonalpaeonal.

4-Methoxy-2-hydroxyphenylstyryl ketone. See Benzylidenepaeonol.

Methoxymethylenecyanacetic acid, methylic and ethylic salts (Bollemont), A., i, 736.

Methoxymethylpropylbenzoic acid and amide (Gattermann and Oberländer), A., i, 510.

4-Methoxy-2-methyl-5-*iso*propylthiobenzanilide (Bamberger), A., i, 695.

Methoxymethylterephthalic acid (Perkin), T., 194.

p-**Methoxy-*o*-** and **-*m*-methylthiobenzanilides** (Bamberger), A., i, 695.

4′-Methoxy-α-naphthaflavone (Keller and von Kostanecki), A., i, 524.

1 : 2- and **1 : 4-Methoxynaphthaldehydes,** behaviour of, towards acetic anhydride and sodium acetate (Rousset), A., i, 296, 297.

1 : 4-Methoxynaphthylacrylic acid (Rousset), A., i, 296.

p-**Methoxyphenylacetylene** (Reychler), A., i, 55.

o-**Methoxyphenyldimethylketopyrrolidone** (Conrad and Hock), A., i, 633.

3-Methoxy-1-phenyl-4-dimethyl-5-pyrazolone (Michaelis and Röhmer), A., i, 234.

2-Methoxyphenyl-4 : 6-dimethylpyrimidine (Gabriel and Colman), A., i, 638.

m- and *p*-**Methoxyphenylgyloxylic acids** (Bouveault), A., i, 287, 288.

2′-Methoxy-3′-phenyl-4′-ketodihydroquinazoline (McCoy), A., i, 361.

p-**Methoxyphenyl-ψ-meconine** (Bistrzycki and de Schepper), A., i, 151.

3-*o*-Methoxyphenyl-1-methyl-5-*cyclo*hexenone, its oxime, and **2 : 4-dicarboxylic acid** (Knoevenagel and Groos), A., i, 215.

3-*p*-Methoxyphenyl-1-methyl-5-*cyclo*hexenone, its oxime, and **2 : 4-dicarboxylic acid**, ethylic salt (Knoevenagel and Goecke), A., i, 215.

2-Methoxyphenyl-4-methylpyrimidine, 6-chloro- (Gabriel and Colman), A., i, 638.

2-*o*-Methoxyphenyl-4-methylpyrimidone (Gabriel and Colman), A., ii, 638.

p-**Methoxyphenylpropiolic acid** (Reychler), A., i, 55.

6-Methoxy-3-phenylpyridazine (Gabriel and Colman), A., i, 391.

p-**Methoxyphenylsuccinimide**, formation of (Benevento), A., i, 349.

3-Methoxypiperonalcoumaranone (Emilewicz and von Kostanecki), A., i, 369.

l-**Methoxypropionic acid**, and methylic, ethylic, and metallic salts, specific rotations of (Purdie and Irvine), T., 485 ; P., **1899**, 74.

4-Methoxy-1-propylbenzenesulphonic acid, chloride and amide (Klages), A., i, 585.

Methoxysuccinic acid, ethereal salts, specific rotations and molecular volumes of (Frankland), T., 353.

p-**Methoxythiobenzanilide**, and 3-chloro-, 3-bromo-, and 3-iodo-, and *p*-chloranilide, and *m*-bromanilide (Bamberger), A., i, 695.

p-**Methoxythiobenzo-*p*-anisidide**, **-α-** and **β-naphthalides**, **-*p*-phenetidide**, and **-*o*-**, **-*m*-**, and **-*p*-toluidides** (Bamberger), A., i, 695, 696, 697.

Methoxythiocresol, and its methylic ether (Gattermann), A., i, 518.

α- and β-**Methoxythionaphthanilides** (Bamberger), A., i, 695.

4-Methoxythionaphtho-*m*-bromanilide, ***p*-chloranilide**, and **α-naphthalide** (Bamberger), A., i, 696, 697.

o- and *p*-**Methoxythiophenols**, and their methylic ethers (Gattermann), A., i, 518.

o- and *p*-**Methoxytoluenes**, *di*chloro- (Martini), A., i, 877.

Methoxytoluenesulphonic acid, potassium salt, chloride, amide, and anilide (Gattermann), A., i, 519.

4-Methoxytoluene-3-sulphinic acid (Gattermann), A., i, 517.

4-Methoxy-*m*-tolylthiofluorescein (Gattermann and Berendes), A., i, 514.

Methoxytricarballylic acid, and methylic salts (Anschütz and Clarke), A., i, 577.

Methoxy-*p*-xylic acid [Me : Me : COOH : OMe = 1 : 2 : 4 : 6], (Perkin), T., 193.

Methronene, formation of (Daïn), A., i, 435.

Methylacetoacetic acid, ethylic salt, action of bromine on (Semenoff), A., i, 791.
  condensation of, with ethylic α-bromopropionate and α-brom*iso*butyrate (Bone and Sprankling), T., 847.
  action of *p*-phenetidine on (Foglino), A., i, 132.

α-**Methylacetoacetic acid**, γ-*di*bromo-, ethylic salt, formation of mesaconic acid from (Conrad), A., i, 481.

Methylacetobutylic alcohol, anhydride and bromide (Sachs), A., i, 302.

β-**Methyl-γ-acetobutyric acid**, electrical conductivity of (von Schilling and Vorländer), A., i, 879.

Methylacetophenylammonium, **Methyldiacetophenylammonium**, and **Methyltriacetophenylammonium** bromides (Schmidt), A., i, 5.

Methylacetylacetone, cyanimino-. See Acetylacetone, *di*cyano-.

α-**Methylacetylsuccinic acid**, ethylic salt (Bone and Sprankling), T., 848.

β-**Methylacetylsuccinic acid**, ethylic salt, action of methylic iodide on the sodium derivative (Bone and Sprankling), T., 848.

Methylacrylic acid, ethylic salt, polymeride of (Bischoff and Brodsky), A., i, 202.

Methylacrylonitrile. See Butenoic acid, nitrile of.

β-**Methyladipic acid**, hydrazide and azide of (Etaix and Freundler), A., i, 245.
  α-*di*bromo-, ethylic salt (Willstätter and von Sicherer), A., i, 633.

β-**Methylæsculetin** (*gelsemic acid*), and its reduction product (Schmidt), A., i, 72.

Methylal, action of ammonia on mercuric chloride dissolved in (Naumann), A., ii, 423.
  *di*chloro-. See Trioxymethylene, *di*chloro-.
1-Methylal-2 : 3′-dimethylnaphthalene, *tri*bromo- (von Baeyer and Villiger), A., i, 922.
Methylallylaniline (Wedekind), A., i, 353, 636.
Methylallylnicotinamide (Pictet and Sussdorff), A., i, 165.
Methylamine, solubility of silver bromide in aqueous (Jarry), A., ii, 738.
  action of lithium on (Moissan), A., i, 410.
  action of electric glow discharge on mixtures of, with oxygen (Mixter), A., ii, 267.
  combination of lithium chloride with (Bonnefoi), A., i, 185.
  compounds of, with metallic salts (Matthews), A., ii, 296.
  hydrochloride, action of chromic acid on (Oechsner de Coninck and Combe), A., i, 244.
  periodide (Norris and Franklin), A., i, 663.
Methylaminoborneol (Duden and Pritzkow), A., i, 626.
Methylaminocamphor, salts, acetyl and nitroso-derivatives, carbamide (Duden and Pritzkow), A., i, 626.
β-Methylaminocrotonoethylideneacetoacetic acid, ethylic salt (Knoevenagel and Reinecke), A., i, 340.
γ-Methylaminopropylenic αβ-glycol (*methylpropanediolamine*), and its hydrochloride and picrolonates (Knorr and Knorr), A., i, 411.
Methyl amyl diketone (*acetylhexoyl*) (Fileti and Ponzio), A., i, 111.
  from action of sulphuric acid on *iso*nitrosomethyl hexyl ketone, and its phenylhydrazoxime, phenylhydrazone and osazone (Ponzio and Prandi), A., i, 253.
Methyl*iso*amyl diketone (*acetyl*iso*hexoyl*) and its dioxime (Fileti and Ponzio), A., i, 111.
Methyl*iso*amylmaleic acid, anhydride and anil of; reduction (Auden, Perkin, and Rose), T., 918; P., **1899**, 163.
α-Methyl-β-*iso*amylsuccinic acids, *cis*- and *trans*-, formation of (Auden, Perkin, and Rose), T., 918; P., **1899**, 163.
  isomeric, and their anhydrides Lawrence), P., **1899**, 164.
α-Methyl-β-*iso*amylsuccinic acid, α-cyano- and β-cyano-, and their hydrolysis; also their ethylic salts (Lawrence), P., **1899**, 163.
Methylaniline, salts of (Menschutkin), A., i, 500.
  o-chloro- (Friedländer), A., i, 351.
  o-chloro-, *m*-chloro-, *p*-chloro-, *m*-chloronitro-, 2 : 4-chloronitro-, 4 : 2-chloronitro-, 4 : 2 : 6-chloro*di*nitro- *o*-chloronitroso-, *m*-chloronitroso-, *p*-chloronitroso-, 2 : 4-chloronitronitroso-, *m*-chloronitronitroso-, 4:2:6-chloro*di*nitronitroso-, *p*-nitronitroso-, 2 : 4-*di*nitronitroso- (Stoermer and Hoffmann), A., i, 43, 44.
  cyano-, and action of ammonia and hydrogen sulphide on (Wallach), A., i, 659.
  p-nitro-, and *o*-nitro-, formation of (Pinnow and Oesterreich), A., i, 202.
  2 : 4-*di*nitro, preparation of (Stoermer and Hoffmann), A., i, 43.
  nitroso-, formation of (Fischer), A., i, 349.
2′-Methylanilino-3′-phenyl-4′-ketodihydroquinazoline (McCoy), A., i, 360.
Methylanilinopropionic acid, ethylic salt (Bischoff and Taraschtschansky), A., i, 202.
α-Methylanilino*iso*valeric acid, ethylic salt (Bischoff and Bernhard), A., i, 202.
Methylazimidoxylene (Pinnow and Oesterreich), A., i, 203.
3 Methylbenzhydrol, 6-amino- (Hanschke), A., i, 775.
N-Methylbenzimidazole, 2-chloro-, mercurochloride (Pinnow), A., i, 203.
2-Methylbenzophenone, 5-amino-, and benzoyl derivatives and salts (Hanschke), A., i, 776.
3-Methylbenzophenone, 6-amino- and salts and benzoyl derivative (Hanschke), A., i, 775.
***o*-Methylbenzophenonephenylimine** (Graebe and Keller), A., i, 703.
***iso*-μ-Methylbenzothiazole**, and its platinochloride (Möhlau and Klopfer), A., i, 240.
Methylbornylamine, hydrochloride, hydriodide, platinochloride, benzoyl derivative (Forster), T., 941; P., **1899**, 72.
  hydriodide from benzylidenebornylamine methiodide (Forster), T., 1151; P., **1899**, 194.
Methylbornylhydrazine (Forster), T., 943.

α-**Methyl*di*bromo-β-propyllactic acid**, from action of bromine on α-methyllactic acid (Fittig and de Haven-Boyd), A., i, 191.
Methyl*di*bromoxindole, preparation of (Hartley and Dobbie), T., 645.
Methylbrucine (Moufang and Tafel), i, 309.
Methyl*iso*butenyl ketone. See Mesityl oxide.
Methyl*tert.*butylacetophenone (Meissel), A., i, 380.
Methylbutylallylcarbinamine, action of nitrosyl chloride on (Solonina), A., i, 473.
Methyl*tert.*butylbenzenes, nitro- [$CH_3 : CMe_3 = 1 : 3$ and $1 : 4$] (Konowaloff and Egeroff), A., i, 801.
Methyl butyl diketone (*acetylvaleryl*) and its dioxime (Fileti and Ponzio), A., i, 111.
Methylbutylenediamine, active, and its hydrochloride, platinochloride, picrate and dibenzoyl derivative (Etaix and Freundler), A., i, 245.
Methyl*iso*butylideneacetic acid. See Heptenoic acid.
Methyl butyl ketone, specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.
Methyl *tert.*butyl ketone. See Pinacolin.
Methylcamphanemorpholine and **Methylcamphenemorpholine**, salts and methiodides (Knorr), A., i, 783, 784.
Methylcarbamide, action of ethylic diethoxysuccinate on, in presence of hydrogen chloride (Geisenheimer and Anschütz), A., i, 575.
  oxidation of (Oechsner de Coninck), A., i, 421.
Methylcarbostyril and **Methyl-ψ-carbostyril**, preparation, absorption spectra, and constitution of (Hartley and Dobbie), T., 644; P., **1899**, 47.
Methyl α-chloroethyl ketone, *di*chloro- (Schneider), A., i, 680.
α-**Methylcinnamic acid.** See Phenylcrotonic acid.
p-**Methylcinnamic acid.** See *p*-Tolylacrylic acid.
Methylcinnamylidene-acetone and **-acetophenone**, and their oximes (Sholtz), A., i, 717.
Methylcitraconic anhydride, action of hydrobromic acid on (Semenoff), A., i, 866.
Methyl*iso*coumarin, and its dibromide (Gottlieb), A., i, 512, 513.
Methylcrotonic acid. See Pentenoic acid.
α-**Methylcrotononitrile.** See Tiglonitrile.
γ-**Methylcrotononitrile** (*β-ethylacrylonitrile*) (Henry), A., i, 567.
Methylcyanotriazen, aminoimino-. See Diazoguanidine cyanide.
Methyldeoxybenzoin (Collet), A., i, 55.
α-**2-Methyldeoxybenzoin-2′-carboxylic acid**, salts and amide (Bethmann), A., i, 520.
β-2′-**Methyldeoxybenzoin-2-carboxylic acid** (Bethmann), A., i, 521.
Methyldeoxycinchonidine, its mercuri- and platino-chlorides, methiodide, oxidation and decomposition products (Koenigs and Höppner), A., i, 87.
Methyl-*m*-diazine. See Methylpyrimidine.
o-**Methyldiazonium salts**, action of alkalis on (Bamberger), A., i, 543.
2′-Methylbenzyl-2-carboxylic acid (Bethmann), A., i, 520.
1 : 3 : 5-Methyldiethylbenzene, and *tri*nitro- (Gattermann, Fritz, and Beck), A., i, 492.
1 : 3 : 5-Methyldiethylbenzoic acid and amide (Gattermann, Fritz, and Beck), A., i, 492.
5-Methyl-2 : 6-diethyl-*m*-diazine, amino-. See Cyanethine.
1′-Methyl-4′ : 4′-diethyldihydroquinoline, identity of, with 1′-methyl-3′ : 3′-diethyl-2′-methylenindoline (Plancher), A., i, 451.
2′-Methyl-3′ - 3′-diethylindolenine, and two isomeric acetyl derivatives (Plancher), A., i, 450.
  action of nitrous acid on (Plancher), A., i, 453.
2′-Methyl-3′ : 3′-diethyl-indoline, -indolinol, and **-2′-methylenindoline** (Plancher), A., i, 451.
1-Methyl-3′ : 3′-diethylindolinone, *di*bromo- (Plancher), A., i, 451.
5-Methyl-3 : 5-diethylpyrazoline, and **5-Methyl-3 : 5-dihexylpyrazoline** (Curtius and Zinkeisen), A., i, 165, 166.
2-Methyldihydroindole (*methylhydroketole*), 1-nitro-, and *p*-nitro- (Stoermer and Dragendorff), A., i, 45.
Methyldihydro-resorcinol and **-resorcylic acid**, electrical conductivity of (von Schilling and Vorländer), A., i, 879.
Methyldihydrotrimesic acid, and salts (Wolff and Heip), A., i, 515.
3-Methyl-2 : 6-diphenylpyridine, and salts (Scholtz), A., i, 717.
5-Methyl-3 : 5-dipropylpyrazoline (Curtius and Zinkeisen), A., i, 165.

Methyl*iso*di-*o*-tolylcarbamide, and its hydrochloride and platinochloride (Daïns), A., i, 592.
Methyleneamino-acetonitrile, action of hydrogen chloride on (Curtius), A., i, 9.
Methyleneasparagine and its copper salt (Schiff), A., i, 870.
Methylenebisaniline, action of, on ethylic malonate (Knoevenagel), A., i, 116.
Methylenebismalonic acid. See Propanetetracarboxylic acid.
Methylenebispiperidine, action of, on ethylic malonate (Knoevenagel), A., i, 116.
Methylene-blue, molecular weight of, in water or alcohol (Krafft), A., ii, 473.
Methylenedi-*p*-anhydroaminobenzylic alcohol (Löb), A., i, 123.
Methyleneduguaiacol (Bouveault), A., i, 264.
Methylenedimalonic acid. See Propanetetracarboxylic acid.
Methylenedioxycinnamic acid, ethylic salt (Reychler), A., i, 55.
  and its dibromide (Baude and Reychler), A., i, 142.
Methylenedioxyphenylacetylene (Baude and Reychler), A., i, 142.
Methylenedioxyphenylpropiolic acid (Baude and Reychler), A., i, 142.
Methylenedi-*p*-phenetidine (Bischoff and Schatz), A., i, 278.
Methylenediphenylhydroxylamine (Bamberger), A., i, 270.
Methylenemalonic acid, ethylic salt, action of bromine on (Komppa), A., i, 417.
Methylene-2-naphthylamine, 1-chloro- and 1-bromo- (Morgan), P., **1899**, 10.
Methylenic chlorhydrin, and the action of sodium acetate on it; also its condensation with benzene (Grassi-Cristaldi and Maselli), A., i, 409.
Methylethylacetic acid. See Valeric acid.
Methylethylacetoacetic acid, γ-bromo- and γ-cyano-, ethylic salts (Lawrence), T., 422; P., **1898**, 252.
β-**Methylethylallene**, and action of hydrogen bromide on (Ipatieff), A., i, 658.
Methylethylallylmalonic acid, and ethylic salt (Ipatieff), A., i, 673.
Methylethylamylsulphine and **Methylethyl*iso*amylsulphine** iodides, and their rotatory power (Brjuchonenko), A., i, 189.
Methylethylazole, imino-. See Methylethylglyoxaline.
Methylethylazolone, imino- (Jänecke), A., i, 476.
Methylethylazolyl-μ-mercaptan, imino- (Jänecke), A., i, 476.
1′-Methyl-3′-ethylbenzimidazolone-2-carboxylic acid (Pinnow and Sämann), A., i, 943.
Methylethyl*iso*butylamine, and the action of propylic iodide on it (Marckwald and Droste-Huelshoff), A., i, 326.
3′-Methyl-1′-ethyldihydrophthalazine (Paul), A., i, 777.
α-**Methylethylethylene**. See Amylene.
Methylethylglycollonitrile and acetate; also action of hydrochloric acid and phosphoric anhydride on the latter (Henry), A., i, 568.
Methylethylglyoxaline (*methylethyliminazole*), from action of nitric acid or ethylic nitrite on aminodiethyl ketone hydrochloride (Jänecke), A., i, 476.
Methylethylglyoxime, reduction of (Jänecke), A., i, 477.
2-Methyl-1-ethyl-3-hydroxyethylpiperidine (N-*ethyl-α-pipecolyl-β-methylalkine*) (Ladenburg and Rosenzweig), A., i, 304.
2-Methyl-1-ethyl-3-hydroxyethyl-Δ_2-tetrahydropyridine (N-*ethyl-α-pipecoleyl-β-methylalkine*), (Ladenburg and Rosenzweig), A., i, 303.
2′-Methyl-1′-ethylindole, identity of, with 2′-methyl-3′-ethylindole (Plancher), A., i, 450.
3′-Methyl-2′-ethylindole, and nitroso-derivative (Plancher), A., i, 453.
Methyl ethyl ketone, specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.
  separation of, from ethylic alcohol (Duchemin), A., i, 666; (Buisine), A., i, 728.
Methylethylmelamine. See Cyanuromethylamidoethylamide, amido-.
iso-**Methylethylnitramine**, action of sulphuric acid on (Franchimont and Umbgrove), A., i, 106.
3-Methyl-1′-ethylphthalazone, and salts (Paul), A., i, 777.
2-Methyl-1-ethylpiperidine, rotation of (Hohenemser and Wolffenstein), A., i, 936.
Methylethylpropyl*iso*butylammonium iodide, platinochloride and aurichloride (Marckwald and Droste-Huelshoff), A., i, 326.

2 : 4- and **4 : 3-Methylethylpyridines** (*α-* and *β-collidines*), action of potassium dichromate and sulphuric acid on (Oechsner de Coninck), A., i, 472.
4-Methylfurfuraldehyde, ω-bromo- (Fenton and Gostling), T., 424 ; P., **1899**, 57.
α-**Methylglucoside**, action of yeast enzymes on (Kalanthar), A., i, 102.
α-**Methylglutaric acid** (*butanedicarboxylic acid*), from carvenone (Tiemann and Semmler), A., i, 224.
  formation of (Bone and Sprankling), T., 850.
β-**Methylglutaric acid** (*butanedicarboxylic acid, ethylidenediacetic acid*), and its anhydride (Knoevenagel), A., i, 116.
  ethylic salt, condensation of, with ethylic oxalate (Dieckmann), A., i, 676.
Methylgranatic acid, methylic salt (Piccinini), A., i, 964.
Methylgranatonine, constitution and *di-iso*nitroso-derivative (Piccinini), A., i, 829, 830.
Methylgranatylamine, and **ψ-Methylgranatylamine** (Piccinini and Quartaroli), A., i, 965.
Methylgranatylphenylthiocarbamides (Piccinini and Quartaroli), A., i, 965.
7-Methylguanine (2-*amino*-6-*oxy*-7-*methylpurine*), identity of epiguanine with, and conversion into heteroxanthine (Krüger and Salomon), A. i, 306.
2-Methyl-4 : 5 : 6-heptatriene (Grignard), A., i, 728.
2-Methyl-4-heptene-6-ine (Grignard), A., i, 727.
Methylheptenol (*methylhexylenecarbinol*), from action of alcoholic potash on geraniol (Tiemann), A., i, 184.
Methylheptenone (2-*methyl*-2-*heptene*-6-*one*), in lemon grass oil (Tiemann), A., i, 623.
  natural, derivatives of (Léser), A., i, 190.
  action of ethylic acetate on, in presence of sodium (Barbier and Léser), A., i, 110.
  action of ethylic oxalate and ethylic formate on, in presence of sodium ethoxide (Léser), A., i, 329.
  action of methylic iodide on, in presence of magnesium (Barbier), A., i, 323.
  action of phosphorus pentachloride on (Grignard), A., i, 727.
Methyl*cyclo*hexane (*methylhexanaphthene*), action of nitrosulphuric acid on (Markownikoff), A., i, 553.
1-Methyl*cyclo*hexane-2-carboxylic acid (cis-*hexahydro*-o-*toluic acid*), and its anilide and 1-bromo-derivative (Sernoff), A., i, 584.
1-Methyl*cyclo*hexane-3-carboxylic acid, and 1-bromo- and 3-bromo-derivatives (Bruhn), A., i, 422.
Methylhexenamide, from action of potash on methyloctenonoic nitrile (Léser), A., i, 414.
1-Methyl*cyclo*hexene-3-carboxylic acid (Bruhn), A., i, 423.
1-Methyl*cyclo*-Δ^6-hexene-2-carboxylic acid (Sernoff), A., i, 584.
2-Methyl-3-hexene-5-ine (Grignard), A., i, 727.
Methylhexenoic acid. See Heptenoic acid.
2 : 3 : 5-Methylhexenone, action of phosphorus pentachloride on (Grignard), A., i, 727.
Methyl*cyclo*hexenone, action of ethylic sodiomalonate on (Vorländer and Gärtner), A., i, 260.
  reduction of (Harries and Kaiser), A., i, 578.
Methylhexenonepyruvic acid (8-*methyl*-7-*nonene*-2 : 4-*dionoic acid*) (Léser), A., i, 329.
  ethylic salt, and its copper derivative (Léser), A., i, 190.
Methyl *iso*hexyl diketone (*acetyl*iso*amylacetyl*) (Fileti and Ponzio), A., i, 111.
Methyl hexyl ketone, specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.
  *iso*nitroso-, action of sulphuric acid on (Ponzio and Prandi), A., i, 253.
p-**Methylhydrazobenzene**, transformation of ; acetyl and diacetyl derivatives ; phenylthiocarbimide (Jacobson and Lischke), A., i, 276.
Methylhydroketole. See 2′-Methyldihydroindole.
Methylhydroxyethylaminoacetic acid (*hydroxyethylsarcosine*), and copper salt (Knorr), A., i, 784.
2-Methyl-3-hydroxyethyl-1 : 1-diethylpiperidinium (*diethylpipecolylalkinium*) salts (Ladenburg and Krügel), A., i, 303.
Methyl hydroxyethyl ketone, formation of (Demjanoff), A., i, 845.
2-Methyl-3-hydroxymethyl-1-ethylpiperidine (N-*ethyl*-*α*-*pipecolyl*-*β*-*alkine*) (Ladenburg and Krügel), A., i, 303.

2-Methyl-3-hydroxymethyl-1-ethyl-Δ_2-tetrahydropyridine (N-*ethyl-α-pipecoleyl-β-alkine*) (LADENBURG and KRÜGEL), A., i, 303.
2-Methyl-3-hydroxymethyl-1-propylpiperidine (N-*propyl-α-pipecolyl β-alkine*) (LADENBURG and THEODOR), A., i, 304.
2-Methyl-3-hydroxymethyl-1-propyl-Δ_2-tetrahydropyridine (N-*propyl-α-pipecoleyl-β-alkine*) (LADENBURG and THEODOR), A., i, 304.
Methylic alcohol, presence of, in plants (LIEBEN), A., ii, 45.
  formation of, from metaformaldehyde (DELÉPINE), A., ii, 142.
  dielectric constant of, temperature coefficient of (ABEGG and SEITZ), A., ii, 623.
  melting point of (LADENBURG and KRÜGEL), A., ii, 545.
  critical temperature of mixtures of, with ethane (KUENEN and ROBSON), A., ii, 356.
  boiling point curves of mixtures of, with chloroform or acetone (PETTIT), A., ii, 632.
  volume changes on mixing equivalent quantities of acids and bases in (MINOZZI), A., ii, 642.
  equilibrium between potassium carbonate, water and (DE BRUYN), A., ii, 591.
  velocity of reaction between methylic benzenesulphonate and (SAGREBIN), A., i, 735.
  ionisation of salts in (ROHLAND), A., ii, 144.
  action of ozone on (OTTO), A., ii, 282.
  action of hydrogen peroxide on, in presence and in absence of iron (FENTON and JACKSON), T., 2; P., **1898**, 240.
  sodium derivative, action of, on ethylic salts of α-bromo-fatty acids (BISCHOFF), A., i, 669.
  detection of (MULLIKEN and SCUDDER), A., ii, 388.
  detection of, in spirits (TRILLAT), A., ii, 387.
  estimation of small quantities of (NICLOUX), A., ii, 253.
  estimation of, in ethylic alcohol (TRILLAT), A., ii, 130.
Methylic allylic ether, compound of, with sulphur dioxide (SOLONINA), A., i, 682.
  amylic ether, density, specific rotation, and molecular volume of (FRANKLAND), T., 360.
    sulphide, specific rotation of (BRJUCHONENKO), A., i, 189; ii, 265.
Methylic *di*bromallylic ether (LESPIEAU), A., i, 184.
  *tetra*bromopropylic ether (LESPIEAU), A., i, 184.
  carbonate, specific heat and heat of vaporisation of (LUGININ), A., ii, 269.
    heat of combustion of (ZOUBOFF), A., ii, 589.
  chloride, melting point of LADENBURG and KRÜGEL), A., ii, 545.
    viscosity of (BREITENBACH), A., ii, 403.
  crotonylic ether (CHARON), A., i, 848.
  ether, influence of water on the velocity of formation of (DE BRUYN and STEGER), A., i, 849.
    hydrochloride, dissociation of (WEGSCHEIDER), A., ii, 591.
    *di*chloro-, from action of hydrogen chloride on trioxymethylene (GRASSI-CRISTALDI and MASELLI), A., i, 409.
  ethylic ether, influence of water on the velocity of formation of (BRUYN and STEGER), A., i, 849.
  hydrogen carbonate (HEMPEL and SEIDEL), A., ii, 152.
  iodide, combination of, with aluminium iodide and carbon *di*sulphide (KONOWALOFF), A., i, 471.
    velocity of action of sodium ethoxide on (STEGER), A., i, 745.
  iodopropargylic ether (LESPIEAU), A., i, 184.
  phosphate, formation of (BELUGOU), A., i, 659.
    velocity of hydrolysis of (CAVALIER), A., ii, 13.
    and its double salts with barium, strontium, potassium, ammonium, and sodium (CAVALIER), A., i, 558.
3-Methylimino-1-phenyl-2-methyltriazoline (BAMBERGER and VON GOLDBERGER), A., i, 548.
3-Methylindazole, and its 3′-amino-derivative (BAMBERGER and VON GOLDBERGER), A., i, 546.
3-Methylindazoletriazolen (BAMBERGER), A., i, 722.
2′-Methylindole (*methylketole*), heats of combustion and formation of (BERTHELOT and ANDRÉ), A., ii, 400.
  action of alkylic iodides on (PICCININI), A., i, 74.
  *iso*nitroso-, and potassium salt and hydrochloride (SPICA and ANGELICO), A., i, 939.
3′-Methylindole (*scatole*), heats of combustion and formation of (BERTHELOT and ANDRÉ), A., ii, 400.
  detection of (GNEZDA), A., ii, 716.

1′-**Methylindole-3′-acetic acid** and salts (Piccinini), A., i, 823.

3′-**Methylindoleacetic acid** (*scatole-acetic acid*), formation of, in putrefaction of proteid (Salkowski), A., ii, 567.

1′-**Methylindole-3′-carboxylic acid**, preparation of (Hartley and Dobbie), T., 645.

Methylisatin, preparation, absorption spectra, and constitution of (Hartley and Dobbie), T., 645.

Methyl-ψ-isatin, preparation, absorption spectra, and constitution of (Hartley and Dobbie), T., 647; P., **1899**, 48.

Methylitaconic acid, and its anhydride and dibromide; also its conversion into pyrocinchonic anhydride, and its reduction (Fittig and Kettner), A., i, 333.

Methylketole. See 2′-Methylindole.

α-**Methyllactic acid**, and its amide; also action of bromine on (Fittig and de Haven-Boyd), A., i, 191.

α-**Methyllactonitrile.** See β-Hydroxy*iso*butyronitrile.

p-**Methylmalachite-green**, leuco-base of (Hanzlik and Bianchi), A., i, 597.

α-**Methylmalic acid.** See Citramalic acid.

Methylmalonic acid. See *iso*-Succinic acid.

Methylmercaptothiazoline, action of hydrochloric acid on (Gabriel and Leupold), A., i, 104.

Methylmesaconic acid, preparation of, from ethylic *di*bromethylacetoacetate (Semenoff), A., i, 792.

β-**Methylmesaconic acid** (*dimethylfumaric acid*), and its calcium, barium, and silver salts; also its conversion into pyrocinchonic anhydride and its reduction (Fittig and Kettner), A., i, 333.

Methylmethebenine methiodide (Freund), A., i, 308.

Methylmorphimethine, reduction of (Vongerichten), A., i, 551.

β-**Methylmorphimethine** methiodide (Vongerichten), A., i, 966.

1 : 3-**Methylmorpholone**, salts and methiodide (Knorr), A., i, 784.

α-**Methyl-β-naphthacinchonic acid** and its β-naphthalide, formation of (Tiemann), A., i, 249.

Methylnaphthalanmorphine, methiodide of (Knorr), A., i, 463.

methylhydroxide and salts, and decomposition products (Knorr), A., i, 782.

1″-**Methylnaphthalanmorpholine**, and salts (Knorr), A., i, 782.

Methylnaphthaphenazonium, salts, 2-amino-, 2-nitro-, and 2-nitro-4′-amino-, and acetyl derivatives (Kehrmann and Jacob), A., i, 237.

Methylnicotinamide and methiodide (Pictet and Sussdorff), A., i, 164.

Methylnitramine, constitution of, mercury derivative of (Ley and Kissel), A., ii, 486.

silver derivative, action of propylic iodide on (Umbgrove and Franchimont), A., i, 106.

and its silver and mercury derivatives, action of sulphuric acid on (Franchimont and Umbgrove), A., i, 106.

Methyl-*o*-nitraniline, condensation of, with formaldehyde (Friedländer), A., i, 350.

p-**Methylnitrosamino-*o*-acetotoluidide, -*o*-tolueneazo-β-naphthylamine, -toluidine, -*s*-xyleneazo-β-naphthylamine,** and **-xylylphenylthiocarbamide** (Pinnow and Oesterreich), A., i, 202, 203.

2-Methyl-2-nonene-6 : 8-dione. See Acetylmethylheptenone.

2-Methyl-2-nonene-6-onoic acid and its ethylic salt; also the phenylhydrazone of the latter (Barbier and Léser), A., i, 111.

2-Methyl-2-nonen-6-one (Léser), A., i, 190, 414.

Methyl nonyl ketone, and oxime and ammonium hydrogen sulphite compound (Carette), A., i, 860.

Methylnornarcotine methiodide, *di*iodo- (Frankforter and Keller), A., i, 782.

2-Methyl-2-octen-6-onal-8 (Léser), A., i, 330, 414.

2-Methyl-2-octen-6-ononitrile-8, and its ethylic derivative (Léser), A., i, 414.

1-Methylol-2 : 3′-dimethylnaphthalene, and its *tri*bromo-derivative; acetyl derivative and ethyl ether of the latter (von Baeyer and Villiger), A., i, 922.

Methyl-orange as an indicator (Waddell), A., ii, 83.

Methyl*iso*oxazolone, oxime of, methylic and potassium salts (Guinchard), A., i, 779.

γ-**Methylpentane**, αγ-*di*bromo-. See Hexane, *di*bromo-.

1-**Methyl*cyclo*pentane** (*methylpentamethylene*) (Markownikoff), A., i, 799.

heat of combustion of (Zouboff), A., ii, 589.

action of nitrosulphuric acid on (Markownikoff), A., i, 553.

1-Methyl*cylco*pentane, 1-amino-, 2-amino-, 3-amino-, 1-chloro-, 2-chloro-, 3-iodo-, 1-nitro-, and 2-nitro- (Markownikoff), A., i, 799, 800.

Methyl*cylco*pentane-2-carboxylic acid (*methylpentamethylenecarboxylic acid*), identity of hexanaphthenecarboxylic acid with (Markownikoff), A., i, 800.

2-Methyl*cyclo*pentane-4 : 5-dione-1 : 3-dicarboxylic acid, diethylic salt and its phenazine derivative (Dieckmann), A., i, 676.

1:3-Methyl*cyclo*pentanone, and oxime (Markownikoff), A., i, 799.

Methyl*cyclo*-Δ^1-pentene (Markownikoff), A., i, 800.

Methyl*cyclo*pentenoneoxime, acetyl derivative of (Bouveault), A., i, 120.

N-Methylphenacetine (Hinsberg), A., i, 495.

Methylphenomorpholine, picronolate (Knorr), A., i, 462.

o-**Methylphenylacetaldehyde**, ω-amino-, benzoyl derivative, oxidation of (Maass and Wolffenstein), A., i, 110.

Methylphloroglucinol, its methylic ether and *di*bromo-derivative (Boehm), A., i, 32.
  *di*chloro-, and its triacetyl derivative (Schneider), A., i, 679.

Methylphthalimide (Sachs), A., i, 280.

N-Methyl-α-pipecoleyl-β-methylalkine. See 1 : 2-Dimethyl-3-hydroxyethyl-Δ^2-tetrahydropyridine.

N-Methyl-α-pipecolyl-β-methylalkine. See 1 : 2-Dimethyl-3-hydroxyethylpiperidine.

2-Methylpiperidine, rotation of (Hohenemser and Wolffenstein), A., i, 936.

Methylpiperidines, 1- and 2-, molecular refractions of (Pope and Peachey), T., 1115.

Methylpiperidineacetonyl chloride and salts (Schmidt and Knuttel), A., i, 229.

Methylpropanediolamine. See γ-Methylamino-$\alpha\beta$-propylenic glycol.

β-Methylpropanetetracarboxylic acid, ethylic salt and amide (Ruhemann), T., 245 ; P., **1899**, 6.

Methyl*iso*propene*cyclo*hexenol, from citral (Verley), A., i, 768.

Methyl*iso*propylbenzaldehyde (Verley), A., i, 207.

Methylpropylbenzylideneaniline and its hydrazone (Bouveault), A., i, 287.

Methylpropylcarbinol. See Amylic alcohol.

1-Methyl-2 : 3-propylenepiperidine, and its salts (Ladenburg and Brandt), A., i, 305.

Methyl*iso*propylglycollonitrile (*methyl*iso*propylketocyanhydrin*) and acetate and dimethylamine derivative (Henry), A., i, 568.

Methyl*iso*propylhexahydrofluorene (Wallach), A., i, 532.

3 : 5-Methyl*iso*propyl*cyclo*hexanone, hydroxylamino oxime (Harries and Matfus), A., i, 583.

Methyl*iso*propylketocyanhydrin. See Methyl*iso*propylglycollonitrile.

Methyl propyl ketone, heat of combustion of (Zouboff), A., ii, 589.
  *iso*nitroso-, action of nitric peroxide on (Ponzio), A., i, 667.

Methyl *iso*propyl ketone, specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.

Methyl *n*- and *iso*-propyl ketones, from the acetone oil from calcium pyrolignate (Buisine and Buisine), A., i, 475.

Methylpropylketoxime, and its reduction (Kursanoff), A., i, 474.

1-Methyl-3-*iso*propylpiperidine (Ladenburg and Brandt), A., i, 305.

Methylpropyltetramethylene-disulphide, and disulphone (Autenrieth and Wolff), A., i, 580.

7-Methylpurine, and 2-amino- and 2-chloro-derivatives (Fischer), A., i, 175.
  2-amino-6-oxy-. See 7-Methylguanine (*epiguanine*).
  *tri*chloro-, behaviour of, with potassium hydrosulphide (Fischer), A., i, 262.
  2-iodo- (Fischer), A., i, 174.

9-Methylpurine and 2(?)-amino-, 2(?)-chloro-, *tri*chloro-, and 2(?)-iodo-derivatives (Fischer), A., i, 175.
  2 : 6-*di*chloro-8-amino- (Fischer), A., i, 393.

5-Methylpyrazoline, maleate, toluene azo- and benzoyl derivatives of (Curtius and Zinkeisen), A., i, 166.

Methylpyridines. See Picolines.

4-Methylpyrimidine(4-*methyl*-m-*diazine*) and salts ; *di*chloro-derivative and its salts (Gabriel and Colman), A., i, 639.

Methylpyrogallol, and its triacetate and dimethylic ether [Me : OH : $(OMe)_2$ = 1 : 3 : 5 : 4] (Rosauer), A., i, 346.

3-Methylpyrrolidine-2 : 5-dicarboxylic acid (Willstätter and von Sicherer), A., i, 633.

1-Methylpyrrylacetic acid, and salts (Piccinini), A., i, 823.

3-**Methylquinoline** and its 2′-hydrosulphide, and 2′-methosulphide, and 2′-chloro-derivative (Fischer and Klitsch), A., i, 634, 635.
2′-**Methylquinoline** (*quinaldine*), aminolytic constant of (Goldschmidt and Salcher), A., ii, 551.
  condensation of, with formaldehyde (Koenigs), A., i, 389.
4′-**Methylquinoline** (*lepidine*), action of potassium dichromate and sulphuric acid on (Oechsner de Coninck), A., i, 472.
  *di*bromonitro-, *tri*bromonitro- (Koenigs), A., i, 74, 75.
Methylquinolylacetonyl chloride (Schmidt and Goehlich), A., i, 232.
Methyl*iso*rosindone, and salts (Fischer and Hepp), A., i, 78.
Methylrosinduline, salts of (Kehrmann and Locher), A., i, 82.
Methylsalicylidenediacetoacetic acid, ethylic salt (Knoevenagel and Groos), A., i, 215.
Methylsalicylidenemalonic acid, ethylic salt (Knoevenagel and Groos), A., i, 117.
2′-**Methylstilbene-2-carboxylic acid** (Bethmann), A., i, 520.
4-**Methylstyrene.** See *p*-Tolylacetylene.
Methylsuccinic acid (i-*pyrotartaric acid, citrapyrotartaric acid, propanedicarboxylic acid*), from oxidation of *β*-aldehydo*iso*butyric acid (Perkin and Sprankling), T., 19.
  and anhydride, anilic acid and calcium salt (Bone and Sprankling) T., 848.
  influence of *d*-pyrotartaric acid on the solubility of, in water (Ladenburg), T., 467; P., **1899**, 73.
Methylsuccinic acid, *β*-bromo-, and *di*bromo-, action of sodium carbonate on (Semenoff), A., i, 867.
  β-cyano-, ethylic salt; hydrolysis; also action of methylic iodide on (Bone and Sprankling), T., 853.
Methyltartronic acid, formation of (Pommerehne), A., i, 574.
6-**Methylterephthalic acid,** 2-iodo- (Noyes), A., i, 285.
1-**Methyltetrahydroquinoline,** molecular refraction of (Pope and Peachey), T., 1115.
  3-nitro-1-nitroso-, and 3-nitro- (Stoermer and Dragendorff) A., i, 45.
2′-**Methyltetrahydroquinoline,** nitronitroso-, 1(?)-nitronitroso-, and 3-nitro- (Stoermer and Dragendorff), A., i, 45.
2′-**Methyltetrahydroquinolines,** *l*- and *i*-, molecular refraction of (Pope and Peachey), T., 1115.
3-**Methyltetrahydroquinoline,** 1-nitro-1′-nitroso-, 1-nitro-, and 2(or 4)-nitro- (Stoermer and Dragendorff), A., i, 45.
Methyltetrahydrotrimesic acid (Wolff and Heip), A., i, 515.
Methyltetramethylene-1 : 3-disulphide, and -1 : 3-disulphone (Autenrieth and Wolff). A., i, 580.
1-**Methyl-*α*-tetramethylpyrrolidine-*β*-carboxylamide,** and 1-**Methyl-*α*-tetramethylpyrroline-*β*-carboxylamide** (Pauly and Rossbach), A., i, 773.
Methylthiocarbimide, effect of pressure on, melting point curve of (Tammann), A., ii, 636.
Methyl-*o*-toluidine, and 4-nitro- and 3-nitro-derivatives (Gnehm and Blumer), A., i, 265.
  4-chloro-, and 4-chloronitroso-, 4 : 3(?)-chloronitronitroso-, 4 : 3-chloronitro-, 4 : 3-chloramino-, and 3 : 5-*di*nitronitroso- (Stoermer and Hoffmann), A., i, 44.
Methyl-*m*-toluidine, nitronitroso- [Me : N(NO)Me : NO_2 = 1 : 3 : 6(?)], and nitro- (Stoermer and Hoffmann), A., i, 44.
Methyl-*o*-toluidine-5-sulphonic acid, and 3-nitro-derivative (Gnehm and Blumer), A., i, 266.
α-2′-**Methyltoluylenehydrate-2-carboxylic acid.** See *α*-Hydroxy-2′-methyldibenzyl-2-carboxylic acid.
Methyltriazen, *bis*aminoimino-. See Triazendicarbodiamidine.
Methyltriazencarboxylic acid, aminoimino-. See Triazendicarbamidine.
Methyltriazole, amino-, and acetyl and benzoyl derivatives, chloro- (Thiele and Manchot), A., i, 167.
Methyltriazoleazo-dimethylaniline, and -*β*-**naphthylamine** (Thiele and Manchot), A., i, 167.
1-**Methyl-2 : 3 : 4-triphenyl*cyclo*-Δ^6-hexenone-5** and its oxime (Goldschmiedt and Knöpfer), A., i, 141.
Methylurazole (Cuneo), A., i, 9.
Methylurethane, nitroso-, constitution of (Brühl), A., i, 871.
  behaviour of, towards alcoholic potash (von Pechmann), A., i, 134.
Methyl-violet, formation of (Wedekind and Gonswa), A., i, 806.
  molecular weight of, in water or alcohol (Krafft), A., ii, 472.
Methylxanthic acid, potassium salt, electrolysis of solution of (Schall and Kraszler), A., i, 414.

1-Methylxanthine, bromo- (Krüger and Salomon), A., ii, 233.

7-Methylxanthine. See Heteroxanthine.

Methylxanthines, physiological action of (Lusini), A., ii, 317.

Methyl-*m*-xylidine, and its salts and acetyl derivative (Friedländer and Brand), A., i, 351.
  and nitroso- and nitro-derivatives (Pinnow and Oesterreich), A., i, 203.

4-Methyl-*m*-xylylenediamine, and its hydrochloride (Pinnow and Oesterreich), A., i, 203.

Mezcaline, physiological action of (Dixon), A., ii, 681.

Mica, optical constants and composition (Zschimmer), A., ii, 768.
  heavy metals in (Stelzner), A., ii, 107.
  action of water on (Clarke), A., ii, 109.
  See also Baddeckite, Biotite, Lepidomelane.

Microcline, pseudomorphous, from Altai Mountains (Jereméeff), A., ii, 673.

Micro-organisms, pathogenic, chemical activity of (Hugounenq and Doyon), A., ii, 376.

Milk, freezing point of (Winter), A., ii, 232.
  human, composition of (Adriance), A., ii, 115.
    relation of ash of, to ash of newborn infant (Hugounenq), A., ii, 682.
    mare's and cow's, presence of opalisin in (Wróblewski), A., ii, 232.
  analysis of, apparatus for rapid (MacDougald), A., ii, 582.
  condensed, analysis of (Hyde), A., ii, 532.
  analysis of sour (de Koningh), A., ii, 707.
  apparatus for estimation of total solids and fat in (Sonn), A., ii, 709.
  detection of formaldehyde in (Leonard and Smith), A., ii, 454; (Vanino), A., ii, 703; (Leys), A., ii, 819.
  detection of the previous heating of (Storch), A., ii, 76.
  detection of nitrates in (Fritzmann), A., ii, 54; (Ackermann), A., ii, 248.
  detection of salicylic and benzoic acids in (Breustedt), A., ii, 532.
  detection of sucrose in (Cayaux), A., ii, 254.
  detection of sucrose and boric acid in (de Koningh), A., ii, 708.
  estimation of boric acid in (Gooch and Jones), A., ii, 332.

Milk, estimation of fat in (Kühn), A., ii, 582; (Richmond and Rosier), A., ii, 708; (Bonnema; Timpe; Windisch), A., ii, 822.
  estimation of phosphoric acid in (Neumann), A., ii, 54.
  estimation of added water in (Woodman), A., ii, 618.
  See also Agricultural chemistry.

Milk-sugar. See Lactose.

Millet. See Agricultural chemistry.

Minerals from Belgium (Cesàro), A., ii, 433.
  from Swaziland (Prior), A., ii, 433.
  origin of gases evolved on heating (Travers), A., ii, 769.
  artificial formation of, in magmas (Morozewicz), A., ii, 762.
  secondary, in andesite from Santorin (Lacroix), A., ii, 305.
  detection of constituents of, in the dry way (Florence), A., ii, 51.
  estimation of carbonic anhydride in (Marshall), A., ii, 249.

Minerals, new. See:—
  Arzrunite.
  Baddeckite.
  Carnotite.
  Cedarite.
  Cupro-goslarite.
  Glaucamphiboles.
  Goldschmidtite.

- **Naphthalanmorpholine** (Knorr), A., i, 463.
  - and salts, nitrosamine and benzoyl derivative (Knorr), A., i, 782.
- α- and **β-Naphthaldehydes**, behaviour of, towards acetic anhydride and sodium acetate (Rousset), A., i, 296, 297.
- **Naphthalene**, in lignite tar (Oehler), A., i, 816.
  - melting point of, influence of pressure on (Hulett), A., ii, 469; (Tammann), A., ii, 635.
  - depression of freezing point of β-naphthol by (Bruni), A., ii, 356.
  - vapour pressure of (Allen), P., **1899**, 122.
  - osmotic pressure of ethereal solutions of (Goodwin and Burgers), A., ii, 273.
  - equilibrium between acetone, water, and (Snell), A., ii, 408.
  - equilibrium between benzene, diphenylamine and; between benzene, β-naphthol and (Bruni), A., ii, 406.
  - molecular weight of alcohols in (Biltz), A., ii, 634.
  - solutions of, in aqueous acetone (Cady), A., ii, 82.
  - solutions, solid and liquid, of, in chloracetic acid, or glycollic acid, and their freezing points (Cady), A., ii, 405.
  - behaviour of, towards fused alkali nitrates (Nägeli), A., i, 916.
- **1 : 4-Naphthalenedisulphonic acid,** amide, and anilide, and 1′-amino-, sodium hydrogen salt of (Gattermann), A., i, 519.
- **1 : 4′-Naphthalenedisulphonic acid,** β-amino- and β-nitro- (Friedländer and Fischer), A., i, 709.
- **α-Naphthaleneneindigo,** and its sulphonic acids (Wichelhaus), A., i, 636.
- **β-Naphthaleneindigo,** preparation of (Wichelhaus), A., i, 636.
- **Naphthalene-1-sulphin-2-sulphonic, -4-sulphonic, and -4 : 1′-disulphonic acids** (Gattermann), A., i, 517.
- α- and **β-Naphthalenesulphonic** trisulphides, sulphides, and tetrasulphides (Troeger and Hornung), A., i, 905.

Naphthalene-1 : 4 : 1′-trisulphonic acid, and chloride (Gattermann), A., i, 519.
Naphthalene-2 : 4 : 1′-trisulphonic acid, sodium salt and chloride (Gattermann) A., i, 519.
γ-**Naphthalidoacridine** and its salts (O. Fischer and Demeler), A., i, 636.
β-**Naphthamide,** 1′-nitro- and 4′-nitro- (Friedländer, Heilpern, and Spielfogel), A., i, 708.
Naphthaphenazine, 5-amino- and 3″-amino- (Kehrmann and Matis), A., i, 81.
Naphthaphenosaffranine, preparation of (Schaposchnikoff), A., i, 432.
Naphthaprasindone, 2-amino- (Kehrmann and Aebi), A., i, 527.
α- and β-**Naphthaquinolines,** α-chloro- (Fischer and Klitsch), A., i, 635.
α-**Naphthaquinone,** condensation of, with diazomethane (von Pechmann and Seel), A., i, 948.
  2 : 1′-*di*amino- (Kehrmann and Haberkant), A., i, 62.
  β-bromo-, identity with Meldola and Hughes' bromindone (Liebermann and Schlossberg), A., i, 764.
  ββ-*di*nitroso- (Zincke and Ossenbeck), A., i, 766.
β-**Naphthaquinone,** 3′-amino-, monoxime (Kehrmann and Matis), A., i, 81.
β-**Naphthaquinoneacetoacetic acid,** bromo-, ethylic salt (Liebermann), A., i, 373.
α- and β-**Naphthaquinoneaminoguanidines** and α-**Naphthaquinonebisaminoguanidine** (Thiele and Barlow), A., i, 48.
α-**Naphthaquinoneaminosalicylic acid** (Fischer and Schaar-Rosenberg), A., i, 283.
α-**Naphthaquinone-3-anilide,** 2-bromo- (Liebermann and Schlossberg), A., i, 765.
α-**Naphthaquinone-2-benzylamide,** and 3-bromo-derivative (Liebermann and Schlossberg), A., i, 765.
α-**Naphthaquinone-cyanacetic and -dicyanacetic acids,** ethylic salts (Libermann), A., i, 522.
α-**Naphthaquinonediphenylmethane** (Möhlau), A., i, 61 ; (Möhlau and Klopfer), A., i, 913.
α-**Naphthaquinoneimide,** 2 : 1′-*di*amino- and 2 : 3′-*di*amino- (Kehrmann and Haberkant), A., i, 62.
Naphthaquinoneimidesulphonic acid, amino- (Gaess), A., i, 374.
α-**Naphthaquinonemalonic acid,** diethylic salt, *p*-toluidide of (Liebermann), A., i, 523.
  bromo-, and 2-chloro-, ethylic salts (Liebermann), A., i, 373.
β-**Naphthaquinonemalonic acid,** and its bromo-derivative, ethylic salts (Liebermann), A., i, 373.
α-**Naphthaquinone-3-naphthylamide,** 2-bromo- (Liebermann and Schlossberg), A., i, 765.
α- and β-**Naphthaquinonesemicarbazones** (Thiele and Barlow), A., i, 48
Naphthaquinonesulphonic acid, amino- (Gaess), A., i, 375.
α-**Naphthaquinonetetramethyl*di*aminodiphenylcarbinol** (Möhlau and Klopfer), A., i, 913.
α-**Naphthaquinonetetramethyl*di*aminodiphenylmethane** (Möhlau), A., i, 61 ; (Möhlau and Klopfer), A., i, 913.
αα-**Naphthaquinoxaline.** See Acenaphthenepheno-*p*-diazine.
Naphthasaffranol, ethylic and methylic ethers (Fischer and Hepp), A., i, 79.
1′ : 1-Naphthasultone-4-sulphonic acid, sodium salt (Gattermann), A., i, 519.
iso-**Naphthazarin.** See Dihydroxynaphthaquinone.
Naphthene. See *cyclo*-Hexane.
Naphthenes, constitution of ; origin of (Bruhn), A., i, 422.
Naphtheneglycol (cyclo*hexenyl glycol*) (Markownikoff), A., i, 24.
Naphthenic acids, properties of the salts of (Charitschkoff), A., i, 423.
tert-**Naphthenol** (Markownikoff and Rudewitsch), A., i, 583.
αβ-**Naphthimidazole,** and its salts (Fischer), A., i, 641.
β-**Naphthoic acid,** 2′-amino-, 4-nitro-, 1-nitro-, and 4′-nitro- (Friedländer, Heilpern, and Spielfogel), A., i, 708, 709.
α-**Naphthol,** action of sodium on, in alcohol (Kunz-Krause), A., i, 200.
  detection of, in β-naphthol (Dubosc), A., ii, 192.
  estimation of, in β-naphthol (Procházka and Herman), A., ii, 65.
α-**Naphthol,** *tri*amino-, hydrochloride (Kehrmann and Haberkant), A., i, 62.
  *di*bromo-, behaviour towards fuming nitric acid (Liebermann and Schlossberg ; Meldola), A., i, 372.
  *tri*nitro-, constitution of (Kehrmann and Haberkant) A., i, 62.
β-**Naphthol,** freezing points of solutions of naphthalene in (Bruni), A., ii, 356.

β-Naphthol, equilibrium between picric acid, ethylenic bromide and; between benzene, naphthalene and (Bruni), A., ii, 406.
  action of sodium on, in alcohol (Kunz-Krause), A., i, 200.
  behaviour of, towards certain salts of copper (Fosse), A., i, 529.
  detection of α-naphthol in (Dubosc), A., ii, 192.
  estimation of small amounts of α-naphthol in (Procházka and Herman), A., ii, 65.
β-Naphthol, *di*nitro- constitution of (Kehrmann and Matis), A., i, 62.
β-Naphtholaminoguanidine, nitroso-, nitrate (Thiele and Barlow), A., i, 48.
β-Naphtholazo-dyes, anhydro-formation of (Bamberger), A., i, 722.
α-Naphtholbenzein, use of, in alkalimetry (Glaser), A., ii, 573.
2-Naphthol-4 : 1′-disulphonic acid, thio-, sodium salt (Gattermann), A., i, 518.
β-Naphtholsemicarbazone, nitroso- (Thiele and Barlow), A., i, 49.
1-Naphthol-2-sulphonic acid, thio-, tin sodium salt (Gattermann), A., i, 518.
1-Naphthol-4-sulphonic acid, thio-, salts (Gattermann), A., i, 518.
1-Naphthol-2′-sulphonic acid, 2 : 4-*di*amino-, hydrochloride (Gaess), A., i, 374.
α-Naphthonitrile, 4′-amino- (Friedländer, Heilpern, and Spielfogel), A., i, 709.
β-Naphthonitrile, 1′-amino-, 2′-amino-, 1-nitro-, 1′-nitro-, and 4′-nitro- (Friedländer, Heilpern, and Spielfogel), A., i, 708, 709.
α- and **β-Naphthonitriles**, action of cuprous chloride on (Rabaut), A., i, 557.
Naphthopicric acid, reduction of (Kehrmann and Haberkant), A., i, 62.
1 : 1′-Naphthoylazomethylene (Herms), A., i, 617; (Berend and Herms), A., i, 824.
1 : 1′-Naphthoyl*di*bromomethylene (Herms), A., i, 617; (Berend and Herms), A., i, 824.
1 : 1′-Naphthoylchloromethylene (Berend and Herms), A., i, 824.
1 : 1′-Naphthoylhydrazimethylene (Herms), A., i, 617; (Berend and Herms), A., i, 823.
1 : 1′-Naphthoylmethylene-*m*-nitro*iso*benzylideneazine (Herms), A., i, 617; (Berend and Herms), A., i 824.
α- and **β-Naphthylacrylic acids** (Rousset), A., i, 296.
α-Naphthylamine, molecular depressions in, and latent heat of fusion of (Stillmann and Swain), A., ii, 728.
  melting point of, influence of pressure on (Hulett), A., ii, 469.
β-Naphthylamine, compounds of, with metallic salts (Matthews), A., ii, 296.
  1-nitro- (Friedländer, Heilpern, and Spielfogel), A., i, 708.
Naphthylamines, methylation of (Pinnow), A., ii, 588.
2′ : 1-Naphthylaminesulphonic acid, colouring matters from (Noelting and Bianchi), A., i, 374.
α- and **β-Naphthylbenzidines** (Merz and Strasser), A., i, 917, 918.
α- and **β-Naphthylcarbamides** (Walther and Wlodkowski), A., i, 591; (Young), A., i, 917.
α- and **β-Naphthyldithiocarbazinic acids**, methylic, ethylic, and benzylic salts (Busch and Best), A., i, 955, 956.
Naphthyldithiodiazolonesulphonic acid (Busch and Münker), A., i, 953.
α- and **β-Naphthyldithiodiazolonethiol**, and its benzoyl derivative, methylic ether, and *di*sulphide (Busch and Münker), A., i, 952.
Naphthylene. See *cyclo*-Hexene.
1 : 1′-Naphthylenebishydrazimethylene (Herms), A., i, 618; (Behrend and Herms), A., i, 824.
1 : 1′-Naphthylenehydrazimethylene-*m*-nitro*iso*benzylideneazine (Herms), A., i, 617; (Berend and Herms), A., i, 824.
1 : 1′-Naphthylene*bis*-*m*-nitro*iso*benzylideneazine (Herms), A., i, 618; (Berend and Herms), A., i, 824.
α- and **β-Naphthylethylthiosemicarbazides** (Marckwald), A., i, 505.
β-Naphthyl-glucoside (Ryan), T., 1055; P., **1899**, 196.
β-Naphthylic *di*sulphide, formation of (Curtius and Lorenzen), A., i, 150.
  methylic ether, behaviour of, towards *iso*butylic bromide (Cohen), A., i, 617.
α- and **β-Naphthylic** *tri*- and *tetra*-sulphides (Troeger and Hornung), A., i, 906.
α- and **β-Naphthylmethylthiodiazolinethiols**, and *di*sulphide, and methylic ether of former (Busch and Best), A., i, 956.
α- and **β-Naphthylmethylthiosemicarbazide**, and the thiodiazolone of latter (Marckwald), A., i, 505.
β-Naphthyloxamic acid (Friedländer, Heilpern, and Spielfogel), A., i, 708.

α- and β-**Naphthylpentahydro-1:3:5-dithiodiazine** (Busch and Best), A., i, 955, 956.
βα-**Naphthyl-α-phenylcarbamide** (Manuelli and Comanducci), A., i, 888.
α-**Naphthylpropylene**, and picrate (Rousset), A., i, 296.
α-**Naphthylpropylenecarboxylic acid** (Rousset), A., i, 296.
α- and β-**Naphthyl-propylsulphones**, and -*iso***propylsulphones** (Troeger and Uhde), A., i, 607.
β-**Naphthyl*iso*rosindone**, and salts (Fischer and Hepp), A., i, 78.
β-**Naphthylsulphonamide**, formation of (Curtius and Lorenzen), A., i, 150.
β-**Naphthylsulphonazide** (Curtius and Lorenzen), A., i, 150.
α- and β-**Naphthylsulphone-butyric** and -*iso***butyric acids**, and salts, chlorides, and *di*bromo-derivatives (Troeger and Uhde), A., i, 606, 608.
β-**Naphthylsulphonehydrazide** (Curtius and Lorenzen), A., i, 149.
β-**Naphthylthiodiazolinethiol** (Busch and Best), A., i, 956.
Narceine, preparation of, from narcotine (Frankforter and Keller), A., i, 781.
Narcotine, heat of combustion and formation of, and of combination with hydrochloric acid (Leroy), A., ii, 631.
  action of *o*-xylylenic bromide on (Scholtz), A., i, 649.
  methiodide, *di*iodo- (Frankforter and Keller), A., i, 782.
Nasturtiic acid (Gadamer), A., i, 930.
Nasturtium officinale, glucoside and essential oil of (Gadamer), A., i, 930.
Nataloin and its acetyl and *tri*- and *tetra*-benzoyl derivatives (Léger), A., i, 821.
Natrolite, vapour pressure of (Tammann), A., ii, 8.
Nectandra caparrapi, oil of (Tapia), A., i, 533.
Neodymium, atomic weight of (Jones), A., ii, 292.
  bands in spectrum of didymium from monazite sands (Urbain), A., ii, 425.
  separation of praseodymium from (Schéele), A., ii, 291.
Neon (Ramsay), A., ii, 211.
  position of, in periodic system (Crookes), A., ii, 552; (Howe), A., ii, 740.
  preparation and refraction of (Ramsay and Travers), A., ii, 746.
  spectrum of, in high vacua obtained by freezing air (Dewar), A., ii, 741.
Nephelite from Norway (Morozewicz), A., ii, 765.
Neroli, oil of (Charabot and Pillet), A., i, 620.
  presence of methylic anthranilate in (Walbaum), A., i, 620, 621; (E. and H. Erdmann), A., i, 621.
Nerve-fibres, proportion of protagon in normal and degenerated (Noll), A., ii, 568.
  degenerated, chemistry of (Mott and Barratt), A., ii, 317.
Neurine, hydrochloride, precipitation of, with phosphotungstic acid; also its picrate, platinochloride, aurichloride, and mercurichlorides (Gulewitsch), A., i, 106.
  presence of, in the intestine (Nesbitt), A., ii, 310.
  physiological action of (Mott and Halliburton), A., ii, 315, 781.
Neutralisation phenomena among diazo-compounds (Hantzsch, Schümann, and Engler), A., i, 687.
Nickel, atomic weight of (Landolt, Ostwald, and Seubert), A., ii, 87; (Richards and Cushmann), A., ii, 488.
  action of, on copper silicide, arsenide, or antimonide (Lebeau), A., ii, 427.
  action of, on sulphuric acid (Adie), P., 1899, 133.
  action of sulphuric and sulphurous acids on (Berthelot), A., ii, 283.
Nickel alloys with calcium (Moissan), A., ii, 154; (Tarugi), A., ii, 749.
  with iron, magnetic behaviour of (Osmond), A., ii, 352.
Nickel salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
  reduction of, by calcium carbide (Tarugi), A., ii, 749.
Nickel antimonate (Senderens), A., ii, 557.
  thioantimonite (Pouget), A., ii, 663.
  ortharsenite, formation of (Reichard), A., ii, 23.
  azoimide, basic (Curtius and Rissom), A., ii, 92.
  chloride, hydrates of (Kuznetzoff), A., ii, 658.
  lead iodide (Mosnier), A., ii, 222.
  molybdiodates (Chrétien), A., ii, 363.
  nitrate, hydrates of (Funk), A., ii, 210.
  lead thallium, and barium thallium nitrites (Przibylla), A., ii, 223.
  oxide, decomposition of carbon monoxide in presence of (Boudouard), A., ii, 417, 595.

- **Nickel** oxide, reduction of, by aluminium (Franck), A., ii, 103.
  - sulphate, hydroxylamine compound of (Uhlenhuth), A., ii, 661.
  - sulphide, theory of formation of (Morgan and Gotthelf), A., ii, 626.
- **Nickel organic compounds** :—
  - Nickel pyridine salts (Reitzenstein), A., i, 161.
    - hypophosphite phenylhydrazine and thiosulphate phenylhydrazine (Moitessier), A., i, 688.
  - Diethylenediaminenickel, Dipropylenediaminenickel, Propylenediaminenickel, Tetraquoethylenediaminenickel, Triethylenediaminenickel, and Tripropylenediaminenickel salts (Werner, Megerle, Pastor, and Spruck), A., i, 856.
- **Nickel, detection, estimation, and separation of** :—
  - detection of (Papasogli), A., ii, 335.
  - influence of ammonium salts on precipitation of, by ammonia (Marshall), A., ii, 696.
  - estimation of, colorimetrically (Lucas), A., ii, 614.
  - estimation of, volumetrically (Giorgis), A., ii, 452.
  - estimation of, in presence of iron (Neumann), A., ii, 386.
  - estimation of silver, gold, and mercury in presence of (Kollock), A., ii, 811.
  - separation of cobalt from (Coehn; Havens), A., ii, 127.
  - separation of iron from (Brearley), A., ii, 815.
  - separation of mercury from (Jannasch and Alffers), A., ii, 60.
  - separation of zinc from (Döhler), A., ii, 811.
- **Nickel-boracite**, containing iodide (Allaire), A., ii, 156.
- **Nickel-steel**, effect of low temperatures on magnetic properties of (Osmond), A., ii, 630.
- **Nicotinanilide** (Pictet and Sussdorff), A., i, 164.
- **Nicotinazide** (Curtius and Mohr), A., i, 73.
- **Nicotine**, amount of, in tobacco (Sinnhold), A., ii, 48.
  - heats of combustion, formation, and solution of (Berthelot and André), A., ii, 400.
  - action of *o*-xylylenic bromide on (Scholtz), A., i, 648, 649.
  - hydrochloride, double salts of, with cadmium chloride (Glaser), A., i, 829.
- **Nicotine, estimation of, in tobacco** (Keller), A., ii, 194; (Hefelmann), A., ii, 261.
- **Nicotinic acid** (*pyridine-3-carboxylic acid*), nitrate, ethylic salt, and piperidine salt (Pictet and Sussdorff), A., i, 164.
  - 2 : 6-*di*chloro-, from action of phosphorus pentachloride on ethylic 2-hydroxy-$\Delta^{2,4}$-hydropyridone-3-carboxylate (Guthzeit and Laska), A., i, 261.
- **Nicotinohydrazide** (Curtius and Mohr), A., i, 73.
- **Nicotino-*p*-toluidide** (Pictet and Sussdorff), A., i, 165.
- **Niobium** :—
  - Perniobic acid, preparation of (Melikoff and Pissarjewsky), A., ii, 491.
- **Nitragin.** See Agricultural chemistry.
- **Nitramines**, aliphatic, and their isomerides, action of sulphuric acid on, and their constitution (Franchimont and Umbgrove), A., i, 106.
- **Nitrates.** See under Nitrogen.
- **Nitre**, from New South Wales (Mingaye), A., ii, 670.
- **Nitric acid, Nitric oxide, Nitric peroxide.** See under Nitrogen.
- **Nitrification.** See Agricultural chemistry.

  iso-Valeronitrile.
  Vinylacetonitrile (*butenoic acid, nitrile of*).

Nitro-compounds of the methane series, action of reducing agents on (KONOWALOFF), A., i, 733.

iso-**Nitro-compounds** (HANTZSCH and VEIT), A., i, 401.

Nitroform and its potassium, sodium, ammonium, and silver salts (HANTZSCH and RINCKENBERGER), A., i, 404.
  mercury compound of (LEY and KISSEL), A., ii, 485.

Nitrogen, from action of sodium amalgam on sodium nitrite or nitrate (DIVERS), T., 87 ; P., **1898**, 222.
  from carbamide, nitrous oxide in (RAYLEIGH), A., ii, 744.
  atomic weight of (DEAN), P., **1898**, 174 ; (BERTHELOT), A., ii, 207.
  melting point and critical temperature of (DEWAR), A., ii, 741.
  pure or atmospheric, densities of (RAMSAY), A., ii, 745.
  liquid, mixtures of, with oxygen, densities of (LADENBURG and KRÜGEL), A., ii, 467.
  fractional diffusion of (RAMSAY and TRAVERS), A., ii, 22.
  diffusion of, through caoutchouc (D'ARSONVAL), A., i, 772.
  absorption of, by mixtures of magnesium with lime and sodium or lithium (HEMPEL), A., ii, 594.

Nitrogen, combination of, with carbon disulphide (Berthelot), A., ii, 648.
  combination of, with oxygen, under the influence of the electric discharge (Berthelot), A., ii, 648.
  oxidation of, in explosion of carbon disulphide with air (Dixon and Russell), T., 610; P., **1899**, 115.
  quinquevalent, stereochemistry of (Aschan), A., i, 542.
  asymmetric optically active compounds of (Pope and Peachey), T., 1127; P., **1899**, 192.
  amidic and proteid, distinction between (Mallet), A., ii, 576.
Nitrogen chloride, injurious action of the fumes of (Hentschel), A., ii, 569.
  chlorides, substituted (Chattaway and Orton), T., 1046; P., **1899**, 152.
  iodide, composition of (Chattaway), P., **1899**, 18; (Norris and Franklin), A., i, 664.
    preparation and properties of; action of light on; action of alkalis, water or hydrogen peroxide on (Chattaway and Orton), P., **1899**, 17, 18, 20.
    action of reducing agents on; action of acids on (Chattaway and Stevens), P., **1899**, 17, 19.
Nitrogen *mon***oxide** (*nitrous oxide*), formed by action of sodium amalgam on sodium nitrite or nitrate; action of sodium amalgam on (Divers), T., 87; P., **1898**, 222; T., 95.
  in nitrogen from carbamide (Rayleigh), A., ii, 744.
  compressed, volatilisation of bromine in (Villard), A., ii, 144.
  action of electric glow discharge on, and on mixture of, with hydrogen (Mixter), A., ii, 267.
  action of, on hydrazine (de Bruyn), A., ii, 745.
  action of, on seeds, seedlings, and water-plants (Sandsten), A., ii, 320.
Nitrogen *di***oxide** (*nitric oxide*) boiling point and melting point of (Ladenburg and Krügel), A., ii, 545.
  nitric peroxide or nitrogen, diffusion of, into (Dixon and Peterkin), T., 614, 624; P., **1899**, 115.
  absorption of, by solutions of ferrous salts (Thomas), A., ii, 426.
  absorption of, by solutions of sodium or potassium sulphite; action of, on silver nitrate (Divers), T., 82; P., **1898**, 221.
Nitrogen *di***oxide** (*nitric oxide*), action of, on chromous chloride (Chesneau), A., ii, 661.
  action of electric glow discharge on, and on mixtures of, with hydrogen or carbon monoxide (Mixter), A., ii, 267.
  reduction of, by copper (Gray), A., ii, 248.
  estimation of (Knorre and Arndt), A., ii, 806.
Nitrogen *tri***oxide** (*nitrous anhydride*), formed by combination of nitric oxide and peroxide (Dixon and Peterkin)), T., 629; P., **1899**, 116.
  formed by electric discharge in attenuated air (Dewar), P., **1899**, 117.
  formed by sparking a mixture of nitrogen and oxygen (Berthelot), A., ii, 648.
  preparation of (Divers), T., 86; P., **1898**, 222; (Groves), P., **1898**, 222.
Nitrogen *tetr***oxide** (*nitric peroxide*), dissociation of (Leduc; Pochettino), A., ii, 729.
  influence of inert gas on dissociation of; diffusion of, into nitrogen and other inert gases (Dixon and Peterkin), T., 616, 619; P., **1899**, 116.
  diffusion of, into nitric oxide (Dixon and Peterkin), T., 623, 627; P., **1899**, 116.
  action of, on sulphuric acid (Lunge and Weintraub), A., ii, 479.
Nitrogen acids:—
  Nitric acid, fuming, preparation of (Vanino), A., ii, 479.
    heat of dilution of (Berthelot), A., ii, 285.
    surface tension of aqueous solutions of (Forch), A., ii, 641.
    influence of, on dissociation of chlorine in water (Jakowkin), A., ii, 736.
    action of metals on, and electrolysis of (Freer and Higley), A., ii, 480.
    electrolytic reduction of (Tommasi), A., ii, 138.
    decomposition of, by action of light (Berthelot), A., ii, 1.
    decomposition of, at low temperatures; action of free hydrogen on (Berthelot), A., ii, 21.
    heat developed in decomposition of potassium cyanide by (Berthelot), A., ii, 737.
    aminolytic constant of aniline in presence of (Goldschmidt and Salcher), A., ii, 551.

Nitrogen acids :—
Nitric acid, detection of, in waters (Cimmino; Winkler), A., ii, 805.
detection of, in milk (Fritzmann), A., ii, 54; (Ackermann), A., ii, 248.
estimation of (Blyth), P., **1899**, 50; (Ackermann), A., ii, 329.
estimation of nitrogen in (Hartwell and Wheeler), A., ii, 519.
Nitrates, hydrates of (Kastle), A., ii, 210.
action of dilute sulphuric, hydrochloric or phosphoric acid on, in presence of ether (Tanret), A., ii, 21.
reduction of, to nitrites by an enzyme in animal tissues (Abelous and Gerard), A., ii, 680, 681.
estimation of perchlorate in (Blattner and Brasseur), A., ii, 328.
See also Agricultural chemistry.
Nitrous acid, constitution of (Kieseritzky), A., ii, 396.
preparation of (Divers), T., 86; P., **1898**, 222; (Groves), P., **1898**, 222.
analysis of (Orloff), A., ii, 693.
distinction between ozone, hydrogen peroxide, and (Erlwein and Weyl), A., ii, 179.
estimation of (Blyth), P., **1899**, 50.
estimation of, in waters (Winkler), A., ii, 805.
Nitrites, constitution of (Divers), T., 92.
formation of, from nitrates, by an enzyme in animal tissues (Abelous and Gerard), A., ii, 680, 681.
triple metallic (Przibylla), A., ii, 223.
Hyponitrous acid, solution of; properties of; estimation of (Divers), T., 113, 116; P., **1898**, 225.
Hyponitrites, methods of preparing (Divers), T., 96.
preparation of, from nitrites through oxyamidosulphonate (Divers and Haga), T., 77; P., **1898**, 220.
Nitrogen, detection and estimation of:—
detection of, in organic compounds (Raikow), A., ii, 123; (Riegler), A., ii, 180.
estimation of, by Dumas's process (Gray), A., ii, 248.
estimation of, by Kjeldahl's method, note on (Atterberg), A., ii, 124; (Maquenne and Roux), A., ii, 381; (Pregl), A., ii, 382.
Nitrogen, estimation of :—
(nitric), estimation of, by Ulsch's process (Brandt), A., ii, 806.
direct estimation of, in gaseous mixtures (Smith), A., ii, 575.
estimation of, in presence of hydrogen and methane (Jaeger), A., ii, 526.
estimation of, in organic substances (Wedemeyer), A., ii, 53; (Hopkins), A., ii, 611; (Budde and Schon), A., ii, 693.
estimation of, in nitrates (Hartwell and Wheeler), A., ii, 519.
Nitrogen. See Agricultural chemistry.
Nitrogenous compounds, action of magnesium on (Eidmann), A., i, 317.
action of oxidising agents on (Oechsner de Coninck), A., i, 243.
Nitrogenous manures. See Agricultural chemistry.
Nitrogenous matter, influence of, on fermentation of sugars by yeasts and moulds (Dubourg), A., ii, 376.
Nitro-group, detection of the, in organic compounds (Mulliken and Barker), A., ii, 382.
Nitrosamines, non-electrolytic, behaviour of, with phosphorus *penta*chloride, acetyl chloride, and ammonia (Hantzsch), A., i, 400.
Nitroso-compounds, behaviour of, towards methylene derivatives (Ehrlich and Sachs), A., i, 883.
Nitrosylsulphuric acid, formation of (Lunge and Weintraub), A., ii, 479.
"**Nitrous ether, spirit of**," assay of (Fischer and Anderson), A., ii, 617.
Nomenclature of univalent hydrocarbon radicles (Vorländer), A., i, 553.
Nonane in lignite tar (Oehler), A., i, 816.
*di*bromo- and *di*chloro- (*nonomethylenic bromide* and *chloride*) (Solonina), A., i, 562.
nitro- (Worstall), A., i, 399.
Nonanedicarboxylic acids. See:—
Heptylsuccinic acid.
β-Hexylglutaric acid.
Nonanetetracarboxylic acid. See Heptylidenebismalonic acid.
Nonenylic alcohol (2 : 6-*dimethyl*-2-*heptene*-6-*ol*), synthesis of (Barbier), A., i, 323.
from action of alcoholic potash on geraniol (Tiemann), A., i, 184.
iso-**Nonodilactone**, from the action of water on brom*iso*butyl*iso*paraconic acid (Fittig and Erlenbach), A., i, 339.
n-**Nonoic acid**, amylic salt, density, specific rotation, and molecular volume of (Frankland), T., 358.

Nonomethylenediamine, action of nitrosyl chloride on (Solonina), A., i, 562.

Nonomethylenic bromide and chloride. See Nonane, *di*bromo- and *di*chloro-.

Nontronite from Moravia (Kovář), A., ii, 671.

Nonylenedicarboxylic acids. See :—
  Hexylaticonic acid.
  Hexylcitraconic acid.
  Hexylitaconic acid,
  and Hexylmesaconic acids.

Nopinolglycol acetate (Wagner and Slawinski), A., i, 767.

Norites from the Transvaal (Henderson), A., ii, 111.

Normal solutions, preparation of (Wagner), A., ii, 379.

Nor-rhizocarpic acid, and its diethylic salts (Hesse), A., i, 384.

Noryohimbic acid (Spiegel), A., i, 966.

Nosite (*nosean*), artificial (Morozewicz), A., ii, 764.

Nostoc punctiforme, development of, in non-nitrogenous solutions, and growth under various conditions (Bouilhac), A., ii, 238.
  formation of chlorophyll by, in the dark (Étard and Bouilhac), A., ii, 46.

Nucleic acid, separation of, into α-, *b*-nucleic acids and nucleothymic acid, their properties, detection and decomposition products, and sodium salts (Neumann), A., i, 467.

Nuclein as a source of uric acid in the living body (Jerome), A., ii, 678.
  relation of, ingestion of, to uric acid formation (Hopkins and Hope), A., ii, 117.
  iron-, separation of, from papayotin, and its oxidising power (Sacharoff), A., ii, 786.

Nuclein bases, conversion of, into uric acid by the action of tissue extracts (Spitzer), A., ii, 604.

Nucleins, properties, detection of, and estimation of phosphorus in (Neumann), A., i, 467.

Nucleohiston, reactions of (Bang), A., i, 836.

Nucleo-proteids, action of, on oxyhæmoglobin, and on glycogen (Bottazzi), A., i, 839.

Nucleothymic acid, its detection, sodium salt, and physiological action (Neumann), A., i, 467.

Nut-shells. See Agricultural chemistry.

Nux vomica, assay of (Squibb), A., ii, 535.

O.

Oak. See Agricultural chemistry.

Oats. See Agricultural chemistry.

Obsidian from Nicaragua (Petersen), A., ii, 38.

Oceanic deposits, chemical changes in (Hartley; Murray and Irvine), A., ii, 437.

n-**Octane**, specific heat and heat of vaporisation of (Luginin), A., ii, 269.
  heat of combustion of (Zouboff), A., ii, 589.
  action of chlorosulphonic acid on (Young), T., 173.
  action of sulphuric acid on (Worstall), A., i, 19.

n **Octane**, **αθ**-*di*bromo- and **αθ**-*di*chloro- (*octomethylenic bromide* and *chloride*), (Solonina), A., i, 562.
  nitro- and *di*nitro- (Worstall), A., i, 399.
  nitro-, action of stannous chloride on (Konowaloff), A., i, 733.
  *di*nitro- (Konowaloff), A., i, 844.

Octane (*di*iso*butyl*), oxidation of, by nitric acid (Markownikoff), A., i, 553.
  *di*bromo- and *di*chloro- (*di*iso*crotonylic bromide* and *chloride*) (Pogorzelsky), A., i, 785.

Octanedicarboxylic acids. See :—
  s-Di*iso*propylsuccinic acid.
  α-Methyl-β-*iso*amylsuccinic acid.

n-**Octane-mono-** and **-di-sulphonic acids** (Worstall), A., i, 19.

cyclo-**Octanone**. See Azelaone.

Octaspartide, tri-, tetr-, hex-, and octanilides, and tri-, tetra-, and pentaphenyloctanilides of (Schiff), A., i, 195.

Octenoic acid (*γ-butylcrotonic acid*), nitrile of (Henry), A., i, 257.

Octinene (*dicrotonyl*), and action of iodine on (Charon), A., i, 848.

Octinene (*di*iso*crotonyl*), and chloride, bromide, oxide, bromhydrin, and iodhydrin (Pogorželsky), A., i, 785.

Octinoic acid, from the distillation of the isomeride of cineolenic acid (Rupe), A., i, 340.

Octitol, and its dibenzylidene compound and acetyl derivative (Vincent and Meunier), A., i, 185.

Octoaspartic acid, action of sodium nitrite on (Schiff and Sevieri), A., i, 674.
  ammonium salt (Schiff), A., i, 674.
  *di*amino- (Schiff and Marzichi), A., i, 674.

Octoaspartide, action of ammonia on (Schiff; Schiff and Marzichi), A., i, 674.

Octoaspartodiamide and **Octoaspartotriamide** (Schiff and Marzichi), A., i, 674.

n-**Octoic acid** (*caprylic acid*), physical constants of (SCHEIJ), A., i, 668.

  separation of, from other fatty acids (HOLZMANN), A., ii, 68.

  amide of, preparation of (ASCHAN), A., i, 14.

  amylic salt, density, specific rotation, and molecular volume of (FRANKLAND), T., 358.

Octomethylenediamine, action of aqua regia on salts of (SOLONINA), A., i, 663.

  action of nitrosyl chloride on (SOLONINA), A., i, 562.

Octomethylenic bromide and chloride. See Octane, *di*bromo- and *di*chloro-.

Octonitrile (*caprylonitrile*), α-chloro- (HENRY), A., i, 256.

Octylenedicarboxylic acid. See Methyl*iso*amylmaleic acid.

Octylenedicarboxylic anhydride. See β-*iso*-Amylcitraconic anhydride.

Octylenic glycol, from action of potash on isobutaldol cyanhydrin (KOHN), A., i, 328.

n-**Octylic alcohol** (*caprylic alcohol*), and its benzenesulphonate, velocity of reaction between (SAGREBIN), A., ii, 735.

  and *iso*octylic alcohol, action of sodium derivatives of, on ethylic salts of α-bromo-fatty acids (BISCHOFF), A., i, 670.

Octylic alcohol (*αδ-dimethylhexylic alcohol*), δ-bromo- and δ-iodo- (*diisocrotonylic bromhydrin* and *iodhydrin*) (POGORŽELSKY), A., i, 785.

Octyl-β-naphthacinchonic acid (SCHIMMEL and Co.), A., i, 923.

Œnanthylic acid. See Heptoic acid.

Œnanthylidenebismalonic acid. See Heptylidenebismalonic acid.

Œnanthylidenecyanhydrin. See α-Hydroxyoctonitrile.

Oil. See Agricultural chemistry.

Oil cake. See Agricultural chemistry.

Oil of opoponax (TSCHIRCH and KNITL), A., i, 714.

Oils, refraction constants of (PROCTER), A., ii, 258.

  heat of bromination test for (GILL and HATCH), A., ii, 533.

  estimation of the iodine number of (ASCHMAN), A., ii, 71.

  estimation of free phosphorus in (LOUÏSE), A., ii, 807.

  drying, chemistry of (HEHNER and MITCHELL), A., ii, 190.

  Indian edible, properties and uses of (CROSSLEY and LE SUEUR), A., ii, 324.

Oil shales, microscopic examination of (BERTRAND), A., ii, 161.

Okenite, vapour pressure of (TAMMANN), A., ii, 8.

Oleamide, preparation of (ASCHAN), A., i, 14.

Oleander, Algerian, presence of strophantin in (DUBIGADOUX and DURIEU), A., ii, 325.

Olefines, action of nitric anhydride and peroxide on (DEMJANOFF), A., i, 845.

Oleic acid and salts, conductivity of, in alcohols (DENNHARDT), A., ii, 351.
  and sodium salt, melting points of, and temperature of solidification of solutions of (KRAFFT), A., ii, 471.
  isomerism of, with elaidic acid (ALBITZKY), A., i, 862.
  conversion of, into elaidic acid (FARNSTEINER), A., ii, 705.
  action of acetic anhydride on; also anhydride (ALBITZKY), A., i, 862.
  formation of a neutral substance on keeping (FAHRION), A., i, 862.
  rancidity of (SCALA), A., i, 478.
  estimation of (TWITCHELL), A., ii, 69; (FARNSTEINER), A., ii, 705.

Oleic acid, sodium salt, molecular weight of (KAHLENBERG and SCHREINER), A., ii, 203.
  or potassium salt, boiling point of solutions of, in water or alcohol (KRAFFT), A., ii, 471.

Oleodistearin and its iodine number and chloriodo-compound (HENRIQUES and KÜNNE), A., i, 330.

Oleo-resin of *Dacryodes hexandra*, composition of (MORE), T., 718; P., **1899**, 150.

Oleum cadi, composition of (TROEGER and FELDMANN), A., i, 376.

Olibano-resen (TSCHIRCH and HALBEY), A., i, 69.

Olibanum electrum, constituents of (TSCHIRCH and HALBEY), A., i, 69.

Oligoclase from Victoria (HOWITT), A., ii, 566.

Olive oil, rancidity of (SCALA), A., i, 478.
  cements made from lime and (DÖRNER), A., ii, 554.
  detection of arachis oil in (VIERTH), A., ii, 583.
  iodine number of (ZEGA and MAJSTOROVIĆ), A., ii, 820.

Olivine, alteration to diopside (BRAUNS), A., ii, 36.
  from Massachusetts (MARTIN), A., ii, 112.

Opal, action of water on (SPEZIA), A., ii, 300.

Opal sinter from the Seychelles (BAUER), A., ii, 565.

Opalisin, presence of, in milk (WRÓBLEWSKI), A., ii, 232.

Opium, assay of, by iodine (PRESCOTT), A., i, 90.
  estimation of morphine in (THOMS), A., ii, 194; (MONTEMARTINI and TRASCIATTI), A., ii, 619; (GORDIN and PRESCOTT), A., ii, 714.

Oponal (TSCHIRCH and KNITL), A., i, 714.

Opopanax, constituents of (TSCHIRCH and KNITL), A., i, 713.

Oporesinotannol, and benzoyl derivative (TSCHIRCH and KNITL), A., i, 714.

Optical isomerides, mixtures of, melting point curves of (CENTNERSZWER), A., ii, 725.

Optical isomerism (WALDEN), A., ii, 393.

Optically active substances, crystallographic relations of (FOCK), A., i, 819.
  racemisation of (MCKENZIE), T., 769.

Optical activity, influence of an unsaturated linking on (FORSTER), T., 1149; P., **1899**, 194.
  of amyl radicle, influence of elements on (WALDEN), A., ii, 537.

Optical antipodes, interconversion of (WALDEN), A., ii, 538.

Optically transparent liquids (SPRING), A., ii, 537.

Orange peel, presence of a sugar in (FLATAU and LABBÉ), A., ii, 445.

Orcinol (3:5-*dihydroxytoluene*), action of sodium on, in alcohol (KUNZ-KRAÜSE), A., i, 200.
  amino-, tribenzoyl derivatives of (HEINRICH), A., i, 171.

o- and *p*-**Orcinoldicarboxylic acids**, and mono- and diethylic salts (JERDAN), T., 814, 818; P., **1899**, 152.

  per-**Osmic acid** (Mylius and Dietz), A., ii, 160.
Osmotic pressure. See Diffusion.
Osyritrin, action of potassium acetate on (Perkin), T., 440; P., **1899**, 65.
Ouabain, hydrolysis of, action of nitric acid on, *mono*- and *di*-nitro-derivatives and salts (Arnaud), A., ii, 70.
Ovalbuminic acid and its salts (Albahary), A., i, 95.
Ovimucoid (Zanetti), A., i, 180.
  amount of glucosamine from (Seeman), A., i, 465.
Oxalacetic acid, ethylic salt, action of potassium cyanide on, in presence of hydrochloric acid (Durand), A., i, 741.
    condensation of, with ethylic phenylpropiolate (Ruhemann and Cunnington), T., 783; P., **1899**, 169.
Oxalatoplatinum compounds (Werner and Grebe), A., i, 865.
Oxalic acid, electrolysis of (Bose), A., ii, 349.
  contraction of aqueous solutions of, on dilution (Wade), T., 270; P., **1899**, 8.
  stability of solutions of (Jorissen), A., i, 739.

Oxalic acid, catalytic action of palladium, platinum, and silver on solutions of (Šulc), A., i, 569.
action of, on fluorides of magnesium, cerite earths, yttria, thoria, &c., and on silicofluorides of cerium, lanthanum, yttrium, &c. (Paternò and Alvisi), A., ii, 17, 18.
detection of tartaric acid in presence of (Fresenius), A., ii, 257.
estimation of (Ulsch), A., ii, 802.
estimation of, in presence of citric and malic acids (Kissling), A., ii, 821.
estimation of, in urine (Salkowski), A., ii, 705.

Oxalic acid, double ammonium salts with aluminium, chromium, and iron, action of metallic chlorides on (Rosenheim and Platsch), A.,i,739.
antimony salts, and double salts of antimony with potassium, sodium, and ammonium (Rosenheim and Bierbrauer), A., i, 570.
bismuth salt, and double salts of bismuth with potassium and ammonium (Rosenheim and Bierbrauer), A., i, 571.
cadmium salt, boiling point of solution of, in presence of hydrochloric acid (Richards and Harrington), A., ii, 140.
cupric, manganous and mercuric salts (Paternò and Alvisi), A., ii, 17.
double molybdenum salts with sodium and barium, and its vanadium barium salt (Rosenheim and Itzig), A., i, 740.
double salt of platinum and potassium (Vèzes), A., i, 572.
potassium salt, heat of formation of (Massol), A., ii, 80.
praseodymium salt (Scheele), A., ii, 100.
double salts of tin with potassium and barium (Rosenheim and Platsch), A., i, 572.
uranous salt of (Aloy), A., ii, 599.
double uranium salts with potassium, sodium, ammonium, cæsium, lithium, and barium (Rosenheim and Lienau), A., i, 569.
vanadium, ammonium, and potassium double salts (Piccini and Brizzi), A., ii, 298.
l-amylic salt, molecular rotation of (Walden), A., ii, 622.
mono-ethylic salt, phenylhydrazide of, formation of (Bouveault), A., i, 416.
ethylic salt, specific heat and heat of vaporisation of (Luginin), A., ii, 269.

Oxalic acid, ethylic salt, velocity of hydrolysis of, in aqueous alcoholic solution (Kistiakowsky), A., ii, 13.
condensation of with ethylic β-methylglutarate, ethylic β-phenylglutarate, and ethylic ββ-dimethylglutarate (Dieckmann), A., i, 676.

Oxalic acid, *di*amino-. See Glycollic acid. diamino-.
*di*chloro-, methylic salt. See Methoxydichloroacetic acid, methylic salt.
imino-. See Glycollic acid, imino-.

Oxalochlorides, estimation of oxalic acid in, by means of cerium (Job), A., ii, 334.

Oxalylamidoguanidine (Thiele and Manchot), A., i, 167.

Oxalylphenylamidoguanidine, picrate of (Cuneo), A., i, 550.

Oxamic acid, elimination of, from the organism (Schwarz), A., ii, 164.

Oxamide, mercury compound of, constitution of (Kieseritzky), A., ii, 395.

6-Oxamidophenylnaphthaphenazonium anhydride (Kehrmann and Locher), A., i, 82.

Oxanilylthiocarbimide (Dixon), T., 409; P., **1899**, 65.

iso-**Oxazole**, β-nitro- (Hill and Torrey), A., i, 789.

Oxazolone, chloro- (Hanriot and Reynaud), A., i, 723.

Oxazolones, preparation of (Japp and Findlay), T., 1027; P., **1899**, 165.

Oxidation, animal, relation of iron-nucleins, bionucleins, and enzymes (Sacharoff), A., ii, 787.

Oxides, crystalline double (Dufau), A., ii, 225.

Oxidising ferments. See Oxydase.

Oximes, constitution of (Pope), T., 1109.
formed from a decomposition product of dimethylindazone oxime (Bamberger and Weeler), A., i, 124.
behaviour of, towards diazo-compounds (Bamberger), A., i, 589.
stereoisomeric, stability of, in presence of acids and alkalis (Abegg), A., i, 327.

Pentene. See Amylene.

cyclo-**Pentenic** oxide (Meiser), A., i, 742.

Pentenoic acid (*allylacetic acid*), and its chloride, amide, and nitrile (Henry and Aschmann), A., i, 257.

Pentenoic acid (*β-dimethylacrylic acid*), and its oxidation; also its ethylic salt (Crossley and Le Sueur, T., 164; P., **1898**, 219.
  nitrile of (Henry), A., i, 257.
  ethylic salt (Bischoff and Bernhard), A., i, 202.
    condensation of, with the sodium derivative of ethylic cyanacetate (Perkin and Thorpe), T., 52.

Pentenoic acid (*α-ethylacrylic acid*), and its salts, and oxidation (Semenoff), A., ii, 866.

Pentenoic acid (*β-ethylacrylic acid*), and its oxidation; also its ethylic salt (Crossley and Le Sueur), T., 166; P., **1898**, 219.

Pentenoic acid (*tiglic acid*, *methylcrotonic acid*), from condensation of acetaldehyde with propionic acid (Kietreiber), A., 331.

Pentinene (*isoprene*), action of hypochlorous acid and bromine on; also its *di*bromide and *di*brombydrin (Mokiewsky), A., i, 726.

Pentonic acid, from acid hydrolysis of maltodextrinic acids, and its calcium salt (Brown and Millar), T., 298; P., **1899**, 12.

Pentosans, *rôle* of, in the manufacture of crude sugar (Komers and Stift), A., i, 185.
  estimation of (Warnier), A., ii, 339.
  estimation of, and use of, in food analysis (Hehner and Skertchly), A., ii, 702.
  estimation of, in presence of sucrose (Andrlík), A., ii, 818.

Pentose, origin of, in the living body, and tests for, in urine (Salkowski), A., ii, 679.

Pentoses, estimation of methylated (Votocek), A., ii, 701.

Pentyl-. See Amyl-.

Pentylenedicarboxylic acids :—
  Dimethylaticonic acid.
  Dimethylcitraconic acid.
  Dimethylglutaconic acid.
  Dimethylitaconic acid.
  Dimethylmesaconic acid.
  Ethylcitraconic acid.
  Ethylitaconic acid.
  Ethylmesaconic acid.
  Teraconic acid.

Peppermint, French essence of, properties of (Charabot), A., i, 441.

Pepsin, action of heat on (Harlay), A., i, 967.
action of, on albumin (Harlay), A., i, 835.
ultimate action of, on fibrin (Harlay), A., i, 656.
solvent power of; estimation of (Effront), A., i, 832.
Peptase, presence of a, in malt (Laszczynski), A., ii, 793.
Peptone, physiological action of (Thompson), A., ii, 604, 677.
Witte's, absorption spectrum of (Blyth), T., 1163.
the albumose of (Schrötter), A., i, 316.
Peptones, molecular weights of (Vaubel), A., i, 839.
presence of, in beet sugar juices (Rümpler), A., ii, 507.
solubility of, in alcohol (Effront), A., i, 835.
action of formaldehyde on (Lepierre), A., i, 654.
physiological action of (Chittenden, Mendel, and Henderson), A., ii, 233.
in pancreas, action of, on alcoholic fermentation (Lépine and Martz), A., ii, 442.
detection of (Gnezda), A., ii, 715.
detection of, in urine (Freund), A., ii, 195.
estimation of (Effront), A., ii, 716.
separation of albumoses from (Müller), A., ii, 136.
Periclase from Sweden, origin of (Sjögren), A., ii, 760.
Peridote, action of hydrogen sulphide on (Didier), A., ii, 596.
Periodic system, position of argon in (Piccini), A., ii, 645.
Peronine. See Morphine benzylic ether.
Peroxides, constitution of (Melikoff and Pissarjewsky), A., ii, 31.
Perseitol, condensation of benzaldehyde with (de Bruyn and Alberda van Ekenstein), A., i, 662.
Pertusarene, **Pertusaric acid**, **Pertusarin**, and **Pertusaridin** from *Pertusaria communis* (Hesse), A., i, 383.
Peruviol, and its cinnamoyl derivative and bromination (Thoms), A., i, 715.
Petalite from the Caucasus (Jereméeff), A., ii, 108.
Petit-grain, oil of (Charabot and Pillet), A., i, 620, 711.
Petroleum from Hungary (John and Eichleiter; Kalecsinszky), A., ii, 493.
Italian (Cecchi-Mengarini), A., i, 841.
Petroleum, diffusion coefficient of, across vulcanised caoutchouc (Flusin), A., ii, 205.
light, and water, mutual solubilities of (Herz), A., ii, 83.
detection of, in turpentine (Schreiber and Zetzsche), A., ii, 815.
estimation of light (Richmond), A., ii, 699.
estimation of alcohol and ether in presence of light (Richmond), A., ii, 698.
estimation of sulphur in (Fileti), A., ii, 575.
Peucedanin (*imperatorin*), viscosity of undercooled (Tammann), A., ii, 272.
velocity of crystallisation of (Bogojawlensky), A., ii, 206.
and action of bromine on (Schmidt, Jassoy, and Haensel), A., i, 377.
Phacolite, vapour pressure of (Tammann), A., ii, 8.
Phaseolus multiflorus. See Agricultural chemistry.
Phenacetin, *o*-bromo- (Vaubel), A., i, 700.
ω-bromo- (Hinsberg), A., i, 496.
ω-Phenacetin, *o*-chloro- (Reverdin and Düring), A., i, 267.
Phenacetolin as an indicator (Waddell), A., ii, 83.
Phenacylbromocinnamic acid (Thiele and Mayr), A., i, 610.
Phenacylcinnamic acid (Thiele), A., i, 217, 609.
Phenacylcyanacetic acid (*α-cyano-β-benzoylpropionic acid*), alkylic salts, and the action of potash on them (Klobb), A., i, 114.
Phenacylhydrocinnamic acid (Thiele), A., i, 217; (Thiele and Mayr), A., i, 611.
Phenacylic iodide. See Acetophenone, ω-iodo-.
Phenacyllævulic acid. See Phenyl-4 : 7-diketohexanecarboxylic acid.
Phenacylmethylcinnamic acid and salts (Thiele), A., i, 610.
9-Phenacylphenanthrone, 9-amino-, (Japp and Meldrum), T., 1034; P., **1899**, 166.
Phenakite from Bohemia (Preis), A., ii, 668.
Phenanthraquinone, interaction of, with acetophenone in presence of ammonia (Japp and Meldrum), T., 1032; P., **1899**, 166.
Phenanthraquinone-*p*-nitrophenylhydrazone (Hyde), A., i, 689.
Phenanthrene, equilibrium between benzene, carbazole and (Bruni), A., ii, 406.

a-**Phenanthroline** (Blau), A., i, 388.

Phenantriazine, amino- (Thiele and Bihan), A., i, 47.

Phenegol, *o*-nitrophenol-*p*-sulphonate of mercury and potassium (Gautrelet), i, 802.

i-*a*-**Phenethylamine** hydrochloride and platinochloride; rotatory power of (Pope and Harvey), T., 1110; P., **1899**, 200.

Phenethylsuccinic acid, and anhydride (Thiele and Meisenheimer), A., i, 603.

Phenetidine, *o*-amino-, diacetyl derivative of (Cohen), A., ii, 944.
  o-amino-, physiological action of (Cohn), A., ii, 781.

Phenetoil, synthesis of (Moureu), A., i, 495.
  2 : 6-*di*bromo-, action of sulphonating agents on (Armstrong), P., **1899**, 178.
  o-bromo-*p*-amino, and picrate; *p*-bromo-*o*-amino-, picrate and acetyl derivative; 2 : 4-bromonitro-, *tri*bromo-; *p*-chloro-*o*-amino-salts, and acetyl derivative; *o*-chloro-*p*-amino-, picrate and acetyl derivative; *p*-chloro-*m*-amino-, picrate and acetyl derivative; 2 : 5-chloronitro-; *di*chloro-*p*-amino-, its salts and acetyl derivative; *p*-nitro-*o*-amino-, and *m*-nitro-*o*-amino-, and acetyl derivatives (Reverdin and Düring), A., i, 266, 267.

o- and *p*-**Phenetoilsulphinic acids** (Gattermann), A., i, 517.

o-**Phenetoilsulphonic acid**, potassium salt, chloride, amide, and anilide (Gattermann), A., i, 518.
  phenylhydrazide (Gattermann), A., i, 518.
  o- and *p*-nitro-, action of bromine on (Armstrong), P., **1899**, 177.

o-**Phenetylmercuric iodide**, chloride, and acetate (Dimroth), A., i, 429.

3-Phenetylpyridazine, 6-chloro-3-bromo- (Gabriel and Colman), A., i, 391.

v-**Phenetylpyridazinone**, and monobromide (Gabriel and Colman), A., i, 391.

p-**Phenetylthiocarbimide** (Bamberger), A., i, 696.

Phenoketoheptamethylene (*phenocycloheptane*, *phenoheptaphanone*), and its semicarbazone (Kipping and Hall), P., **1899**, 174.

Phenol, synthesis of, from acetylene (Berthelot), A., i, 264.
  influence of pressure on melting point of (Hulett), A., ii, 469.

Phenol, equilibrium between, and hydrocyanic acid in combination with potassium (Berthelot), A., ii, 737.
  equilibrium between water, aniline, and (Schreinemakers), A., ii, 739.
  absorption of argon by (Berthelot), A., ii, 653.
  condensation of, with benzoin (Japp and Meldrum), T., 1037; P., **1899**, 167.
  products of destructive distillation of (Müller), A., i, 27.
  fate of, when introduced into the organism (Menegazzi), A., ii, 317.
  sodium salt of, heat of formation of (de Forcrand), A., ii, 589.
  detection of, by ferric chloride (Peters), A., ii, 340.
  estimation of, in urine (Neuberg), A., ii, 454.

Phenol, *o*-amino-, methylation of (Pinnow), A., i, 588.
    and *p*-amino-, *o*- and *p*-nitro-, oxidation of, with chromic acid (de Coninck and Combe), A., i, 347.
  m-amino-, preparation of (Meyer and Sundmacher), A., i, 755.
  *penta*bromo- (Bodroux), A., i, 29.
  4 : 2-bromocyano-, 4 : 6 : 2-*di*bromocyano-, and 4 : 2-nitrocyano- (Auwers and Walker), A., i, 198.
  2 : 4 : 6-bromo*di*nitro- (Reverdin and Düring), A., i, 267.
  2 : 4 : 6 : 3-*tri*bromonitro-(Jackson and Koch), A., i, 677.
  6 : 4-chloramino- and 4 : 6 : 2-chloro-*di*nitro- (Kehrmann and Grab), A., i, 129.
  o-cyano-, ammonium and silver derivatives (Auwers and Walker), A., i, 198.
  o-nitro-, electrolytic formation of (Schall), A., i, 364.
    influence of pressure on melting point of (Hulett), A., ii, 469.
    molecular depression of freezing point of (Ampola and Rimatori), A., ii, 353.
    and *p*-nitro-, behaviour of, towards anhydrides of dibasic organic acids (Schryver), T., 662; P., 121.
  p-nitro-, from condensation of nitromalonic aldehyde with acetone (Hill and Torrey), A., i, 789.
    constitution of the salts of (Hantzsch), A., i, 400.
    use of, in alkalimetry (Glaser), A., ii, 573.
  o- or *m*-nitro-, sodium derivatives of, action of carbon dioxide on; compounds of, with nitrophenol (Monnet and Benda), A., i, 585

Phenol, *di*nitro-, velocity of crystallisation of (Bogojawlensky), A., ii, 206.

Phenols, conductivity of salt solutions in (Kahlenberg and Lincoln), A., ii, 397.
- cryoscopic behaviour of picrates of (Bruni and Carpené), A., ii, 8.
- action of hydrazine hydrate on (Hoffmann), A., i, 221.
- action of ozone on (Otto), A., ii, 282.
- alkylated, action of bromine on (Zincke), A., i, 265.
- diortho-substituted, behaviour of, towards anhydrides of dibasic organic acids (Schryver), T., 662; P., **1899**, 121.
- analysis of commercial (Schryver), A., ii, 700.
- estimation of, in presence of soap (Spalteholz), A., ii, 64.

Phenols, list of. See Alcohols and Phenols.

Phenolphthalein, constitution of (Meyer), A., i, 707.
- phenylhydrazide, and dimethylic and diethylic ethers (Gattermann and Ganzert), A., i, 514.
- use of, in alkalimetry (Glaser), A., ii, 573.

Phenolphthalein, *di*nitro-, and *di*amino- (Gattermann and Bamberg), A., i, 514.

Phenolsaccharein (Monnet and Kœtschet), A., i, 212.

Phenol-*p*-sulphonic acid, action of bromine on (Armstrong), P., **1899**, 177.

Phenoltetramethyl*di*aminodiphenylmethane, *p*-nitroso- (Möhlau and Klopfer), A., i, 913.

Phenolthymoquinone (Biltris), A., i, 199.

Phenoltoluquinone (Biltris), A., i, 199.

Phenomorpholine, exhaustive methylation of (Knorr), A., i, 462.

Phenonaphthazine, chloro- (Fischer and Hepp), A., i, 78.

Phenoxyacetic acid, phenylic and *p*-bromophenylic salts; *p*-bromo-, and phenylic salt (Vandevelde), A., i, 209.

Phenoxyacetic chloride, and *p*-bromo- (Vandevelde), A., i, 209.

Phenoxyacetophenylhydrazide, and *p*-bromo- (Vandevelde), A., i, 209.

Phenoxybenzene-*p*-sulphonic acid, action of bromine on (Armstrong), P., **1899**, 177.

δ-**Phenoxybutylbenzamide** (Gabriel and Maass), A., i, 595.

β-**Phenoxybutylene** (Solonina), A., i, 681.

δ-**Phenoxybutylphthalimide** (Gabriel and Maass), A., i, 595.

α-**Phenoxy-δ-hexylene** (Solonina), A., i, 561, 681.

β-**Phenoxy-δ-hexylene** (Solonina), A., i, 681.

α-**Phenoxy-β-nonylene**, and α-**Phenoxy-β-octylene** (Solonina), A., i, 562.

β-**Phenoxy-3-pentylene** (Solonina), A., i, 681.

1-γ-Phenoxypropylpyrrolidine (Schlinck), A., i, 541.

p-**Phenoxythiobenzanilide**, and *p*-**Phenoxy-4-thiobenzanilide** (Bamberger), A., i, 695.

Phenylacetaldehyde, formation of (Moritz and Wolffenstein), A., i, 424.

Phenylacetamide, formation of (Mathews), A., i, 57.

Phenylacetamidocinnamic acid, and its lactimide (Erlenmeyer and Kunlin), A., i, 761.

β-*o*-**Phenylacetamidophenylbenzimidazole** (von Niementowski), A., i, 645.

α-**Phenylacetamidophenylpropionic acid**, its salts and amide (Erlenmeyer and Kunlin), A., i, 761.

Phenylacetanilide, *o*-amino- and *o*-nitro- (König and Reissert), A., i, 458.

Phenylacetic acid, ethylic salt, velocity of formation of (Sudborough and Lloyd), T., 470; P., **1899**, 3.
- menthyl salt, optical activity and molecular volume of (Tschugáeff), A., ii, 3.

Phenylacetic acid, bromo-, ethylic salt, action of benzylaniline and diphenylamine on (Bischoff), A., i, 125.
- *tri*nitro- (Jackson and Phinney), A., i, 603.

Phenylacetimidoethyl ether (Hessler), A., i, 900.

α-**Phenylacetoacetic acid**, ethylic salt (Beckh), A., i, 211.

β-**Phenyl-γ-acetobutyric acid**, electrical conductivity of (von Schilling and Vorländer), A., i, 879.

Phenylacetonitrile (*benzylic cyanide*), formation of (Mathews), A., i, 57.
- action of cuprous chloride on (Rabaut), A., i, 557.
- condensation of, with benzaldehyde (Henze), A., i, 218.

Phenyl acetyl nitrogen chloride (*acetylphenylchloramine*), and *p*-chloro-, and 2 : 4-*di*chloro- (Chattaway and Orton), T., 1050; P., **1899**, 153.

β-**Phenylacrylic acid**. See Cinnamic acid.

Phenylalanine (Erlenmeyer and Kunlin), A., i, 761.
Phenylallylcarbamide (Dains), A., i, 593.
Phenylamine. See Aniline.
Phenylamino-. See Anilino-.
a-**Phenyl-*m*-*di*aminobenzoxazole** and its diacetyl derivative (Kym), A., i, 648.
Phenyl*di*aminoquinone. See Anilinoaminoquinone.
Phenylammonium, lead iodide (Mosnier), A., ii, 222.
a-**Phenyl*sec*amylamine** (Konowaloff and Egoroff), A., i, 801.
a-**Phenyl-*β*-amylcarbamide** (Manuelli and Comanducci), A., i, 888.
Phenylaniline, nitroso-, heat of combustion of (Matignon and Deligny), A., i, 127.
Phenyl anilinomethyl ketone, *p*-chloro-, and *p*-bromo- (Collet), A., i, 698.
Phenyl-*p*-anisidoacetic acid, and its amide and nitrile (Miller, Plöchl, and Scheitz), A., i, 128.
Phenylaticonic acid, and anhydride (Fittig and Brooke), A., i, 437.
  oxidation of (Fittig and Köhl), A., i, 418.
Phenyl-azimidobenzene and **-*ψ*-azimidobenzene,** conversion of, into ketochlorides and orthodiketones (Zincke and Petermann), A., i, 135.
Phenylazoacetoacetic acid and sodium and ethylic salts, phenylhydrazone and methylamide (Bülow), A., i, 355.
  nitro-, ethylic salt (Bülow), A., i, 356.
  p-nitro-, ethylic salt, sodium derivatives, and phenylhydrazone amide (Bülow), A., i, 271.
"**Phenylazochromotropic acid,**" oxidation of (Hantower and Täuber), A., i, 63.
Phenylazoglutaconic acid, and monethylic salt (Henrich), A., i, 794.
Phenylazonitroethane, conversion of, into acetophenylhydrazide (Bamberger), A., i, 355.
Phenylazonitropentane, conversion of, into valerophenylhydrazide (Bamberger), A., i, 355.
Phenylazonitropropane, conversion of, into propionophenylhydrazide (Bamberger), A., i, 355.
Phenylazo-. See also Benzeneazo-.
o-**Phenylbenzaldehyde,** and its hydrazone (Rousset), A., i, 292.
  and oxime and phenylhydrazone (Fanto), A., i, 367.
2′-Phenylbenzimidazole, and hydrochloride (Japp and Meldrum), A., T., 1043; P., **1899**, 169.
  o-amino- and acetyl derivative (von Niementowski), A., i, 645.
  2-amino- and *p*-2-*di*amino-, and acetyl derivatives (Kym), A., i, 943.
  3-amino-, *m*-amino-, 3-nitro-, and *m*-nitro- (Pinnow and Wiskott), A., i, 501.
  and its *o*-, *m*-, and *p*-nitro-derivatives (Walther and Pulawski), A., i, 640, 641.
2′-Phenylbenzimidazoleazodimethylaniline (Pinnow and Wiskott), A., i, 501.
Phenylbenzoin and its hydrazone (Biltz), A., i, 439.
Phenylbenzoin-*m*-nitrobenzylidenazine (Biltz), A., i, 439.
2′-Phenylbenzoxazole, 3-amino-, and its *p*-amino-derivative and diacetyl derivative of latter (Kym), A., i, 647, 648.
Phenyl benzoyl nitrogen chloride (*benzoylphenylchloramine*), and *p*-chloro- and 2 : 4-*di*chloro- (Chattaway and Orton), T., 1053; P., **1899**, 153.
2′-Phenyl-1′-benzylbenzimidazole, 3-nitro- (Pinnow and Wiskott), A., i, 500.
γ-**Phenyl-*β*-benzylbutyrolactoneacetic acid,** *β*-bromo- (Stobbe, Russwurm, and Schultz), A., i, 903.
Phenylbenzylcarbamylthiocarbimide (Dixon), T., 407; P., **1899**, 64.
Phenylbenzylcarbamyl-*o*-tolylguanidine (Dixon), T., 408; P., **1899**, 64.
a-**Phenylbenzyl*iso*crotonic acid** (Thiele and Meisenheimer), A., i, 614.
3 : 1-Phenylbenzyl-*a*- and **-*β*-crotonolactones** (Thiele and Mayr), A., i, 611.
γ-**Phenyl-*β*-benzylcrotonolactoneacetic acid** and salts (Stobbe, Russwurm, and Schultz), A., i, 903.
a-**Phenylbenzyl-*e*-diphenylthiobiuret,** and its piperidine derivative (Dixon), T., 398; P., **1899**, 63.
Phenylbenzylethylallylammonium iodide, preparation of (Wedekind), A., i, 352.
e-**Phenylbenzyl-*a*-ethylthiobiuret** (Dixon), T., 408; P., **1899**, 64.
Phenylbenzylethylthiourea (Dixon), T., 399.
Phenylbenzylglutaconic acid, diethylic salt, and monoethylic salt (Ruhemann), T., 249; P., **1899**, 6.
Phenylbenzylglycine, preparation of (Bischoff), A., i, 125.

o-**Phenylbenzylic alcohol** (Fanto), A., i, 367.

3 : 1-Phenylbenzylidene-butyrolactone and **-crotonolactone** (Thiele), A., i, 609, 610.

Phenylbenzylideneglyoxalidone (Ruhemann and Cunnington), T., 959; P., **1899**, 185.

γ-Phenyl-β-benzylidene-α-ketobutyric acid, and **-α-ketobutyrolactone** (Erlenmeyer), A., i, 602.

Phenylbenzylidenemethylcrotonolactone (Thiele), A., i, 610.

1-Phenyl-4-benzylidene-5-pyrazolone (Michaelis and Röhmer), A., i, 234.

Phenylbenzylidenepyridazone (Thiele), A., i, 609.

γ-Phenyl-γ-benzylidenepyrotartaric acid, and salts (Stobbe and Russwurm), A., i, 902.

Phenyl benzyl ketone. See Deoxybenzoin.

α-Phenylbenzylmethylallylammonium iodides and bromides, *d*- and *l*-, rotatory powers of (Pope and Peachey), T., 1129; P., **1899**, 192.

α- and **β-Phenylbenzylmethylallylammonium** iodides (Wedekind), A., i, 353.

c-**Phenylbenzyl-*α*-methylthiobiuret** (Dixon), T., 408; P., **1899**, 64.

n-**Phenyl-*v*-benzylmethylthiourea**, *v*-**Phenylbenzyl-*n*-methylthiourea** and *v*-**Phenyl-*n*-benzyl-*v*-methylthiourea** (Dixon), T., 373, 374; P., **1899**, 54.

Phenylbenzylpropylenetricarboxylic acid, ethylic salt, action of ammonia on (Ruhemann), T., 249; P., **1899**, 6.

Phenylbenzylpyridazone (Thiele and Rössner), A., i, 613.

α-**Phenylbenzyl-β-thioallophanic acid**, benzylic salt of (Dixon), T., 409; P., **1899**, 65.

c-**Phenylbenzylthiobiuret** (Dixon), T., 408; P., **1899**, 64.

Phenylbromobenzyl-α-crotonolactone (Thiele and Mayr), A., i, 611.

Phenylbromobenzylidenecrotonolactone (Thiele and Mayr), A., i, 610.

Phenylbromocinnamenylacrylic acid (Thiele and Rössner), A., i, 613.

Phenyl*di*bromopropiono-diethylamide and **-piperidide** (Hermann and Vorländer), A., i, 813.

Phenyl*tri*bromomethylcarbinol, and its acetate (Siegfried), A., i, 747.

Phenyl bromomethyl ketone, *p*-bromo-, and *p*-chloro-, and *di*bromomethyl ketone, *p*-bromo- and *p*-chloro- (Collet), A., i, 699.

Phenyl*di*bromopyridazone (Bistrzycki and Simonis), A., i, 392.

α-Phenylbutane-αγδ-tricarboxylic acid (?), its methylic salt and anhydride (Thiele and Meisenheimer), A., i, 604.

β-Phenylbutane-αγδ-tricarboxylic acid, δ-cyano-, ethylic salt, and its hydrolysis (Thorpe and Udall), T., 906; P., **1899**, 184.

cis- and *trans*-**β-Phenylbutane-αγδ-tricarboxylic acids**, and their anhydro-acid (Thorpe and Udall), T., 904; P., **1899**, 184.

γ-Phenylbutyric acid, behaviour of the chloride of, towards aluminium chloride (Kipping and Hill), T., 146; P., **1899**, 4.

β-Phenylbutyrolactoneacetic acid, β-bromo- (Stobbe and Heun), A., i, 902.

1-Phenyl-4 : 5-campho-3-pyrazolone and **1-Phenyl-3 : 4-campho-5-pyrazolone** (Wahl), A., i, 778.

Phenylcamphorformeneamine and **Phenylcamphoformeneaminecarboxylic acid**, aniline salt, and anilide (J. B. and A. Tingle), A., i, 444.

Phenylcarbamazide, *p*-bromo- (Curtius and Burkhardt), A., i, 137.

Phenylcarbamic acid, *p*-nitrobenzylic salt, from the action of heat on the aniline derivative of *p*-nitrobenzylic nitrocarbamate (Thiele and Dent), A., i, 15.
  m-bromo- and *p*-bromo-, methylic and ethylic salts (Curtius and Portner), A., i, 136.
  imino-, ethylic salt, and its platinochloride (Stieglitz and McKee), A., i, 594.
  nitro-, ethylic salts, preparation of (Vittenet), A., i, 756.
  *di*thio-, benzylic salt (Fromm and Bloch), A., i, 887.

Phenylcarbamide, oxidation of (Oechsner de Coninck), A., i, 421.
  m-nitro-, and nitroso- (Walther and Wlodkowski), A., i, 591.

Phenylcarbaminazide (Curtius and Burkhardt), A., i, 137.

Phenylcarbazinic acid, potassium salt (Busch and Stern), A., i, 956.

Phenylcarbimide (*carbanil*), *p*-*di*bromo- (Curtius and Portner), A., i, 136.

Phenylcarbimides, nitro-, preparation of (Vittenet), A., i, 756.

Phenylcarboxyglutaconic acid. See Phenylpropylenetricarboxylic acid.

β-Phenylcarboxyglutaranilide, ethylic salt (Herrmann and Vorländer), A., i, 814.

Phenylcarboxyglutaric acid, and amide and diethylamino-derivative (Herrmann and Vorländer), A., i, 812, 813.

Phenylchloracetic acid, optical isomerism of (Walden), A., ii, 393.

Phenyl-3-chlorophenylthiosemicarbazide and **Phenyl-4-chlorophenylthiosemicarbazide** (Marckwald), A., i, 504.

Phenyl-*di*- and -*tetra*-chlorostibine (Hasenbäumer), A., i, 209.

Phenylcinnamenylacrylic acid, preparation of (Thiele and Schleussner), A., i, 612.

Phenylcitraconic acid and **anhydride** (Fittig and Brooke), A., i, 437.

Phenyl-*m*- and -*p*-cresylacetamides (Cramer), A., i, 153, 154.

Phenyl-*p*-cresylaminoacetamide and acetyl derivative (Cramer), A., i, 153, 154.

Phenyl-*m*- and -*p*-cresylbromacetolactones (Cramer), A., i, 153, 154.

Phenyl-*p*-cresylethoxyacetic acid and amide (Cramer), A., i, 154.

Phenyl-*m*- and -*p*-cresylethoxyacetolactones (Cramer), A., i, 154.

Phenyl-*p*-cresylglycine (Cramer), A., i, 154.

Phenylcrotonic acid (*α-methylcinnamic acid*), salts, and stereoisomeride (Daïn), A., i, 435.

Phenyl*iso*crotonic acid, condensation of, with benzaldehyde (Thiele), A., i, 216.

Phenylcyanamide, formation of (Rizzo), A., i, 53.

Phenyldiazolonethiol, methylic ether of (Busch and Stern), A., i, 957.

Phenyldihydro*iso*lauronolic acid, salts, chloride (Blanc), A., i, 926.

α-**Phenyldihydro-β-naphthoic acid** (Thiele), A., i, 609.

3′-Phenyldihydroquinazoline, preparation of (Kulisch), A., i, 944.

Phenyl*di*hydro-resorcinol and **-resorcylonitrile** and **ethylic phenyldihydroresorcylate,** electrical conductivity of (von Schilling and Vorländer), A., i, 879.

Phenyl-4 : 7-diketohexanecarboxylic acid (*phenacyllævulic acid*) (Kehrer and Igler), A., i, 569.

5-Phenyl-1 : 3-diketo*cyclo*hexane-4 : 6-dicarboxylic acid, ethylic salt (Knoevenagel and Faber), A., i, 146.

3-Phenyl-1 : 5-diketopheno*cyclo*heptane-2 : 4-dicarboxylic acid, diethylic salt (Dieckmann), A., i, 914.

3-Phenyl-1 : 5-diketopiperidine-2-carboxylic acid, ethylic salt (Hermann and Vorländer), A., i, 813.

1-Phenyldiketotetrahydro-α-triazine (Frerichs and Beckurts), A., i, 809.

μ-**Phenyl-2 : 7-dimethylacridine,** and its *di*amino-derivative (Meyer and Gross), A., i, 946.

Phenyldimethylcoumalin, action of alcoholic potash on (Bossi), A., i, 521.

Phenyldimethylethylmethane (Konowaloff and Egoroff), A., i, 801.

1-Phenyl-3 : 3-dimethylketopyrrolidone, and monoxime and phenylhydrazone (Conrad and Hock), A., i, 633.
  from action of aniline on methylic γ-cyanodimethylacetoacetate (Conrad and Gast), A., i, 258.

Phenyldimethyl*cyclo*methylenetriazan (Voswinckel), A., i, 958.

Phenyldimethylosotriazole, *p*-bromo-, and bromonitro- (Ponzio), A., i, 718.

2-Phenyl-3 : 4-dimethyl-4-*iso*oxazoleacetic acid (Bossi), A. i, 552.

1-Phenyl-3 : 4-dimethylpyrazole, 5-chloro- (Michaelis and Röhmer), A., i, 233.

1-Phenyl-4 : 4(or **3 : 4**)**-dimethylpyrazolone,** chloro-, two isomeric forms of (Michaelis and Röhmer), A., i, 234.

2-Phenyl-3 : 6-dimethylpyridine (Scholtz), A., i, 717.

2-Phenyl-3 : 4-dimethyl-6-pyridone (Bossi), A., i, 522.

e-**Phenyl-*ae*-dimethylthiobiuret** (Dixon), T., 402 ; P., **1899**, 64.

Phenyldimethylthiodiazolinethiol (Busch and Stern), A., i, 956.

Phenyl-*n*- and -*iso*-dinaphthazonium chloride, salts, and 4-amino- and acetyl derivative (Kehrmann and Sutherst), A., i, 527, 528.

Phenylditolylmethane, *tetra*amino- (Meyer and Gross), A., i, 945.

Phenylditolylmethane-*o*-carboxylic acid (Guyot), A., i, 293.

Phenyldixylylmethane, *p*-nitro-*di*-amino-, and its diacetyl derivative (Friedländer and Brand), A., i, 351.

cyclo-**Phenylenebenzylidene oxide,** reduction of (Cohn), A., i, 295.

5 : 5-Phenylenebis-3-imino-1-phenyltriazoline (Cuneo), A., i, 549.

p-**Phenylene-bisnitroethanol-** and **-bisnitroethylene** (Thiele), A., i, 585.

o-**Phenylenediamine,** condensation of, with *m*-nitrobenzaldehyde (Pinnow and Wiskott), A., i, 501.

- *o*-**Phenylenediamine**, nitro-, condensation with benzaldehyde (Pinnow and Wiskott), A., i, 500.
- *p*-**Phenylenediamine**, heats of combustion and formation of (Berthelot and André), A., ii, 400.
- **Phenylenediamines**, *o*-, *m*-, and *p*-, condensation of, with benzoin (Japp and Meldrum), T., 1043 ; P., **1899**, 169.
  - hydrochlorides of, action of chromic acid on (Oechsner de Coninck and Combe), A., i, 244.
  - methylation of (Pinnow), A., i, 588.
- **Phenylenedibenzimidazole**, and salts (Walther and Pulawski), A., i, 640.
- **Phenylenedimethylcarbamide**, and *di*nitro-derivative (Pinnow and Sämann), A., i, 943, 944.
- **Phenylenedimethylcarbamidecarboxylic acid.** See 1′ : 3′-Dimethylbenzimidazolone-2-carboxylic acid.
- *o*-**Phenylenedioxydiacetic acid** (Moureu), A., i, 700.
- **1 : 4-Phenylenediphosphoric acid** (Genvresse), A., i, 342.
- **Phenylenefurazan** (Zincke and Schwartz), A., i, 751.
  - *o*-nitro- (Drost), A., i, 752.
- **Phenylenemethylcarbamide** (Pinnow and Sämann), A., i, 944.
- *m*- and *p*-**Phenylene*di*thiocarbimides**, compounds of, with anisoil and phenetoil (Bamberger), A., i, 697.
- **Phenylethane**. See Ethylbenzene.
- **Phenylethenyl-β-*o*-aminophenylbenzimidazole** (von Niementowski), A., i, 646.
- *i*-**Phenylethoxyacetic acid**, and salts (McKenzie), T., 755 ; P., **1899**, 150.
- *l*-**Phenylethoxyacetic acid**, and ethylic and metallic salts, and their specific rotations (McKenzie), T., 757 ; P., **1899**, 150.
- **Phenylethylcarbamylthiocarbimide** (Dixon), T., 405 ; P., **1899**, 64.
- *n*-**Phenylethylcarbamyl-thiourantoin** (Dixon), T., 406 ; P., **1899**, 64.
- **Phenylethyldinaphtha*apo*saffranine** (Fischer and Hepp), A., i, 79.
- **Phenylethylene.** See Styrene.
- **Phenylethyleneglycol**, methylene, ethylidene, and amylidene acetals (Verley), A., i, 376.
- **Phenylethylglycocinylcarbamide** (Frerichs and Beckurts), A., i, 806.
- **Phenylethylideneoxy*cyclo*triazan**, and its bromo- and chloro-derivatives (Voswinckel), A., i, 958.
- **3-Phenyl-1-ethylphthalazone** (Gottlieb), A., i, 512.
- **β-Phenyl-α-ethylpropionic acid,** *o*-cyano- (Landsberger), A., i, 211.
- *o*-**Phenylethylsalicylic acid** (Heyl), A., i, 216.
- *α*-**Phenylethyl-β-thioallophanic acid,** benzylic salt (Dixon), T., 406 ; P., **1899**, 64.
- *c*-**Phenylethylthiobiuret** (Dixon), T., 406 ; P., **1899**, 64.
- **Phenylethylthiosemicarbazide,** 4-bromo-, 4-chloro-, and 2-nitro-; also the iminodiazolone and thiodiazolone from the first (Marckwald), A., i, 504, 505.
- **Phenylethyltriazan,** and hydrochloride and benzylidene compound (Voswinckel), A., i, 959.
- **Phenylfurazan,** *o*-*di*chloro- (Werner and Bloch), A., i, 754.
- **Phenylfurfurylamine,** and salts and acetyl derivative (Marquis), A., i, 798.
- **Phenylglucosazone,** *p*-nitro- (Hyde), A., i, 689.
- **Phenylglutaconic acid,** ethylic salt (Ruhemann), T., 248 ; P., **1899**, 6.
- **β-Phenylglutaranilic acid** (Herrmann and Vorländer), A., i, 813.
- **β-Phenylglutaric acid,** methylic salt, imide and anhydride (Herrmann and Vorländer), A., i, 812.
  - ethylic salt, condensation of, with ethylic oxalate (Dieckmann), A., i, 676.
    - condensation of, with ethylic phthalate (Dieckmann), A., i, 914.
- **β-Phenylglutaric acid,** α-cyano-, ethylic salt, condensation of, with ethylic bromacetate (Thorpe and Udall), T., 905 ; P., **1899**, 184.
  - *m*-nitro- (Knoevenagel and Schürenberg), A., i, 214.
  - *p*-nitro- (Knoevenagel and Hoffmann), A., i, 215.
- **Phenylglutaro-piperidide** and **-piperidocarboxylic acid** (Herrmann and Vorländer), A., i, 813.
- **Phenylglycinyl-carbamide,** -*p*-**ethoxyphenylcarbamide, -ethylurethane, -methylcarbamide,** and **-phenylcarbamide** (Frerichs and Beckurts), A., i, 806.
- **Phenylglycollic acid.** See Mandelic acid.
- **Phenylglyoxylic acid,** *p*-bromo-, and *p*-chloro- (Collet), A., i, 699.
- **Phenylguaiacol,** *o*-nitro-, and *p*-nitro- (Bouveault), A., i, 264.
- **Phenylhexahydropyridazine,** salts of (Gabriel and Colman), A., i, 391.

Phenylhydrazinaceto-carbamide, -methylcarbamide, -phenylcarbamide, and **-*p*-ethoxylphenylcarbamide,** and their benzylidene derivatives (Frerichs and Beckurts), A., i, 808.
Phenylhydrazine, action of chromic acid and potassium dichromate on (Oechsner de Coninck), A., i, 243.
  action of methylic *di*chloroxalate on (Anschütz and Stiepel), A., i, 573.
  behaviour of, towards mercuric acetate (Bamberger), A., i, 688.
  combination of, with alkylic iodides (Genvresse and Bourcet), A., i, 501.
  compound of bromanilic acid with (Descomps), A., i, 690.
  compounds of, with bismuth chloride, bismuth nitrate, zinc sulphite, and manganese sulphite (Pastureau), A., i, 205.
  compounds of, with calcium chloride, calcium bromide, and strontium iodide (Moitessier), A., i, 205.
  compound of, with chloranilic acid (Descomps), A., i, 205; (Imbert and Descomps), A., i, 690.
  cupro-chloride, -bromide, and -iodide (Moitessier), A., i, 807.
  propylic iodide, and butylic iodide (Le Canu), A., i, 808.
  sodium bisulphite compound of (Pastureau), A., i, 807.
  compounds of, with metallic thiosulphates, dithionates, and hypophosphites (Moitessier), A., i, 688.
  tricarballylate and citrate (Manuelli and de Righi), A., i, 885.
  compounds with salts of zinc, cadmium, and nickel (Moitessier), A., i, 752.
  detection of (Simon), A., ii, 134.
Phenylhydrazine, *p*-nitro-, as a reagent for the detection and isolation of ketones and aldehydes (Bamberger), A., i, 666.
  picrate, β-formyl, β-acetyl, β-benzoyl, and triacetyl derivatives (Hyde), A., i, 688.
Phenylhydrazine-αβ dicarboxylic acid, ethylic salt (Rupe and Labhardt), A., i, 356.
as-**Phenylhydrazinoacetic acid,** formation of (Frerichs and Beckurts), A., i, 808.
Phenylhydrazinoethylidenephenylhydrazone (Freer), A., i, 358.
Phenylhydrazinoformic acid, ethylic salt, *o*-nitrobenzylidene derivative (Rupe and Labhardt), A., i, 356.
Phenylhydrazinoformylphenylketodihydrotriazole, and its silver derivative (Frerichs and Beckurts), A., i, 809.
Phenylhydrazinoglyoxylyl-phenylcarbamide, and **-*p*-ethoxyphenylcarbamide** (Frerichs and Beckurts), A., i, 809.
Phenylhydrazone, $C_{28}H_{24}N_4O$, obtained from phenyl phthalidemethyl ketone (Hamburger), A., i, 144.
Phenylhydroxyamylthiocarbamide, and the action of hydrochloric acid on it (Jänecke), A., i, 477.
Phenylhydroxylamine, discovery of (Wohl), A., i, 49.
  formation of (Haber), A., i, 269; (Bamberger and Tschirner), A., i, 348.
  direct production of, from aniline (Bamberger and Tschirner), A., i, 687.
Phenylhydroxylamine, *p*-chloro- and *exo*-chloro- (Bamberger, Büsdorf, and Szolayski), A., i, 341.
  nitroso-, compound of, with zinc ethyl (Hantzsch), A., i, 692.
Phenyl-β-hydroxynaphthyl-benzyloxyacetolactone, -bromacetolactone, -ethoxyacetolactone, and **-methoxyacetolactone** (Simonis), A., i, 154.
Phenylhydroxypivalic acid, and phenylhydrazone (Stritar), A., i, 890.
  oxidation of (Daïn), A., i, 436.
Phenylic allylic ether (Solonina), A., i, 681.
  allylic, *iso*amylic, *iso*butylic, ethylic, methylic, and *n*- and *iso*-propylic carbonates, preparation of (Cazeneuve and Morel), A., i, 29.
  o-aminobenzylic ether, and *o*-amino- (Thiele and Dimroth), A., i, 426.
  benzylic, butylic, caprylic, heptylic, and octylic carbonates (Morel), A., i, 875.
  carbamate, preparation of, and *p*-chloro- (Morel), A., i, 876.
  chlorocarbonate (Barral and Morel), A., i, 802.
    and *tri*chloro-, *tri*bromo-, and *penta*chloro- (Barral and Morel), A., i, 747.
  p-chlorophenylic carbonate (Morel), A., i, 876.
  dipropylcarbamate (Morel), A., i, 877.
  ethylic carbonate, and *p*-chloro- (Morel), A., i, 876.
  ethylic chlorophosphate, phosphamide, and phosphanilide (Morel), A., i, 747.
    phosphates (Morel), A., i, 264, 492, 747.
    propylic phosphate (Morel), A., i, 492.
  guaiacylic carbonate, and *p*-chloro- (Morel), A., i, 876.

Phenylic guaiacylic ethylenic ether (Boscogrande), A., i, 427.
  methylic, ethylic, propylic, *iso*propylic, *iso*butylic, *iso*amylic, and allylic carbonates, refractive indices of (Morel), A., i, 876.
  o-nitrobenzylic ether (Thiele and Dimroth), A., i, 426.
  phenyl-carbamate and -carbazinate (Morel), A., i, 876, 877.
  *tri*sulphide (Troeger and Hornung), A., i, 906.
  o-titanate (Kling), A., i, 429.
  p-tolylic carbonate (Morel), A., i, 876.
Phenyliminophenylcarbamic acid, ethylic salt (Dains), A., i, 593.
Phenyliminotriazoline, bromo- (Bamberger and von Goldberger), A., i, 548.
1′-Phenyl*iso*indazolone, and benzoyl derivative (König and Reissert), A., i, 457.
1′-Phenylindole, *p*-chloro-, and *p*-bromo- (Collet), A., i, 699.
2′-Phenylindole, 3-nitro-1′-nitroso- (Stoermer and Dragendorff), A., i, 46.
  nitroso-, formula of (Angeli and Spica), A., i, 938.
  *iso*nitroso- and acetyl and benzoyl derivatives (Spica and Angelico), A., i, 938.
Phenyl iodomethyl ketone (Collet), A., i, 434.
Phenylitaconic acid, and **anhydride** (Fittig and Brooke), A., i, 437.
  oxidation of (Fittig and Köhl), A., i, 418.
β-Phenyllactic acid, α-amino-, and copper salt (Erlenmeyer), A., i, 759.
  d- and *l*-, α-bromo- and cinchonine salts, specific rotations of (Erlenmeyer and Moebes), A., i, 896.
Phenyllactosazone, *p*-nitro- (Hyde), A., i, 689.
α-Phenyl-α′-lutidone. See 2-Phenyl-3 : 4-dimethyl-6-pyridone.
Phenylmalonic acid, *tri*nitro-, ethylic salt and metallic salts (Jackson and Phinney), A., i, 602.
Phenylmaltosazone, *p*-nitro- (Hyde), A., i, 689.
Phenylmesaconic acid, and salts (Fittig and Brooke), A., i, 437.
i-**Phenylmethoxyacetic acid**, preparation of (McKenzie), T., 760.
l-**Phenylmethoxyacetic acid**, and salts, preparation and specific rotation of, conductivity and affinity constant of (McKenzie), T., 761 ; P., **1899**, 150.
Phenyl-δ-methoxybutylthiocarbamide (Schlinck), A., i, 539.
4-Phenyl-6-methyl-5-aceto-2-pyrone (Ruhemann), T., 415 ; P., **1899**, 15.
γ-**Phenyl-γ-methylaconic acid** (Stobbe), A., i, 902.
Phenylmethylacridinium hydroxide, conversion of, into phenylmethylacridol (Hantzsch), A., i, 400.
Phenylmethylalanine (Bischoff and Taraschtschansky), A., i, 202.
Phenyl-3-methylanthranol (Guyot), A., i, 294.
Phenylmethylarabinosazone (Morrell and Crofts), T., 791 ; P., **1899**, 99.
1 : 3-Phenylmethyl-4-benzeneazo-5-pyrazolone (Bülow), A., i, 356.
1-Phenyl-2-methyl-3 : 4-campho-5-pyrazolone and **1-Phenyl-2-methyl-4 : 5-campho-3-pyrazolone** (Wahl), A., i, 778.
Phenylmethylcarbamic chloride, action of, on sodium acetanilide (Dixon), T., 384.
α-**Phenylmethylcarbamyl-β-phenylthiosemicarbazide** (Dixon), T., 403 ; P., **1899**, 64.
Phenylmethylcarbamylthiocarbimide (Dixon), T., 401 ; P., **1899**, 64.
n-**Phenylmethylcarbamylthiourantoin** (Dixon), T., 403 ; P., **1899**, 64.
Phenylmethylcarbinol, and its benzenesulphonate, velocity of reaction between (Sagrebin), A., ii, 735.
4′-Phenyl-3-methyl-3′ : 4′-dihydroquinazoline, and its benzoyl and 2′-bromo-derivatives (Hanschke), A., i, 775.
1-Phenyl-4-methyl-2 : 3-dihydro-1 : 2 : 5-triazole (*phenyl*-3-*methyl*-1 : 2-*oxypyrro*-1 : 4-*diazole*) 2 : 3-oxide, and nitro-derivative (Ponzio), A., i, 718.
Phenylmethyldihydroresorcylonitrile, electric conductivity of (von Schilling and Vorländer), A., i, 879.
3-Phenyl-1′-methyl-2′ : 4′-diketotetrahydroquinazoline (McCoy), A., i, 360.
γ-**Phenyl-γ-methylenepyrotartaric acid** (Stobbe), A., i, 900 ; (Stobbe and Heun), A., i, 902.
1-Phenyl-3-methyl-4-ethyl-2 : 3-dihydro-1 : 2 : 5-triazole, 2 : 3-oxide (*phenyl*-2-*methyl*-3-*ethyl*-1 : 2-*oxypyrro*-1 : 4-*diazole*) and salts and nitro-derivative (Ponzio), A., i, 827.
1-Phenyl-4-methyl-3-ethyl-2 : 3-dihydro-1 : 2 : 5-triazole, 2 : 3-oxide, and hydrochloride and nitro-derivative (Ponzio), A., i, 827.
β-**Phenyl-α-methylethylenelactic acid,** and its salts, preparation of (Daïn), A., i, 436.
Phenylmethylethylideneoxy*cyclo*triazan (Voswinckel), A., i, 958.

1-Phenyl-3-methyl-4-ethylosotriazole, amino-, bromo-, chloro-, chloronitro-, and nitro- (Ponzio), A., i, 827.
μ-Phenyl-β-methyl-α-ethyloxazoline, from action of benzoic chloride on 3-bromo-2-aminopentane hydrobromide; also its picrate (Jänecke), A., i, 477.
Phenylmethylethyloxypyrrodiazole. See Phenylmethylethyldihydro-1 : 2 : 5-triazole oxide.
Phenylmethylethylthiodiazolinethiol (Busch and Stern), A., i, 956.
Phenylmethylglucosazone (Morrell and Crofts), T., 788 ; P., **1899**, 99.
Phenylmethylglycinyl-*iso*butylurethane, -ethylurethane, and **-carbamide** (Frerichs and Beckurts), A., i, 806, 807.
3 : 1-Phenylmethyl*cyclo*hexane, 5-amino- (Knoevenagel and Goldsmith), A., i, 291.
3 : 1-Phenylmethyl*cyclo*hexanol-5, and acetyl derivative (Knoevenagel and Goldsmith), A., i, 290.
3 : 1-Phenylmethyl*cyclo*hexanone-5, and oxime (Knoevenagel and Goldsmith), A., i, 291.
  hydroxylamino-oxime (Harries and Matfus), A., i, 583.
3 : 1-Phenylmethyl*cyclo*hexene (Knoevenagel and Goldsmith), A., i, 291.
3-Phenyl-1-methyl-5-*cyclo*hexenone, dimeric form of, and salts (Knoevenagel and Reinecke), A., i, 341.
  α- and β-oximes of, and their salts (Knoevenagel and Goldsmith), A., i, 25.
  p-chloro-, and oximes (Knoevenagel and Weiss), A., i, 215.
  m-nitro-, and oxime and phenylhydrazone (Knoevenagel and Schürenberg), A., i, 214.
  p-nitro-, and its oxime and phenylhydrazone (Knoevenagel and Hoffmann), A., i, 215.
3-Phenyl-1-methyl-5-*cyclo*hexenonecarboxylic acid, *p*-nitro-, ethylic salt (Knoevenagel and Hoffmann), A., i, 214.
3-Phenyl-1-methyl-5-*cyclo*hexenone-2 : 4-dicarboxylic acid, *p*-chloro-, ethylic salt (Knoevenagel and Weiss), A., i, 215.
Phenylmethylhydrazine, action of chromic acid and potassium dichromate on (Oechsner de Coninck), A., i, 243.
Phenylmethylhydrazinopyruvic acid, preparation of (Hartley and Dobbie), T., 645.
Phenylmethyl-3 : 4-iminazolone-1 : 2-naphthaquinone (Kehrmann and Zimmerli), A., i, 80.
Phenylmethyliminothiazolinethiocarbamide, and its benzyl derivative (Fromm and Philippe), A., i, 485.
γ-Phenyl-γ-methylitaconic acid, and anhydride (Stobbe), A., i, 901.
γ-Phenyl-γ methyl*iso*itaconic acid, and its salts and anhydride (Stobbe and Heun), A., i, 902.
4′-Phenyl-3-methyl-2′-ketodihydroquinazoline, and salts and benzoyl derivative (Hanschke), A., i, 775.
Phenyl methyl ketone, *p*-chloro-, and its oxime and phenylhydrazone (Collet), A., i, 699.
4′-Phenyl-3-methyl-2′-ketotetrahydroquinazoline, and acetyl derivative (Hanschke), A., i, 776.
Phenyl methyl ketoxime, *p*-bromo- (Collet), A., i, 699.
Phenylmethylmethenylaminophenylimidine, and salts (Wheeler and Johnson), A., i, 269.
Phenylmethyl*cyclo*methylenetriazan (Voswinckel), A., i, 959.
Phenylmethyl-methyliminothiazolinethiocarbamide, and its hydrochloride (Fromm and Philippe), A., i, 485.
1 : 3-Phenylmethyl-4-*p*-nitrobenzeneazo-5-pyrazolone, *p*-nitro- (Bülow), A., i, 272.
Phenylmethylosotriazole, amino-, bromo-, *di*bromo-, chloro-, *di*chloro-, chloronitro-, iodo-, iodonitro-, and nitro- (Ponzio), A., i, 719.
Phenyl-3-methyloxanthranol (Guyot), A., i, 294.
μ-Phenyl-β-methyloxazoline, and its *o*-nitro- and *p*-nitro-derivatives (Uedinck), A., i, 497, 498.
1 : 4-Phenylmethyl-3-oxydiazolone (Rupe and Labhardt), A., i, 356.
Phenylmethyloxy*cyclo*methylenetriazan, and its bromo- and chloro-derivatives (Voswinckel), A., i, 958.
Phenyl-3-methyl-1 : 2-oxypyrro-1 : 4-diazole. See 1-Phenyl-4-methyl-2 : 3-dihydro-1 : 2 : 5-triazole 2 : 3-oxide.
γ-Phenyl-γ-methylparaconic acid, *cis*- and *trans*-β-bromo-, and *trans*-ethylic salt (Stobbe and Heun) A., i, 902.
β-Phenyl-α-methylpropionic acid, *o*-cyano-, and ethylic salt (Landsberger), A., i, 211.
Phenylmethyl*iso*propyl-methylamine, and **-nitromethane** (Konowaloff and Egoroff), A., i, 801.
1-Phenyl-3-methylpyrazole, 5-chloro- (Michaelis and Röhmer), A., i, 233.

1-Phenyl-3-methylpyrazole, 5-chloro-, 4 : 5-*di*chloro-, *p*-4 : 5-*tri*chloro-, 5-chloro-4-bromo-, 5-chloro-4-iodo-, 5-iodo-, and their alkyl haloid and perhaloid compounds (Michaelis and Pasternack), A., i, 942.

1-Phenyl-4-methylpyrazole, 3 : 5-*di*chloro- (Michaelis and Röhmer), A., i, 234.

1-Phenyl-3 methylpyrazole-4-phosphinic acid, 5-chloro- (Michaelis and Pasternack), A., i, 942.

4-Phenyl-6-methylpyridone and its platinochloride (Ruhemann), T., 413; P., **1899**, 55.

4-Phenyl-6-methylpyridone-5-carboxylic acid and ethylic salt (Ruhemann), T., 412 ; P., **1899**, 55.

4-Phenyl-6-methyl-2-pyrone (Ruhemann and Cunnington), T., 780 ; P., **1899**, 169.

4-Phenyl-5-methyl-2-pyrone-6-carboxylic acid, *p*-nitro-, ethylic salt (Ruhemann and Cunnington), T., 782 ; P., **1899**, 169.

4-Phenyl-6-methyl-2-pyrone-5-carboxylic acid, ethylic salt, hydrolysis of, and action of ammonia on (Ruhemann), T., 251 ; P., **1899**, 6.
  action of alcoholic ammonia on (Ruhemann), T., 412 ; P., **1899**, 55.
  action of ethylamine on (Ruhemann and Cunnington), T., 780 ; P., **1899**, 169.

γ-Phenyl-γ-methylpyrotartaric acid, and its salts (Stobbe), A., i, 901.

1-Phenyl-2-methylpyrrolidine, and its *m*-nitro-derivative (Scholtz and Friemehlt), A., i, 541.

4′-Phenyl-3-methylquinazoline, 2′-chloro- (Hanschke), A., i, 775.

2′-Phenyl-3′-methylquinoline, 4-amino-. See Flavaniline.

o-**Phenylmethylsalicylic acid** (Heyl), A., i, 216.

a-**Phenylmethylsemicarbazide** (Bamberger and von Goldberger), A., i, 548.

Phenylmethyltetramethylenedisulphone (Autenrieth and Wolff), A., i, 580.

μ-Phenyl-β-methylthiazoline, from action of nitrous acid on propylene-ψ-thiocarbamide (Gabriel and Leupold), A., i, 104.

a-**Phenylmethyl-β-thioallophanic acid,** benzylic salt (Dixon), T., 404 ; P., **1899**, 64.

c-**Phenylmethylthiobiuret** (Dixon), T., 402 ; P., **1899**, 64.

Phenylmethylthiocarbamide, formation of (Wallach), A., i, 659.

Phenylmethylthiodiazoline *di*sulphide action of ammonia and aniline on (Busch), A., i, 953.

3′-Phenyl-1′-methylthio-4′-ketodihydroquinazoline, and 3′-Phenyl-2′-methylthio-4′-ketodihydroquinazoline (McCoy), A., i, 360.

Phenylmethylthiosemicarbazide, the imidodiazolone and thiodiazolone from (Marckwald), A., i, 504.
  3-bromo-, 4-bromo-, 2 : 4 : 5-*tri*bromo-, 2-chloro-, 3-chloro-, 2-nitro-, 3-nitro-, and 4-nitro- (Marckwald), A., i, 504, 505.

4′-Phenyl-3-methyl-2′-thiotetrahydroquinazoline (Hanschke), A., i, 776.

1-Phenyl 2-methyltriazoline, 3-imino-, and salts (Bamberger and von Goldberger), A., i, 548.

1-Phenyl-5-methyltriazoline, 3-imino- (Cuneo), A., i, 548.

Phenylnaphthaphenazonium chlorides, 4′-*p*-*di*amino-, 2 : 4-*p*-*tri*amino-, 2-nitro-4′-*p*-*di*amino-, and *p*-nitro-4′-amino-, and their acetyl derivative (Kehrmann, Rademacher, and Feder), A., i, 236.
  chloride, 2 : 4-*di*amino-. See Rosinduline chloride, 2-amino-.

Phenyl*iso*naphthaphenazonium salts, 2-amino-, 2 : 4-*di*amino-, and 2-nitro- (Kehrmann and Levy), A., i, 238, 239.
  chloride, 2″-amino-, acetyl derivative and salts (Kehrmann and Ravinson), A., i, 525.
  2 : 3′-*di*amino-, 3 : 2′-*di*amino-, and 2-amino-3′-acetamino- (Kehrmann and Aebi), A., i, 526.

Phenylnaphthazonium and its salts (Schaposchnikoff), A., i, 431.

Phenyl-α- and -β-naphthyl*iso*dithiodiazolone (Busch and Best), A., i, 956.

Phenyl-α- and -β-naphthylthiosemicarbazides and their 4-bromo-derivatives (Marckwald), A., i, 504.

Phenylnitramine, compound of, with zinc ethyl (Hantzsch), A., i, 692.

Phenylnitroazoethane. See Acetaldehyde, nitro-, phenylhydrazone.

Phenylnitroazopentane. See Valeraldehyde, nitro-, phenylhydrazone.

Phenylnitroazopropane. See Propaldehyde, nitro-, phenylhydrazone.

Phenyl-3-nitrobenzimidazole, 2′-nitro- (Pinnow and Wiskott), A., i, 501.

Phenyl-1′-nitrobenzylbenzimidazole, 2′-nitro- (Pinnow and Wiskott), A., i, 501.

Phenyl-*p*-nitrobenzyldimethylammonium chloride (Wedekind), A., i, 352 ; (Wedekind and Gonswa), A., i, 806.

Phenylnitroethanol, *o*-nitro-, and its acetyl derivative (Thiele), A., i, 585.

Phenylnitromethane. See Toluene, nitro-.

Phenyl*iso*nitromethane. See Toluene, ω-*iso*nitro-.

1-Phenyl-4-nitropyrazole, from action of heat on the hydrazones of nitromalonic aldehyde (Hill and Torrey), A., i, 788.

Phenylorcylacetolactone, and its bromo- and *di*bromo-derivatives (Simonis), A., i, 155.

iso-**Phenylorcylacetolactone** (Simonis), A., i, 155.

Phenyloxamide, formation of (Dixon), T., 410.

a-**Phenyloxamyl**-*b*-**phenylthiocarbamide** (Dixon), T., 410; P., **1899**, 65.

Phenyloxanthranol, condensation of, with toluene, and with benzene (Guyot), A., i, 295.
  chloro- (Haller and Guyot), A., i, 221.

Phenyloximido-oxazolone, hydrate, methylic salt, and potassium salts of (Guinchard), A., i, 781.

Phenyl-*m*(*p*)-**oxytolimidazole,** β-*o*-amino- (von Niementowski), A., i, 645.

Phenyl pentadecyl ketone, boiling point of, in a vacuum (Krafft), A., ii, 465.

Phenylpentadecylthiocarbamide (Jeffreys), A., i, 731.

2-Phenyl*cyclo*pentane-4 : 5-dione-1 : 3-dicarboxylic acid, diethylic salt, and its phenazine derivative (Dieckmann), A., i, 676.

μ-**Phenylpentylene**-ψ-**thiocarbamide,** from action of hydrochloric acid on phenylhydroxyamylthiocarbamide; also its picrate (Jänecke), A., i, 477.

Phenylphenazonium, and its salts (Schaposchnikoff), A., i, 431.

Phenyl-*o*-**phenylene**-*p*-**aminobenzenylamidine,** and amino-, and **Phenyl**-*o*-**phenylene**-*p*-**nitrobenzenylamidine,** and *p*-nitro- (Muttelet), A., i, 354.

Phenylphosphoric acid (Genvresse), A., i, 342.

Phenylphthalidemethyl ketone, and action of bromine on; oxime (Hamburger), A., i, 143.

α-**Phenyl**-β-**piperidylcarbamide** (Manuelli and Comanducci), A., i, 888.

Phenylpropanetricarboxylamide (Ruhemann), T., 247; P., **1899**, 6.

Phenylpropanetricarboxylic acid, ethylic salt, action of ammonia on (Ruhemann), T., 247; P., **1899**, 6.

Phenylpropenylmalonic acid, and salts (Thiele and Meisenheimer) A., i, 603.

Phenylpropiolic acid hydrobromide, preparation of bromindone from (Lanser), A., i, 895.
  ureide of (Ruhemann and Cunnington), T., 958; P., **1899**, 185.
  ethylic salt, condensation of, with acetylacetone, and with benzoylacetone (Ruhemann), T., 415; P., **1899**, 15.
    condensation of, with acetylacetone, with benzoylacetone, and with ethylic oxaloacetate (Ruhemann and Cunnington), T., 780; P., **1899**, 169.
    action of diethylamine, hydroxylamine, carbamide, benzamidine, and bromine on (Ruhemann and Cunnington), T., 956; P., **1899**, 185.
    condensation of, with ethylic alkylacetoacetates (Ruhemann and Cunnington), T., 783; P., **1899**, 169.
    condensation of, with ethylic acetoacetate, and with ethylic benzoylacetate (Ruhemann), T., 251; P., **1899**, 6.

Phenylpropiolic acid, *p*-nitro-, ethylic salt, condensation of with ethylic acetoacetate and with ethylic benzoylacetate (Ruhemann and Cunnington), T., 782; P., **1899**, 169.

Phenylpropiolohydroxamic acid, and its barium, silver, and methylic salts (Ruhemann and Cunnington), T., 957; P., **1899**, 185.

Phenylpropionic acid, menthylic salt, optical activity and molecular volume of (Tschugáeff), A., ii, 3.

α-**Phenylpropionic acid** (*hydratropic acid*), *di*bromo-, action of sodium carbonate on (Semenoff), A., i, 867.

i-**Phenylpropoxyacetic acid,** and salts (McKenzie), T., 764.

i-**Phenyl*iso*propoxyacetic acid,** and zinc salt (McKenzie), T., 754; P., **1899**, 150.

l-**Phenyl*iso*propoxyacetic acid,** and sodium and potassium salts, specific rotations of (McKenzie), T., 765; P., **1899**, 150.

Phenylpropylenetricarboxylic acid, ethylic salt, action of ammonia on (Ruhemann), T., 248; P., **1899**, 6.

Phenylpropylethylene, formation of (Daïn), A., i, 436.

β-**Phenyl**-α-*iso***propylethylenelactic acid,** and salts (Daïn), A., i, 436.

Phenylpropylidenemalonic acid, and its barium salt (Thiele and Meisenheimer), A., i, 603.

Phenylpropylsulphone, formation of, and bromo-derivative (Troeger and Uhde), A., i, 607, 608.

Phenyl*iso*propylsulphone (Troeger and Uhde), A., i, 607.

1-Phenylpyrazole, 3 : 5-*di*chloro- (Michaelis and Röhmer), A., i, 234.

1-Phenyl-3 : 5-pyrazolidone. See 3-Hydroxy-1-phenyl-5-pyrazolone.

3-Phenylpyrazoline, 5-imino-, and its salts (Seidel), A., i, 139.

1-Phenyl-5-pyrazolone, 3-chloro-, 4-*iso*nitroso- (Michaelis and Röhmer), A., i, 234.
  m-nitro- (Rougy), A., i, 753.

1-Phenyl-5-pyrazolone-3-carboxylic acid (Leighton), A., i, 51.

3-Phenylpyridazine, amino-, 6-chloro-, 6-iodo-, and nitro-derivatives (Gabriel and Colman), A., i, 390.

Phenylpyridazinone, bromo- (Gabriel and Colman), A., i, 390.

3-Phenylpyridazone (Gabriel and Colman), A., i, 390.

Phenylpyrrolidone (Baillie and Tafel), A., i, 268.

4-Phenyl-2-pyrone-5 : 6-dicarboxylic acid, ethylic salt (Ruhemann and Cunnington), T., 783 ; P., **1899**, 169.

2′-Phenylquinoline-4-carboxylic acid (Garzarolli-Thurnlackh), A., i, 940.

Phenylresorcylacetolactone, and its *di*bromo-derivative (Simonis), A., i, 155.

iso-**Phenylresorcylacetolactone** (Simonis), A., i, 154.

Phenylrosinduline, amino-, and salts, and phenylsulphone derivative (Kehrmann and Locher), A., i, 82.

Phenyl*apo*saffranine (Schaposchnikoff), A., i, 432.

o-**Phenylsalicylic acid** (Heyl), A., i, 701.
  methylic and ethylic salts (Heyl), A., i, 216.

Phenylsarcosine, formation of (Miller, Plöchl, and Kollegorsky), A., i, 128.

Phenylsemicarbazide, hydrochloride, sodium and acetyl derivatives, and formation of (Curtius and Burkhardt), A., i, 137.
  p-nitro- (Hyde), A., i, 689.

Phenylsemicarbazideacetoacetic acid, ethylic salt (Curtius and Burkhardt), A., i, 137.

Phenylsemicarbazidecarboxylic acid, ethylic salt (Rupe and Labhardt), A., i, 356.

Phenylstibic acid, Phenylstibine oxide, and sulphide (Hasenbäumer), A., i, 209.

Phenylsulphonacetyl-amylurethane, -*iso***butylurethane, -carbamide, -ethylurethane,** and **-methylcarbamide** (Frerichs), A., i, 795, 796.

Phenylsulphonebutyric acid and its salts and chloride and bromo-derivative, ethylic salt (Troeger and Uhde), A., i, 606, 608.

Phenylsulphone*iso*butyric acid, and salts, and chloride (Troeger and Uhde), A., i, 607, 608.

Phenylsulphonesodioacetic acid, ethylic salt, substitution of alkyls for sodium in (Michael), A., i, 816.

Phenyltartronic acid, *tri*nitro-, ethylic salt, and nitrite, acetyl and benzoyl derivatives (Jackson and Phinney), A., i, 602.

1-Phenyl-*ac*-tetrahydronaphthalene-3-carboxylic acid, and 2-bromo-derivative (Thiele and Meisenheimer), A., i, 614.

1-Phenyltetrahydro-β-naphthenone (Goldschmiedt and Knöpfer), A., i, 141.

2-Phenyltetramethylene, -disulphide, -disulphone, and bromo-derivative of the latter (Autenrieth and Wolff), A., i, 580.

μ-**Phenylthiazoline**, from action of nitrous acid on ethylene-ψ-thiocarbamide, and its picrate and dichromate (Gabriel and Leupold), A., i, 104.

Phenyl*di*thiobiuret, action of *mono*chloracetone and acetic anhydride on ; also action of hydrogen chloride on a mixture of it with ethylic acetoacetate (Fromm and Philippe), A., i, 484.

Phenylthiocarbamide, action of chromic acid and potassium dichromate on (Oechsner de Coninck), A., i, 244.
  oxidation of (Oechsner de Coninck), A., i, 421.

Phenylthiocarbazide, potassium salt, electrolysis of solution of (Schall and Kraszler), A., i, 414.

Phenylthiocarbazinic acid, methylic, ethylic, and benzylic salts, and its *di*sulphide (Busch and Stern), A., i, 957.

Phenyl*di*thiocarbazinic acid, ethylic and benzylic salts of (Busch and Becker), A., i, 953.

Phenylthiocarbimide, formation of (Dixon), T., 395 ; P., **1899**, 63 ; (Dunlap), A., i, 697.
  action of, on sodium acetanilide (Dixon), T., 384.
  substance obtained by action of aluminium chloride on (Bamberger), A., i, 694.

Phenylthiocarbimide, *m*-bromo- (Bamberger), A., i, 696.
  o-chloro-, and *di-o*-chloro- (Grosch), A., i, 509.
Phenyl*di*thiodiazolone, *o*-phenylenediamine salt of (Busch and Wolff), A., i, 949.
  disulphide, action of amines on (Busch and Wolff), A., i, 949.
Phenyl*di*thiodiazoloneacetonylsulphide (Busch and Wolff), A., i, 951.
Phenyl*di*thiodiazolone-anisalsulphime, -*m*-**nitrobenzalsulphime,** and **-piperonalsulphime** (Busch and Wolff), A., i, 951.
Phenyl*di*thiodiazolonefurfuralsulphime (Busch and Wolff), A., i, 950.
Phenyl*di*thiodiazolonehydrosulphamine, condensation of, with aldehydes and ketones (Busch and Wolff), A., i, 950.
Phenyl*di*thiodiazolonemercaptol (Busch and Wolff), A., i, 951.
Phenyl*di*thiodiazolonesulphinic acid (Busch and Stramer), A., i, 949.
Phenyl*di*thiodiazolonethiol, its ethylic ether, iodine additive product, bromide, ethylenic ether, benzylic ether, benzoyl derivative and diazosulphide (Busch and Stramer), A., i, 949.
  α- and β-aminonaphthylic ethers of, and hydrochloride, diazo-compounds, and azo-dyes from (Busch and Wolff), A., i, 950.
  o- and *m-di*aminophenylic ethers of, and azimino-compound of (Busch and Wolff), A., i, 949.
o-**Phenylthiohydantoic acid** (Rizzo), A., i, 53.
α-**Phenyl*di*thio-C-methylketuretcarboxylic acid,** and its ethylic and dibenzylbenzylic salts; also the action of acetic anhydride on it (Fromme and Philippe), A., i, 484.
1-Phenyl-3-thiotriazolone and its silver and barium compounds (Pellizzari and Ferro), A., i, 550.
Phenylthiourea, formation of (Dixon), T., 410; P., **1899**, 65.
Phenyl-*m*(*p*)-tolimidazole, *o*-amino-, acetyl derivative (von Niementowski), A., i, 645.
Phenyltolylanthrone (Guyot), A., i, 294.
e-**Phenyl**-*a*-*o*-**tolyl**-*e*-**benzylthiobiuret** (Dixon), T., 407; P., **1899**, 64.
α-**Phenyl**-β-*p*-**tolylcarbamide** (Manuelli and Comanducci), A., i, 888.
Phenyl-*p*-tolyldisulphone (Kohler and MacDonald), A., i, 905.
Phenyl-*o*-tolylenediamine, methenyl derivative, picrate, mercurichloride (Jacobson and Lischke), A., i, 276.
Phenyl-*o*-tolylene-*p*-nitrobenzenylamidine (Muttelet), A., i, 354.
e-**Phenyl**-*a*-*o*-**tolyl**-*e*-**ethylthiobiuret,** and *e*-**Phenyl**-*a*-*p*-**tolyl**-*e*-**ethylthiobiuret** (Dixon), T., 405, 406; P., **1899**, 64.
Phenyl-*p*-tolylformamidine (Wheeler and Johnson), A., i, 353.
Phenyl-*p*-tolyl ketone (Weiler), A., i, 490.
Phenyl-*p*-tolylketosulphone, and its hydrate (Kohler and MacDonald), A., i, 905.
Phenyl-*p*-tolylmethane, action of chromyl chloride on (Weiler), A., i, 519.
Phenyl-*p*-tolylmethenylamidine, preparation of (Wheeler and Johnson), A., i, 269.
Phenyltolyl-3-methylanthrone (Guyot), A., i, 295.
e-**Phenyl**-*a*-*o*-**tolyl**-*e*-**methylthiobiuret,** and *e*-**Phenyl**-*a*-*p*-**tolylmethylthiobiuret** (Dixon), T., 402; P., **1899**, 64.
Phenyl-*p*-tolyloxybutylthiocarbamide (Schlinck), A., i, 540.
1-Phenyl-3-*p*-tolylpyrazoline, 5-imino- (Seidel), A., i, 139.
Phenyl-*p*-tolylthiodiazolinethiol, and methylic ether, ethylic ether, and benzylic ether (Busch and Lingenbrink), A., i, 954.
Phenyl-2-tolylthiosemicarbazides (Marckwald), A., i, 504.
Phenyl-4-tolylthiosemicarbazide, and 2 : 4 : 5-*tri*bromo-derivative (Marckwald), A., i, 504, 505.
Phenyltolyl-*o*-toluic acid (Guyot), A., i, 294.
Phenyltriazan (Voswinckel), A., i, 959.
1-Phenyltriazoline, 3-imino-, and 2-nitroso-3-imino- (Bamberger and von Goldberger), A., i, 547.
Phenyltriethylammonium bromide, *o*-nitro- (Nagornoff), A., i, 425.
β-**Phenyl**-γ-**trimethacetobutyric acid,** electrical conductivity of (von Schilling and Vorländer), A., i, 879.
Phenyltrimethylammonium bromide (Bischoff and Taraschtschansky), A., i, 202; (Wedekind), A., i, 352.
N-Phenyltrimethyleneimine and its picrate (Scholtz), A., i, 881.
1-Phenylurazole, action of phosphorus pentasulphide on (Pellizzari and Ferro), A., i, 550.
  nitroso- (Rupe and Labhardt), A., i, 356.

Phenylvaleric chloride, action of aluminium chloride on (Kipping and Hall), P., **1899**, 173.

α-Phenyl-β-*m*-xylylcarbamide (Manuelli and Comanducci), A., i, 888.

Phenyl-*m*-xylylhydrazine, 2 : 4-dinitro- (Willgerodt and Klein), A., i, 883.

Phenyl-2-xylylketoxime-2-carboxylic acid, oximidolactone of (Bethmann), A., i, 520.

Phenyl-2-xylylphthalazone (Bethmann), A., i, 520.

Phenylxylylthiocarbamide, 1-Phenyl-4-xylylthiosemicarbazide, 4-Phenyl-1-xylylthiosemicarbazide (Busch), A., i, 496, 497.

Phenyl-2 : 4-xylylthiosemicarbazide, the imidodiazolone and thiodiazolone (Marckwald), A., i, 504.

Phenyl- and **tolyl-3-thiobistriazoles** and **-3-thiotriazolones,** attempts at reduction of (Andreocci and Mannino), A., i, 946.

Philipstadite from Sweden (Daly), A., ii, 436.

Phillipsite, vapour pressure of (Tammann), A., ii, 8.

Philothion (de Rey-Pailhade), A., i, 180.

Phlobaphen in grapes and grape seeds (Girard and Lindet), A., ii, 445; (Sostegni), A., ii, 446.

Phloracetophenone diethylic and triethylic, trimethylic, and dimethylic ethers, and acetate of the last (Kostanecki and Tambor), A., i, 892.

Phloridzin, action of moulds on (Puriewitsch), A., ii, 683.
  physiological action of (Cremer), A., ii, 169.
  source of sugar excreted under the influence of (Kumagawa and Miura), A., ii, 776.

Phloridzin poisoning, nature of (Ray, McDermott, and Lusk), A., ii, 783.
  acetonuria in (Geelmuyden), A., ii, 235.

Phloroglucide, condensation product obtained from, with acetic acid (Herzig), A., i, 32.

Phloroglucinol obtained from filicic acid (Boehm), A., i, 32.
  condensation of, with benzoin (Japp and Meldrum), T., 1042; P., **1899**, 166.
  triethylic ether, *di*nitro- (Jackson and Koch), A., i, 677.

Phloroglucinoltricarboxylic acid, ethylic salt, from action of ethylic malonate on ethylic acetonetricarboxylate, in presence of sodium ethoxide (Willstätter), A., i, 577.

Phorone, action of ethylic sodiomalonate on (Vorländer and Gärtner), A., i, 259.

Phoronediacetic acid, its methylic salt, oxime, and anhydride; also its oxidation (Vorländer and Gärtner), A., i, 259.

Phosgenite. See Cromfordite.

Phosphates. See under Phosphorus.

Phosphatic deposits from caves in New South Wales (Mingaye), A., ii, 670.

Phosphines, chloro-, of the aliphatic series (Guichard), A., i, 563.

Phosphorescence of strontium, barium, calcium, and zinc sulphides (Mourelo), A., ii, 420.
  of strontium sulphide, influence of manganese on (Mourelo), A., ii, 484.

Phosphorised oil, estimation of phosphorus in (Ekroos), A., ii, 180.

Phosphorites, manufacture of citrate soluble phosphoric acid from (Knoop), A., ii, 801.

Phosphorochalcite from Belgium (Cesàro), A., ii, 433.

Phosphorus, spectrum of; detection of, in cast iron, by spectrum (Gramont), A., ii, 345.
  melting point of, influence of pressure on (Hulett), A., ii, 469.
  metallic and red, identity of; red, vapour tension and vapour density of; white, vapour density of (Chapman), T., 735; P., **1899**, 102.
  red and yellow, entropic relations of, with arsenic, antimony, and bismuth (Linck), A., ii, 416.
  action of aqueous alcoholic alkalis on (Michaelis and Pitsch), A., ii, 285.
  action of, on hydrazine (de Bruyn), A., ii, 745.
  poisoning by, the supposed formation of fat in (Athanasiu), A., ii, 441.
  poisoning by, relation of, to phloridzin poisoning (Ray, McDermott, and Lusk), A., ii, 783.
  organic, supposed presence of, in urine (Oertel), A., ii, 116.
  nature of the compounds of, in urine (Jolly), A., ii, 41.
  metabolism of proteids containing (Zadik), A., ii, 774.

Phosphorus *penta*bromide, dissociation of, in carbon *di*sulphide, carbon tetrachloride, or chloroform (Kastle and Beatty), A., ii, 481.
  *tri*chloride, molecular weight of, in nitrobenzene (Kahlenberg and Lincoln), A., ii, 397.
  *penta*chloride, dissociation of (Wegscheider), A., ii, 590.
  lead iodide (Mosnier), A., ii, 222.

Phosphorus *sub*oxide, non-existence of (Chapman and Lidbury), T., 973 ; P., **1899**, 186.
(Michaelis and Pitsch), A., ii, 285.
Hypophosphorous acid, reduction of bismuth or antimony salts by, and palladium (Engel), A., ii, 750.
reduction of molybdic acid by (Ebaugh and Smith), A., ii, 489.
Phosphoric acid, electric conductivity of solutions of, at high pressures (Bogojawlensky and Tammann), A., ii, 138.
surface tension of aqueous solutions of (Forch), A., ii, 641.
etherification of, by methylic alcohol (Belugou), A., i, 659.
excretion of, before and after removal of the ovaries (Schulz and Falk), A., ii, 504.
estimation of (Lasne ; Neumann), A., ii, 54 ; (Ulsch), A., ii, 802 ; (Aschman), A., ii, 807.
estimation of citrate-soluble (Maercker), A., ii, 807.
estimation of citrate-soluble, in basic slags (Freundlich), A., ii, 331.
estimation of total and soluble, in basic slag (Dafert and Reitmair), A., ii, 383.
estimation of, in malt (Matthews and Woolcott), A., ii, 174.
estimation of, in soils (Maxwell), A., ii, 521.
estimation of, in superphosphates (Littmann), A., ii, 330.
estimation of, colorimetrically in water (Jolles), A., ii, 579.
separation of selenium from (Jannasch and Heimann), A., ii, 60.
See also Agricultural chemistry.
Phosphates, black, from the Pyrenees (Levat), A., ii, 229.
alkali, spark spectra of (de Gramont), A., ii, 345.
action of hydrochloric acid on (Tunnell and Smith), A., ii, 744.
amount of, in the urine of infants (Oechsner de Coninck), A., ii, 678.
Algerian, occurrence of chromic oxide in (Schüler), A., ii, 335.
analysis of (Antony and Mondolfo), A., ii, 330.
estimation of ferric oxide and alumina in (Blattner and Brasseur), A., ii, 128.
Superphosphates, estimation of citrate soluble phosphoric acid in (Böttcher), A., ii, 55.

Phosphorus :—
Trimetaphosphoric acid, heat of neutralisation of (Tanatar), A., ii, 416.
Amidoheximidoheptaphosphoric acid (Stokes), A., ii, 94.
Amidotetrimidopentaphosphoric acid (Stokes), A., ii, 93.
Pentametaphosphimic acid, preparation of (Stokes), A., ii, 93.
Thiophosphates, spectra of (Gramont), A., ii, 345.
Phosphiodic acid (Chrétien), A., ii, 362.
Phosphotungstic acid, preparation of (Winterstein), A., ii, 370.
Phosphorus, detection and estimation of :—
detection of, in insoluble substances by sterelectrolysis (Mayençon), A., ii, 181.
microchemical detection of, in animal tissues (Macallum), A., ii, 232.
estimation of, in the free state (Reed), A., ii, 451.
estimation of, in fats and oils (Louïse), A., ii, 807.
estimation of, in iron ores (Wetzke), A., ii, 61.
estimation of, in nucleins (Neumann), A., i, 467.
estimation of, in phosphomolybdates (Brearley), A., ii, 337.
estimation of, in plants (Berthelot), A., ii, 330.

Photochemistry :—
Actinometer, zinc sulphide (Henry), A., ii, 394.
Light, chemical changes induced by (Berthelot), A., ii, 1, 2.
action of, on dibenzyl ketone (Fortey), T., 871 ; P., **1899**, 182.
action of, on nitrogen iodide (Chattaway and Orton), P., **1899**, 18.
action of, on photographic plates (Liesegang), A., ii, 720.
action of, on platinum, gold, and silver chlorides (Sonstadt), P., **1898**, 179.
action of, on silver iodide (Scholl), A., ii, 621.
Daguerreotype plates, development of (Scholl), A., ii, 621.
Photographic plates, action of light on, and development of (Liesegang), A., ii, 720.
action of hydrogen peroxide on (Russell), A., ii, 720.
Radiations from carnotite (Friedel and Cumenge), A., ii, 435.
from uranium, radium, polonium, and thorium (Becquerel), A., ii, 393.

PHOTOCHEMISTRY :—
- **Röntgen rays**, action of, on photographic plates (Villard), A., ii, 266.
  - ionisation of gases by (Townsend), A., ii, 729.
  - photometer for ; absorption of, by metallic salts (Hébert and Reynaud), A., ii, 586.
- **Polarisation** :—
- **Rotation**, change of sign of, produced by substituting halogen for hydroxyl (Walden), A., ii, 539.
  - of electrolytes, influence of dilution and dissociation on (Rimbach), A., ii, 345.
  - and molecular association of optically active liquids (Pope and Peachey), T., 1112 ; P., **1899**, 201.
  - and position isomerism (Guye and Babel), A., ii, 718, 719.
  - of ethereal salts, maximum, and product of asymmetry (Frankland), T., 351.
  - of a racemic compound of *d*- and *l*-, acetyldesmotroposantonin (Andreocci), A., i, 931.
  - of amylic derivatives (Brjuchonenko), A., ii, 265.
  - of *l*-amylic salts (Walden), A., ii, 621.
  - of amylic nitro-, bromo-, and aminobenzoates, and *m*-toluate, and tartaryl, valeryl, and malyl anilides and toluidides (Guye and Babel), A., ii, 718.
  - of alanine, *d*- and *l*-, and benzoyl-, *d*- and *l*-benzoylaspartic and benzoylglutamic acids, and *d*-glutamic acid (Fischer), A., i, 888.
  - of compounds formed by the condensation of benzaldehyde with polyhydric alcohols (de Bruyn and Alberda van Ekenstein), A., i, 662.
  - of bornylamine derivatives (Forster), T., 934 ; P., **1899**, 71.
  - of compounds of camphor with aromatic aldehydes (Haller and Muller), A., ii, 622.
  - of *d*- and *l*-camphoroxime *d*-camphorsulphonates (Pope), T., 1006 ; P., **1899**, 199.
  - of camphorsulphonic chlorides, and of *d*- and *l*-pinene, and of their solutions in alcohol (Kipping and Pope), T., 1123 ; P., **1899**, 200.

PHOTOCHEMISTRY :—
- **Rotation** of dibenzylidene-*l*-idonic, dibenzylidene-*l*-xylonic, benzylidene-*d*-saccharic and benzylidene-α-glucoheptonic acids (Alberda van Ekenstein and de Bruyn), A., i, 904.
  - of dihydroxybutyric acid and *iso*saccharin (Faber and Tollens), A., i, 855.
  - of *iso*diphenylhydroxyethylamine, *d*- and *l*-, and tartrates (Erlenmeyer), A., i, 882.
  - of butoxysuccinic, ethoxysuccinic, diethoxysuccinic acids and their salts (Purdie and Pitkeathly), T., 155, 158 ; P., **1898**, 6.
  - of gallotannic acid (Rosenheim and Schidrowitz), P., **1899**, 67.
  - of *l*- and *d*-mandelic acid (McKenzie), T., 757, 768.
  - of *d*- and *l*-mandelic acid, and cinchonine salts (Rimbach), A., i, 895.
  - of methoxy- and ethoxy-propionates (Purdie and Irvine), T., 483 ; P., **1899**, 74.
  - of methylic and ethylic malates, benzoylmalates, and *o*-, *m*-, and *p*-toluoylmalates (Frankland and Wharton), T., 337 ; P., **1899**, 25.
  - of *d*-methylmalic acid (Marckwald and Axelrod), A., i, 419.
  - of methyl-, ethyl-, and propylpiperidines and of ethyl-, propyl-, and *iso*amyl-pipecolines (Hohenemser and Wolffenstein), A., i, 937.
  - of nitrocamphor and π-bromonitrocamphor, change of (Lowry), T., 218 ; P., 25.
  - of *i*-α-phenethylamine hydrochloride and *d*-camphorsulphonate (Pope and Harvey), T., 1110 ; P., **1899**, 200.
  - of *d*- and *l*-α-phenylbenzylmethylallylammonium bromides, iodides, and *d*-camphorsulphonates (Pope and Peachey), T., 1128 ; P., **1899**, 192.
  - of *l*-phenylethoxyacetic acid, and its salts (McKenzie), T., 758.
  - of *d*- and *l*-phenyllactic acids, α-bromo-, and cinchonine salts (Erlenmeyer and Moebes), A., i, 896.
  - of phenylmethoxyacetic acid and salts (McKenzie), T., 762.
  - of phenyl*iso*propoxyacetic acid, and its sodium and potassium salts (McKenzie), T., 765.

Photochemistry :—
Rotation of *l*-pinene in various solvents (Pope and Peachey), T., 1118 ; P., **1899**, 201.
of pinene hydrochloride (Long), A., i, 819.
of piperidine bases, and of bornylamines, influence of introduction of benzoyl group on (Pope and Peachey), T., 1076.
of sugar solutions (Mascart and Bénard), A., i, 851.
of solutions of sucrose, influence of temperature on (Wiley), A., ii, 702.
of tannin in aqueous, alcoholic, or acetic acid solution (Flawitzky), A., i, 806.
of concentrated solutions of *d*-tartaric acid (Lepeschkin), A., i, 576.
of tartaric acid solutions, and of turpentine oil (Wendell), A., ii, 199.
of *l*- and *d*-tetrahydroquinaldine, their hydrochlorides, and *d*-camphorsulphonates (Pope and Peachey), T., 1067 ; P., **1899**, 199.
of tetrahydro-*p*-toluquinaldine, *d*- and *l*-, and hydrochlorides (Pope and Rich), T., 1094.
Mutarotation of sugars, nitrocamphor, and π-bromonitrocamphor (Lowry), T., 211 ; P., 25.
Magnetic rotation in salt solutions, effect of concentration on (Oppenheimer), A., ii, 139.
Refraction and dispersion of water Bender), A., ii, 621.
and dispersion of compounds of camphor with aromatic aldehydes (Haller and Muller), A., ii, 622.
of γ-amino-αβ-propylenic glycol (L. and E. Knorr), A., i, 411.
of amylic nitro-, bromo-, and aminobenzoates, and *m*-toluate (Guye and Babel), A., ii, 718.
of argon, neon, and helium (Ramsay and Travers), A., ii, 746.
of butyric, caproic, caprylic, capric, lauric, myristic, palmitic, and stearic acids, and their glycerylic salts (Scheij), A., i, 668.
of solutions of cadmium bromide, sugar, and *di*- and *tri*-chloracetic acids, and their potassium salts (Hallwachs), A., ii, 462.
of coniine (Pope and Peachey), T., 1111.

Photochemistry :—
Refraction of ethylic salts of methyl-substituted cyanosuccinic acids (Bone and Sprankling), T., 855.
of ethylic glutaconate (Henrich), A., i, 794.
of solutions of hydrochloric acid and alkali chlorides (Conroy), A., ii, 717.
of nitroamylbenzene, and of phenylmethyl*iso*propylnitromethane (Konowaloff and Egoroff), A., i, 801.
of ω-nitrotoluene, ω-nitro-*p*-xylene, *p*-xylylamine, and ω-mesitylamine (Konowaloff), A., i, 873, 874.
of phenylic alkylic carbonates (Morel), A., i, 875.
of *l*- and *i*-tetrahydroquinaldines (Pope and Peachey), T., 1114.
Atomic refraction of iodine in some compounds (Sullivan), A., ii, 398.
Refractometer, double-trough (Hallwachs), A., ii, 461.
Dispersion, anomalous, of sodium vapour (Becquerel) A., ii, 266.
Spectroscopy, interference, new method of (Fabry and Perot), A., ii, 540.
Spectra, atomic and molecular, of compounds (de Gramont), A., ii, 197.
stellar, oxygen and unknown lines in (Gill), A., ii, 718.
stellar, and temperature classification of stars (Lockyer), A., ii, 718.
of stars, of helium, and of asterium (Lockyer), A., ii, 4.
dissociation, of fused chlorides, bromides, and iodides (de Gramont), A., ii, 137.
of didymium oxide from monazite sands (Urbain), A., ii, 425.
of hydrogen (Richards), A., ii, 266.
compound line, of hydrogen (Hutton), A., ii, 3.
of electric arc between mercury poles in a vacuum (Fabry and Perot), A., ii, 461.
of neon and helium in high vacua obtained by freezing air (Dewar), A., ii, 741.
of sodium, method of reversing (Kreusler), A., ii, 717.
of sodium, lithium, and potassium in their fused salts; and of aluminium, tellurium, and selenium (de Gramont), A., ii, 198, 199.
spark, of fused sulphates, sulphides, and phosphates (de Gramont), A., ii, 345.

Photochemistry :—
Spectra, phosphorescent, of victorium (Crookes), A., ii, 751.
produced by electric discharges in organic compounds (Wiedemann and Schmidt), A., ii, 5.
of chlorophyll and hæmoglobin derivatives (Schunck), A., ii, 540.
of cyanuric acid (Hartley), P., **1899**, 46.
of isatin and carbostyril and their alkyl derivatives (Hartley and Dobbie), T., 640 ; P., **1899**, 47.
of proteids in relation to that of tyrosine (Blyth), T., 1162 ; P., **1899**, 175.
Photography. See Photochemistry.
Phthalamic acid, methylic salt (Hoogewerff and Dorp), A., i, 870.
m- and *p*-**Phthalamidobenzoic acids**, ethylic salts (Limpricht), A., i, 292.
Phthalanil (Landsberger), A., i, 211 ; (Meyer and Sundmacher), A., i, 756.
3-nitro-, 4-nitro-, 4-chloro-, 3 : 4-*di*chloro-, and *tetra*chloro- (Graebe and Buenzod), A., i, 762.
Phthalanilic acid (Meyer and Sundmacher), A., i, 756.
Phthalazine, salts, and 4′-chloro-derivatives (Paul), A., i, 776.
Phthalic acid, equilibrium in formation of anhydride from (Bancroft), A., ii, 411.
citronellyl salt and *di*bromide of (Flatau and Labbé), A., i, 409.
ethylic salt, condensation of, with ethylic glutarate, and ethylic β-phenylglutarate (Dieckmann), A., i, 914.
geranyl salt, and *tetra*bromide of (Flatau and Labbé), A., i, 409.
*iso*propylic salt (Gucci), A., i, 513.
thymylic hydrogen salt (Schryver), T., 664 ; P., 121.
Phthalic acid, 3-nitro-, 4-nitro-, 4-chloro-, 3 : 4-*di*chloro-, and *tetra*chloro-, aniline salts (Graebe and Buenzod), A., i, 762.
4-nitro-, formation of (Heusler and Schieffer), A., i, 366.
iso-**Phthalic acid**, formation of (Weiler), A., i, 491.
5-nitro-, aniline salt (Graebe and Buenzod), A, i, 763.
p-**Phthalic acid.** See Terephthalic acid.
Phthalic anhydride, condensation of, with benzaldehyde (Thiele), A., i, 216.
condensation of, with *o*-tolylacetic acid (Bethmann), A., i, 520.
Phthalide, 5-nitro-, formation of (Gabriel and Landsberger), A., i, 133.
*di*thio- (Gabriel and Leupold), A., i, 121.
Phthalidedimethyl ketone and its reaction with phenylhydrazine and with bromine (Hamburger), A., i, 142.
Phthalidedimethylketoximes, two isomeric, and an acetate (Hamburger), A., i, 143.
Phthalimide, formation of (Mathews), A., i, 57.
oxidation of (Oechsner de Coninck), A., i, 508.
mercury compound of, constitution of (Kieseritzky), A., ii, 395.
Phthalimidine, constitution of (Gabriel and Landsberger), A., i, 133.
thio- (Gabriel and Leupold), A., i, 121.
ψ-**Phthalimidine**, 5-nitro-, and its salts (Gabriel and Landsberger), A., i, 133.
Phthalimidobutylmalonic acid, ethylic salt (Gabriel and Maass), A., i, 595.
Phthalimidomethylenephenylhydrazine (Sachs), A., i, 280.
Phthalimidosulphonal (Posner), A., i, 604.
Phthalophenylamic acid, methylic salt, formation of (Hoogewerff and van Dorp), A., i, 870.
Phthalophenylimide, action of methylic alcohol on (Hoogewerff and van Dorp), A., i, 870.
Phthalylcamphoroxime (Frankforter and Glasoe), A., i, 713.
Phthalyl-green, constitution of (Haller and Guyot), A., i, 155.
m- and *p*-**Phthalyloxybenzoic acids**, ethylic salts (Limpricht), A., i, 292.
ββ-**Phthalyloxydinaphthalene** (Fosse), A., i, 817.
Phthalylphenyl*iso*crotonic acid, two isomeric forms of (Thiele), A., i, 217.
Phthalylphenylmethylenediamine and **Phthalylpiperylmethylenediamine**, (Sachs), A., i, 280.
Phthalylsalicylic acid (Limpricht), A., i, 293.
Phyllotaonin, relation of, to chlorophyll (Kohl), A., i, 228.
Phylloxanthin, non-relation of, to chlorophyll (Kohl), A., i, 228.
Physcia pulverulenta and *P. ciliaris*, constituents of (Hesse), A., i, 382.
Physiological action of acids and alkalis (Loeb), A., ii, 167 ; (Zoethout), A., ii, 235.

Physiological action of aconine, aconitine, benzaconine, and diacetylaconitine (Cash and Dunstan), A., ii, 42.
of *o*-aminophenetidine (Cohn), A., ii, 781.
of anhalonine, lophophorine, and mezcaline (Dixon), A., ii, 681.
of aspirin (*acetylsalicylic acid*) (Dreser), A., ii, 605.
of choline (Asher and Wood), A., ii, 373.
of choline, eucaine-B, and neurine (Mott and Halliburton), A., ii, 315, 781.
of extracts of pituitary body (Schäfer and Vincent), A., ii, 782.
of hederin (Joanin), A., ii, 605.
of hydrogen peroxide and benzoic peroxide (Nencki and Zaleski), A., ii, 676.
of iodine and iodides (Heinz), A., ii, 440.
of *di*iodoacetylidene (Loew), A., ii, 169.
of various ketonic bases and their oximes (Schmidt), A., i, 4.
of laurotetanine (Filippo), A., i, 312.
of methylxanthines (Lusini), A., ii, 317.
of nitrogen chloride (Hentschel), A., ii, 569.
of peptones and proteoses (Chittenden, Mendel, and Henderson), A., ii, 233; (Thompson), A., ii, 677.
of phloridzin (Cremer), A., ii, 169.
of proteose (Thompson), A., ii, 604.
of sodium fluoride (Baldwin), A., ii, 605.
of extracts of sympathetic ganglia (Cleghorn), A., ii, 569.
Physiology, importance of stereochemistry in (Fischer), A., ii, 169.
Phytosterol (*phytosterin*) presence of, in lichens (Hesse), A., i, 382.
from the oil of *Tropæolum majus* (Gadamer), A., i, 864.
preparation of (Bömer), A., ii, 191.
extraction of, from fats (Juckenack and Hilger), A., i, 38.
detection of, in fats (Kreis and Wolf), A., ii, 343; (Wirthle; Foerster), A., ii, 824.
Picea excelsa seeds, constituents of, and decomposition of the proteids in (Rongger), A., ii, 241.
Pichi-pichi, constituents of (Kunz-Krause), A., i, 448.
Picoline, haloid and perhaloid salts of (Murrill), A., i, 934.
a-**Picoline** (2-*methylpyridine*) aminolytic constant of (Goldschmidt and Salcher), A., ii, 551.
hydrochloride, methobromide, ethobromide, hydrogen *di*bromide, hydrogen *tri*bromide, methyl *tri*bromide, ethyl *tri*bromide, hydriodide bromide, hydrogen *di*iodide, *tri*iodide, *pent*iodide, methyl *tri*iodide, methyl *pent*iodide, *hept*iodide, ethyl *tri*iodide, ethyl *pent*iodide, propyl *tri*iodide, hydriodide *di*bromide, methiodide *di*bromide, methiodide iodobromide, allyliodide *di*bromide, methiodide, ethiodide, propiodide, *iso*propiodide, butiodide, *iso*butiodide *sec*butiodide, *iso*amyliodide, allyliodide, *sec*butyl *tri*iodide, *sec*butyl *pent*iodide, *iso*amyl *di*iodide, *iso*amyl *tri*iodide, *iso*amyl *pent*iodide, allyl *tri*iodide, allyl *pent*iodide, ethyl propyl *pent*iodide, *iso*propyl *di*iodide, *iso*propyl *tri*iodide, *iso*propyl *pent*iodide, butyl *tri*iodide, butyl *pent*iodide, *iso*butyl *tri*iodide, and *iso*butyl *pent*iodide of (Murrill), A., i, 934, 935.
β-**Picoline** (3-*methylpyridine*), methyl *tri*iodide, methyl *pent*iodide (Murrill), A., i, 934.
γ-**Picoline** (4-*methylpyridine*), methyl *tri*-iodide, methyl *pent*iodide, *hept*iodide (Murrill), A., i, 934.
a- and β-**Picolines**, action of potassium dichromate and sulphuric acid on (Oechsner de Coninck), A., i, 472.
Picramic acid (4 : 6-di*nitro*-2-*aminophenol*), oxidation of, with chromic acid (Oechsner de Coninck and Combe), A., i, 347.
Picric acid (2 : 4 : 6-*trinitrophenol*), velocity of crystallisation of (Bogojawlensky), A., ii, 206.
equilibrium between β-naphthol, ethylenic bromide, and (Bruni), A., ii, 406.
oxidation of, with chromic acid (Oechsner de Coninck and Combe), A., i, 347.
Picrotin, and benzoyl-, dibenzoyl-, acetyl-, diacetyl-, anhydrodiacetyl-, and anhydronitro-derivatives (Meyer and Bruger), A., i, 227.
Picrotoxic acid, and bromo-derivative (Meyer and Bruger), A., i, 227.
Picrotoxide (Meyer and Bruger), A., i, 226.
Picrotoxin, resolution of, into picrotoxinin and picrotin (Meyer and Bruger), A., i, 226.
detection of (Melzer), A., ii, 193; (Kreis), A., ii, 827.

Picrotoxinin, and its chloro-, bromo-, iodo-, and diacetyl derivatives and polymeric form (MEYER and BRUGER), A., i, 226.

Picrylazo-*m*-xylene (WILLGERODT and KLEIN), A., i, 883.

Picrylguaiacol. See Guaiacol picrate.

Picryl-*m*-xylylhydrazine (WILLGERODT and KLEIN), A., i, 882.

Pigment, $C_{18}H_{11}O_{10}N_5$, from oxidation of melanin (JONES), A., i, 396.
  production of, by action of *Bacillus coli* on artichokes (ROUX), A., ii, 444.

Pigments, ferruginous, examination of (BAMKE), A., ii, 129.
  fluorescent, production of, by bacteria (JORDAN), A., i, 318.

Pilandite from the Transvaal (HENDERSON), A., ii, 111.

n-**Pimelic acid,** formation of, by action of trimethylene *di*bromide on ethylic sodiocyanacetate (CARPENTER and PERKIN), T., 933; P., **1899**, 135.
  formation of, in the oxidation of fats, and its separation (BOUVEAULT), A., i, 480.

Pinacolin (*methyl* tert*butyl ketone*), heat of combustion of (ZOUBOFF), A., ii, 589.
  *di*bromo- (KONDAKOFF), A., i, 859.

Pinacolinoxime and its reduction (MARKOWNIKOFF), A., i, 554.

Pinacone, action of hydrobromic acid on (KONDAKOFF), A., i, 859.

Pinene, in oil of rosemary (SCHIMMEL and Co.), A., i, 63.
  behaviour of, towards formaldehyde (KRIEWITZ), A., i, 298.
  hydrochloride, rotatory power (LONG), A., i, 819.
  chlorhydrin (GINZBERG and WAGNER), A., i, 618.
  chlorhydrins, constitution of (GINZBERG), A., i, 619.

l-**Pinene,** in oils of hemlock and spruce (SCHIMMEL and Co.), A., i, 63.
  presence of, in essential oil of oleoresin from *Dacryodes hexandra* (MORE), T., 718; P., **1899**, 150.
  rotatory power of, and in various solvents (POPE and PEACHEY), T., 1118; P., **1899**, 201.

d- and *l*-**Pinene,** and solutions of, in methylic and ethylic alcohols, equilibrium between, and rotatory powers of (KIPPING and POPE), T., 1123; P., **1899**, 200.

Pine-wood sawdust, action of nitric acid on (FABER and TOLLENS), A., i, 854.

Pinole chlorhydrin (GINZBERG), A., i, 618.

Pinole *tetra*bromide (WALLACH, STIEHL, and SIEVERTS), A., i, 710.
  bisnitrosochloride and *iso*nitrosochloride (WALLACH, STIEHL, and SIEVERTS), A., i, 710.

cis-**Pinole** oxide (WAGNER and SLAWINSKI), A., i, 766.

iso-**Pinole** *di*bromide (WALLACH, STIEHL, and SIEVERTS), A., i, 709.

Pinolglycol from pinol; diacetyl derivative, mono- and di-urethanes (SLAWINSKI), A., i, 529.
  from *di*bromopinol, diacetyl derivative (SLAWINSKI), A., i, 529.
  anhydride (GINZBERG), A., i, 619.

d-cistrans-**Pinolglycol** (WAGNER and SLAWINSKI), A., i, 767.

Pinolol (WALLACH, STIEHL, and SIEVERTS), A., i, 710.

Pinolone, semicarbazone, oxime, carbamide derivative (WALLACH, STIEHL, and SIEVERTS), A., i, 710.

Pinonic acids, crystallographic relations of (FOCK), A., i, 819.

Pinus cembra seeds, constituents of (SCHULZE and RONGGER), A., ii, 241.

Pinus sylvestris, amount of lignin in wood of (CIESLAR), A., ii, 447.

Piperazine, diurethane of; α- and β-naphthylic diurethane of; guaiacol derivative of (CAZENEUVE and MOREAU), A., i, 167.

Piperic acid, action of sodium on, in alcohol (KUNZ-KRAUSE), A., i, 201.

Piperidine (*hexahydropyridine*), formation of, from amylamine, by silent electric discharge (BERTHELOT), A., ii, 653.
  specific heat and heat of vaporisation of (LUGININ), A., ii, 354.
  action of chromic acid on (OECHSNER DE CONINCK and COMBE), A., i, 244.
  action of, on ethylic acetylenedicarboxylate (RUHEMANN and CUNNINGTON), T., 956; P., **1899**, 185.
  action of nitrosyl chloride on (SOLONINA), A., i, 473.
  condensation of, with αδ-*di*bromopentane (SCHOLTZ and FRIEMEHLT), A., i, 541.
  hydrobromide (BISCHOFF and MAISEL), A., i, 230; (WEDEKIND), A., i, 636.
  *per*chromate (WIEDE), A., i, 245.
  *di*thiocarbamate, from action of carbon *di*sulphide on δ-aminovaleraldehyde (MAASS and WOLFFENSTEIN), A., i, 110.

Piperidine, cyano-, and action of ammonia and hydrogen sulphide on (WALLACH), A., i, 659.

Piperidine-bases, rotatory power of, influence of introduction of benzoyl group on (Pope and Peachey), T., 1076.

Piperidine-series, stereochemistry of (Hohenemser and Wolffenstein), A., i, 936.

Piperidinemethoxyphenylurethane, Piperidine-α- and β-naphthylurethanes, Piperidinephenylurethane (Cazeneuve and Moreau), A., i, 132, 133.

Piperidylacetaldehyde, and its hydrochloride, and salts (Stoermer), A., i, 73.

Piperidylacetic acid, and ethylic salt (Bischoff and Stefanowski), A., i, 229.

benzylo-bromide and -iodide, ethylic salts of (Wedekind), A., i, 352.

Piperidylacetoxime (Matthaiopoulos), A., i, 10.

α-Piperidylbutyric acid, and ethylic salt (Bischoff and Kuszell), A., i, 230.

Piperidylcarbinol, condensation of, with bromonitromethane (Maas), A., i, 322.

γ-Piperidyldimethylacetoacetic acid, methylic salt, from action of piperidine on methylic γ-cyanodimethylacetoacetate (Conrad and Gast), A., i, 258.

Piperidylmaleic acid, ethylic salt (Ruhemann and Cunnington), T., 956; P., **1899**, 185.

α-Piperidylopropionic acid and ethylic salt (Bischoff and Maisel), A., i, 230.

Piperidylthiocarbamide, formation of (Wallach), A., i, 659.

α-Piperidyl*iso*valeric acid, and ethylic salt (Bischoff and Pakis), A., i, 230.

Piperil and its acetate, oximes and α- and β-osazones (Biltz and Wienands), A., i, 911.

Piperine, viscosity of undercooled (Tammann), A., ii, 272.

action of sodium on, in alcohol (Kunz-Krause), A., i, 201.

Piperonalcoumaranone (Feuerstein and Kostanecki), A., i, 369.

Piperonaldime hydrochloride (Busch and Wolff), A., i, 951.

Piperonal-2′-hydroxyacetophenone and acetyl derivative and dibromide (Feuerstein and von Kostanecki), A., i, 369.

Piperonalpaeonol, and acetyl derivative and dibromide (Emilewicz and von Kostanecki), A., i, 369.

Piperonylidenecamphor (Haller), A., i, 770.

Piperonylidenediacetoacetic acid, ethylic salt and oxime (Knoevenagel and Hoffmann), A., i, 214.

Piperonylidenemalonic acid (Knoevenagel), A., i, 145.

ethylic salt (Knoevenagel and Giese), A., i, 117.

3-Piperonyl-1-methyl-5-*cyclo*hexenone, and oxime (Knoevenagel and Hoffmann), A., i, 214.

3-Piperonyl-1-methyl-5-*cyclo*hexenone-2 : 4-dicarboxylic acid, ethylic salt of (Knoevenagel and Hoffmann), A., i, 214.

Pituitary body, physiological action of extracts of (Schäfer and Vincent), A., ii, 782.

extract, effects of, on blood pressure (Schäfer and Vincent), A., ii, 441.

Pitticite from Moravia (Kovář), A., ii, 672.

Plagioclase, alteration of (Barlow), A., ii, 565.

Placodium saxicolum, constituents of (Hesse), A., i, 382.

Plagionite, artificial (Sommerlad), A., ii, 218.

from the Harz (Spencer and Prior), A., ii, 431.

Plants, estimation of chlorine in (Berthelot), A., ii, 327.

estimation of sulphur and phosphorus in (Berthelot), A., ii, 330.

See also Agricultural chemistry.

Platinum in meteoric iron (Davison), A., ii, 308.

commercial, purity of (Mylius and Dietz), A., ii, 160.

free from iridium, preparation of (Bergsöe), A., i, 299, 320.

dissolution of, in electrolytes (Margueles), A., ii, 200.

gauze electrodes, electrolytic precipitation of metals on (Winkler), A., ii, 723.

absorption of gases by, at low temperatures; and existence of a compound of, with hydrogen (Hemptinne), A., ii, 146.

sponge, occlusion of gases by (Hemptinne), A., ii, 228.

action of, on sulphuric acid (Adie), P., **1899**, 133.

Platinum alloys with calcium (Tarugi), A., ii, 749.

Platinum salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.

reduction of, by calcium carbide (Tarugi), A., ii, 749.

Platinoazoimide potassium salt (Curtius and Rissom), A., ii, 92.

Platinum *tetra*chloride, electrolysis of solutions of (Dittenberger and Dietz), A., ii, 629.
  hydrated, electrolysis and constitution of (Hittorf and Salkowski), A., ii, 398.
  action of solution of, on antimony trioxide (Harding), A., ii, 490.
  influence of, on the reaction between potassium permanganate and hydrochloric acid (Wagner), A., i, 275.

Platinum organic compounds:
  double oxalate and chloride of, with potassium (Vèzes), A., i, 572.
  Platino-oxalates; Dichloroplatinioxalates and Platiniplatino-oxalates (Werner and Grebe), A., i, 865.
  Platoso-oxalonitrous acid, potassium salt (Vèzes), A., i, 671, 741.
  Dipropylenediamineplatinous hydroxide and salts; Dipropylenediamineplatinic chloride, and *di*chloro- and *di*bromo-derivatives; Propylenediaminediammineplatinous chloride, and *di*bromo-derivative; Propylenediamineplatinum, *di*- and *tetra*chloro- (Werner, Megerle, Pastor, and Spruck), A., i, 857, 858.

Platinum, estimation and separation of:—
  best precipitants for (Atterberg), A., ii, 125.
  estimation of, volumetrically (Peterson), A., ii, 253.
  estimation of silver, gold, and mercury in presence of (Kollock), A., ii, 811.
  separation of gold from (Vanino and Seemann), A., ii, 579.

Platinum metals, detection of (Mylius and Dietz), A., ii, 161.

Platysma diffusum, and *P. glaucum*, constituents of (Zopf), A., i, 716, 717.

Plumieride and **Plumieridic acid** (Franchimont), A., i, 933, 934.

Pneumonia, excretion of chlorides in (Hutchison), A., ii, 168.

Poirrier's blue, C_4B, use of, in alkalimetry (Glaser), A., ii, 573.

Polarisation. See Photochemistry.

Polonium in carnotite (Friedel and Cumenge), A., ii, 435.
  radiation from (Becquerel), A., ii, 393.

Polyargyrite, artificial (Sommerlad), A., ii, 216.

Polyaspartic acids (Schiff), A., i, 195.

Polyporus officinalis, the fungose of, and yield of chitin from (Tanret), A., ii, 171.

Polysaccharides, hydrolysis of, by yeast enzymes (Kalanthar), A., i, 102.

Polystichalbin, Polystichic acid, Polystichin, Polystichinin, Polystichinol, Polystichocitrin, and **Polystichoflavin** (Poulsson), A., i, 379.

Polystichum spinulosum, constituents of extract of root of (Poulsson), A., i, 379.

Pomegranate, alkaloids of (Piccinini), A., i, 829; (Gordin and Prescott), A., i, 964; (Piccinini and Quataroli), A., i, 965.
  composition of juice of, and amount of alcohol in the wine made from (Borntäger and Paris), A., ii, 447.
  bark, estimation of alkaloids in (Ewers), A., ii, 457.

Porcelain, Egyptian, composition of (Le Chatelier), A., ii, 751.

Portland cement, constitution of (Rebuffat), A., ii, 289.
  estimation of silica and insoluble residue in (Shimer) A., ii, 520.

Portugal, oil of, composition of (Flatau and Labbé), A., i, 442.

Posidonia caulini, amount of ash and cellulose in (Chancel), A., ii, 682.

Potash. See Potassium hydroxide, and also Agricultural chemistry.

Potash bulbs, new form of (Anderson), A., ii, 577.

Potassium, spectrum of, in its fused salts (Gramont), A., ii, 198.
  ion, velocity of, in flames (Wilson), A., ii, 723.

Potassium amalgams (Divers), T., 103; (Pocklington), A., ii, 200; (Maey), A., ii, 547.

Potassium salts, absorption of Röntgen rays by (Hébert and Reynaud), A., i, 586.
  conductivity of mixed solutions of sodium salts and (Barmwater), A., ii, 396.
  taste of (Höber and Kiesow), A., ii, 207.

Potassium amidochromate (Ohly), A., ii, 754.
  ammonia (Moissan), A., ii, 152.
  antimonates (Senderens), A., ii, 557.
  thioantimonite, and double salts with zinc, manganese, lead, or copper; action of, on mercuric chloride (Pouget), A., ii, 663.
  azoimide, cobaltoazoimide, and platinoazoimide (Curtius and Rissom), A., ii, 92.
  bismuthate, preparation of (Deichler), A., ii, 429.
    action of hydrofluoric acid on (Weinland and Lauenstein), A., ii, 370.

Potassium bromate, preparation of (Müller), A., ii, 742.
- action of hydrofluoric acid on (Weinland and Lauenstein), A., ii, 364.

bromide, spark spectrum of (de Gramont), A., ii, 137.
- fluidity and conductivity of (Dennhardt), A., ii, 351.
- heat of dilution of (Dunnington and Hoggard), A., ii, 728.
- precipitation of, from acetone (Rohland), A., ii, 144.
- action of chlorine on (Küster), A., ii, 22.

cupric bromide (Kurnakoff and Sementschenko), A., ii, 287.

carbide, formation of (Moissan), A., i, 241.

carbonate, thermal change on diluting saturated solutions of (Pollok), P., **1899**, 8.
- equilibrium between methylic or ethylic alcohols, water, and (de Bruyn), A., ii, 591.
- equilibrium between water, alcohol, and (Snell), A., ii, 408.
- reduction of, by aluminium (Franck), A., ii, 102.

*per*ceric carbonate (Job), A., ii, 487.

chlorate, preparation of (Müller), A., ii, 742.
- electrolytic production of (Vaubel), A., ii, 88.
- application of principle of maximum work to electrolysis of solutions of (Tommasi), A., ii, 413.
- solubility of, in water at different temperatures (Pawlewski), A., ii, 405.
- use of, in ammonium nitrate explosives (Le Chatelier), A., ii, 647.

*per*chlorate, electrolytic preparation of (Foerster), A., ii, 88; (Winteler), A., ii, 366.

chloride, molecular refraction of solutions of (Hallwachs), A., ii, 462.
- spark spectrum of (de Gramont), A., ii, 137.
- concentration cell, with water and methylic or ethylic alcohols (Salvadori), A., ii, 721.
- fluidity and conductivity of (Dennhardt), A., ii, 351.
- conductivity of solutions of, in nitrobenzene, benzonitrile, or furfuran (Euler), A., ii, 462.
- electrolysis of aqueous solutions of (Bischoff and Foerster), A., ii, 89.

Potassium chloride, depression of freezing point of water by (Raoult), A., ii, 204.
- heat of dilution of (Dunnington and Hoggard), A., ii, 728.
- thermal change on diluting saturated solutions of (Pollok), P., **1899**, 8.
- surface tension of solutions of (Linebarger), A., ii, 469.
- contraction of aqueous solutions of, on dilution (Wade), T., 268; P., **1899**, 8.
- densities and refractive indices of solutions of (Conroy), A., ii, 717.
- densities of aqueous solutions of (Barnes and Scott), A., ii, 406; (de Coppet), A., ii, 590.
- solubilities of mixtures of, with sodium chloride or nitrate and potassium nitrate (Soch), A., ii, 84.
- equilibrium between sodium sulphate, sodium potassium sulphate, and (Meyerhoffer and Saunders), A., ii, 410.
- equilibrium between water, acetone, and (Snell), A., ii, 407.
- precipitation of, from acetone (Rohland), A., ii, 144.
- and ammonium chlorides, conductivities of mixed solutions of (Jones and Knight), A., ii, 628.

cerium *hexa*chloride (Koppel), A., ii, 98.

cupric chlorides (Kurnakoff and Sementschenko), A., ii, 287; (Gröger), A., ii, 289.

magnesium chloride and cadmium bromide (Jones and Knight), A., ii, 628.

osmium chloride, and bromide (Rosenheim and Sasserath), A., ii, 665.

uranium chlorides and bromides (Aloy), A., ii, 555.

double chlorides of, with zinc and cadmium, conductivities of aqueous solutions of (Jones and Ota), A., ii, 587.

*per*chromate, crystalline, formation of (Wiede), A., i, 320.

*di*fluoriodate (Weinland and Lauenstein), A., ii, 363.

fluoromanganite (Weinland and Lauenstein), A., ii, 368.

*mono*fluorophosphate, *di*fluorotellurate, and *di*fluorodithionate (Weinland and Alfa), A., ii, 595.

*di*fluorodisulphate and *di*fluorodiselenate (Weinland and Alfa), A., ii, 595.

fluorouranate, fluoromolybdate, and fluorotungstate, conductivity of (Miolati and Alvisi), A., ii, 350.

- **Potassium** hydroxide, electrolysis of aqueous solutions of (Glaser), A., ii, 79.
  - or dichromate, influence of, on the hydration of calcium oxide (Rohland), A., ii, 596.
  - iodate, preparation of (Müller), A., ii, 742.
- manganic iodate (Berg), A., ii, 426.
- iodide, spark spectrum of (de Gramont), A., ii, 137.
  - fluidity and conductivity of (Dennhardt), A., ii, 351.
  - conductivity of solutions of, in nitrobenzene, benzonitrile, or furfuran (Euler), A., ii, 462.
  - heat of dilution of (Dunnington and Hoggard), A., ii, 728.
  - influence of, on the boiling point of liquid ammonia (Franklin and Kraus), A., ii, 202.
  - action of bromates, chromates, dichromates, and di-iodates on (Wagner), A., ii, 326.
  - action of chlorine on (Küster), A., ii, 22.
  - action of, on mercurous iodide (François), A., ii, 751.
- *per*manganate, action of hydrochloric acid on, in presence of catalytic agents (Wagner), A., ii, 275.
- mercuriodide, action of water on (François), A., ii, 598.
- molybdate, chromate, and dichromate, influence of, on the oxidation of iodide by bromic acid (Schiloff), A., ii, 147.
- *per*oxide *per*molybdate, preparation of (Melikoff and Pissarjewsky), A., ii, 31.
- *per*niobate, and *per*tantalate and calcium double salt (Melikoff and Pissarjewsky), A., ii, 491.
- nitrate, fused, luminous phenomena produced by ammonium salt and (Tommasi), A., ii, 483.
  - fluidity and conductivity of (Dennhardt), A., ii, 351.
  - mixtures of, with lithium and sodium nitrates, melting points of (Carveth), A., ii, 141.
  - thermal change on diluting saturated solutions of (Pollok), P., **1899**, 8.
  - densities of solutions of (Barnes and Scott), A., ii, 406.
  - solubilities of mixtures of, with potassium chloride and sodium chloride or nitrate (Soch), A., ii, 84.
  - and thallium chloride, solubility of mixtures of (Noyes), A., ii, 10.
- **Potassium** nitrate, equilibrium between water, alcohol, and, temperatures at which two liquid phases appear in (Dodge and Gratton), A., ii, 408.
  - deliquescence of (Kortright), A., ii, 644.
  - action of dilute sulphuric, hydrochloric, and phosphoric acids on, in presence of ether (Tanret), A., ii, 21.
  - and nitrite, electrolytic reduction of; chlorate and arsenite, electrolytic oxidation of (Tommasi), A., ii, 138.
- nitrite, preparation of (Divers), T., 85 ; P., **1898**, 222.
  - reduction of, by potassium amalgam (Divers), T., 90 ; P., **1898**, 223.
- ruthenium nitrite (Brizard), A., ii, 664.
- rhodium nitrite, and *hexa*rhodite (Joly and Leidié), A., ii, 34.
- hyponitrite, preparation of (Divers), T., 102 ; P., **1898**, 224.
  - preparation of, from sodium nitrite (Divers and Haga), T., 80 ; P., **1898**, 221.
- osmiamate (Brizard), A., ii, 559.
- oxide, heat of formation of (Moissan), A., ii, 352.
  - heats of formation and solution of (de Forcrand), A., ii, 588.
- phosphate. See Agricultural chemistry.
- phosphiodate, molybdiodate, and tungstiodate (Chrétien), A., ii, 363.
- platinochloride, action of light on solutions of (Sonstadt), P., **1898**, 179.
- platosochloride (Vèzes), A., ii, 492, 572.
- ruthenate (Mylius and Dietz), A., ii, 160.
- ruthenichloride (Antony and Lucchesi), A., ii, 756.
- ruthenochloride ; chloronitrosoruthenate, action of sulphur *di*oxide on (Antony and Lucchesi), A., ii, 558.
- selenibromide (Lenher), A., ii, 19.
- selenide and polyselenide (Hugot), A., ii, 650.
- silicate, hydrolysis of, in aqueous solution (Kahlenberg and Lincoln), A., ii, 95.
- silicofluoride, fluoroxyuranate, fluoroxytungstate, and fluoroxymolybdate, action of oxalic acid on (Paternò and Alvisi), A., ii, 18.
- sulphate, electrolysis of, with copper ferrocyanide membrane (Schreber), A., ii, 273.

Potassium sulphate crystals, thermal expansion of (Tutton), A., ii, 630.
  thermal change on diluting saturated solutions of (Pollok), P., **1899**, 8.
  densities of solutions of (Barnes and Scott), A., ii, 406.
 antimony sulphate (Gutmann), A., ii, 33.
 copper sulphate, conductivity of solutions of (MacGregor and Archibald), A., ii, 201.
 iron alum (Howe and O'Neal), A., ii, 103.
 ferrous sulphate, hydrates of, and their solubilities and transition temperatures (Küster and Thiel), A., ii, 753.
 praseodymium sulphate and selenate (Scheele), A., ii, 99.
 sodium sulphate (Meyerhoffer and Saunders), A., ii, 410.
 vanadium sulphate (Piccini), A., ii, 297.
 *per*sulphate, action of potassium iodide on, catalysis in; molecular formula of (Price), A., ii, 147.
 sulphite, absorption of nitric oxide by solutions of (Divers), T., 82; P., **1898**, 221.
 sulphonosmate, and osmisulphites (Rosenheim and Sasserath), A., ii, 665, 666.
 tellurides and sulphides, by action of potassammonium on tellurium and sulphur (Hugot), A., ii, 747.
 paratungstate, action of hydrogen on; tungstate, compound of, with tungsten *di*- and *tri*-oxides (Hallopeau), A., ii, 32.
 magnesium, manganese, zinc, and cadmium paratungstates (Hallopeau), A., ii, 159, 160.
 *hexa*tungsto*per*iodate (Rosenheim and Liebknecht), A., ii, 744.
 tungsto-tungstate (Hallopeau), A., ii, 555.
 pyro*per*vanadate and *per*vanadate (Melikoff and Pissarjewsky), A., ii, 298.

Potassium organic compounds:—
 acetylide (Moissan), A., i, 241.
 cuprotartrate, and its electrolysis (Masson and Steele), T., 725; P., **1899**, 120.
 carbonylferrocyanide, synthesis of (Muller), A., i, 728.
 cyanide, heat evolved on mixing solutions of, with solutions of phenol, hydrochloric acid, nitric acid, acetic acid, hydrogen sulphide, or boric acid (Berthelot), A., ii, 737.

Potassium organic compounds:—
 cyanide, stability of, towards alkalis, relative to that of acetonitrile (Fischer), A., i, 262.
  compound of, with chromium *tetr*oxide (Wiede), A., i, 319.
  condensing action of, on aldehydes and on mixtures of aldehydes and ketones (Claisen), A., i, 667.
 mercuric and potassium zinc cyanides, action of hydrogen sulphide or sodium sulphide on (Berthelot), A., ii, 422.
 silver cyanide, and its decomposition (Berthelot), A., i, 846.
   action of hydrogen sulphide or sodium sulphide on solutions of (Berthelot), A., ii, 421.
 zinc cyanide, and its decomposition (Berthelot), A., i, 847.
 β-ferricyanide, formation of, by the action of acids on the normal ferricyanide (Locke and Edwards), A., i, 407, 557.
 ferrocyanide, comparison of its solubility with that of sodium ferrocyanide (Conroy), A., i, 2.
  contraction of aqueous solutions of, on diluting (Wade), T., 271; P., **1899**, 8.
  action of carbonic anhydride on (Gigli), A., ii, 387.
  action of dilute acids on (Autenrieth), A., ii, 387.
 vanadium thiocyanate (Cioci), A., i, 321.
 pallado-oxalate (Vèzes), A., i, 672.
 platoso-oxalate (Vèzes), A., i, 572.
 platoso-oxalonitrite (Vèzes), A., i, 671, 741.

Potassium, detection and estimation of:—
 detection of, in silicates (Cole), A., ii, 521.
 estimation of (Diamant), A., ii, 57; (Atterberg), A., ii, 125; (Bell), A., ii, 809.
 estimation of, as *per*chlorate (Shiver), A., ii, 521.
 estimation of, as platinochloride (Bolm), A., ii, 695.
 estimation of, in fertilisers (Eggertz and Nilson), A., ii, 384.
 estimation of, in rocks (Bonjean), A., ii, 695.
 estimation of, in soils (Maxwell), A., ii, 521.
 estimation of, in urine (Herringham), A., ii, 333.

Potatoes. See Agricultural chemistry.

Potential. See Electrochemistry.

Pottery, Egyptian, composition of (Le Chatelier), A., ii, 752.

Poudrette. See Agricultural chemistry.
Powellite from Michigan (Palache), A., ii, 495.
Praseodymium, atomic weight of (Jones), A., ii, 292.
  bands, in spectrum of didymium from monazite sands (Urbain), A., ii, 425.
Praseodymium chloride, bromide, nitrate, sulphate, selenate acid selenite, carbonate, dithionate, platinochloride, platinobromide, platinocyanide, aurichloride, and auribromide, sodium and ammonium nitrates, potassium and ammonium sulphates, and potassium selenate (Scheele), A., ii, 99, 100.
  oxide, complex oxides containing (Wyrouboff and Verneuil), A., ii, 424.
Praseodymium, separation of neodymium from (Scheele), A., ii, 291.
Pregnancy, effects of inanition during (Charrin and Guillemonat), A., ii, 733.
Prehnite, vapour pressure of (Tammann), A., ii, 8.
Prehnitolcarboxylic acid, synthesis of (Gattermann and Prentice), A., i, 510.
Presidential Address (Dewar), T., 1167; P., **1899**, 77.
Presidents, Past, banquet to, P., **1899**, 189.
Pressure, apparatus for reactions under high (Hite), A., i, 592.
Principle of minimum work (Tommasi), A., ii, 413.
Propaldehyde, action of hydrogen cyanide on (Henry), A., i, 182.
  *di*bromo- (*acraldehyde dibromide*), action of water on (de Bruyn), A., i, 110.
  nitro-, phenylhydrazone (*phenylnitroazopropane*) and its hydrolysis (Bamberger), A., i, 108.
Propane, from the decomposition of hexane by aluminium chloride, and solubility in amylic alcohol (Friedel and Gorgeu), A., i, 181.
  ratio of specific heats for (Daniel and Pierron), A., ii, 725.
Propane, *αβ-di*bromo-. See Propylenic bromide.
  *ααβ-tri*bromo-, from action of bromine on *αβ*-propylenic bromide in presence of aluminium bromide, and the action of bromine on it (Mouneyrat), A., i, 555.
  *αβγ-tri*bromo- ((*tribromhydrin*) and *ααβ-tri*bromo-, from action of bromine on propylenic bromide in presence of aluminium bromide (Mouneyrat), A., i, 97, 555.
Propane, *ααβγ-tetra*bromo- (Mouneyrat), A., i, 97, 556.
  *ααγγ-tetra*bromo-, from action of bromine on hydrocarbon, C_3H_4 (Freundler), A., i, 98.
  *ααβγγ-penta*bromo- (Mouneyrat), A., i, 97, 556.
  *di*chloro-. See Propylenic chloride.
  *ααβ-tri*chloro-, *ααβγ-tetra*chloro- and *penta*chloro- (Mouneyrat), A., i, 725.
  nitro-, electrolytic reduction of (Pierron), A., i, 844.
  αβ- and *αγ-di*thiocyano-, action of, on ethylic cupracetoacetate (Kohler), A., i, 737.
cyclo-**Propane** (*trimethylene*), preparation of (Wolkoff and Menschutkin), A., i, 196; (Gustavson), A., i, 421.
  boiling and melting points of (Ladenburg and Krügel), A., ii, 545.
  conversion of, into propylene (Wolkoff and Menschutkin), A., i, 196; Tanatar), A., i, 422, 657.
  action of bromine on (Tanatar), A., i, 657; (Berthelot), A., i, 872.
  cyano-, attempted preparation of (Carpenter and Perkin), T., 927; P., **1899**, 134.
cyclo-**Propanecarboxylic acid** (*trimethylenecarboxylic acid*) (Idzkowska and Wagner), A., i, 489.
  cyano-, salts and amide (Carpenter and Perkin), T., 924; P., **1899**, 134.
cyclo-**Propanecarboxylonitrile** (*ethyleneacetonitrile, trimethylenecarbonitrile*) (Henry), A., i, 676.
Propanedicarboxylic acids. See:—
  Glutaric acid.
  Methylsuccinic acid.
cyclo-**Propanedicarboxylic acid** (*trimethylenedicarboxylic acid*), formation of (Carpenter and Perkin), T., 927; P., **1899**, 134.
Propanediolamine. See *αβ*-Propylenic glycol, *γ*-amino-.
Propanepentacarboxylamide (Ruhemann), T., 247; P., **1899**, 6.
Propanepentacarboxylic acid, ethylic salt, action of ammonia on (Ruhemann), T., 247; P., **1899**, 6.
Propanetetracarboxylic acid (*methylenedimalonic acid*), ethylic salt (Knoevenagel), A., i, 116; (Komppa), A., i, 416.
Propanetricarboxylic acid. See Carboxyglutaric acid.
Propanilide, action of sulphuric acid on (Bagnall), T., 282.
Propargylic alcohol (*propinol*), and its iodo-derivative, and action of water (Lespieau), A., i, 184.

ω_2-Δ-ω_1-Propenetricarboxylic acid. See *iso*-Aconitic acid.

Propenyl-β-*o*-aminophenylbenzimidazole, and its salts (von Niementowski), A., i, 646.

Propionamide, preparation of (Aschan), A., i, 14.
  mercury compound of, constitution of (Kieseritzky), A., ii, 395.

Propionamidoazobenzene, α-bromo-, and its lactyl derivative (Bischoff and Hurewitsch), A., i, 231.

Propionic acid, probable presence of, in plants (Lieben), A., ii, 45.
  from oxidation of ethylacrylic acid, and its anilide (Crossley and Le Sueur), T., 167; P., **1898**, 219.
  influence of, on formation of azo-compounds (Goldschmidt and Bürkle), A., ii, 276.
  condensation of *iso*butaldehyde and acetaldehyde with (Kietreiber), A., i, 331.
  separation of, from other fatty acids (Holzmann), A., ii, 68.
  separation of acetic, butyric, and formic acids from (Haberland), A., ii, 531.

Propionic acid, mercury salt, dissociation and conductivity of (Ley and Kissel), A., ii, 486.
  praseodymium salt (Scheele), A., ii, 100.
  silver salt, solubility of (Arrhenius), A., ii, 360.
  amylic salt, density, specific rotation and molecular volume of (Frankland), T., 358.
    depression of freezing point of thymol by, and viscosity of solutions of, in thymol (Schall), A., ii, 640.
  and bromo-, *l*-amylic salts, molecular rotations of (Walden), A., ii, 622.
  and αα-*di*bromo-, ethylic salts, velocity of formation and hydrolysis of (Sudborough and Lloyd), T., 474; P., **1899**, 3.

Propionic acid, α-bromo-, ethylic salt, action of benzylaniline and diphenylamine on (Bischoff), A., i, 125.
    ethylic salt, action of sodium alkyloxides on (Bischoff), A., i, 669, 670.
    ethylic salt, condensation of, with ethylic acetoacetate, methylacetoacetate, malonate, methylmalonate, cyanacetate, and α-cyanopropionate (Bone and Sprankling), T., 847.

Propionic acid, chloro-, optical isomerism of (Walden), A., ii, 393.
    and bromo-, ethereal salts, densities, specific rotations and molecular volumes of (Frankland), T., 357.
  α-*di*chloro-, sodium salt, electrolysis of; also formation of α-*di*chlorethylic salt of (Troeger and Ewers), A., i, 12.
  α-cyano-, ethylic salt, condensation of, with ethylic α-brom*iso*butyrate (Bone and Sprankling), T., 851.
  β-iodo-, sodium salt, electrolysis of (Troeger and Ewers), A., i, 12.

Propionitrile (*ethylic cyanide*), conductivity of electrolytes in (Dutoit and Friderich), A., ii, 350.
  action of cuprous chloride on (Rabaut), A., i, 557.
  α-and β-chloro- (Henry), A., i, 183.

Propionobenzylamide, α-bromo- (Bischoff and Tschunkew), A., i, 277.

Propiono-benzylanilide and **-diphenylamide,** α-bromo- (Bischoff), A., i, 126.

Propionodiphenylhydrazide, α-bromo- (Bischoff), A., i, 278.

Propiono-*o*-nitranilide, α-bromo (Bischoff and Päpke), A., i, 278.

Propiono-*m*-nitranilide, α-bromo- (Bischoff and Watschjanz), A., i, 278.

Propiono-*p*-nitranilide, α-bromo- (Bischoff and Hirschfeld), A., i, 278.

Propionophenetidide, bromo- (Bischoff and Schatz), A., i, 278.

Propionophenylhydrazide, preparation of (Leighton), A., i, 51.

β-Propionophenylhydrazide, from hydrolysis of nitropropaldehydephenylhydrazone (Bamberger), A., i, 108.

Propionopiperidide (Auerbach and Wolffenstein), A., i, 936.
  α-bromo- (Bischoff and Holm), A., i, 230.

Propiono-*m*-toluidide, α-bromo- (Bischoff and Päpke), A., i, 277.

Propiono-*m*-xylidide, α-bromo- (Bischoff and Päpke), A., i, 278.

p-**Propionylanisoil,** hydrolysis of, by phosphoric acid (Klages and Lickroth), A., i, 599.

Propionylbutyryl. See Ethyl propyl diketone.

Propionylcarbazole, α-bromo- (Bischoff and Waldmann), A., i, 231.

Propionyl-ψ-cumene and its compound with phosphoric acid (Klages and Lickroth), A., i, 599.

p-**Propionylethylbenzene,** and oxime (Klages and Lickroth), A., i, 599.

Propionylformic acid (*α-ketobutenoic acid*), probable formation of, by action of soda on vinylglycollic acid (Sleen), A., i, 864.
αα-**Propionylhydroxypropionic acid**, oxime, and salts (Hanriot and Reynaud), A., i, 723.
Propionylmalic acid, ethereal salts, specific rotations, and molecular volumes of (Frankland), T., 348, 351.
Propionylpentethylbenzene (Klages and Lickroth), A., i, 599.
Propionylpropionitrile, action of cuprous chloride on (Rabaut), A., i, 557.
Propionylvaleryl. See Ethyl butyl diketone.
o-**Propiophenonecarboxylic acid** (Gottlieb), A., i, 511.
p-**Propoxybenzamide** (Gattermann and Kjellbom), A., i, 510.
Propylacetoacetic acid, *di*bromo-, ethylic salt, formation of ethylmesaconic acid from (Semenoff), A., i, 792.
iso-**Propylacetoacetic acid**, *di*bromo-, ethylic salt, formation of dimethylmesaconic acid from (Semenoff), A., i, 792.
β-*iso*-**Propylacetobutyric acid**, ethylic salt, and action of sodium ethoxide on (Barbier and Grignard), A., i, 113.
iso-**Propylacrylic acid.** See Hexenoic acid.
β-*iso*-**Propylacrylic acid.** See Hexenoic acid.
β-*iso*-**Propylacrylonitrile.** See Hexenoic acid, nitrile of.
Propylamine, compounds of, with metallic salts (Matthews), A., ii, 296.
  action of nitrosyl chloride on (Solonina), A., i, 473.
o-**Propylaniline** (Gottlieb), A., i, 512.
  and its salts, and acetyl and benzoyl derivatives (Piccinini and Camozzi), A., i, 74.
Propylbenzamide, β-bromo- (Uedinck), A., i, 497.
Propylbenzenesulphonamides, *o*-, *m*-, and *p*- (Moody), P., **1899**, 16.
Propylbenzene-2-, -3-, and -4-sulphonic acids, and their amides (Moody), P., **1899**, 16.
Propylbenzoic acid. See *n*-Cuminic acid.
Propylbornylamine, hydrochloride, hydriodide, platinochloride, benzoyl derivative (Forster), T., 948; P., **1899**, 72.
iso-**Propylbornylamine**, platinochloride (Forster), T., 949; P., **1899**, 72.
p-*iso*-**Propyl***iso***butenylbenzene** (Saposchnikoff), A., i, 896.
β-*iso*-**Propylbutyric acid.** See Heptoic acid.
Propylcacodylic acid. See Dipropylarsinic acid.
Propylcarbamide, *di*bromo-, and its aurichloride and picrate (Rundqvist), A., i, 17.
n- and *iso*-**Propylchlorophosphine**, and action of water, chlorine, and sulphur on (Guichard), A., i, 563.
Propylcitraconic acid and its anhydride; also its reduction, and its conversion into propylitaconic and propylmesaconic acids (Fittig and Fichter), A., i, 336.
iso-**Propylcitraconic acid** and its anhydride; also its reduction, and its conversion into *iso*propylitaconic and *iso*propylmesaconic acids (Fittig and Burwell), A., i, 336.
Propylene, production of, from *cyclo*propane (Tanatar), A., i, 422, 657; (Berthelot), A., i, 872.
  boiling point of (Ladenberg and Krügel), A., ii, 545.
  action of bromine on (Tanatar), A., i, 657; (Berthelot), A., i, 872.
  bromhydrin and iodhydrin, action of potassium cyanide on (Henry), A., i, 182.
Propylene, α-bromo-, and β-bromo-, formation of (Solonina), A., i, 681.
  *di*bromo-, from action of bromine on hydrocarbon, C_3H_4 (Freundler), A., i, 98.
  α-*di*chloro- (Jocitsch and Faworsky), A., i, 786.
Propylenediamine, compounds of, with salts of nickel and platinum (Werner, Megerle, Pastor, and Spruck), A., i, 856.
Propylenedicarboxylic acids. See :—
  Citraconic acid.
  Glutaconic acid.
  Itaconic acid.
  Mesaconic acid.
Propylenedipiperidide (Aschan), A., i, 542.
iso-**Propylenemalonic acid,** ethylic salt, condensation of, with ethylic sodiomalonate (Lawrence), P., **1899**, 62.
Propylene-ααβγ-tetracarboxylic acid ethylic salt, from action of ethylic sodiomalonate on ethylic *di*bromomaleate (Ruhemann and Cunnington), T., 963; P., **1899**, 186.
Propylene-ααγγ-tetracarboxylic acid. See Dicarboxyglutaconic acid.
Propylene-ψ-thiocarbamide, action of nitrous acid on, and its nitro-derivative (Gabriel and Leupold), A., i, 104.
Propylenetricarboxylic acids. See Aconitic acids.

Propylenic bromide (*αβ-dibromopropane*), from action of bromine on propylic bromide in presence of aluminium bromide (Mouneyrat), A., i, 97.
  action of bromine on, in presence of aluminium bromide (Mouneyrat), A., i, 555.
  action of solution of aluminium bromide in carbon *di*sulphide on (Konowaloff), A., i, 471.
  action of zinc on (Berthelot), A., i, 872.
 chloride, formation of, and action of chlorine on, in presence of aluminium chloride (Mouneyrat), A., i, 725.

αβ-**Propylenic glycol,** preparation of (Henry), A., i, 660.
 action of bromine water on (Kling), A., i, 787.
 biochemical oxidation and purification of (Kling), A., i, 323.

αβ-**Propylenic glycol,**γ-amino- (*propanediolamine*) (Chiari), A., i, 325; (Knorr and Knorr), A., i, 411.
 α-thiocyano- (*α-thiocyanhydrin*), from action of potassium thiocyanate on α-chloropropylenic glycol (Engle), A., i, 3.

αγ-**Propylenic glycol.** See Trimethylene glycol.

iso-**Propylethane.** See Pentane.

iso-**Propylethylene.** See Amylene.

iso-**Propylethylnitramine** (Franchimont and Umbgrove), A., i, 106.

β-iso-**Propylglutaric acid** (*hexanedicarboxylic acid*) (Lawrence), T., 532; P., 105.
 and its ethylic and silver salts (Knoevenagel), A., i, 116.
 and imide, anhydride, and anilic acid; also dissociation constant (Howles and Thorpe), P., **1899**, 104.

β-iso-**Propylglutaric acid,** α-cyano, ethylic, and ethylic hydrogen salts (Howles and Thorpe), P., **1899**, 104.

n- and *iso*-α-**Propylglyceric acids** (*dihydroxyhexoic acids*), and the lead salt of the former (Semenoff), A., i, 866.

Propylic alcohol, dielectric constant of, temperature coefficient of (Abegg and Seitz), A., ii, 623.
 specific heat and heat of vaporisation of (Luginin), A., ii, 269.
 critical temperatures of mixtures of, with ethane (Kuenen and Robson), A., ii, 356.
 heat of combustion of (Zouboff), A., ii, 589.
 action of hydrogen peroxide on, in presence and absence of iron (Fenton and Jackson), T., 2; P., **1898**, 240.

Propylic alcohol, velocity of reaction between propylic benzenesulphonate and (Sagrebin), A., ii, 735.
 sodium derivative, action of, on ethylic salts of α-bromo-fatty acids (Bischoff), A., i, 669.
 compound of, with carbon *di*oxide (Hempel and Seidel), A., ii, 152.

Propylic alcohol, *αβ-di*bromo- (*αβ-dibromhydrin*), action of potassium thiocyanate on (Engle), A., i, 3.
 ββγ- and *βγγ-tri*bromo-, and *ββγγ-tetra*bromo- (Lespieau), A., i, 184.
 α- and γ-cyano-. See α- and γ-Hydroxybutyronitrile.
 *αβ-di*thiocyano- (*αβ-dithiocyanhydrin*), from action of potassium thiocyanate on *αβ-di*bromopropylic alcohol (Engle), A., i, 3.

iso-**Propylic alcohol,** electrical dispersion of (Löwe), A., ii, 201.
 specific heat and heat of vaporisation of (Luginin), A., ii, 269.
 heat of combustion of (Zouboff), A., ii, 589.
 critical temperature of mixtures of, with ethane (Kuenen and Robson), A., ii, 356.
 and its benzenesulphonate, velocity of reaction between (Sagrebin), A., ii, 735.
 action of hydrogen peroxide on, in presence and in absence of iron (Fenton and Jackson), T., 2; P., **1898**, 240.
 action of phosphorus *tri*bromide on (Menschutkin), A., i, 937.
 action of phosphorus *tri*chloride on (Milobendski), A., i, 659.
 aluminium derivative of (Tistschenko), A., i, 408.
 sodium derivative, action of, on ethylic salts of α-bromo-fatty acids (Bischoff), A., i, 669.

iso-**Propylic alcohol,** ββ-bromonitro-, and its nitrate and acetate; also the action of formaldehyde on it (Maas), A., i, 322.
 *αγ-di*chloro- (*αγ-dichlorhydrin*), action of potassium thiocyanate on (Engle), A., i, 3.
 β-cyano-. See β-Hydroxybutyronitrile.
 nitro-, and the action of acetic chloride on it (Henry), A., i, 475.
  action of potassium dichromate and sulphuric acid on (Henry), A., i, 251.
 *αγ-di*thiocyano- (*αγ-dithiocyanhydrin*), from action of potassium thiocyanate on *αγ-di*chlor*iso*propylic alcohol (Engle), A., i, 3.

Propylic amylic ether, density, specific rotation, and molecular volume of (Frankland), T., 360.
  β-*di*sulphide, *di*amino-, from action of iodine on mercaptomethylthiazoline, and its hydrochloride and picrate (Gabriel and Leupold), A., i, 104.
  bromide, action of bromine on, in presence of aluminium bromide (Mouneyrat), A., i, 97.
    action of solution of aluminium bromide in carbon *di*sulphide on (Konowaloff), A., i, 471.
  chloride, action of chlorine on, in presence of aluminium chloride (Mouneyrat), A., i, 725.
  cyanide. See Butyronitrile.

β-**Propylideneaminobiuret**, and the action of nitric acid and of hydrogen cyanide on it (Thiele and Uhlfelder), A., i, 118.

β-**Propylidenebenzenesulphonehydrazine**, and acetyl derivative (Curtius and Lorenzen), A., i, 149.

β-**Propylidene-*m*- and *p*-bromobenzhydrazides** (Curtius and Portner), A., i, 136.

Propylidenedicarboxylic acid. See Ethylidenemalonic acid.

β-**Propylidene-β-naphthylsulphonehydrazide** (Curtius and Lorenzen), A., i, 149.

Propylidenetricarboxylic acid. See *iso*-Aconitic acid.

iso-**Propylimidazolone** (Conrad and Hock), A., i, 632.

Propylitaconic acid, and its reduction (Fittig and Fichter), A., i, 336.

iso-**Propylitaconic acid**, and its reduction (Fittig and Burwell), A., i, 336.
  action of sulphuric acid on (Fittig and Thron), A., i, 337.

Propylmalonic acid, heat of solution and neutralisation of (Massol), A., ii, 204.

Propyl-β-mercaptan, amino-, hydrochloride, from action of hydrochloric acid on mercaptomethylthiazoline; also its picrate (Gabriel and Leupold), A., i, 104.

Propylmesaconic acid, and its reduction (Fittig and Fichter), A., i, 336.

iso-**Propylmesaconic acid** ("*oxyheptic acid*"), and its reduction (Fittig and Burwell), A., i, 336.

iso-**Propylmethylnitramine** (Franchimont and Umbgrove), A., i, 106.

Propylnitramine and its alkyl derivatives (Umbgrove and Franchimont), A., i, 105, 106.

Propyl-*o*- and -*p*-nitrobenzamides, β-bromo- (Uedinck), A., i, 498.

Propylnitrolic acid, formation of (Ponzio), A., i, 667.

n- and *iso*-**Propyloxychlorophosphines** (Guichard), A., i, 564.

Propylparaconic acid, ethylic salt, action of sodium ethoxide on (Fittig and Fichter), A., i, 336.

iso-**Propylparaconic acid**, ethylic salt, and the action of sodium ethoxide on (Fittig and Burwell), A., i, 336.

iso-**Propyl*iso*paraconic acid**, and its ethylic salts (Fittig and Burwell), A., i, 337.
  preparation of, and the action of heat on it; also the action of sodium on its ethylic salt (Fittig and Thron), A., i, 337.

N-*iso*-Propylphenacetine (Hinsberg), A., i, 495.

p-**Propylphenol**, and its *tri*bromo-derivatives (Klages), A., i, 585.

p-**Propylphenylic methylic ether** (Klages), A., i, 585.

3-*iso*-Propylphenyl-1-methyl-*cyclo*-hexanol-5, and acetyl derivative; **3-*iso*-Propylphenyl-1-methyl*cyclo*hexanone-5-**, and semicarbazone; **3-*iso*-Propylphenyl-1-methyl*cyclo*hexene** (Knoevenagel, Wedemeyer, and Giese), A., i, 291.

3-*iso*-Propylphenyl-1-methyl-5-*cyclo*-hexenone and oxime (Knoevenagel and Wedemeyer), A., i, 215.
  dimeric form of (Knoevenagel and Reinecke), A., i, 341.

3-*iso*-Propylphenyl-1-methyl-5-*cyclo*hexenone-2:4-dicarboxylic acid, ethylic salt and oxime (Knoevenagel and Wedemeyer), A., i, 215.

p-*iso*-**Propylphenylpivalic acid**, synthesis of, and salts (Saposchnikoff), A., i, 896.

n- and *iso*-**Propyl-phosphinic** and **-phosphinous acids** (Guichard), A., i, 564.

Propylphthalide, and *iso*-**Propylphthalide** (Gucci), A., i, 513.

1-Propyl-2-pipecoleine (1-*propyl*-Δ^2-*tetrahydropicoline*) (Ladenburg and Theodor), A., i, 304.

N-Propyl-α-pipecoleyl-β-alkine. See 2-Methyl-3-hydroxymethyl-1-propyl-Δ^2-tetrahydropyridine.

1-Propyl-2-pipecoline (Ladenburg and Theodor), A., i, 304.
  rotation of (Hohenemser and Wolffenstein), A., i, 937.

N-Propyl-α-pipecolyl-β-alkine. See 2-Methyl-3-hydroxymethyl-1-propylpiperidine.

2-Propylpiperidine, rotation of (Hohenemser and Wolffenstein), A., i, 936.
  oxide (Auerbach and Wolffenstein), A., i, 935.
Propylpyrrolidine, bromo- (Schlinck), A., i, 541.
4′-Propylquinoline and salts (Koenigs), A., i, 75.
2′-*iso*-Propylquinoxaline (Conrad and Hock), A., i, 642.
***iso*-Propylsuccinic acid,** oxidation of (Lawrence), T., 531; P., 105.
n- and ***iso*-Propylsuccinic acids,** β-bromo- (Semenoff), A., i, 866.
1-Propyl-Δ_2-tetrahydropicoline. See 1-Propyl-2-pipecoleine.
***iso*-Propyltetrahydroquinoxaline** (Conrad and Hock), A., i, 642.
Propylthiochlorophosphine (Guichard), A., i, 564.
Propylvaleraldehyde, amino-, action of carbon *di*sulphide on (Maass and Wolffenstein), A., i, 110.
Prosopite from Utah (Hillebrand), A., ii, 301.
Prostate, action of the secretion of the (Camus and Gley), A., ii, 779.
Protagon, amount of, in normal and degenerated nerve-fibres (Noll), A., ii, 568.
Protamine of mackerel spermatozoa (Kuraéeff), A., ii, 313.
  detection of, in sections of animal organs (Saint-Hilaire), A., ii, 133.
Protamines, classification and hydrolytic products of (Kossel), A., i, 833.
Proteid food stuffs, digestibility of certain (Schulze), A., ii, 509.
  nitrogen, distinction between amidic nitrogen and (Mallet), A., ii, 576.
  substances, non-formation of, by *Bacillus choleræ*, *B. diptheritidis* and Löfler's bacillus (Hugounenq and Doyon), A., ii, 377.
Proteids (*albuminoids*), constitution of (Hausmann; Pröscher), A., i, 653; (Osborne), A., i, 836.
  molecular weights of (Vaubel), A., i, 839.
  presence of, in fungi (Winterstein), A., ii, 240.
  of muscle (Stewart and Sollmann). A., ii, 680.
  in *Picea excelsa* seeds, decomposition of (Rongger), A., ii, 241.
  in plants, formation of (Hébert), A., ii, 47.
  of wheat gluten (Ritthausen), A., i, 724.
  separable from yeast extract (Wróblewski), A., ii, 170.
Proteids (*albuminoids*), basic and acid capacity of (Spiro and Pemsel), A., ii, 230.
  action of formaldehyde on (Lepierre), A., i, 654.
  action of superheated water on (Salkowski), A., ii, 374.
  absorption of, from the intestine (Mendel), A., ii, 230; (Levene and Levin), A., ii, 309.
  coagulation of, by electricity (Hardy), A., ii, 567.
  the decomposition processes of (Prianischnikoff), A., ii, 787.
  influence of sugar on decomposition of (Salkowski), A., i, 724.
  in plants, decomposition of (Schulze), A., ii, 240.
  conversion of, into fat in the living body (Cremer), A., ii, 775.
  conversion of, into sugar in the living body (Kumagawa and Miura; Cohn), A., ii, 776.
  course of peptic digestion of (Zunz), A., ii, 774.
  products of digestion of (Lawroff), A., ii, 309.
  formation of glycocine by decomposition of (Spiro), A., ii, 777.
  formation of scatoleacetic acid in putrefaction of (Salkowski), A., ii, 567.
  influence of sodium chloride on metabolism of (Straub), A., ii, 372.
  metabolism of phosphorus-containing (Zadik), A., ii, 774.
  reactions of the histone group of (Bang), A., i, 836.
  solubility of, in glycerol (Ritthausen), A., i, 724.
  coagulable, separation of, from malt, wort and beer (Laszczynski), A., ii, 793.
  detection of (Elliott), A., ii, 136; (Gnezda), A., ii, 715.
  estimation of, in blood serum (Patein), A., ii, 827.
  estimation of, in urine (Chibret), A., ii, 459.

Proustite, artificial (Sommerlad), A., ii, 216.
Prozan (*triazan*), derivatives of (Thiele and Osborne), A., i, 413.
Prunus laurocerasus, presence and distribution of hydrocyanic acid in (van der Ven), A., ii, 240.
Prussian Blue, solubility of, in ether and chloroform in presence of fat (Fresenius and Grünhut), A., ii, 262.
Prussic acid. See Hydrocyanic acid under Cyanogen.
"**Pseudo-catalysis**" (Wagner), A., ii, 275.
Pseudomalachite. See Phosphorochalcite.
Psilomelane from Colorado (Eakins), A., ii, 564.
Ptomaines (*leucomaines*) of the brain (Gulewitsch), A., ii, 439.
  estimation of, in urine (Chibret), A., ii, 459.
Ptyalin, influence of various substances on the activity of (Kübel), A., ii, 603.
Pulegenacetone, and oxime, and benzoyl derivative (Barbier), A., i, 299.
iso-**Pulegol,** in commercial citronellal (Tiemann), A., i, 622.
Pulegone and its hydrosulphonic acids, formation of, from action of sulphurous acid on citronellal (Tiemann and Krüger), A., i, 248.
  action of ethylic sodiomalonate on (Vorländer and Gärtner), A., i, 259.
Pulveraria chlorina, *P. latebrarum* and *P. farinosa*, constituents of (Hesse), A., i, 385.
Pulveraric acid from *Pulveraria farinosa*, and its barium salt (Hesse), A., i, 386.
Pulverin from *Pulveraria latebrarum* (Hesse), A., i, 385.
Pump, Geissler's, modification of (Guglielmo), A., ii, 474.
Purine, and salts (Fischer), A., i, 175.
  *tri*chloro-, behaviour of, towards potassium hydrosulphide (Fischer), A., i, 262.
  2 : 6-*di*iodo (Fischer), A., i, 175.
Purine group, summary of results, and of methods of synthesis (Fischer), A., i, 458.
Purpurin (1 : 2 : 4-*trihydroxyanthraquinone*), *mono*metallic derivatives of (Perkin), T., 435; P., **1899**, 65.
  methylic ether (Perkin), T., 446; P., **1899**, 66.
Putrescine. See Tetramethylenediamine.
Pyknometer, Sprengel's modification of (Minozzi), A., ii, 646.
  temperature corrections in using (Fuchs), A., ii, 272.
Pyrazole, from acetylene and diazomethane (von Pechmann), A., i, 232.
1 : 3 : 5-Pyrazole, formation of (Seidel), A., i, 139.
Pyrazole-4 : 5-dicarboxylic acid, and methylic salt (von Pechmann and Seel), A., i, 948.
Pyrazolones, conversion of, into pyrazoles (Michaelis and Röhmer), A., i, 233.
Pyridazine-3-carboxylic acid (Gabriel and Colman), A., i, 392.
Pyridazone, *di*bromo-, and its barium salt (Bistrzycki and Simonis), A., i, 392.

Pyridine, specific heat, and heat of vaporisation of (Luginin), A., ii, 354.
  depression of freezing point of *o*-nitrophenol by (Ampola and Rimatori), A., ii, 353.
  aminolytic constant of (Goldschmidt and Salcher), A., ii, 551.
  distillation of, with aliphatic acids (André), A., i, 160.
  absorption of argon by (Berthelot), A., ii, 653.
  action of chloranil on (Imbert), A., i, 633.
  action of, on cupric salts (Moitessier), A., i, 808.
  action of ethylenic iodide on (Ladenburg), A., i, 387.
  action of potassium dichromate and sulphuric acid on (Oechsner de Coninck), A., i, 472.
  reactions of metallic salts dissolved in (Naumann), A., ii, 423.
  compound of, with carbonyl chloride (Morel), A., i, 877.
  compounds of palladium (Rosenheim and Maass), A., i, 163.
  compounds of, with metallic salts (Matthews), A., ii, 296.
  salts and hydrates of bivalent metals with (Reitzenstein), A., i, 160.
  cerium hexachloride (Koppel), A., ii, 98.
  hydrochloride, action of chlorine on (Sell and Dootson), T., 979; P., **1899**, 187.
Pyridine, 2-amino-, *o*-hydroxybenzylidene, and *p*-nitrobenzylidene derivatives of (Fischer, Hoerger, and Jaeger), A., i, 634.
  3-amino- (Curtius and Mohr), A., i, 73.
  2-bromo-, and salts (Fischer and Seidel), A., i, 634.
  2-chloro- (Fischer, Hoerger, and Jaeger), A., i, 633.
  4-chloro-, salts of (Fischer and Demeler), A., 635.
  *di*chloro-, *tetra*chloro-, and *tri*chloramino- (Sell and Dootson), T., 986; P., **1899**, 187.
  2-iodo-, methiodide of (Fischer, Hoeger, and Jaeger), A., i, 634.
Pyridineazoresorcinol (Mohr), A., i, 72.
Pyridine-3-carboxylic acid. See Nicotinic acid.
Pyridylacetonyl chloride and its oxime, and physiological action of (Schmidt), A., i, 4.
    oxime, hydrazone, and salts, and monoacetyl derivative (Schmidt and Knuttel), A., i, 228, 229.
Pyridylacetophenyl bromide and its oxime, and physiological action of (Schmidt), A., i, 4.
β-Pyridilurethane (Curtius and Mohr), A., i, 73.
Pyrimidine (m-*diazine*) (Gabriel and Colman), A., i, 639.
Pyrimidine-4-carboxylic acid (Gabriel and Colman), A., i, 639.
Pyrites (*iron pyrites*) deposited by mineral water (Knett), A., ii, 772.
  tetartohedrism (?) of (Miers and Hartley), A., ii, 432.
  estimation of sulphur in (Heidenreich), A., ii, 517; (Meineke), A., ii, 693; (Herting), A., ii, 804.
  magnetic, relation of ferrous sulphide and troilite to (Linck), A., ii, 416.
Pyrocatechol. See Catechol.
Pyrochroite from Sweden, origin of (Sjögren), A., ii, 761.
Pyrocinchonic anhydride, from distillation of methylitaconic and methylmesaconic acids (Fittig and Kettner), A., i, 333.
  condensation of, with benzaldehyde (Thiele), A., i, 216.
Pyrogallol, influence of, on the oxidation of iodide by bromic acid (Schiloff), A., ii, 147.
  action of sodium on, in alcohol (Kunz-Krause), A., i, 200.
  action of iron salts on (Hirsch), A., ii, 817.
  distinction between gallic acid and (Griggi), A., ii, 581.
  potassium derivative, absorption of oxygen by (Berthelot), A., i, 427.
  dimethylic ether, and its ethylic carbonate (Rosauer), A., i, 346.
Pyrogallolsuccinein, and salts (von Georgievics), A., i, 803.
Pyromeconic acid, action of iodic acid and of iodoform on (Peratoner and Leonardi), A., i, 421.
  iodo- (Peratoner and Leonardi), A., i, 421.
Pyromorphite from New South Wales (Mingaye), A., ii, 670.
Pyromucic acid, barium salt, hydrocarbon from distillation of (Freundler), A., i, 98.
1 : 2-Pyromucylacetic acid, ethylic salt (Bouveault), A., i, 120.
α-Pyrone derivatives, formation of, from ethylic phenylpropiolate and β-diketones (Ruhemann), T., 415; P., **1899**, 55.
Pyrophyllite from Russia (Alexéeff), A., ii, 673.
  vapour pressure of (Tammann), A., ii, 8.

Pyrotartaric acid. See Methylsuccinic acid.

Pyroxene. See Augite, Diopside, Diallage, Enstatite.

2 : 4-Pyrrodiazole. See 1 : 2 : 4-Triazole.

Pyrrolidineallyl-thiocarbamide, and -ψ-thiocarbamide (Schlinck), A., i, 541.

Pyrrolidine-phenyl-, -methyl-, and **-ethyl-thiocarbamides** (Schlinck), A., i, 540.

Pyrroline, heats of combustion and formation of (Berthelot and André), A., ii, 400.

action of, on argon (Berthelot), A., ii, 653.

isonitroso-, and its sodium salt (Spica and Angelico), A., i, 939.

Pyruvamide, semicarbazone of (Thiele and Bailey), A., i, 169.

β-*o*-**Pyruvaminophenyl**-*m*(*p*)-**tolimidazole** (von Niementowski), A., i, 645.

Pyruvic acid, action of benzylideneaniline on (Garzarolli-Thurnlackh), A., i, 823, 940.

action of, on malonic acid (Garzarolli-Thurnlackh), A., i, 790.

action of potassium cyanide on, and the hydrolysis of the product (Pommerehne), A., i, 574.

p-nitrophenylhydrazone (Hyde), A., i, 689.

salts of, transformation of, into the salts of parapyruvic acid (Wolff), A., i, 483.

Pyruvonitrile, semicarbazone of (Thiele and Bailey), A., i, 169.

Q.

Quartz, artificial formation of, by dry fusion (Morozewicz), A., ii, 765.

solubility of, in water; growth of (Spezia), A., ii, 300.

pseudomorphous, from N. Carolina (Hidden and Pratt), A., ii, 300.

See also Amethyst, Citrine, &c.

Quartz-porphyry from Algeria (Duparc and Ritter), A., ii, 601.

Quenstedtite from Iowa (Kuntze), A., ii, 761.

Quercetin, presence of, in heather (*Calluna vulgaris*) (Perkin and Newbury), T., 837 ; P., **1899**, 179.

monometallic derivatives, and tri-, and tetra-acetyl derivatives (Perkin), T., 438 ; P., **1899**, 65.

methylic ether. See Rhamnetin.

dimethylic ether. See Rhamnazin.

Quercetin, *di*bromo-, potassium derivative of (Perkin), T., 438 ; P., **1899**, 65.

Quercitrin, action of potassium acetate on (Perkin), T., 439.

Quercus. See Agricultural chemistry.

Quinacetophenone monethylic ether. See 5-Ethoxy-2-hydroxyacetophenone.

Quinaldine. See 2'-Methylquinoline.

Quince. See Agricultural chemistry.

Quince-seed oil (Hermann), A., i, 822.

Quinic acid, action of potash on (Holleman), A., i, 283.

Quinidine *d*- and *l*-mandelates (McKenzie), T., 967.

Quinine, azoimide (Pommerehne), A., i, 88.

d- and *l*-mandelates (McKenzie), T., 967.

detection of, with Piutti's reagent (Scarpitti ; Simoncelli), A., ii, 344.

detection of, in urine (Christomanos), A., ii, 344.

the thalleioquinine test for (Polacci), A., ii, 391.

estimation of, in cinchona bark (Lenz), A., ii, 391.

Quinol (1 : 4-*dihydroxybenzene*), action of sodium on, in alcohol (Kunz-Krause), A., i, 200.

condensation of, with benzoin (Japp and Meldrum), T., 1041 ; P., **1899**, 166.

Quinol, *tetra*chloro-, identification and separation of fatty acids by means of ; also its diacetyl-, dipropionyl-, dibutyryl-, and di-α-methyl*iso*crotonyl-derivatives (Bouveault), A., i, 790.

Quinoldbisdiphenylmethane (Möhlau and Klopfer), A., i, 913.

Quinoldicarboxylic acid. See 3 : 6-Dihydroxyterephthaiic acid.

Quinoline, aminolytic constant of (Goldschmidt and Salcher), A., ii, 551.

action of bromacetophenone on (Schmidt), A., i, 5.

action of potassium dichromate and sulphuric acid on (Oechsner de Coninck), A., i, 472.

compounds of, with metallic salts (Matthews), A., ii, 296.

cerium hexachloride (Koppel), A., ii, 98.

*per*chromate (Wiede), A., i, 245.

hydrohaloids, halogen compounds of (Trowbridge), A., i, 636, 637.

Quinoline, *di*iodo- (Istrati), A., i, 389.

iso-**Quinoline,** hydrochloride, heat of formation of (Leroy), A., ii, 466.

4′-Quinolinealdehyde, nitro- (Koenigs), A., i, 74.

***β-o*-Quinolinebenzimidazole** and its sulphate (von Niementowski), A., i, 647.

Quinoline-4′-carboxylic acid. See Cinchonic acid.

Quinolyl- and *iso*-**Quinolyl-acetonyl** chlorides (Schmidt), A., i, 5; (Schmidt and Goelich), A., i, 232.

***α*-Quinolylbutanetriol** (Koenigs), A., i, 390.

***α*-Quinolylethanol** (*2-hydroxyethylquinoline*) (Koenigs), A., i, 389.

4′-Quinolylethanol (*4′-hydroxyethylquinoline*, *lepidinealkine*), and salts (Koenigs), A., i, 75.

***α*-Quinolylpropanediol** (Koenigs), A., i, 390.

4′-Quinolylpropanediol, and salts, bromhydrin, *mono-* and *di*-iodohydrin (Koenigs), A., i, 75.

Quinone (*benzoquinone*), condensation of, with diazomethane (von Pechmann and Seel), A., i, 947.
  chloro- (Kehrmann and Idzkowska), A., 493.

Quinones, colour reactions of, with malonic acid derivatives (Liebermann), A., i, 219.
  condensation of, with ethylic cyanoacetate, and with ethylic malonate (Liebermann), A., i, 522.

p-**Quinones**, preparation of (Bayrac), A., i, 125.
  condensation of, with benzhydrols (Möhlau and Klopfer), A., i, 914.

Quinones, list of. See Ketones and Quinones.

Quinone-aminoguanidine and **-bisaminoguanidine** (Thiele and Barlow), A., i, 47.

Quinonebisdiphenylmethane (Möhlau), A., i, 61; (Möhlau and Klopfer), A., i, 912.

Quinonebistetramethyl*di*aminodiphenylmethane (Möhlau and Klopfer), A., i, 913.

Quinonedicarboxylic acid, *di*iodo, ethylic salt (Guichard), A., i, 700.

Quinonedioxime, *m*-chloro-, and its diacetyl derivative (Kehrmann and Grab), A., i, 129.

Quinonedisemicarbazide (Thiele and Barlow), A., i, 48.

Quinoneoxime, *p*-*di*chloro-, and its acetyl derivative (Kehrmann and Grab), A., i, 129.
  2:3-*di*nitroso- (Nietzki and Geese), A., i, 347.

Quinoneoximesemicarbazone (Thiele and Barlow), A., i, 48.

Quinonephenylhydrazone, from action of hydrochloric acid on hydroxyazobenzene potassium derivative (Hantzsch), A., i, 400.

Quinonesemicarbazone (Thiele and Barlow), A., i, 48.

Quinonoid structure of flavones, alizarin derivatives, in relation to colour (Perkin), T., 452.

R.

Racemic acid. Under Tartaric acid.

Racemic compounds, characterisation of (Kipping and Pope), T., 36, 1119; P., **1898**, 219; **1899**, 200; A., ii, 733; (Ladenberg), T., 465; P., **1899**, 73; A., ii, 551; (Pope), P., **1899**, 73; (Roozeboom), A., ii, 276, 732.
  resolution of (Marckwald and McKenzie), A., ii, 733.

Radishes. See Agricultural chemistry.

Radium in carnotite (Friedel and Cumenge), A., ii, 435.
  radiation from (Becquerel), A., ii, 393.

Rafaelite from Chili (Arzruni, Thaddéeff, and Dannenberg), A., ii, 563.

Raffinose (*melitose*, *melitriose*), action of yeast enzymes on (Kalanthar), A., i, 102.
  estimation of, in sugar beet (Sempolowski), A., ii, 389.

Rape and **rape-cake.** See Agricultural chemistry.

Rape oil, amount of arachidic acid in (Archbutt), A., ii, 340.
  detection of (Palas), A., ii, 72.

Reduction flasks, syphon arrangement for (Göckel), A., ii, 614.

Rennet, neutralising action of blood-serum on (Briot), A., ii, 780.

Resacetophenone. See 2:4-Dihydroxyacetophenone.

Resin from oleo-resin of *Dacryodes hexandra* (More), T., 719; P., **1899**, 150.

Resins, and the cholesterol reaction (Tschirch and Halbey), A., i, 69.
  of stick-lac (Tschirch and Farner), A., i, 447.

Resins. See also:—
  Amber.
  Chemawinite.
  Convolvulus resin.
  Fabianaresen.
  Galbanum resin.
  Hop-resin.
  Lac resin.
  Lariciresinol.
  Olibano-resin.

Resine. See :—
Olibanum electrum, resin of.
Oporesinotannol.
Resin-acid, presence of, in beetroot liquors (Andrlík and Votoček), A., i, 157.
Resinotannols (Tschirch and Farner), A., i, 447 ; (Tschirch and Knitl), A., i, 714.
Resorcinol, action of sodium on, in alcohol (Kunz-Krause), A., i, 200.
condensation of, with benzoin (Japp and Meldrum), T., 1039 ; P., **1899**, 166.
diacetate, preparation of (Freyss), A., i, 875.
monoethylic ether, substance obtained by action of nitrous acid on (Kietaibl), A., i, 345.
preparation of ; α-*o*-nitroso-, β-*o*-nitroso-, and *p*-nitroso-, and salts (Kietaibl), A., i, 343.
diethylic ether. See 1 : 3-Diethoxybenzene.
Resorcinol, 4 : 6-*di*nitro-, and diethylic, ethylic, and dimethylic ethers (Jackson and Koch), A., i, 677.
*tri*nitro- (Gurewitsch), A., i, 880.
Resorcinolsaccharein and its triacetyl derivative, bromo- and iodo- (Monnet and Kœtschet), A., i, 213.
Resorcinolsulphurein and tetrabromo- (Sisley), A., i, 289.
Respiration, relation of pigment of *Aelosoma tenebrarum* to (Griffiths), A., ii, 115.
of plants. See Agricultural chemistry.
Respiratory exchange, effect of compression of one lung on (Harley), A., ii, 675.
influence of alcohol on human (Wendlestadt), A., ii, 602.
Reticular tissue, composition of (Tebb), A., ii, 312.
Retzian, composition of (Sjögren), A., ii, 35.
Rhamnazin (*quercetin dimethylic ether*), potassium derivative of (Perkin), T., 439 ; P., **1899**, 65.
Rhamnetin (*quercetin monomethylic ether*), potassium derivative of (Perkin), T., 438 ; P., **1899**, 65.
Rhamnitol, condensation of benzaldehyde with (de Bruyn and Alberda van Ekenstein), A., i, 662.
Rhamnus purshiana, constituents of the bark of (Leprince), A., i, 820.
Rhizocarpinic acid, and its acetyl derivatives (Hesse), A., i, 384.
Rhizocarpon geographicum, f. contiguum, and *f. lecanorinum*, constituents of (Hesse), A., i, 384.
Rhizonic acid and **Rhizoninic acid** (Hesse), A., i, 385.
Rhodamine, and salts and acetyl derivative (Meyer and Sundmacher), A., i, 756.
Rhodamine, $C_{34}H_{22}O_9N_2$, obtained from aminosalicylic acid (Fischer and Schaar-Rosenberg), A., i, 283.
Rhodamines, isomerides of (Noelting and Paira), A., i, 371.
Rhodinol, use of term (Schimmel and Co.), A., i, 64.
Rhodium, commercial, purity of (Mylius and Dietz), A., ii, 160.
Rhodium bases, constitution of (Jörgensen), A., ii, 293.
Rhodiopentammine chloride (Mylius and Dietz), A., ii, 160.
Rhodium potassium, sodium, and barium nitrites, and *di*oxide (Joly and Leidié), A., ii, 34.
Rhodochrosite from the Odenwald (Kraatz-Koschlau), A., ii, 302.
Rhodolite, associated minerals of (Hidden and Pratt), A., ii, 300.
Rhubarb powder, detection of turmeric in (Jaworowski), A., ii, 75.
Rhyolite from New Zealand (Park and Rutley), A., ii, 769.
from North Carolina (Diller), A., ii, 499.
Ricinus seeds, metabolism of reserve material in, during germination (Maquenne), A., ii, 171.
Rickets, elimination of chlorides in (Oechsner de Coninck), A., ii, 42.
Riebeckite from Roumania (Mrazec), A., ii, 768.
Rigor mortis, influence of fatigue on (Latimer), A., ii, 117.
Robinia. See Agricultural chemistry.
Roccellic acid, presence of, in *Lecanora sordida Swartzii* (Hesse), A., i, 383.
Rocks from Antarctic regions (Prior), A., ii, 436.
from Mont-Dore (Bonjean), A., ii, 674.
from Oaxaca, Mexico (Lenk), A., ii, 305.
from the Seychelles (Bauer), A., ii, 565.
from U.S.A., vanadium in (Turner and others), A., ii, 498.
artificial (Morozewicz), A., ii, 762.
classification of alumino-silicate (Morozewicz), A., ii, 763.
differentiation of, in magmas (Teall), A., ii, 162.
vanadium and molybdenum in (Hillebrand), A., ii, 113.
estimation of sodium and potassium in (Bonjean), A., ii, 695.

Rocks, dykes of Adamello mountains (Riva), A., ii, 38.
  volcanic, of Mont-Dore (Bonjean; Lévy), A., ii, 500.
Rocks, new. See:—
  Hatherlite.
  Kyschtymite.
  Pilandite.
Roots. See Agricultural chemistry.
Rosa canina fruit, the pectin of (Bourquelot and Hérissey), A., i, 652, 967.
Rosaniline hydrochloride, molecular weight of, in water or alcohol (Krafft), A., ii, 472.
  action of chromic acid on (Oechsner de Coninck and Combe), A., i, 244.
Rosanilines, formation of, from *p*-nitro*di*aminotriphenylmethanes (Prud'homme), A., i, 217.
Rosanilinesulphonic acids, behaviour of, towards Schiff's reagent (Cazeneuve), A., i, 296.
Roscoelite from California (Hillebrand, Turner, and Clarke), A., ii, 496.
Rosemary (Dalmatian) oil of (Schimmel and Co.), A., i, 63.
Roses, oil of (Flatau and Labbé), A., i, 534.
  examination of (Raikow), A., ii, 63, 130.
  See also Agricultural chemistry.
Rosewood oil (Schimmel and Co.), A., i, 924.
Rosindone, preparation of (Schaposchnikoff), A., i, 432.
iso-**Rosindone** and 2-amino-derivative (Kehrmann and Levy), A., i, 238.
1:4:2:7-Rosindonesulphonic acid (Gaess), A., i, 376.
Rosinduline chloride, 2-amino-, and salts (Kehrmann, Rademacher and Feder), A., i, 235.
  2-nitro-, anhydride of, and salts and acetyl derivative (Kehrmann, Rademacher and Feder), A., i, 235.
Rosinduline, sixth isomeride of (Kehrmann and Jacob), A., i, 238.
  seventh isomeride of (Kehrmann and Ravinson), A., i, 525.
Rosolic acid, use of, in alkalimetry (Glaser), A., ii, 573.
Rottlerin, action of alkali acetates on (Perkin), T., 443.
  decomposition products of (Perkin), T., 829; P., **1899**, 162.
Rubber wares. See Caoutchouc.
Rubidium, ion velocity of, in flames (Wilson), A., ii, 723.
Rubidium, azoimide (Curtius and Rissom), A., ii, 92.
  chloride, spark spectrum of (de Gramont), A., ii, 137.
    densities and refractive indices of, solutions of (Conroy), A., ii, 717.
    density of aqueous solutions of (de Coppet), A., ii, 590.
  fluoriodate (Weinland and Lauenstein), A., ii, 363.
  *di*fluorodiselenate, *di*fluorotellurate, and *di*fluorodithionate (Weinland and Alfa), A., ii, 595.
  fluoromanganite (Weinland and Lauenstein), A., ii, 368.
  lead iodide (Mosnier), A., ii, 222.
  iodochloride, potential difference between, and chlorine (Sullivan), A., ii, 398.
  selenibromide (Lenher), A., ii, 19.
  silicate, hydrolysis of, in aqueous solution (Kahlenberg and Lincoln), A., ii, 95.
  sulphate crystals, thermal expansion of (Tutton), A., ii, 630.
  iron alum and cobalt alum (Howe and O'Neal), A., ii, 103.
  *per*sulphate, preparation and solubility of (Foster and Smith), A., ii, 747.
Russula delica juice, colour reaction of, with digested albumin (Harlay), A., i, 835.
Ruthenium potassium nitrite (Brizard), A., ii, 664.
  *di*oxide and *tetr*oxide (Mylius and Dietz), A., ii, 160.
  *tetr*oxide (Howe and O'Neal), A., ii, 103.
  *per***Rhuthenic acid** (Mylius and Dietz), A., ii, 160; (Antony and Lucchesi), A., ii, 299.
  sulphate and sulphide (Antony and Lucchesi), A., ii, 558.
  Ruthenic potassium chloride (Antony and Lucchesi), A., ii, 756.
  Ruthenious dithionate (Antony and Lucchesi), A., ii, 229.
Ruthenium, separation of, from iridium (Leidié), A. ii, 664.
Rutile ("favas") from Brazil (Hussak), A., ii, 432.
  action of sulphuric acid on (Blondel), A., ii, 556.
Rutin, potassium salt of (Perkin), T., 440; P., **1899**, 65.
Rye. See Agricultural chemistry.

"**Sacchareins**" (Monnet and Kœtschet), A., i, 289.
  action of acids on (Sisley), A., i, 289.

Saccharic acid, action of caustic potash on (Holleman), A., i, 283.
  potassium hydrogen salt, action of hydrobromic acid on (Hill and Phelps), A., i, 576.
"**Saccharin**" (*o-benzoicsulphinide*), detection of (Gawalowski), A., ii, 255; (Hasterlik), A., ii, 819.
  valuation of (Reid), A., ii, 581.
  See also *o*-Benzoicsulphinide.
iso-**Saccharin**, and its rotatory power (Faber and Tollens), A., i, 855.
iso-**Saccharinic acid**, from decomposition of celloxin (Faber and Tollens), A., i, 855.
Saccharomyces cerevisiæ, the fungose of (Tanret), A., ii, 171.
Saccharomyces Ludwigii, influence of non-fermentable sugars on fermentative power of (Dienert), A., ii, 442.
Saccharose. See Sucrose.
apo-**Saffranine** (Schaposchnikoff), A., i, 431.
iso-**Saffrole**, action of ozone on (Otto), A., ii, 282.
  nitrosite, compound obtained by action of alkalis on (Angeli), A., i, 681.
Sahlite. See Diopside.
Salazinic acid, from *Lecidea sudetica* (Zopf), A., i, 717.
Salicil-α-osazone, triacetyl derivative, and **Salicil-β-osazone**, tetracetyl derivative (Biltz), A., i, 502, 503.
Salicylaldehyde, thermochemistry of (Delépine and Rivals), A., ii, 727.
  condensation of, with bromethylamine hydrobromide (Gabriel and Leupold), A., i, 104.
  sodium derivative of (Cajar), A., i, 146.
  acetate (Reychler), A., i, 56.
  mono- and tri-acetates (Freyss), A., i, 875.
Salicylaldehydehydrazone, and a compound of, with ethylic acetoacetate (Cajar), A., i, 146.
Salicylaldehydephenylhydrazone, oxidation of, by air (Biltz), A., i, 502.
  3-nitro- and 5-nitro-, and acetyl derivatives (Biltz), A., i, 503.
Salicylaldehyde-*m*-nitrophenylhydrazone (Rougy), A., i, 753.
Salicylaldoxime, ethylic carbonate (Cajar), A., i, 147.
Salicylamide, oxidation of, with chromic acid (Oechsner de Coninck and Combe), A., i, 347.
  mercury compound of, constitution of (Kieseritzky), A., ii, 395.
  *di*bromo-, formation of (Jeffreys), A., i, 732.
Salicylhydramide, thermochemistry of (Delépine and Rivals), A., ii, 727.
Salicylic acid, thermochemistry of (Delépine and Rivals), A., ii, 727.
  and sodium salt, solubility of mixtures of (Hoitsema), A., ii, 10.
  action of sodium on, in alcohol (Kunz-Krause), A., i, 200.
  detection of, in beer and wine (Abraham), A., ii, 341.
  detection of, in milk (Breustedt), A., ii, 532.
  estimation of (Fresenius and Grünhut), A., ii, 581.
Salicylic acid, copper salt, dissociation of, in solution (Calame), A., ii, 145.
  sodium salt, heat of formation of (Massol), A., ii, 353.
  ethoxyphenylic salt (Merck), A., i, 802.
  ω-hydroxyphenacetin salt of (Hinsberg), A., i, 496.
  and *o*-methoxybenzoic acid, methylic salts and amides of, relative stability of, towards alkalis (Fischer), A., i, 262.
  methylic salt, estimation of (Kremers and James), A., ii, 192.
  α- and β-naphthylic salts of, viscosity of undercooled (Tammann), A., ii, 272.
Salicylic acid, 5-amino-, preparation of (Fischer and Schaar-Rosenberg), A., i, 283.
  5-chloro-, ethylic salt (Mazzara), A., i, 700.
  3 : 5-*di*chloro- (Martini), A., i, 877.
  thio-, and salts, and *di*thio- (Gattermann), A., i, 518.
  *di*thio- (Henderson), A., i, 430.
Salicylic series, chloro-derivatives, thermochemistry of (Rivals), A., ii, 204.
Salicylonitrile, bromonitro- $[OH:Br:NO_2=2:4:5]$, and nitro- $[OH:NO_2=2:6]$ (Auwers and Walker), A., i, 199.
Salicyl-*p*-phenetidide, preparation of, and its acetate and benzoate (Bolezzi), A., i, 258.
Salicyl-O-phosphinic acid, and its aniline salt and phenylhydrazide (Michaelis and Kerkhof), A., i, 54.
Saligenin, bromo-, and *di*bromo- and acetyl derivatives (Auwers and Büttner), A., i, 37.
Saline, incrustation on limestone (Hoffmann), A., ii, 110.
  sublimation from Vesuvius (Franco), A., ii, 600.
Salipyrine, velocity of crystallisation of (Bogojawlensky), A., ii, 206.
Salite. See Diopside.

Saliva, influence of various substances on the activity of (Kübel), A., ii, 603.
  human, amount of, and percentage of thiocyanic acid in (Kruger), A., ii, 165.
Salmine, hydrolytic products of (Kossel), A., i, 833.
Salol, three forms of, velocity of crystallisation of (Tammann), A., ii, 549.
  fate of, in the living body (Humnicki), A., ii, 781.
Salol-O-*tetra*chlorophosphine, Salol-O-oxychlorophosphine, Saloloxyphosphazophenyl, Salol-O-phosphinic acid, and its salts, dianilide di-*p*-toluidide and diphenylhydrazide (Michaelis and Kerkhof), A., i, 54.
Salt on shore of Lake Ruszanda, Hungary (Kalecsinszky), A., ii, 161.
Salts, colloidal, as membrane-formers in dyeing (Krafft), A., ii, 472.
  oceanic deposits of (van't Hoff and Dawson), A., ii, 759.
  vaporised, electric conductivity of (Smithells, Dawson, and Wilson), A., ii, 722.
Samandarin (Faust), A., i, 380.
Sand in the efflorescence on walls (van Erp), A., ii, 96.
Sandalwood oil, East Indian (Schimmel and Co.; von Soden and Müller), A., i, 924.
  from *Santalum cygnorum* (Schimmel and Co.), A., ii, 299.
Sandstone from Virginia (Miller), A., ii, 769.
  cemented by barium sulphate (Clowes), A., ii, 761.
Santalene (von Soden and Müller), A., i, 924.
Santalin, potassium salt and formula of (Perkin), T., 443; P., **1899**, 66.
Santalol (Schimmel and Co.; von Soden and Müller), A., i, 924.
Santalylphthalic acid (Schimmel and Co.), A., i, 924.
Santonic acid, methylic salt, α- and β-oximes of (Wedekind), A., i, 631.
  preparation of, from the oxime (Wedekind), A., i, 631.
  specific rotation of, and conversion into *l*-desmotroposantonin (Andreocci and Bertolo), A., i, 301.
  velocity of crystallisation of (Bogojawlensky), A., ii, 206.
  action of sodium on, in alcohol (Kunz-Krause), A., i, 200.
  the ferric chloride reaction with (Bertolo), A., i, 930.
  estimation of (Katz), A., ii, 619.
Santonin-oxime, action of heat on (Wedekind), A., i, 631.
d-**Santonous acid,** from reduction of *l*-desmotroposantonin (Andreocci and Bertolo), A., i, 301.
Santonous acids, ferric chloride reaction with (Bertolo), A., i, 931.
d- and *l*-*iso*-**Santonous acids,** m. p. and specific rotation of; also their separation (Andreocci and Alessandrello), A., i, 931.
Sap. See Agricultural chemistry.
Saponification of fats, apparatus for (Annan), A., ii, 343.
Sarcina rosea extract, presence of a proteolytic enzyme in (Geret and Hahn), A., i, 95.
Sarcomata, composition of (Petry), A., ii, 568.
Sarcosine, oxidation of (Oechsner de Coninck), A., i, 509.
Sardine oil, saponification value of (Fahrion), A., ii, 711.
Saturation curve for mixtures of enantiomorphous isomerides (Bruni), A., ii, 732.
Sausage meat, estimation of starch in (Weller), A., ii, 703.
Sawdust, detection of, in flour (Le Roy), A., ii, 453.
Saxifrageæ, distribution of hydrocyanic acid in the (Hébert), A., ii, 377.
Scapolite from Mexico (Lenk), A., ii, 306.
Scatole. See 3′-Methylindole.
Scatoleacetic acid. See 3′-Methylindoleacetic acid.
Schizothrix lardacea, development of, in non-nitrogenous solutions (Bouilhac), A., ii, 238.
Scleroclase, artificial (Sommerlad), A., ii, 218.
Scolesite, vapour pressure of (Tammann), A., ii, 8.
Scombrine, separation of, from spermatozoa of mackerel (Kuraéeff), A., ii, 313.
  hydrolytic products of (Kossel), A., i, 833.
Scoparein, formation and decomposition products of (Perkin), P., **1899**, 123.
Scoparin, composition, decomposition products, dyeing properties of, and relation to vitexin (Perkin), P., **1899**, 123.
  action of potassium acetate on (Perkin), T., 443; P., **1899**, 66.
Scopolamine (commercial), chemistry of (Pinner), A., i, 178.
Scopolamine. See under Hyoscine.
Scopolamine (inactive). See under Atroscine.

Scopoline. See under Oscine.
Scorodite, artificial (METZKE), A., ii, 294.
Sea water. See Water.
Sebacic acid (*ipomic acid*), and its salts (MASSOL), A., ii, 80.
  amide of, preparation of (ASCHAN), A., i, 14.
  l-amylic salt, molecular rotation of (WALDEN), A., ii, 622.
Secretion, metabolism during (HENDERSON), A., ii, 774.
Seed and **Seedling.** See Agricultural chemistry.
Sekisanine, from *Lycoris radiata* (MORISHIMA), A., i, 93.
Selenium, atomic weight of (LENHER), A., ii, 18.
  in Vesuvian products (MATTEUCCI and GIUSTINIANI), A., ii, 600.
  in impure hydrogen (SCHLAGDENHAUFFEN and PAGEL), A., ii, 475.
  spectrum of (DE GRAMONT), A., ii, 199.
  insoluble in anhydrous liquid ammonia (HUGOT), A., ii, 650.
  action of, on sulphuric acid (ADIE), P., **1899**, 133.
  compounds (METZNER), A., ii, 364.
Selenium *tetra*bromide, double salts of, with amines (LENHER), A., ii, 19, 20.
  hydride. See Hydrogen selenide.
  *mon*oxide, attempts to prepare (LENHER), A., ii, 20.
  *di*oxide, preparation of (DIVERS and HADA), T., 537.
  Selenious acid, estimation of (NORTON), A., ii, 518.
  Amidoselenites, non-existence of (DIVERS and HADA), T., 539; P., **1899**, 101.
  Selenic acid, preparation of (METZNER), A., ii, 21.
  Selenates, action of hydrochloric acid on (TUNNELL and SMITH), A., ii, 744.
  sulphate and nitrate, for detection of alkaloids (BARTH), A., ii, 47.
Selenium, separation of:—
  separation of barium and tellurium from (JANNASCH and MÜLLER), A., ii, 60.
  separation of sulphuric and phosphoric acids from (JANNASCH and HEIMANN), A., ii, 60.
Semicarbazide, action of, on formaldehyde (THIELE and BAILEY), A., i, 109.
Semiorthoxalic acid, methylic and dimethylic diethylic salts, and the action of acetamide on the former (ANSCHÜTZ and STIEPEL), A., i, 573.
Semiphenylhydrazone-oxalic acid, methylic salt (ANSCHÜTZ and STIEPEL), A., i, 573.
Semi-*p*-tolylimino-oxalic acid, methylic salt (ANSCHÜTZ and STIEPEL), A., i, 573.
Semseyite from the Harz (SPENCER and PRIOR), A., ii, 431.
Serin, estimation of, in blood-serum (PATEIN), A., ii, 828.
Serpentine. See Chrysotile.
Serum, influence of carbonic anhydride and alkali on the bactericidal action of (HAMBURGER), A., ii, 603.
  blood-, preparation of glutolin from (FAUST), A., i, 466.
  determination of percentage volume of, in blood (STEWART), A., ii, 603.
  globulin, estimation of, in blood-serum (PATEIN), A., ii, 828.
Sesamé oil, detection of (KREIS; BREINL), A., ii, 824.
  detection of, in butter (LEONARD), A., ii, 190.
  detection of, in butter and margarine (SOLTSIEN), A., ii, 71.
  iodine number of (ZEGA and MAJSTOROVIĆ), A., ii, 820.
Sesquiterpene, from *Oleum cadi* (TROEGER and FELDMANN), A., i, 376.
Setaria Italica, presence of an active principle in (LADD), A., ii, 240.
Sewage effluents, estimation of oxygen in (GERLAND), A., ii, 697.
Shells of *Crania*, *Terebratulina*, and *Waldheimia*, composition of (KUNCKELL), A., ii, 313.
Sheep. See Agricultural chemistry.
Silicon (VIGOUROUX), A., ii, 211.
  graphitoidal, preparation of (HYDE), ii, 653; (VIGOUROUX), A., ii, 746.
  reduction of alumina by, in chlorine (DUBOIN and GAUTIER), A., ii, 653.
  Silicides, metallic (VIGOUROUX), A., ii, 211.
Silicon *tetr*amide (LENGFELD), A., ii, 553.
  *tetra*chloride, preparation of (VIGOUROUX), A., ii, 746.
  *octo*chloride, preparation of (GATTERMANN and ELLERY), A., ii, 418.
  *di*imide (LENGFELD), A., ii, 553.
  nitride, action of magnesium on (EIDMANN), A., i, 317.
  *di*oxide (*silica*), fibrous forms of, from Moravian serpentines (BAVIŘ), A., ii, 671.
    amount of, in Egyptian porcelain, and in glaze of Egyptian pottery (LE CHATELIER), A., ii, 751.
    action of, on mono-alkali salts of hydroxy-acids (HENDERSON, ORR, and WHITEHEAD), T., 554; P., **1899**, 108.
    reduction of, by aluminium (FRANCK), A., ii, 103.

Silicon *di*oxide (*silica*), estimation of, in ores (Lehnkering), A., ii, 251.
  estimation of, in Portland cement (Shimer), A., ii, 520.
 Silicic acid, colloidal, coagulation of (Linebarger), A., ii, 12.
 Silicates, natural, alkaline reaction of; decomposition of, by water (Clarke), A., ii, 109.
  natural, solubility of, in water (Steiger), A., ii, 496.
  action of hydrogen sulphide on (Didier), A., ii, 596.
  of the alkalis, hydrolysis of, in aqueous solution (Kahlenberg and Lincoln), A., ii, 95.
  decomposition of, by boric anhydride (Jannasch and Weber), A., ii, 578.
  detection of potassium in (Cole), A., ii, 521.
 Silicotungstic acid, use of, as a test for alkaloids (Bertrand), A., ii, 457.
Silicon organic compounds:—
 Silicomesoxalic acid (Gattermann and Ellery), A., ii, 418.
 Silicon tetrethyl, preparation of (Kipping and Lloyd), P., **1899**, 174.
  tetrethylamide (Lengfeld), A., ii, 554.
 Triphenylsilicol, and its acetate (Kipping and Lloyd), P., **1899**, 174.
 Triphenylsilicyl ether (Kipping and Lloyd), P., **1899**, 174.
Silicon, analysis of (Bornträger), A., ii, 695.
Silk, proteoid constituents of, action of acids on (Wetzel), A., i, 466.
Silk-gelatin, action of acids on (Wetzel), A., i, 466.
Silkworm excrement, amount of cellulose and pentosans in (Menozzi), A., ii, 683.
Sillimanite, artificial (Zemjatschensky), A., ii, 111; (Morozewicz), A., ii, 672.
Silver, native, from Sardina (Traverso), A., ii, 759.
 atomic weight of (Berthelot), A., ii, 207.
 pure, preparation of (Pfeiffer; Kuhn), A., ii, 366.
 presence of, in sediment from copper refining (Hollard), A., ii, 452.
 precipitated by cadmium, presence of cadmium in (Shengle and Smith), A., ii, 749.
 electrochemical equivalent of (Kahle), A., ii, 358.
 voltameter, deposition of silver in (Kahle), A., ii, 347.
Silver, potential difference between, and solutions of its salts in organic solvents (Kahlenberg), A., ii, 624.
 colloidal solutions of, coagulation of, by zinc chloride (Stark), A., ii, 644.
 partition of, in lead-zinc mixtures (Bancroft), A., ii, 470.
 action of solutions of alkali chlorides on (Berthelot), A., ii, 288.
 action of, on nitric acid (Freer and Higley), A., ii, 480.
 action of dilute nitric acid on (Divers), T., 93.
 action of hydrogen sulphide on (Pélabon), A., ii, 24.
 action of, on sulphuric acid (Adie), P., **1899**, 133; (Berthelot), A., ii, 283.
Silver amalgam, heat of formation of (Ogg), A., ii, 15.
Silver salts, action of magnesium on solutions of (Bryant), A., ii, 289.
 reduction of, by calcium carbide; alloys with calcium (Tarugi), A., ii, 749.
 (haloid), solubility of, in alcohols (Rohland), A., ii, 144.
 Argentammonium chloride, dissociation of, change of entropy in (Matignon), A., ii, 273.
  chlorides and iodides, preparation and dissociation of (Jarry), A., ii, 738.
  iodate, and *per*iodates (Rosenheim and Liebknecht), A., ii, 743.
  nitrate, and oxide, preparation and thermochemistry of (Berthelot and Delépine), A., ii, 748.
   decomposition of hydrogen peroxide (Berthelot), A., ii, 149.
 Silverdiammine nitrate (Hantzsch), A., ii, 215.
Silver thioantimonite, thiohypoarsenite, pyrothioarsenite, and thioarsenite (Sommerlad), A., ii, 215, 516.
 arsenite (Reichard), A., ii, 23.
 *sub*bromide, formation of, by action of light on silver bromide (Liesegang), A., ii, 720.
 bromide, solubility of, in aqueous methylamine (Jarry), A., ii, 738.
  and chloride, precipitated, equilibrium in (Küster), A., ii, 206.
   solubility of, in sodium thiosulphate solutions (Richards and Faber), A., ii, 288.
  fused, dissociation coefficient in (Lorenz), A., ii, 269.
  and iodide, electrolysis and heat of formation of (Czepinski), A., ii, 268.

- **Silver** bromide, chloride, and iodide, reduction of, by formaldehyde (Vanino), A., ii, 249.
  - osmium bromide (Rosenheim and Sasserath), A., ii, 665.
  - chlorate and hypochlorite (Foerster and Jorre), A., ii, 280.
    - compound with cupric hydroxide (Sabatier), A., ii, 654.
  - chloride, action of light on (Sonstadt), P., **1898**, 180.
    - latent heat of fusion of (Weber), A., ii, 725.
    - solubility of, in alkali nitrite solutions (Divers), T., 85.
  - iodide, action of light on, influence of silver on (Scholl), A., ii, 621.
  - melting point and transition curves of (Tammann), A., ii, 636.
  - molybdiodates (Chrétien), A., ii, 363.
  - nitrate, molecular weight of, in urethane (Castoro), A., ii, 360.
    - determination of polarisation in cells containing (Heim), A., ii, 78.
    - electromotive force required to electrolyse (Bose), A., ii, 349.
    - mixtures of, with copper nitrate, electrolysis of, application of principle of maximum work to (Tommasi), A., ii, 412.
    - dissociation of, in fused sodium or potassium nitrates (Gordon), A., ii, 347.
    - action of heat on, and of nitric oxide on (Divers), T., 83; P., **1898**, 221.
    - equilibrium in systems containing silver amalgam, mercurous nitrate, and (Ogg), A., ii, 14.
    - solubility of ammonia in aqueous solutions of (Konowaloff), A., ii, 418.
    - reactions of, in organic solvents (Naumann), A., ii, 423.
    - compound of, with cupric hydroxide (Sabatier), A., ii, 654.
  - hyponitrite, preparation of, from sodium nitrite (Divers and Haga), T., 81; P., **1898**, 221.
    - preparation and properties of; action of heat on; nitrato-nitrite, nitrato-hyponitrite, and nitrito-hyponitrite (Divers), T., 104, 110; P., **1898**, 224.
  - osmiamate (Brizard), A., ii, 559.
  - oxide, action of heat on; and *sub*oxide Guntz), A., ii, 418.
    - reduction of, by aluminium (Franck), A., ii, 103.
  - *sesqui*oxide (Berthelot), A., ii, 149.
- **Silver** phosphate, pyrophosphate, sulphate and hydroxide, action of hydrogen on (Colson), A., ii, 215.
  - metaphosphate, heat of solution of (Tanatar), A., ii, 417.
  - *penta*metaphosphimate, amido*tetr*-imido*penta*phosphate, *tri*imido*tetra*-phosphate, *hexa*metaphosphimate, and amido*hex*imido*hepta*phosphate (Stokes), A., ii, 93, 94.
  - selenite (Lenher), A., ii, 19.
  - sulphate or dithionate, compound of cupric hydroxide with (Sabatier), A., ii, 654.
  - *per*oxysulphate (Mulder), A., ii, 483.
  - sulphide, action of hydrogen on (Pélabon), A., ii, 24.
    - action of sulphuric acid on (Berthelot), A., ii, 283.
  - *di*sulphide (Hantzsch), A., ii, 215.
  - sodium thiosulphates (Richards and Faber), A., ii, 228.
- **Silver organic compounds**:—
  - Methylammonio-silver bromide, and iodides, preparation and dissociation of (Jarry), A., ii, 738.
  - Silver acetylide, and its compounds with silver nitrate, sulphate, chloride, and iodide (Berthelot and Delépine), A., i, 841.
    - potassium cyanide and its decomposition (Berthelot), A., i, 846.
      - action of hydrogen sulphide or sodium sulphide on solutions of (Berthelot), A., ii, 421.
- **Silver, estimation and separation of**:—
  - estimation of, in presence of platinum, copper, zinc, nickel, or cobalt (Kollock), A., ii, 811.
  - deposition of, electrolytically (Küster and von Steinwehr), A., ii, 125.
  - estimation of, in presence of cadmium or iron (Kollock), A., ii, 811.
  - separation of antimony and arsenic from (Atkinson), A., ii, 615.
  - separation of copper from (Revay), A., ii, 127.

  - azoimide, and auroazoimide (Curtius and Rissom), A., ii, 92.
  - ortho*mono*thioxyarsenate (McCay), A., ii, 96.
  - *mono-* and *di-*thioxyarsenates (McCay), A., ii, 745.
  - bismuthate, preparation of (Deichler), A., ii, 430.
  - *per*borate, action of water on (Melikoff and Pissarjewsky), A., ii, 31.
    - decomposition of (Tanatar), A., ii, 553.
  - bromide, spark spectrum of (de Gramont), A., ii, 137.
    - heat of dilution of (Dunnington and Hoggard), A., ii, 728.
    - conductivity of solutions of, in nitrobenzene, benzonitrile, or furfuran (Euler), A., ii, 462.
  - carbide (Moissan), A., i, 241.
  - carbonate, natural formation of (Melikoff), A., ii, 229.
    - in the efflorescence on walls (van Erp), A., ii, 96.
    - thermal change on diluting concentrated solutions of (Pollok), P., **1899**, 8.
    - reduction of, by aluminium (Franck), A., ii, 102.
  - hydrogen carbonate from Vesuvius (Matteucci), A., ii, 600.
      - detection of, in presence of sodium carbonate (Kubil), A., ii, 57.
  - *per*carbonate, preparation of, and heat of decomposition of (Tanatar), A., ii, 482.

Sodium chlorate, electrolytic formation of (Vaubel), A., ii, 88; (Wohlwill), A., ii, 214.
crystallisation of, in a magnetic field, and in dextrose solution (Wright and Kreider), A., ii, 265.
*per*chlorate, electrolytic preparation of (Foerster), A., ii, 88; (Winteler), A., ii, 366.
chloride in steam from brine pans of Salies-de-Béarn (Garrigou), A., ii, 414.
spark-spectra of (de Gramont), A., ii, 137.
electric conductivity of solutions of, at high pressures (Bogojawlensky and Tammann), A., ii, 138.
transference ratio of, with various septa (Bein), A., ii, 399.
boiling point of solutions of, containing cadmium sulphate (Gordon, Henderson, and Harrington), A., ii, 141.
thermal change on diluting saturated solutions of (Pollok), P., **1899**, 8.
heat of dilution of (Dunnington and Hoggard), A., ii, 728.
depression of freezing point of water by (Raoult), A., ii, 204.
densities and refractive indices of solutions of (Conroy), A., ii, 717.
densities of solutions of (Hahn), A., ii, 23; (Barnes and Scott), A., ii, 406; (de Coppet), A., ii, 590.
contraction of aqueous solutions of, on dilution (Wade), T., 256, 263; P., **1899**, 8.
surface tension of solutions of (Linebarger), A., ii, 469; (Forch), A., ii, 641.
molecular depression of vapour pressure of solutions of (Dieterici), A., ii, 403.
osmotic pressures of solutions of (Ponsot), A., ii, 591.
equilibrium between water, succinonitrile and (Snell), A., ii, 408.
absorption of water by, and hydrates of (Busnikoff), A., ii, 409.
crystalline form of, influence of dissolved substances on (Orloff), A., ii, 654.
influence of ingestion of, on proteid metabolism (Straub), A., ii, 372.
and nitrate, solubilities of mixtures of, with potassium chloride or nitrate (Soch), A., ii, 84.
and sulphate, mixture of, transition point of (Meyerhoffer and Saunders), A., ii, 7.
Sodium chloride and sulphate, mixture of, and chromate, carbonate, thiosulphate, bromide and phosphate, transition temperatures of (Richards and Briggs), A., ii, 354.
aluminium chloride, conductivity of aqueous solutions of (Jones and Ota), A., ii, 587.
osmium *hexa*chloride, and bromide (Rosenheim and Sasserath), A., ii, 665.
zinc chloride, and zinc or cadmium bromide, conductivity of solutions of (Jones and Knight), A., ii, 628.
hypochlorite, crystalline (Muspratt and Smith), A., ii, 553.
electrolytic formation of (Wohlwill), A., ii, 213.
preparation and stability of strong solutions of (Muspratt and Smith), A., ii, 281.
stability of solutions of, in presence of caustic soda (Thomsen), A., ii, 476.
conversion of, into chlorate (Foerster and Jorre), A., ii, 278.
*di*fluoriodate (Weinland and Lauenstein), A., ii, 364.
hydroxide, electrolysis of aqueous solutions of (Glaser), A., ii, 79.
influence of, on the hydration of calcium oxide (Rohland), A., ii, 596.
solution of, in water (Divers), T., 97.
action of, on benzaldehyde or benzylic benzoate (Kohn and Trantom), T., 1155; P., **1899**, 194.
aluminate, phosphate or fluoride, removal of lime or magnesia from natural waters by (Griffin), A., ii, 655.
hydroximidosulphonate and hydroxyamidosulphonate, formation of, in preparation of hyponitrite (Divers and Haga), T., 78; P., **1898**, 221.
iodate and hypoiodite, formation of (Péchard), A., ii, 593.
*per*iodate, estimation and properties of (Péchard), A., ii, 477.
iodide, spark spectrum of (de Gramont), A., ii, 137.
conductivity of, in nitrobenzene, benzonitrile or furfuran (Euler), A., ii, 462.
lead iodide (Mosnier), A., ii, 222.
nitrate, heat of dilution of (Dunnington and Hoggard), A., ii, 728.
thermal change on diluting concentrated solutions of (Pollok), P., **1899**, 8.

Sodium nitrate, mixtures of, with lithium and potassium nitrates, melting points of (Carveth), A., ii, 141.
  surface tensions of solutions of (Forch), A., ii, 641.
  densities of solutions of (Barnes and Scott), A., ii, 406.
  electrolytic reduction of (Tommasi), A., ii, 138.
  deliquescence of (Kortright), A., ii, 644.
  (*Chili saltpetre*), amount of perchlorate in (Zaharia), A., ii, 799.
    detection of perchlorate in (Nyssens), A., ii, 327.
    estimation of perchlorate in (Foerster), A., ii, 57; (Freytag), A., ii, 179; (Ahrens and Hett), A., ii, 245; (Blattner and Brasseur), A., ii, 328.
    See also Agricultural chemistry.
 praseodymium nitrate (Scheele), A., ii, 99.
 nitrite, preparation of (Divers; Groves), T., 85; P., **1898**, 222.
   manufacture and estimation of (Darbon), A., ii, 745.
 rhodium nitrite, and *octo*rhodite (Joly and Leidié), A., ii, 34.
 hyponitrite, action of heat on; molecular weight and constitution of (Divers), T., 102, 122; P., **1898**, 224.
   formed from nitrite or nitrate by sodium amalgam (Divers), T., 87, 96; P., **1898**, 222, 223.
 oxide, heat of formation of (Moissan), A., ii, 352.
   heats of formation and solution of (de Forcrand), A., ii, 588.
 *sub*oxide, *mon*oxide and *di*oxide (de Forcrand), A., ii, 95.
   and *per*oxide, heats of formation of (de Forcrand), A., ii, 141.
 phosphate, electric conductivity of solutions of, at high pressures (Bogojawlensky and Tammann), A., ii, 138.
 hydrogen phosphate, dehydration of (Whitelock and Barfield), A., ii, 747.
   reaction of, with phenolphthalein (Brunner), A., ii, 152.
 metaphosphate, reduction of, by aluminium (Franck), A., ii, 102.
 *tri*metaphosphate, preparation and heat of solution of (Tanatar), A., ii, 416.
 magnesium pyrophosphate (Berthelot and André), A., ii, 156

Sodium *tetra*metaphosphimate, and acid salt, *tri*imido*tetra*phosphate, *di*imido*tri*phosphate, *penta*metaphosphimates, *hexa*metaphosphimate, and amido*hex*imido*hepta*phosphate (Stokes), A., ii, 93, 94.
 phosphiodate and molybdiodate (Chrétien), A., ii, 363.
 selenide and polyselenide (Hugot), A., ii, 650.
 silicoaluminate (Friedel), A., ii, 564.
  hydrated (Friedel), A., ii, 563.
 sulphate, natural, from Hungary (Kalecsinszky), A., ii, 161.
   in the efflorescence on walls (van Erp), A., ii, 96.
   preparation of, from sodium chloride (Krutwig and Dernoncourt), A., ii, 214.
   galvanic polarisation in solutions of (Jahn), A., ii, 542.
   thermal change on diluting saturated solutions of (Pollok), P., **1899**, 8.
   surface tension of solutions of (Forch), A., ii, 641.
   densities of solutions of (Barnes and Scott), A., ii, 406.
   equilibrium between potassium chloride, sodium potassium sulphate, and (Meyerhoffer and Saunders), A., ii, 410.
   equilibrium between ethylic alcohol, water, and (de Bruyn), A., ii, 591.
   and ammonium nitrate, separation of (Roca), A., ii, 358.
 antimony sulphate (Gutmann), A., ii, 34.
 potassium sulphate (Meyerhoffer and Saunders), A., ii, 410.
 sulphide, action of, on potassium silver, potassium mercuric, or potassium zinc cyanides (Berthelot), A., ii, 422.
 sulphite, absorption of nitric oxid by solutions of (Divers), T., 82 P., **1898**, 221.
 silver thiosulphates (Richards and Faber), A., ii, 288.
 sulphonosmate, and osmisulphites (Rosenheim and Sasserath), A., ii, 664, 665.
 *per*tantalate (Melikoff and Pissarjewsky), A., ii, 492.
 tellurides and sulphides, by action of sodammonium on tellurium and sulphur (Hugot), A., ii, 747.
 *tetra*tungstate, reduction of (Granger), A., ii, 32.
 *per*tungstate, preparation of (Thomas), A., ii, 489.

Sodium and sodium diammonium *mono*tungsto*per*iodate (Rosenheim and Liebknecht), A., ii, 744.
*hexa*tungsto*per*iodate (Rosenheim and Liebknecht), A., ii, 743.
*per*uranate, action of aluminium hydroxide on (Melikoff and Pissarjewsky), A., ii, 31.
uranyl salts, conductivity of solutions of (Dittrich), A., ii, 629.

Sodium organic compounds :—
Sodium acetylide (Moissan), A., i, 241.
amyloxide, action of fermentation amylic alcohol on (Guerbet), A., i, 472.
or ethoxide, decomposition of chloro-, bromo-, or iodo-benzene by (Löwenherz), A., ii, 639.
*iso*butyloxide, action of *iso*butylic alcohol on (Guerbet), A., i, 472.
ethoxide, action of ethylic alcohol on (Guerbet), A., i, 472.
ethyl pyrosulphite and sulphite, formation of (Divers and Ogawa), T., 535.
ferrocyanide, composition and solubility of (Conroy), A., i, 2.
methoxide and benzyloxide, action of, on benzaldehyde (Kohn and Trantom), T., 1155 ; P., **1899**, 194.
vanadium thiocyanate (Cioci), A., i, 322.

Sodium, estimation of :—
estimation of, in rocks (Bonjean), A., ii, 695.
estimation of, in urine (Herringham), A., ii, 333.

Soils, estimation of calcium carbonate in (Mayer), A., ii, 385 ; (Stutzer and Hartleb), A., ii, 521.
estimation of lime, potash, and phosphoric acid in (Maxwell), A., ii, 521.
See also Agricultural chemistry.
Solanaceæ, the alkaloids of the (Pinner), A., i, 177.

Solanine, and its hydrolysis (Cazeneuve and Bretau), A., i, 551.
detection of (Bauer), A., ii, 392.

Solubility. See Solution.

SOLUTION, hydrate theory of (Flawitzky), A., ii, 730.

Solution, equilibrium in, and dilution (Wegscheider), A., ii, 590.
vapour pressure and heat of dilution of (Schiller), A., ii, 357.
of gases, osmotic pressure in (Kistiakowski), A., ii, 730.
in liquids, invasion and evasion coefficients in (Bohr), A., ii, 641.

SOLUTION :—
Solution of naphthalene in β-naphthol, freezing points of (Bruni), A., ii, 356.
distribution ratio of acetic acid between benzene and water (Waddell), A., ii, 144.

Solubility at different temperatures, determination of (Pawlewski), A., ii, 405.
of mixed electrolytes containing no common ion (Noyes), A., ii, 9.
of organic compounds in water (Vaubel), A., i, 317.
mutual, of organic liquids and water (Herz), A., ii, 83.
use of, in recognition of racemic compounds (Roozeboom), A., ii, 733.
of racemic compounds (Roozeboom), A., ii, 276.
of racemic compounds and of enantiomorphic mixtures (Ladenburg ; Pope), T., 466 ; P., **1899**, 73.
of racemic compounds, pseudoracemic mixtures, and inactive conglomerates (Roozeboom), A., ii, 401.
of mixed salts (Soch), A., ii, 84.
of salts, relation between electroaffinity and (Abegg and Bodländer), A., ii, 542.
of mixtures of two salts with one common ion (Hoitsema), A., ii, 10.
of haloid salts in alcohols (Rohland), A., ii, 144.
of the normal acids of the oxalic series (Lamouroux), A., i, 479.
of ammonia in aqueous solutions of silver nitrate (Konowaloff), A., ii, 418.
of bromine in water (Winkler), A., ii, 742.
of benzoic acid in solutions of sodium formate or acetate (Noyes and Chapin), A., ii, 274.
of benzylidene compounds of hydroxy-acids, in water, methylic or ethylic alcohols (Alberda van Ekenstein and de Bruyn), A., i, 904.
of cæsium and rubidium *per*sulphates (Foster and Smith), A., ii, 747.
of calcium hydroxide in solutions of ammonium chloride (Noyes and Chapin), A., ii, 405.
of gold in solutions of alkali cyanides, influence of oxidising agents on (Noelting and Forel), A., ii, 755.
of hydrates of ferrous potassium sulphate (Küster and Thiel), A., ii, 753.
of iodine, in dilute solutions of potassium iodide (Noyes and Seidenstraker), A., ii, 11.

SOLUTION :—
Solubility of lime in water and in sugar solutions (WEISBERG), A., ii, 748.
of substituted malonic and succinic acids (MASSOL and LAMOUROUX), A., i, 479.
of silver acetate, propionate, and *iso*butyrate (ARRHENIUS), A., ii, 360.
of silver chloride or iodide in liquid ammonia, and of bromide in aqueous methylamine (JARRY), A., ii, 738.
Solutions, aqueous, changes of volume due to dilution of (WADE), T., 254 ; P., **1899**, 7.
colloidal, crystallisation of (KRAFFT), A., ii, 472.
diffusion of light by (SPRING), A., ii, 585.
boiling points of (KRAFFT), A., ii, 470.
speed of coagulation of (LINEBARGER), A., ii, 12.
of gold, silver or arsenious sulphide, coagulation of, by zinc chloride (STARK), A., ii, 644.
mercurial, vapour pressure of (CADY), A., ii, 395.
solid, of menthol in thymol (GARELLI and CALZOLARI), A., ii, 732.
of saturated and unsaturated open-chain compounds (BRUNI and GORNI), A., ii, 731.
and liquid, of chloracetic acid and glycollic acid in naphthalene (CADY), A., ii, 405.
saturated, thermal changes on dilution of (POLLOK), P., **1899**, 8.
supersaturated velocity of crystallisation of (WILDERMAN), P., **1899**, 175.
Sorbitol, action of hydrogen peroxide on, in presence and absence of iron (FENTON and JACKSON), T., 10 ; P., **1898**, 240.
a new sugar accompanying (VINCENT and MEUNIER), A., i, 185.
d-**Sorbitol**, condensation of benzaldehyde with (DE BRUYN and ALBERDA VAN EKENSTEIN), A., i, 662.
Sorbose bacterium. See Bacterium.
Specific gravity. See Density.
Specific heat. See Thermochemistry.
Specific rotation. See Photochemistry.
Spectrum. See Photochemistry.
Spermine, effects of administration of, on animal metabolism (POEHL), A., ii, 502.
Sperrylite from N. Carolina (HIDDEN and PRATT), A., ii, 301.
Sphærite from Moravia (KOVÁŘ), A., ii, 669.
Sphene from Mexico (LENK), A., ii, 306.
Spike, oil of, composition of (SCHIMMEL and Co.), A., i, 299.
Spinel from Inverness-shire (CLOUGH and POLLARD), A., ii, 667.
from Sweden (PETRÉN), A., ii, 759.
artificial (MOROZEWICZ), A., ii, 762.
formation of, in magmas (PRATT), A., ii, 758; (MOROZEWICZ), A., ii, 762.
Spirits, detection of caramel in (CRAMPTON and SIMONS), A., ii, 530.
detection of methylic alcohol in (TRILLAT), A., ii, 387.
"**Spiritus Cochleariæ**," preparation and examination of (GADAMER), A., ii, 456.
Spleen, diminution of iron in, during pregnancy (CHARRIN), A., ii, 773.
Spruce-fir. See Agricultural chemistry.
Stable manure. See Agricultural chemistry.
Standard solutions, protection of (STEINFELS), A., ii, 380.
Stannic and **Stannous**. See under Tin.
Staphisagroidine and **Staphisagroine** (AHRENS), A., i, 652.
Staphylococcus aureus, action of, on dextrose and on biliverdin, bilirubin, and hæmoglobin (HUGOUNENQ and DOYON), A., ii, 376.
Starch, formation of, from carbohydrates absorbed by roots of plants (LAURENT), A., ii, 173.
formation of, by *Aspergillus niger*, and its specific rotatory power (TANRET), A., ii, 170.
formation of, in plants, and relation to diastase (MEYER), A., ii, 321.
soluble (WRÓBLEWSKI), A., i, 324.
constitution of (BROWN and MILLAR), T., 336 ; P., **1899**, 14.
molecular weight of (FRIEDENTHAL), A., i, 851.
hydrolysis of, with oxalic acid (BROWN and MILLAR), T., 307 ; P., **1899**, 12.
nitration and recovery of (BROWN and MILLAR), T., 309 ; P., **1899**, 13.
acetylation of (SKRAUP and HAMBURGER), A., i, 852.
action of amylase on (PETIT), A., i, 559.
barley, action of diastase on (LING), A., ii, 187.
hydrolysis of, by malt diastase (BROWN and MILLAR), T., 286 ; P., **1899**, 11.
and "soluble" starch, action of yeast-extract on (BUCHNER and RAPP), A., ii, 606.
digestion of, in plants (DU SABLON), A., ii, 239.
action of sodium peroxide on (WRÓBLEWSKI), A., i, 325.

Starch, formation of furfuraldehyde from (SESTINI), A., i, 103.
  solution of, effect of iodine on the freezing point of (FRIEDENTHAL), A., i, 852.
  potato-, influence of manure on the production of (DEHÉRAIN), A., ii, 687.
  maize, detection of, in wheat flour (BAUMANN), A., ii, 703.
  wheat-, digestibility of residues of (SCHULZE), A., ii, 509.
  estimation of, by takadiastase (STONE and WRIGHT), A., i, 95.
  estimation of, in sausage meat (WELLER), A., ii, 703.
  zinc iodide solution, preparation of (SEYDA), A., ii, 342.
Starfish, composition and manurial value of (FIELD), A., ii, 690.
Stars, oxygen in atmosphere of (GILL), A., ii, 718.
  spectra and temperature of (LOCKYER), A., ii, 4, 718.
Staurolite from N. Carolina (HIDDEN and PRATT), A., ii, 301.
Steam, specific volumes, latent and total heat, and entropy of (STARKWEATHER), A., ii, 270.
Stearamide, preparation of (ASCHAN), A., i, 14.
Stearic acid (*hexadecylacetic acid*) in ancient cements (DÖRNER), A., ii, 554.
  physical constants of (SCHEIJ), A., i, 668.
  volatilisation of, in compressed ethylene (VILLARD), A., ii, 144.
  melting point of, influence of pressure on (HULETT), A., ii, 469.
  and sodium salt, melting points of, and temperature of solidification of solutions of (KRAFFT), A., ii, 471.
  solidifying points of mixtures of, with palmitic acid (VISSER), A., i, 255.
  molecular weight of, in elaidic acid (BRUNI and GORNI), A., ii, 731.
  action of acetic anhydride on; also anhydride (ALBITZKY), A., i, 862.
  estimation of (TWITCHELL), A., ii, 69.
  separation of, from other fatty acids (HOLZMANN), A., ii, 68.
Stearic acid, potassium salt, boiling point of solutions of (KRAFFT), A., ii, 471.
  amylic salt, density, specific rotation, and molecular volume of (FRANKLAND), T., 358.
Stearic acid, chloro- (ALBITZKY), A., i, 861.
Steel. See under Iron.
Stelznerite from Chili (ARZRUNI, THADDÉEFF, and DANNENBERG), A., ii, 563.
Stereocaulic acid, from *Stereocaulon pileatum* and *Parmelia omphalodes* (ZOPF), A., i, 717.
Stereochemistry in relation to physiology (FISCHER), A., ii, 169.
  of nitrogen (POPE and PEACHEY), T., 1127; P., **1899**, 192.
Stereoisomerides, equilibria of (BANCROFT), A., ii, 411.
Sterilisation of liquids by kieselguhr filter (HAUSSER), A., ii, 569.
Stictaurin, from *Sticta aurata*, *Candellaria vitellina*, *C. concolor*, and *Gyalolechia aurella*, and probable identity with dipulvic acid (ZOPF), A., i, 716.
Stilbene (s-*diphenylethylene*), formation of (GOLDSCHMIEDT and KNÖPFER), A., i, 141.
  molecular weight of, in azobenzene solution (BRUNI and GORNI), A., ii, 731.
  mixtures of, with dibenzyl, freezing points of; cryoscopic behaviour of, in benzylaniline solution (GARELLI and CALZOLARI), A., ii, 732.
  *di*chloride, equilibrium of stereoisomeric forms of (BANCROFT), A., ii, 145.
Stilbenediol, and its α- and β-diacetyl derivatives (THIELE), A., i, 609.
Still, new form of, for preparing sterilised water (GAWALOWSKI), A., ii, 515.
Still-head, forms of, for fractional distillation (YOUNG), T., 684; P., **1899**, 147.
Stolpenite from Moravia (KOVÁŘ), A., ii, 671.
Stomach contents, estimation of hydrochloric acid in (LEO), A., ii, 516; (SIRINGO), A., ii, 803.
Straw. See Agricultural chemistry.
Streptococcus pyogenes, action of, on dextrose (HUGOUNENQ and DOYON), A., ii, 377.
Strigovite from Minnesota (BERKEY), A., ii, 371.
Strontianite from Bohemia (EICHLEITER), A., ii, 371.
Strontium, metallic (LENGYEL), A., ii, 219.
Strontium salts, absorption of Röntgen rays by (HÉBERT and REYNAUD), A., ii, 586.
Strontium arsenide, preparation of (LEBEAU), A., ii, 655.
  azoimide (CURTIUS and RISSOM), A., ii, 92.
  carbonate, reduction of, by aluminium (FRANCK), A., ii, 102.

Strontium chloride, heat of dilution of (Dunnington and Hoggard), A., ii, 728.
    contraction of aqueous solutions of, on dilution (Wade), T., 270; P., **1899**, 8.
  cadmium chloride, conductivity of solutions of (Jones and Knight), A., ii, 628.
  uranium chloride and bromide (Aloy), A., ii, 556.
  lead iodide (Mosnier), A., ii, 222.
  hydroxide, electrolysis of aqueous solutions of (Glaser), A., ii, 79.
  molybdiodate (Chrétien), A., ii, 363.
  hyponitrite, and hyponitrosoacetate (Divers), T., 117; P., **1898**, 224.
  sulphide, crystalline (Mourlot), A., ii, 97.
    phosphorescent (Mourelo), A., ii, 97, 98, 336, 420, 484.
  *hexa*tungsto*per*iodate (Rosenheim and Liebknecht), A., ii, 744.
Strontium, estimation and separation of:—
  estimation of, in presence of calcium and barium (Knobloch), A., ii, 182.
  separation of, from barium and calcium in mixture of sulphates, theory of (Morgan), A., ii, 627.
Strophanthidin (Kohn and Kulisch), A., i, 159.
Strophanthin, and its acetyl derivative (Kohn and Kulisch), A., i, 159.
  presence of, in Algerian oleander (Dubigadoux and Durieu), A., ii, 325.
Strychnic acid, ethyl and benzyl betaines of (Moufang and Tafel), A., i, 310.
Strychnine, action of bromacetophenone on (Schmidt), A., i, 5.
  action of sulphuric acid on (Bailey and Lange), A., ii, 194.
  action of *o*-xylylenic bromide on (Scholtz), A., i, 649.
  azoimide (Pommerehne), A., i, 88.
  *hept*iodide (Prescott), A., i, 90.
  d- and *l*-mandelates (McKenzie), T., 967.
  tartrates, specific gravity and rotation formulæ, and conversion temperature of (Ladenburg and Doctor), A., i, 310.
  detection of (Seyda), A., ii, 344.
  separation of brucine from (Stoeder), A., i, 715.
Strychnine-like alkaloid from a corpse (Mecke and Wimmer), A., i, 311.
Sturine, hydrolytic products of (Kossel), A., i, 833.
Styrene (*cinnamene, phenylethylene*), from xanthorrhœa resin oil (Schimmel and Co.), A., i, 63.
  and bromo- and chloro-derivatives (Jocitsch), A., i, 748.
  bromo-, and *di*chloro- (Jocitsch and Faworsky), A., i, 786.
  *exo*nitro-, polymerisation of, by action of ethylic sodiomalonate (Herrmann and Vorländer), A., i, 812.
  ω-nitro-, ω-*m*-*di*nitro-, ω-*o*-*di*nitro-potassium salt, and ω-*p*-*di*nitro- (Thiele), A., i, 584.
  Metastyrene, formation of (Herrmann and Vorländer), A., i, 812.
Suberamide (Aschan), A., i, 14.
Suberic acid, and potassium and potassium hydrogen salts (Massol), A., ii, 80.
  l-amylic salt, molecular rotation of (Walden), A., ii, 622.
Suberone, formation of, from α-hydroxy-*cyclo*heptanecarboxylic acid (Willstätter), A., i, 26.
Submaxillary gland, metabolism of the (Henderson), A., ii, 774.
Substance, m. p. 112°, obtained from *tri*bromo*di*nitrobenzene by action of sodium ethoxide (Jackson and Koch), A., i, 677.
  m. p. 138—140° and 154—155°, from campheride (Ciamician and Silber), A., i, 537.
  m. p. 156°, from action of dry ammonia on nitroso-oreoselone (Schmidt, Jassoy, and Haensel), A., i, 378.
  m. p. 178—180°, from action of alkali hydroxide on fabianaresen (Kunz-Krause), A., i, 449.
  m. p. 180°, from reduction of santonin-oxime (Wedekind), A., i, 631.
  m. p. 183°, from oxidation of trimethylbrazilin (Gilbody and Perkin), P., **1899**, 28.
  $CH_2S_2Cu_2$ and $C_2H_4S_3Cu_2$, from action of methylene thiocyanate on ethylic cupracetoacetate (Kohler), A., i, 737.
  $C_2H_3O_3N_2Br$ and $C_2H_3O_3N_2Br_3$, from action of bromine on leuco-salts of ethylnitrolic acid (Graul and Hantzsch), A., i, 188.
  $C_4H_{10}O_5N_4$, from action of alcohol on guanidinecarboxylazide (Thiele and Uhlfelder), A., i, 119.
  $C_5H_3O_2Cl_3$, from methylphloroglucinol and chlorine (Schneider), A., i, 680.
  $C_5H_7O_2NCl_2$ and $C_5H_8O_2N_2Cl_2$, from action of hydroxylamine on *tri*chlorethylideneacetone (Salkind), A., i, 733.

Substance, $C_5H_9O_2Cl$, from action of water on the chlorhydrin of isoprene-erythritol (Mokiewsky), A., i, 726.
  $C_5H_{10}O_2N_6 + \frac{1}{2}H_2O$, from condensation of semicarbazide with formaldehyde (Thiele and Bailey), A., i, 109.
  $C_6H_6O_5Br_2,H_2O$ and $C_6H_6O_5Br_2,2H_2O$, from action of bromine on the acids formed by reduction of dehydromucic acid (Hill and Wheeler), A., i, 576.
  $C_6H_9N_2$, from acetylacetone and semicarbazide (Bouveault), A., i, 456.
  $C_6H_9O_4N$, from action of methyl alcoholic ammonia on lævulose; also its tetracetyl derivative (de Bruyn), A., i, 732.
  $C_6H_{10}ON_2Cl_2$, from action of hydrochloric acid on mesitylnitrimine (Harries and Gley), A., i, 567.
  $C_6H_{12}ON_2$ or $C_6H_{11}O_2N$, from action of potash on allylamine dibromide (Chiari), A., i, 326.
  $C_7H_7O_3Br$, and its barium salt, obtained from *tetra*bromofilicic acid (Boehm), A., i, 805.
  $C_8H_6O_3NBr_3$, obtained by action of fuming nitric acid on *tri*brom-*o*-xylenol (Auwers and Rapp), A., i, 30.
  $C_8H_7O_2Br_3$, obtained from *tri*brom-*o*-xylenol (Auwers and Rapp), A., i, 30.
  $C_8H_7NS_2$, from dimethylaniline and sulphur (Möhlau and Klopfer), A., i, 240.
  $C_8H_8O_4NBr$, from action of bromine on ethylic 2-hydroxy-$\Delta^{2\cdot4}$-hydropyridone-3-carboxylate (Guthzeit and Laska), A., i, 261.
  $C_8H_{12}O$, from ethylic β-methylaminocrotonoethylideneacetoacetate (Knoevenagel and Reinecke), A., i, 340.
  $C_8H_{14}ON_4$, from the action of ethylenediamine on glyoxal; also its platinochloride (Kolda), A., i, 328.
  $C_8H_{14}O_4N_4$ or $C_6H_9O_3N_3$, from action of methylic semiorthoxalate on acetamide (Anschütz and Stiepel), A., i, 573.
  $C_8H_{16}N_2$, from the action of soda on isobutaldazine hydrochloride (Franke), A., i, 329.
  $C_9H_9O_3NBr_2$, obtained by action of fuming nitric acid on *di*bromomesitol (Auwers and Rapp), A., i, 30.
  $C_9H_{10}O_2Br_2$, obtained from *di*bromomesitol (Auwers and Rapp), A., i, 30

Substance, $C_9H_{10}O_2Br_2$, obtained from *di*bromo-ψ-cumenol, and its acetyl and diacetyl derivatives (Auwers and Rapp), A., i, 30.
  $C_9H_{10}O_3$, from scoparein (Perkin), P., **1899**, 123.
  $C_9H_{10}O_5$, from oxidation of trimethylbrazilin (Gilbody and Perkin), P., **1899**, 28.
  $C_9H_{12}O_5N_2$, from action of phosphorus trichloride on the ureines of ethylic dioxysuccinate and diethoxysuccinate (Geisenheimer and Anschütz), A., i, 575.
  $C_9H_{13}N$, from camphoroxime (Forster), T., 1147; P., **1899**, 193.
  $C_9H_{13}O_6N_7$, from aminoguanidineglyoxylic acid and *m*-nitraniline (Wedekind and Bronstein), A., i, 828.
  $C_9H_{15}ON$, from camphoroxime (Forster), T., 1148; P., **1899**, 193.
  $C_{10}HN_2Cl_{11}$, from pyridine hydrochloride and chlorine (Sell and Dootson), T., 983; P., **1899**, 187.
  $C_{10}HON_2Cl_9$, from substance $C_{10}HN_2Cl_{11}$, and moisture (Sell and Dootson), T., 983; P., **1899**, 187.
  $C_{10}HON_3Cl_7$, from pyridine hydrochloride and chlorine (Sell and Dootson), T., 984; P., **1899**, 187.
  $C_{10}H_7ON_6Cl_3$, from 2:6-*di*chloro-δ-oxy-7-methylpurine and phosphorus oxychloride (Fischer), A., i, 394.
  $C_{10}H_{11}O_4N_3$, from the aniline derivative of oximidoacetic acid and nitrous acid (Jovitschitsch), A., i, 239.
  $C_{10}H_{12}O_2NBr$, from action of bromine on cinnamide in presence of sodium methoxide (Jeffreys), A., i, 731.
  $C_{10}H_{14}O_6N_2$, from α-*di*bromocamphor and nitric acid (Lapworth and Chapman), T., 992; P., **1899**, 159.
  $C_{10}H_{14}ONBr$, from camphoroxime (Forster), T., 1146; P., **1899**, 193.
  $C_{10}H_{16}O_2NBr$, from camphoroxime and potassium hypobromite (Forster), T., 1144; P., **1899**, 193.
  $C_{10}H_{16}O_2N_2S_2$, from the action of heat on the ammonia compound of *di*thioacetylacetone (Vaillant), A., i, 415.
  $C_{10}H_{17}O_2Br$, from fencholenic acid and bromine (Cockburn), T., 506.
  $C_{10}H_{18}O$, from fenchene (Schimmel and Co.), A, i, 299.
  $C_{10}H_{24}NI$, from ethylic iodide and piperazine (van Rijn) A., i, 166.
  $C_{11}H_7N_3O$, obtained from β-naphthaquinoneaminoguanidine, and its sodium and silver derivatives (Thiele and Barlow), A., i, 48.

Substance, $C_{11}H_8N_4$, $C_{11}H_{10}N_4$, and $C_{11}H_8N_4O$, obtained from β-naphtholaminoguanidine, and their salts (Thiele and Barlow), A., i, 48.

$C_{11}H_{13}O_2N_2ClS$, obtained by oxidation of benzylpropylene-ψ-thiocarbamide (Uedinck), A., i, 498.

$C_{11}H_{14}O_6$, from $C_{13}H_{14}O_7$, from oxidation of trimethylbrazilone (Gilbody and Perkin), P., **1899**, 28.

$C_{11}H_{16}N_2O_3$, from bromoxazolone and caustic potash (Hanriot and Reynaud), A., i, 723.

$C_{11}H_{18}O$, from dipentene, and formaldehyde; acetyl derivative (Kriewitz), A., i, 298.

$C_{11}H_{18}O$, from limonene and formaldehyde (Kriewitz), A., i, 298.

$C_{11}H_{18}O$, from pinene and formaldehyde; dihydrochloride, dihydrobromide, acetyl and benzoyl derivatives (Kriewitz), A., i, 298.

$C_{11}H_{19}O_2N$, from pinole nitrosochlorides (Wallach, Stiehl, and Sieverts), A., i, 710.

$C_{12}H_{11}O_2N$, obtained by action of glycocine on benzylmethylketone-*o*-carboxylic acid (Gottlieb), A., i, 513.

$C_{12}H_{14}O_6$, from $C_{13}H_{14}O_7$, from oxidation of trimethylbrazilone (Gilbody and Perkin), P., **1899**, 28.

$C_{12}H_{16}O_3N_2$, from 3-methoxy-1-phenyl-4-dimethyl-5-pyrazolone (Michaelis and Röhmer), A., i, 234.

$C_{12}H_{16}O_4N_2$, from bromoxazolone (Hanriot and Reynaud), A., i, 723.

$C_{12}H_{17}O_7N_2Br$, from action of *p*-bromophenylhydrazine on glycuronic acid and on hydrolysed urochloralic acid (Neuberg), A., i, 933.

$C_{12}H_{20}O_3Br_2$, from pinole tribromide (Wallach, Stiehl, and Sieverts), A., i, 710.

$C_{12}H_{20}(NO_2)_2$, from nitrohexanaphthene (Markownikoff), A., i, 23.

$C_{12}H_{21}O_2N$, from pinole nitrosochlorides (Wallach, Stiehl, and Sieverts), A., i, 710.

$C_{12}H_{23}N_{10}N + 2H_2O$, from action of methylic alcohol on *d*-glucosamine (Sjollema), A., i, 732.

$C_{13}H_{12}ON_4 + H_2O$, from nitrobenzenylnitrophenyleneamidine (Pinnow and Wiskott), A., i, 501.

$C_{13}H_{14}O_7$, from oxidation of trimethylbrazilone (Gilbody and Perkin), P., **1899**, 28.

$C_{13}H_{18}O_2N_2$, from acetylacetone and anisamidine (Gabriel and Colman), A., i, 638.

Substance, $C_{14}H_{11}O_3N_5$, from *m*-xylylaznitroso*di*nitrobenzene (Willgerodt and Klein), A., i, 883.

$C_{14}H_{14}ON_2$, and hydrochloride (Ehrlich and Sachs), A., i, 884.

$C_{14}H_{22}ON_2$, from action of water on methylic and ethylic *iso*valerylcyanacetates (Klobb), A., i, 113.

$C_{15}H_{14}ON_2$, from anilinoacetonitrile and benzaldehyde (Miller, Plöchl, and Luppe), A., i, 128.

$C_{15}H_{18}O_3N_4S$, obtained by action of diazobenzenesulphonic acid on *m*-aminodimethyl-*p*-toluidine (Pinnow and Matcovitch), A., i, 50.

$C_{15}H_{23}ON$, from pentamethyldihydroquinoline methiodide (Piccinini), A., i, 76.

$C_{16}H_6O_2N + 3H_2O$, from chloranil and pyridine (Imbert), A., i, 633.

$C_{16}H_{10}O_4$, obtained by reducing the tetramethylic derivative of *di*thiodiphthalylic acid (Gabriel and Leupold), A., i, 122.

$C_{16}H_{10}O_4N_2$, from trihydroxyphenyl*apo*saffranone (Kehrmann and Duret), A., i, 83.

$C_{16}H_{10}S_3$, obtained from *di*thiodiphthalide by the action of potassium hydrosulphide (Gabriel and Leupold), A., i, 121.

$C_{16}H_{14}ON_4$ and $C_{32}H_{37}N_7$, obtained by the action of nitrous acid on phenyl-*p*-tolyliminopyrazoline (Seidel), A., i, 139.

$C_{16}H_{14}O_2NBr_3$, obtained from *di*bromanhydro-*p*-hydroxymesitylic alcohol bromide (Auwers and Allendorff), A., i, 32.

$C_{16}H_{15}ON$, obtained from ethylic anilinobenzylacetoacetate (Bertini), A., i, 897.

$C_{16}H_{16}ON_2$, from anhydroformaldehyde-*p*-toluidine and benzaldehyde (Miller, Plöchl, and Sieber), A., i, 128.

$C_{16}H_{16}ON_2$, from benzylidenemethylamine and benzaldehyde (Miller, Plöchl, and Kollegorsky), A., i, 128.

$C_{16}H_{16}ON_2$, from ethylideneaniline and benzaldehyde (Miller, Plöchl, and Hamburger), A., i, 128.

$C_{16}H_{19}O_7NS_2$, obtained from *p*-phenetoilsulphinic acid by action of nitrous acid (Gattermann), A., i, 517.

$C_{16}H_{21}ON$, from the action of methylaniline on methyloctenonal (Léser), A., i, 415.

$C_{16}H_{26}N_6$, 5-methylpyrazoline maleate (Curtius and Zinkeisen), A., i, 166.

Substance, $C_{16}H_{28}O_4$, from action of sodium ethoxide on ethylic *β-iso*propylacetobutyrate, and its hydrolysis (BARBIER and GRIGNARD), A., i, 113.
$C_{17}H_{11}N_5S_6$, from acetone and phenyl*di*thiodiazolonehydrosulphamine (BUSCH and WOLFF), A., i, 951.
$C_{17}H_{12}ON_2$, from action of benzoic chloride on acetonitrile (SEIDEL), A., i, 139.
$C_{17}H_{13}O_4N$, from phthalic chloride and ethylic *p*-aminobenzoate (LIMPRICHT), A., i, 293.
$C_{17}H_{15}ON$, obtained by action of potassium cyanide on chlorobenzylphenylacetone (GOLDSCHMIEDT and KNÖPFER), A., i, 140.
$C_{17}H_{18}O_2N_4$, from pyruvic acid hydrazone (FREER), A., i, 358.
$C_{18}H_{17}O_6N$, a secondary oxidation product of bebeerine and phenylhydrazone (SCHOLTZ), A., i, 92.
$C_{18}H_{17}O_7N$, a secondary oxidation product of bebeerine (SCHOLTZ), A., i, 92.
$C_{18}H_{18}O_{11}$, from action of sodium on ethylic malonate (WILLSTÄTTER), A., i, 577.
$C_{18}H_{19}O_4N$, from oxidation of bebeerine; oxidation products, and phenylhydrazone (SCHOLTZ), A., i, 92.
$C_{19}H_{22}O_6$, isomeric with lariciresinol (BAMBERGER and LANDSIEDL), A., i, 929.
$C_{20}H_{16}O_3N_6$, from *β*-benzoinphenylhydrazone (FREER), A., i, 358.
$C_{20}H_{18}N_2$, from bromacetophenonephenylhydrazone (FREER), A., i, 358.
$C_{20}H_{18}O_7N_2S_2Ba$, from thymol-*p*-sulphonic and diazonaphthionic acids (STEBBINS), A., i, 917.
$C_{21}H_{12}O_6$, obtained from acid $C_{20}H_{14}O_7$ and benzoic chloride (HEWITT and PITT), T., 523; P., **1899**, 101.
$C_{21}H_{18}ON_2$, from action of benzaldehyde on benzylideneaniline, and its isomeride (MILLER, PLÖCHL, and BRUHN), A., i, 127.
$C_{21}H_{22}O_3$, from *o*-diethoxydiphenyltetrahydropyrone (PETRENKO-KRITSCHENKO), A., i, 440.
$C_{22}H_{20}O_2N_2$, from phenyl-*p*-anisidoacetonitrile and benzaldehyde (MILLER, PLÖCHL, and SCHEITZ), A., i, 128.
$C_{22}H_{20}O_3N_2$, from action of benzaldehyde on benzylideneaniline (MILLER, PLÖCHL, and BRUHN), A., i, 127.
Substance, $C_{22}H_{20}O_4Br_4$, obtained from *di*bromo-*p*-hydroxymesitylic bromide (AUWERS and ALLENDORFF), A., i, 33.
$C_{22}H_{22}ON_2$, from action of heat on the aniline salt of the phenylimide of methylhexenonepyruvic acid (LÉSER), A., i, 329.
$C_{22}H_{30}O_4$, from camphoroxalic acid and benzoic chloride (TINGLE), A., i, 445.
$C_{23}H_{19}O_{10}N$, from nitrobenzaldehyde and gallacetophenone (RUPE and LEONTÉEFF), A., i, 371.
$C_{23}H_{20}O_4$, from oxidation of *o*-tolylic carbonate and its acetyl derivative (CAZENEUVE), A., i, 296.
$C_{24}H_{19}N_5S_6$, from acetophenone and phenyldithiodiazolonehydrosulphamine (BUSCH and WOLFF), A. i, 951.
$C_{24}H_{24}O$, from menthenone and benzaldehyde (WALLACH), A., i, 533.
$C_{24}H_{24}O_2$, from eucarvone and benzaldehyde (WALLACH), A., i, 531.
$C_{24}H_{24}ON_2$, from cuminaldehyde and phenylanilinoacetonitrile (MILLER, PLÖCHL, and GERNGROSS), A., i, 127.
$C_{24}H_{26}O$, by reduction of $C_{24}H_{24}O$ (WALLACH), A., i, 533.
$C_{24}H_{26}O_2$, from carvenone and benzaldehyde (WALLACH), A., i, 533.
$C_{24}H_{28}O_2$, from benzaldehyde and tetrahydrocarvone (WALLACH), A., i, 532.
$C_{24}H_{36}O_8$, from hydrolysis of ouabain (ARNAUD), A., i, 70.
$C_{25}H_{44}O$, from oleo-resin of *Dacryodes hexandra*; and its acetyl and *tetra*nitro-derivative (MORE), T., 719; P., **1899**, 150.
$C_{26}H_{18}O$, from *o*-phenylbenzaldehyde (FANTO), A., i, 367.
$C_{26}H_{19}N_3O_3$, from *o*-aminodiphenylamine and nitrobenzil (KEHRMANN and NATCHEFF), A., i, 81.
$C_{26}H_{20}O_4$, from benzoin and resorcinol (VON LIEBIG), A., i, 915.
$C_{26}H_{20}N_3Cl$, from benzil and *α*-*di*aminodiphenylamine, and acetyl derivative (KEHRMANN and NATCHEFF), A., i, 81.
$C_{27}H_{25}O_2N_2Cl$, from *α*-naphthaquinonetetramethyl*di*aminodiphenylmethane, and lead peroxide (MÖHLAU), A., i, 62.
$C_{30}H_{23}N_7$, from action of nitrous acid on cyanacetophenonephenylhydrazone (SEIDEL), i, 139.
$C_{30}H_{26}O_2$, obtained from dibenzyl ketone (FORTEY), T., 872; P., **1899**, 182.

Substance, $C_{32}H_{26}O_2N_2$, from action of phenylcarbimide on β-benzoylpropionic acid (Klobb), A., i, 511.
  $C_{34}H_{24}O_5S_2$, from thioguaiacol (Gattermann and Bamberg), A., i, 514.
  $C_{38}H_{26}O_6$, and its hydrates from benzil and resorcinol (von Liebig), A., i, 915.
  $C_{38}H_{26}O_6+11H_2O$, from benzil and resorcinol (von Liebeg), A., i, 915.
  $C_{40}H_{28}O_2N_2$, from flavinduline and deoxybenzoin (Sachs), A., i, 239.
  $C_{40}H_{60}O_4$, from galbanic acid (Tschirch and Knitl), A., i, 714.
  $C_{44}H_{64}Cu_3$, from the action of acetylene on copper and on cuprous oxide (Erdman and Köthner), A., i, 21.
  $C_{53}H_{51}O_{20}$ or $C_{52}H_{51}O_{20}$, obtained from wormwood, and derivative (Adrian and Trillat), A., i, 301.
  $C_{54}H_{98}O_2$, from reduction of fabianaresen (Kunz-Krause) A., i, 449.
Substances with labile atom-groupings, determination of structure of (Hantzsch), A., i, 399.
Succinamic acid, methylic salt (Hoogewerff and van Dorp), A., i, 870.
Succinamide, oxidation of (Oechsner de Coninck), A., i, 509.
  mercury compound of, constitution of, (Kieseritzky), A., ii, 395.
  *di*amino-, ureine of (Geisenheimer and Anschütz), A., i, 575.
Succinanilic acid (Dunlap), A., i, 697.
Succinic acid, from malic acid by action of bacteria (Emmerling), A., ii, 570.
  from oxidation of β-aldehydepropionic acid (Perkin and Sprankling), T., 16; P., **1898**, 112.
  equilibrium in, formation of anhydride from (Bancroft), A., ii, 411.
  compound of, with sulphuric acid (Hoogewerff and van Dorp), A., ii, 672.
  diureine of, and its ammonium and silver salts (Geisenheimer and Anschütz), A., i, 175.
Succinic acid, potassium salt, heat of formation of (Massol), A., ii, 80.
  methylic and ethylic salts, diureines of, also methyldiureine of the latter (Geisenheimer and Anschütz), A., i, 575.
  thymylic hydrogen and guaiacylic hydrogen salts (Schryver), T., 664; P., **1899**, 121.
Succinic acid, amino-. See Aspartic acid.
  bromo-, ethylic salt, synthesis of terebic acid from (Blaise), A., i, 115.
    and chloro-, optical isomerism of (Walden), A., ii, 393.
Succinic acid, chloro-, ethereal salts, specific rotations and molecular volumes of (Frankland), T., 348, 352.
  l-chloro- and *l*-bromo-, hydrolysis of, with different agents, optical inversion during; alkyloxy-derivatives of, optical behaviour of (Walden), A., ii, 538.
  *di*chloro-, ethylic salt, from action of hypochlorous acid on ethylic fumarate (Henry and Aschmann), A., i, 258.
Succinic acids, substituted, melting points of (Solonina), A., ii, 633.
  solubility of (Massol and Lamouroux), A., i, 479.
iso-**Succinic acid** (*methylmalonic acid, ethanedicarboxylic acid*), and its dinitrile, from hydrolysis of *tri*cyanethane (Hantzsch and Osswald), A., i, 406.
  ethylic salt, action of ethylic brom*iso*butyrate on (Bone), P., **1899**, 5.
    action of bromacetal on sodium derivative of (Perkin and Sprankling), T., 18.
    condensation of sodium derivative of, with ethylic bromopropionate and brom*iso*butyrate (Bone and Sprankling), T., 849.
iso-**Succinic acid**, *di*bromo-, ethylic salt, from action of bromine on ethylic methylenemalonate (Komppa), A., i, 417.
  cyanimino-. See Malonic acid, *di*cyano-.
Succinimide, formation of (Mathews), A., i, 56.
  and its mercury and silver compounds, constitution of (Kieseritzky), A., ii, 395, 396.
  action of methylic alcohol on (Hoogewerff and van Dorp), A., i, 870.
Succinonitrile (*ethylenic cyanide*), equilibrium between sodium chloride, water, and (Snell), A., ii, 408.
  action of cuprous chloride on (Rabaut), A., i, 557.
Succino-*p*-nitrobenzylamic acid, methylic salt, and **Succino-*p*-nitrobenzylimide**, and the action of methylic alcohol on it (Hoogewerff and van Dorp), A., i, 870.
Succinylcamphoroxime (Frankforter and Mayo), A., i, 713.
Sucrose (*saccharose, cane sugar*), production of (Lieben), A., ii, 45.
  molecular refraction of (Hallwachs), A., ii, 462.
  influence of temperature on specific rotation of (Wiley), A., ii, 702.

- **Sucrose** (*saccharose, cane sugar*), aqueous solutions of, molecular depression of vapour pressure of (Dieterici), A., ii, 403.
  - depression of freezing point of water by (Raoult), A., ii, 203.
  - contraction of aqueous solutions of, on dilution (Wade), T., 256, 270 ; P., **1899**, 8.
  - surface tension of aqueous solutions of (Forch), A., ii, 641.
  - viscosity of undercooled (Tammann), A., ii, 272.
  - osmotic pressure of solutions of (Ponsot), A., ii, 204, 357.
  - velocity of inversion, and osmotic pressure of solutions of (Arrhenius), A., ii, 359.
  - inversion of, in aqueous alcohol (Cohen), A., ii, 275.
  - inversion of, by metallic salts (Kahlenberg, Davis, and Fowler), A., ii, 470.
  - inversion of, by neutral salts in presence of glucose (Geerligs), A., i, 101.
  - inversion of, by water, and the influence of platinum, palladium, iridium, copper, and silver on the action (Raýman and Šulc), A., i, 102.
  - velocity of hydrolysis of, by different acids (Sigmond), A., ii, 146.
  - action of yeast enzymes on (Kalanthar), A., i, 102.
  - antiseptic action of (Salkowski), A., i, 724.
  - changes in, during storage (Jesser ; Rydlewski), A., ii, 48.
  - cobalt derivatives of (Herzog), A., ii, 818.
  - solubility of lime in solutions of (Weisberg), A., ii, 748.
  - fate of, after injection into the circulation (Pavy), A., ii, 677.
  - in plants, function and distribution of (Schulze), A., ii, 570.
  - formation of dextrin and dextrose from by *Aspergillus niger* (Tanret), A., ii, 171.
- **Sucrose, detection and estimation of :—**
  - detection of (Gawalowski), A., ii, 255.
  - detection of, in milk (Cayaux), A., ii, 254 ; (de Koningh), A., ii, 707.
  - estimation of (Ling), A., ii, 67.
  - estimation of, as osazones (Lintner and Krober), A., ii, 66.
  - estimation of, in chocolate (Carles), A., ii, 67 ; (Woy), A., ii, 187.
  - estimation of, in fodders (Foerster), A., ii, 818.
- **Sucrose, estimation of :—**
  - estimation of, in presence of lactose (Dowzard), T., 371 ; P., **1899**, 9.
  - estimation of, in molasses, &c. (Ling and Baker), A., ii, 67.
  - influence of, on estimation of pentosans (Andrlík), A., ii, 817.
  - presence of unfermentable reducing substances in (Glendinning), A., ii, 187.
- **Sucrose.** See also Agricultural chemistry.
- **Sugar**, presence of a, in orange-peel (Flatau and Labbé), A., ii, 445.
  - optically inactive, from hydrolysis of fabianaglucotannoid (Kunz-Krause), A., i, 448.
  - from albumin (Müller and Seemann ; Blumenthal and Mayer), A., i, 968.
  - nature of the, in diabetic urine (Patein and Dufau), A., ii, 375.
  - source of, in phloridzin glycosuria (Kumagawa and Miura), A., ii, 776.
  - influence of experimental jaundice on the metabolism of (von Reusz), A., ii, 168.
- **Sugar-beet**, estimation of quality of (Sempolowski), A., ii, 389.
- **Sugar-cane.** See Agricultural chemistry.
- **Sugar, "invert,"** estimation of, colorimetrically (Sidersky), A., ii, 254.
  - estimation of moisture in (Thorne and Jeffers), A., ii, 51.
- **Sugars**, cause of mutarotation of (Lowry), T., 212 ; P., **1899**, 25.
  - subcutaneously injected, injurious action of large doses of (Kóssa), A., ii, 504.
  - action of yeast-extract on (Buchner and Rapp), A., ii, 606.
  - fermentation of, by yeasts and moulds, and influence of nitrogenous matter thereon (Dubourg), A., ii, 376.
  - fermentable, influence of, on glycogen formation in yeast-extract (Cremer), A., ii, 606.
  - brewing, analysis of (Morris), A., ii, 187.
  - diabetic, estimation of (Landolph), A., ii, 186.
  - reducing and invertible, of maize stalks (Istrati and Œttinger), A., ii, 506, 507.
  - estimation of, by iodine and Fehling's solution (Schoorl), A., ii, 617.
  - estimation of, by Kjeldahl's process (Bruhns), A., ii, 254.
  - estimation of, by weighing the copper precipitates (Meillère and Chappelle), A., ii, 616.

Sugars, estimation of glycerol in presence of (Laborde), A., ii, 816.
  estimation of, in meat and urine (Polenske), A., ii, 186.
  estimation of, as osazones (Lintner and Kröber), A., ii, 66.

Sugars. See also:—
  Arabinose.
  Cane-sugar (*sucrose*).
  Dextrose.
  Digitalose.
  Digitoxose.
  Formose.
  Galactose.
  Glucose (*dextrose*).
  Hederose.
  Hexose.
  Invert-sugar.
  Lactose.
  Lævulose.
  Maltose.
  Mannose.
  Melibiose.
  Melicitose.
  Melitriose (*raffinose*).
  Morfose.
  Raffinose.
  iso-Saccharin.
  Sucrose (*cane sugar*).
  Trehalose.
  Xylose.

Sulphacetic acid, from action of sulphuric acid on acetic acid (Bagnall), T., 279.

o-**Sulphamidobenzoic acid**, methylic salt, formation of (Hoogewerff and van Dorp), A., i, 870.

m- and *p*-**Sulphanilic acids**, action of, on tetramethyl*di*aminobenzhydrol (Suais), A., i, 59.

Sulph-hæmoglobin, preparation of, and action of acids on (Harnack), A., i, 467.

Sulphates. See Sulphur.

Sulphines, identity of the four affinities of sulphur in (Brjuchonenko), A., i, 189.

Sulphides, and **Sulphites**. See under Sulphur.

o-**Sulphobenzaldehyde**-*m*-**nitrophenylhydrazone** (Rougy), A., i, 753.

as-**Sulphobenzimide** (Mathews), A., i, 58.

o-**Sulphobenzoic acid**, and ammonium salt, melting points of (Mathews), A., i, 57.

Sulphocamphylic acid, oxidation of (Perkin), T., 175; P., **1893**, 110.

Sulphocarbanilic acid (Cazeneuve and Moreau), A., i, 431.

Sulphocinchenine (*sulphocinchine*) (Koenigs and Höppner), A., i, 88.

Sulphomethyltriazancarboxylic acid, aminoimino-, ethylic salt and amide of (Thiele and Osborne), A., i, 413.

Sulphonal (*diethylsulphonedimethylmethane;* iso*propylidenediethylsulphone*), velocity of crystallisation of (Bogojawlensky), A., ii, 206.
  amino-, and salts and nitroso-compound (Posner), A., i, 604.

Sulphonalphthalamic acid, and potassium salt (Posner), A., i, 604.

Sulphones:—
  Benzenesulphonazide.
  Benzenesulphonehydrazide.
  Benzylidenebenzenesulphonehydrazide.
  Benzylidenenaphthylsulphonehydrazide.
  Dibenzenesulphonehydrazide.
  Dimethoxydiphenyldisulphonehydroxylamine.
  Di-naphthylsulphonehydrazide.
  Diphenylenedisulphone.
  iso-Diphenylenedisulphone.
  Diphenylsulphone.
  Diphthalimidosulphonal.
  Ditolyldisulphone.
  Ditolylenedisulphone.
  Ethylacetonetriethyltrisulphone.
  Methoxyaminopropanetriethyltrisulphone.
  Naphthylpropylsulphone.
  Naphthyl*iso*propylsulphone.
  β-Naphthylsulphonazide.
  Naphthylsulphonebutyric acids.
  Naphthylsulphonehydrazide.
  Phenylpropylsulphone.
  Phenyl*iso*propylsulphone.
  Phenylsulphonebutyric acid.
  Phenylsulphone*iso*butyric acid.
  Phenylsulphonesodioacetic acid.
  Phenyltolyldisulphone.
  Phenyltolylketosulphone.
  Phthalimidosulphonal.
  Propylidenebenzenesulphonehydrazide.
  Propylidenenaphthylsulphonehydrazide.
  Sulphonal.
  Sulphonalphthalamic acid.
  Toluenesulphonacetic acid.
  Toluenesulphonacetoacetic acid.
  Toluenesulphonomalonic acid.
  Tolyl-*n*- and -*iso*propylsulphones.
  Tolylsulphone-*n*- and -*iso*butyric acid.
  Tolylsulphonephenylhydroxylamine.

Sulphonic acids, aliphatic (Kohler), A., i, 19.
  of the paraffins (Worstall), A., i, 18.

1-*p*-Sulphophenyl-4-aminopyrazolone-3-carboxylic acid. See Tartrazinogenic acid, amino-.
Sulphur (native) from Sardinia (Millosevich), A., ii, 492.
deposited by mineral water (Knett), A., ii, 772.
hylotropic-isomeric forms of (Schaum), A., ii, 733.
insoluble, formation of, by heating sulphur (Küster), A., ii, 90.
atomic weight of (Berthelot), A., ii, 207.
molecular weight of, in carbon *di*sulphide (Barnes), A., ii, 415.
molecular weight of, in naphthalene and in phosphorus (Gloss), A., ii, 415.
identity of the four affinities of, in sulphines (Brjuchonenko), A., i, 189.
spectrum of (Gramont), A., ii, 345.
vapour, colour of (Howe and Hamner), A., ii, 89.
effect of pressure on melting point and transition curves of (Tammann), A., ii, 636.
liquid, absorption of hydrogen sulphide by (Duhem), A., ii, 740.
action of iodine on (Prunier), A., ii, 650.
combination of, with hydrogen (Konowaloff), A., ii, 415.
action of, on silver nitrate dissolved in benzonitrile (Naumann), A., ii, 423.
action of, on sulphuric acid (Adie), P., **1899**, 133.
compounds in the urine under different conditions (Harnack and Kleine), A., ii, 375.
Sulphur chloride, action of, on hydrocarbons, in presence of aluminium-mercury couple (Cohen and Skirrow), T., 887; P., **1899**, 183.
oxychloride, Ogier's, a mixture (Knoll), A., ii, 18.
hydride. See Hydrogen sulphide.
Sulphides, alkali, spark spectra of, (Gramont), A., ii, 345.
detection of sulphites, sulphates, and thiosulphates in presence of (Browning and Howe), A., ii, 124.
estimation of, in presence of sulphites and thiosulphates (Feld), A., ii, 246.
Polysulphides, estimation of, in presence of sulphides and free sulphur (Feld), A., ii, 246.
Sulphur *di***oxide** (*sulphurous anhydride*), liquid, specific gravity, coefficients of expansion and compressibility of; commercial, action of, on iron (Lange), A., ii, 478.
compressibility of mixture of, with carbon *di*oxide (Berthelot and Sacerdote), A., ii, 404.
action of, on ferric sulphate (Antony and Manasse), A., ii, 753.
action of, on hydrazine (de Bruyn), A., ii, 745.
combustion of mixtures of, with hydrogen (Berthelot), A., ii, 282, 283.
liquid, action of, on iron (Harpf; Lange), A., ii, 594.
Sulphur acids:—
Sulphurous acid, action of, on metals (Berthelot), A., ii, 283.
Sulphurous acid, detection and estimation of:—
detection of sulphides, sulphates, and thiosulpates in presence of (Browning and Howe), A., ii, 124.
estimation of (Feld), A., ii, 246.
estimation of sulphur in (Bourgougnon), A., ii, 517.
estimation of, in presence of sulphur in the free state (Feld), A., ii, 247.
estimation of, in presence of sulphides and thiosulphates (Feld), A., ii, 246.
Sulphuric acid, from coal containing sulphur or pyrites (Thörner), A., ii, 746.
ions of, migration number of, and temperature coefficient of (Starck), A., ii, 625.
heat of dilution of (Berthelot), A., ii, 271.
solutions of, molecular depression of vapour pressure of (Dieterici), A., ii, 403.
contraction of aqueous solutions of, on dilution (Wade), T., 256; P., **1899**, 8.
densities of solutions of (Barnes and Scott), A., ii, 405.
absorption of water by, and hydrates of (Busnikoff), A., ii, 360, 409.
action of some elements on (Adie), P., **1899**, 132.
action of, on metals (Berthelot), A., ii, 283.
action of nitric *per*oxide on (Lunge and Weintraub), A., ii, 479.
compounds of titanium *di*oxide with (Blondel), A., ii, 556.
Sulphates, alkali, spark spectra of (de Gramont), A., ii, 345.

Sulphur acids :—
Sulphates, action of hydrochloric acid on (TUNNELL and SMITH), A., ii, 744.
normal, action of nitric acid on (TANRET), A., ii, 22.
reduction of, by bacteria (HARTLEY), A., ii, 437.
Sulphuric acid, detection and estimation of :—
detection of sulphides, sulphites, and thiosulphites in presence of (BROWNING and HOWE), A., ii, 124.
estimation of (MARBOUTIN and PÉCOUL), A., ii, 180; (ULSCH), A., ii, 802.
estimation of, in presence of iron (KÜSTER and THIEL), A., ii, 247, 611; (LUNGE), A., ii, 805.
estimation of combined (MARBOUTIN and MOLINIÉ), A., ii, 247, 518.
preparation of standard solutions of (MARSHALL), A., ii, 575.
titration of combined (REUTER), A., ii, 53.
separation of selenium from (JANNASCH and HEIMANN), A., ii, 60.
Pyrosulphuric acid, detection of (BARRAL), A., ii, 123.
estimation of (GRÜNHUT), A., ii, 381.
per-**Sulphuric acid**, and HSO_4 ions, formation of (STARCK), A., ii, 625.
per-**Sulphates**, valuation of (MONDOLFO), A., ii, 805.
Thiosulphates, action of, on iodates (JÖRGENSEN), A., ii, 248.
detection of sulphides, sulphates, and sulphites in presence of (BROWNING and HOWE), A., ii, 124.
estimation of, in presence of sulphides and sulphites (FELD), A., ii, 246.
Sulphur, detection and estimation of :—
detection of, in organic compounds (RAIKOW), A., ii, 123.
estimation of, in coal (HEATH), A., ii, 52; (ANTONY and LUCCHESI), A., ii, 517.
estimation of, in gases (PHILLIPS), A., ii, 35.
estimation of, in cast-iron and steel, volumetrically (THILL), A., ii, 693.
estimation of, in substances rich in iron (MEINEKE), A., ii, 693.
estimation of, in iron, pyrites, slags, coal, coke, asphalt, rubber, &c. (HERTING), A., ii, 804.
estimation of, in iron ores (MEINEKE), A., ii, 518.
estimation of, in liver of sulphur BARTHE), A., ii, 329.
Sulphur, estimation of :—
estimation of, in organic substances (LONGHI), A., ii, 328.
estimation of, in petroleum (FILITI), A., ii, 575.
estimation of, in plants (BERTHELOT), A., ii, 330.
estimation of, in pyrites (HEIDENREICH), A., ii, 517.
estimation of sulphides, sulphites, and thiosulphates in presence of (FELD), A., ii, 246.
estimation of, in sulphites (BOURGOUGNON), A., ii, 517.
estimation of, in crude sulphur (FUCHS), A., ii, 329.
Sulphur-bacteria (HARTLEY), A., ii, 437.
"**Sulphureins**" (SISLEY), A., i, 289.
Sulphuretted hydrogen. See Hydrogen sulphide under Hydrogen.
μ-**Sulphydro-*β*-methyl-*α*-ethylthiazoline** (*mercaptomethylethylthiazoline*), from action of carbon disulphide on 3-bromo-2-aminopentane hydrobromide (JÄNECKE), A., i, 477.
Superphosphates. See Agricultural chemistry.
Suprarenal capsules, comparative physiology of (VINCENT), A., ii, 41.
secretion of the (DREYER), A., ii, 231.
nature of active substance in the (VON FÜRTH), A., ii, 115.
xanthine bases in the (OKERBLOM), A., ii, 778.
Suprarenal extract, action of, on the heart (WALLACE and MOGK), A., ii, 310.
effect of, when given by the mouth (GRÜNBAUM), A., ii, 441.
Surface tension of aqueous solutions, molecular depression or elevation of (FORCH), A., ii, 640.
of solutions of alkali chlorides (LINEBARGER), A., ii, 469.
Sweet orange, oil of. See Portugal, oil of.
l-**Sylvestrene**, presence of, in essential oil of oleo-resin from *Dacryodes hexandra* (MORE), T., 718; P., **1899**, 150.
Sympathetic ganglia, physiological action of extracts of (CLEGHORN), A., ii, 569.
Symplesite from Sicily (LA VALLE), A., ii, 495.
Széchenyiite from Burma (KRENNER), A., ii, 673.

T.

Tachylyte from Antarctic regions (PRIOR), A., ii, 436.

Tachylyte from the North Atlantic (Termier), A., ii, 436, 501.
Tænite, carbon in (Cohen), A., ii, 674.
Taka-diastase, the activity of, and estimation of starch by (Stone and Wright), A., i, 95.
d-**Talitol**, condensation of benzaldehyde with (de Bruyn and Alberda van Ekenstein), A., i, 662.
Tallow, rancidity of (Scala), A., i, 478.
  detection of, in cacao butter (Lewkowitsch), A., ii, 712.
  iodine absorption of (Smetham), A., ii, 710.
Tannic acid (Walden), A., i, 212.
Tannin, amount of, in heather (Perkin and Newbury), T., 838; P., **1899**, 179.
  in oaks, formation of, and relation to starch (Mer), A., ii, 607.
  colloidal nature of (Krafft), A., ii, 473.
  specific rotation of aqueous, alcoholic, or acetic acid solution of (Flawitzky), A., i, 805.
  action of sodium on, in alcohol (Kunz-Krause), A., i, 200.
  detection of (Seyda; Todeschini), A., ii, 341.
  estimation of (Vignon), A., ii, 135.
Tannins, reactions and classification of (Kunz-Krause), A., i, 762.
Tanning liquors, estimation of acidity of (Paessler and Spanjer), A., ii, 618.
Tanning materials, examination of (Proctor and Parker), A., ii, 75.
Tantalum:—
  per-**Tantalic acid**, preparation of (Melikoff and Pissarjewsky), A., ii, 491.
  d-**Tartaric acid**, electric conductivity of solutions of, at high pressures (Bogojawlensky and Tammann), A., ii, 138.
    influence of magnetic field on (Wright and Kreider), A., ii, 265.
    solutions, specific rotation of (Wendell), A., ii, 199.
    lævorotation of, in concentrated solution (Lepeschkin), A., i, 576.
    action of alkalis on (Holleman), A., i, 283.
    action of, on metallic iron (Ulsch), A., i, 868.
    detection of, in presence of oxalic acid (Fresenius), A., ii, 257.
    estimation of (Moszczewski), A., ii, 69; (Kulisch, Kohlmann, and Höppner), A., ii, 340.
    estimation of, in argols (Eckstein; Schäfer), A., ii, 70.
Tartaric acid, mono-alkali salts, action of titanic and stannic oxides on (Henderson, Orr, and Whitehead), T., 554; P., **1899**, 108.
  calcium salt, solubility of (Enell), A., ii, 706.
  complex copper salts, with sodium, potassium, and ammonium (Bullnheimer and Seitz), A., i, 868.
  potassium hydrogen salt, estimation of, in wines (Magnier de la Source), A., ii, 70; (Jay), A., ii, 133.
  rubidium salt, dissociation of (Rimbach), A., ii, 345.
  silver salt, action of *iso*propylic iodide on (Purdie and Pitkeathly), T., 156; P., **1899**, 6.
  sodium salt, electric conductivity of solutions of, at high pressure (Bogojawlensky and Tammann), A., ii, 138.
  sodium ammonium, sodium potassium, and potassium hydrogen salts, specific rotations of, and separation of, from *l*- and racemic forms (Kipping and Pope), T., 38; P., **1898**, 220.
  ethereal salts, densities, molecular volumes and specific rotations of (Frankland), T., 349, 361.
  p-aminophenylic hydrogen salt (Hinsberg), A., i, 496.
  *iso*diphenylhydroxyethylamine, *l*- and *d*-, salts (Erlenmeyer), A., i, 882.
  ethylic salt, action of ethylic iodide on, in presence of silver oxide (Purdie and Pitkeathly), T., 158; P., **1899**, 6.
  strychnine salts, specific gravity, rotation formulæ and conversion temperature of (Ladenburg and Doctor), A., i, 310.
  Racemic acid, solubility of, in water, effect of tartaric acid on (Ladenburg), T., 466; P., **1889**, 73.
    potassium salt, racemic transformation of (van't Hoff and Müller), A., i, 483.
    sodium potassium and potassium hydrogen salts, separation of, from *d*-tartrates (Kipping and Pope), T., 42; P., **1898**, 220.
  l-**Tartaric acid**, sodium ammonium salt, separation of, from *d*-form (Kipping and Pope), T., 38; P., **1898**, 200.
Tartaric acids, *d*- and *l*-, sodium ammonium salts, solubility of mixtures of, in water (Ladenburg), T., 467; P., **1899**, 73.

Tartaric acids, *d*-, *l*-, and *i*-, melting point curves of mixtures of optically isomeric forms of, and of methylic salts (Centnerszwer), A., ii, 726.

Tartaryl anilide, and *o*-, *m*-, and *p*-toluidides, specific rotations of (Guye and Babel), A., ii, 719.

Tartrazinogenic acid, amino- (Anschütz), A., i, 638.

Taste in relation to chemical constitution (Sternberg), A., ii, 772.

  of salts (Höber and Kiesow), A., ii, 206.

Taurocholic acid, detection of (Vitali), A., ii, 342; (Gnezda), A., ii, 715.

Tautocinchonine (Skraup), A., i, 960.

Tautomeric compounds, solidification of mixtures of (Roozeboom), A., ii, 355.

Tautomerism (Knorr), A., i, 673.

  absorption spectra of isatin and carbostyril and alkyl derivatives in relation to (Hartley and Dobbie), T., 640; P., **1899**, 47.

Tea, estimation of caffeine in (Gadamer), A., ii, 390.

Teeth, estimation of fluorine in (Hempel and Scheffler), A., ii, 380.

Tellurium, preparation of (Lenher), A., ii, 478.

  atomic weight of, and position in periodic system (Wilde), A., ii, 148.

  spectrum of (de Gramont), A., ii, 199.

  compounds (Metzner), A., ii, 364.

  Tellurates, action of hydrochloric acid on (Tunnell and Smith), A., ii, 744.

  separation of palladium and selenium from (Jannasch and Müller), A., ii, 60.

  separation of sulphuric and phosphoric acids from (Jannasch and Heimann), A., ii, 60.

Tellurium ores, assay of (Fulton), A., ii, 63.

Temperature. See under Thermochemistry.

Tennantite from British Columbia (Hoffmann), A., ii, 110.

Tephrite from Rhön Mountains (Seyfried), A., ii, 162.

Teraconic acid (*dimethylitaconic acid*), and its anhydride; also its reduction (Fittig and Krafft), A., i, 334.

  and its identity with dimethylitaconic acid (Semenoff), A., i, 793.

Terbium in monazite sands (Urbain), A., ii, 28.

  metals in didymium from monazite sands (Urbain), A., ii, 425.

Terebenthene, absorption of argon by (Berthelot), A., ii, 653.

Terebic acid, from *cis*- and *trans*-caronic acids (Perkin and Thorpe), T., 59.

  synthesis of (Lawrence), T., 531; P., **1899**, 105; (Blaise), A., i, 115, 419.

  ethylic salt, action of sodium ethoxide on (Fittig and Krafft), A., i, 334.

iso-**Terebic acid** (*dimethylisoparaconic acid*), and the action of baryta on it (Fittig and Petkow), A., i, 335.

  bromo-, and the action of alkalis on it (Fittig and Petkow), A., i, 335.

iso-**Terebilenic acid** (Fittig and Petkow), A., i, 335.

Terephthalic acid (p-*phthalic acid*), synthesis of, by action of soda on β-aldehydopropionic acid (Perkin and Sprankling) T., 18.

  formation of (Verley), A., i, 425; (Collet), A., i, 434; (Weiler), A., i, 491.

  aniline salt, nitro-, and 2:5-*di*chloro- (Graebe and Buenzod), A., i, 763.

Terpene, $C_{10}H_{16}$, from pinene dibromide. See Tricyclene.

Terpenes, in lemon grass oil (Tiemann), A., i, 623.

  action of, on photographic plates (Russell), A., ii, 720.

Terpene series, cryoscopic researches in (Biltz), A., i, 297.

Δ^4-**Terpene-3-one**, crystalline substance from (Hobbs), A., i, 767.

Terpenylic acid, from *l*-terpineol (Godlewsky), A., i, 920.

  synthesis of (Lawrence), T., 531; P., 105.

Terpinene, from *l*-linalool (Stephan), A., i, 68.

  in oil of *Origanum majorana* (Biltz), A., i, 535.

Terpineol, in cardamoms oil (Schimmel and Co.), A., i, 63.

  in oil of *Origanum majorana* (Biltz), A., i, 535.

  behaviour of, towards sodium acetate and acetic anhydride (Schimmel and Co.), A., i, 64.

d-**Terpineol**, from *l*-linalool (Stephan), A., i, 68.

l-**Terpineol**, from *d*-linalool (Stephan), A., i, 68.

  oxidation of (Godlewsky), A., i, 920.

Tetracetohydrazide (Cuneo), A., i, 9; (Stolle), A., i, 413.

Tetracetoxydinaphthylmethane (Meyer and Conzetti), A., i, 764.

Tetracetoxynaphthalene (Zincke and Ossenbeck), A., i, 765.

Tetracetylcitryltriphenylhydrazide (Manuelli and de Righi), A., i, 885.

Tetracetyllariciresinol (Bamberger and Landsiedl), A., i, 929.

Tetracetylluteolin (Perkin and Newbury), T., 831 ; P., **1899**, 179.

Tetracetylmorin (Perkin), T., 448 ; P., **1899**, 66.

Tetracetylmucic acid, from action of acetic anhydride on mucic acid in presence of sulphuric acid (Skraup), A., i, 112.

Tetracetylquercetin (Perkin), T., 449 ; P., **1899**, 67.

Tetra-aspartic acid, action of sodium nitrite on (Schiff and Sevieri), A., i, 674.

  tri- and tetra-phenylhydrazides, di-, tri-, and tetra-anilides, and phenyltetranilide of (Schiff), A., i, 195.

Tetrabenzoylnataloin (Léger), A., i, 821.

Tetrabenzoyloxydioxy-ββ′-dipyridyl (Sell and Jackson), T., 515 ; P., **1899**, 98.

Tetrabenzyl-ββ-*di*aminodinaphthylmethane (Morgan), P., **1899**, 10.

Tetraethyl-ββ-*di*aminodinaphthylmethane (Morgan), P., **1899**, 10.

Tetraethyl-*m*-aminodiphenolsaccharein, its salts and acetyl derivative (Monnet and Kœtschet), A., i, 213.

Tetraethyl*di*aminodi-*o*-tolylmethane (Friedländer), A., i, 350.

Tetraethylammonium lead iodide (Mosnier), A., ii, 222.

Tetraethylphenol (Jannasch and Rathjen), A., i, 878.

Tetraethylthiuram *di*sulphide, electrolytic preparation of (Schall and Kraszler), A., i, 414.

Tetrahedrite from Austria (John and Eichleiter), A., ii, 493.

Tetrahydrocornicularolactone. See *αδ*-Diphenyl-*αγ*-pentanolide.

Tetrahydrodicampherylic acid, silver salt (Perkin), T., 184 ; P., **1893**, 110.

Tetrahydro*iso*lauronic acid (Blanc), A., i, 927.

Tetrahydro-*α*-naphthylamine, from *α*-ketotetrahydronaphthaleneoxime (Kipping and Hill), T., 152 ; P., **1899**, 5.

d-ac-**Tetrahydro-*β*-naphthylamine**, *d-α*-bromocamphorsulphonate, *d*-camphorsulphonate (Pope), P., **1899**, 170.

Tetrahydro-*β*-oxazole, diketones of (Lambling), A., i, 85.

r-**Tetrahydropapaverine**, crystallisation and resolution of ; its tartrate and nitrosamine (Goldschmiedt) A., i, 86.

Tetrahydropapaveroline, and hydriodide and hydrochloride (Goldschmiedt), A., i, 87.

d-**Tetrahydroquinaldine**, preparation of, and *d*-camphorsulphonate and hydrochloride, fractional crystallisation of (Pope and Peachey), T., 1078 ; P., **1899**, 199.

l-**Tetrahydroquinaldine**, preparation of, from the externally compensated hydrochloride, and salts ; density and specific and molecular rotation of (Pope and Peachey), T., 1069 ; P., **1899**, 199.

Tetrahydroquinaldines, *l*- and *i*-, density, refraction and rotation of, and influence of solvent on (Pope and Peachey), T., 1113 ; P., **1899**, 201.

  l- and *r*-, melting points of, and of mixtures, and of benzoyl derivatives (Pope and Peachey), T., 1092.

Tetrahydroquinoline, 4-nitro-, 4-nitro-1′-nitroso-, 2-nitro-1′-nitroso-, 2-nitro- (Stoermer and Dragendorff), A., i, 45.

Tetrahydroquinolineurethane, phenylic and naphthylic salts and chloro-derivative (Cazeneuve and Moureau), A., i, 305.

Tetrahydrotolualloxazine, and its hydrochloride (Kühling), A., i, 722.

Δ^2-**Tetrahydro-*o*-toluic acid** (*methylcyclohexenecarboxylic acid*) (Sernoff), A., i, 584.

Tetrahydro-*p*-toluquinaldine, *l*- and *d*-, and hydrochlorides, rotatory power of, and *r*-, and its hydrochloride ; crystalline forms of (Pope and Rich), T., 1093 ; P., **1899**, 200.

α-, *β*-, *γ*-, and Δ^4-**Tetrahydrouvitic acids** (Wolff and Heip), A., i, 515.

2 : 4 : 2′ : 4′-Tetrahydroxybenzophenone (Meyer and Conzetti), A., i, 763.

Tetrahydroxydinaphthylmethane, tetracetyl derivative of (Meyer and Conzetti), A., i, 764.

2 : 3 : 2′ : 3′-Tetrahydroxy-6 : 6′-dioxy-5 : 5′-dipyridyl, and its tetrabenzoyl derivative (Sell and Jackson), T., 515 ; P., **1899**, 98.

Tetrahydro-xylic acid. See Dimethyl*cyclo*hexenecarboxylic acid.

Tetrahydroxynaphthalene, tetracetyl derivative (Zincke and Ossenbeck), A., i, 765.

1 : 4 : 3′ : 4′-Tetrahydroxynaphthalenediphenylmethane (Möhlau and Klopfer), A., i, 913.

Tetraketohydronaphthalene, dioxime (Zincke and Ossenbeck), A., i, 765.

Tetramethyl*di*aminobenzhydrol, action of *p*- and *m*-sulphanilic acids on (SUAIS), A., i, 58.

Tetramethyl-ββ-*di*aminodinaphthylmethane (MORGAN), P., **1899**, 10.

Tetramethyl*di*aminodiphenylethane, salts, alkylhaloids, and *di*nitro-, *tri*bromo- and *tri*iodo-derivatives of (TRILLAT), A., i, 817.

as-**Tetramethyl*di*aminodiphenylethane**, and its platinochloride (TRILLAT), A., i, 615.

Tetramethyl*di*aminodiphenylmethane (WEINMANN), A., i, 204.

Tetramethyl*di*aminodiphenylmethanedimethylaminohydroxyphenoxazonecarboxylic acid, hydrochloride of (MÖHLAU and KLOPFER), A,, i, 914.

Tetramethyl*di*aminodiphenylmethanedimethyl-naphthaphenoxazimium and **-hydroxynaphthaphenoxazimium** chloride hydrochlorides (MÖHLAU and KLOPFER), A., i, 914.

Tetramethyl*di*aminodiphenylthioketone (WEINMANN), A., i, 204.

Tetramethyl*di*aminotriphenylcarbinol, *p*-nitro-, and its picrate (WEDEKIND and GONSWA), A., i, 806.

Tetramethylammonium lead iodide (MOSNIER), A., ii, 222.
*per*chromate (WIEDE), A., i, 244.

Tetramethylbenzidine (BAMBERGER and TSCHIRNER), A., i, 682.
hydrochloride methochloride (PINNOW), A., i, 588.

αα-**Tetramethylbutane**, *ββ*-*di*imino-. See Diacetylacetone, *di*cyano-.

s-**Tetramethyldibenzyl** (MORITZ and WOLFFENSTEIN), A., i, 910.

3 : 5 : 3′ : 5′-Tetramethyl-*p*-dihydroxystilbene, 2 : 6 : 2′ : 6′-*tetra*bromo-, and its diacetate (AUWERS and ALLENDORFF), A., i, 33.

2 : 2′ : 6 : 6′-Tetramethyldipyridyl, and salts (HUTH), A., i, 934.

Tetramethylene (cyclo*butane*), cyano- (CARPENTER and PERKIN), T., 932.

Tetramethylenecarboxylic acid. See *cyclo*-Butanecarboxylic acid.

Tetramethylenediamine (*putrescine*), formation of, from ornithine ; also its dibenzoyl derivative (ELLINGER), A., i, 186.

Tetramethylenedicarboxylic acid. See *cyclo*-Butanedicarboxylic acid.

Tetramethylenedi-*o*-phenylenediamine (FISCHER), A., i, 353.

Tetramethylene-1 : 3-disulphide (AUTENRIETH and WOLFF), A., i, 580.

1 : 3-Tetramethylenedisulphone, and 2 : 2-*di*bromo-derivative (AUTENRIETH and WOLFF), A., i, 580.

Tetramethylethylene. See Hexylene.

Tetramethylethylenic bromide. See Hexylenic bromide.

Tetramethylhæmatoxylin and its oxidation derivatives (GILBODY and PERKIN), P., **1899**, 28.

Tetramethylhæmatoxylone and its acetyl derivative (GILBODY and PERKIN), P., **1899**, 28.

Tetramethylindigo, preparation of (KONOWALOFF), A., i, 891.

Tetramethylmethane. See Pentane.

2 : 6 : 11 : 15-Tetramethyl-2 : 6 : 10 : 14-octodecatetrene-8 : 9-diol (VERLEY), A., i, 768.

Tetramethylphloroglucinol, preparation of, and *mono*methylic ether (REISCH), A., i, 803, 804.

2 : 2 : 6 : 6-Tetramethylpiperidine, 4-bromo-, 1 : 4-*di*bromo-, 3 : 4-*di*bromo-, 1-bromo-4-iodo-, and 4-iodo- (SAMTLEBEN), A., i, 542.

Tetramethylpyrazine, formation of (DEMJANOFF), A., i, 845.

α-**Tetramethylpyrrolidine-β-carboxylamide**, salts, and nitroso-derivative (PAULY and ROSSBACH), A., i, 774.

α-**Tetramethylpyrroline-β-carboxylic acid**, and its methylic and ethylic salts, amide and methylamide (PAULY and ROSSBACH), A., i, 774.

2 : 2 : 6 : 6-Tetramethyl-Δ^3-tetrahydropyridine hydrobromide, *per*bromide of (SAMTLEBEN), A., i, 542.

Tetramethylthioaniline, and its hydrochloride (WEINMANN), A., i, 204.

Tetranthera citrata (*Litsœa citrata*), the alkaloid of (FILIPPO), A., i, 312.

1 : 2 : 4 : 5-Tetraphenylbenzene (WISLICENUS and LEHMANN), A., i, 59.

Tetraphenylbutane (COHN), A., i, 296.

Tetraphenyldimethylenetetrazine (BISCHOFF), A., i, 279.

Tetraphenylerythritol. See Benzoinpinacone.

Tetraphenylmethane (GOMBERG), A., i, 155.

Tetraphenyl*cyclo*pentadiene, and its *di*bromo-compound (WISLICENUS and CARPENTER), A., i, 60.

Tetraphenyl*cyclo*pentane (WISLICENUS and CARPENTER), A., i, 60.

1 : 2 : 3 : 5-Tetraphenyl*cyclo*pentane-1 : 2-diol (WISLICENUS and CARPENTER), A., i, 60.

Tetraphenyl-*o*-phenylenediamine (HAUESSERMANN and BAUER), A., i, 685.

α- and *β*-**Tetraphenylphenylenediamines**, and their nitro-derivatives (HAUESSERMANN and BAUER), A., i, 684.

Tetraphenylphosphorketobetaine, and its salts (Michaelis and Köhler), A., i, 596.
2 : 3 : 5 : 6-Tetraphenylpyridine (Wislicenus and Carpenter), A., i, 60.
Tetraphenylurea, formation of (Dixon), T., 401.
Tetrazodianisyl, sulphate and chloride (Starke), A., i, 589.
Tetrazodianisylsulphonic acid, sodium salt (Starke), A., i, 589.
4 : 4′-Tetrazodiphenyl-3 : 3′-dicarboxylic acid (Bülow and von Reden), A., i, 150.
Tetrazolecarboxylic acid, and amide (Thiele), A., i, 171.
Tetrazoline. See Dihydrotetrazine.
Tetric acid (*acrylacetic acid*), constitution of; also its methylic salt (Conrad and Gast), A., i, 114.
Tetruret, from action of ammonia on allophanazide (Thiele and Uhlfelder), A., i, 118.
Thalénite from Sweden (Benedicks), A., ii, 765.
Thalite from Lake Superior (Winchell), A., ii, 765.
Thallium in marcasite from Poland (Antipoff), A., ii, 667.
  cathodes, pulverisation of, during electrolysis (Bredig and Haber), A., ii, 78.
  action of hydrogen sulphide on, in acid solution (Loczka), A., ii, 100.
  action of, on sulphuric acid (Adie), P., **1899**, 133.
Thallium azoimide (Curtius and Rissom), A., ii, 92.
  chloride, and potassium nitrate, solubility of mixtures of (Noyes), A., ii, 10.
  lead copper, lead nickel, lead iron, copper barium, and nickel barium nitrites (Przibylla), A., ii, 223.
  *per*sulphate (Foster and Smith), A., ii, 747.
  arsenic sulphide (Loczka), A., ii, 100.
Thallœdema candidum, constituents of (Hesse), A., i, 384.
Thamnolic acid from *Thamnolia vermicularis* (Hesse), A., i, 381.
Thaumasite from Skottvång, Sweden (Bäckström), A., ii, 36.
Thebaine, derivatives of (Freund), A., i, 307.
  heat of combustion and formation of, and of combination with hydrochloric acid (Leroy), A., ii, 631.
  detection of (Melzer), A., ii, 193.
Thebenine (Freund), A., i, 308.
  ethylic ether. See Ethebenine.
  methylic ether. See Methebenine.
  propylic ether. See Prothebenine.
Theobromine, homologues of (Brunner), A., i, 306.
  estimation of (Brunner and Leins), A., ii, 261.
  separation of caffeine from (Brunner and Leins), A., ii, 261.
THERMOCHEMISTRY :—

3-Thio-bis-1-*p*-tolyltriazole (Pellizzari and Ferro), A., i, 551.
Thiobiurets, nomenclature of (Dixon), T., 392.
Thiocarbamide, action of chromic acid and potassium chromate on (Oechsner de Coninck), A., i, 244.
action of ethylic dioxysuccinate on (Geisenheimer and Anschütz), A., i, 575.
conversion of, into ammonium thiocyanate (Waddell), A., ii, 410.
oxidation of (Oechsner de Coninck), A., i, 420.
Thiocarbimides, behaviour of, towards phenylhydrazine and its derivatives (Marckwald), A., i, 503.
Thiocarbonyl-β-*o*-aminophenylbenzimidazole (von Niementowski), A., i, 647.
Thiocarbonylphenylcarbazinic acid, chloro-, ethylic salt of (Busch and Stern), A., i, 957.
Thiocyanhydrins, formation of, by the action of potassium thiocyanate on chlorhydrins (Engle), A., i, 3.
Thiocyanic acid, ammonium salt, conversion of, into thiocarbamide (Waddell), A., ii, 410.
potassium salt, action of, on aliphatic chlorhydrins (Engle), A., i, 3.
action of, on silver nitrate dissolved in pyridine (Naumann), A., ii, 423.
methylic, ethylic, *n*- and *iso*-propylic, benzylic, and chlorethylic salts, action of, on ethylic cupracetoacetate and sodacetoacetate (Kohler), A., i, 737.

Thiocyanic acid, phenylic salt, absorption of argon by (Berthelot), A., ii, 653.

αβ-Thiocyano-α-acetylpropylic alcohol. See α-Acetylpropylic alcohol, αβ-*di*thiocyano-.

α-Thiocyanopropylenic glycol. See Propylenic glycol, α-thiocyano-.

αβ-Thiocyanopropylic alcohol. See Propylic alcohol, αβ-dithiocyano-.

αγ-Thiocyano*iso*propylic alcohol. See *iso*-Propylic alcohol, αγ-*di*thiocyano-.

Thiodiazole-2 : 5-disulphonic acid (Busch and Ziegele), A., i, 826.

Thiodiazole-2 : 5-dithiol, aminobenzylic ether and its salts and diazochloride; dimethylic and dibenzylic ethers of, and its *di*sulphide and a polysulphide (Busch and Ziegele), A., i, 825.

Thiodiazolethiolsulphamine, monobenzylic ether of (Busch and Ziegele), A., i, 826.

Thioglycollic acid, formation of (Dixon), T., 398; P., **1899**, 63.

Thiolcarbamic acid, methylic, ethylic, *iso*propylic, *iso*butylic, and *iso*amylic salts (Wheeler and Barnes), A., i, 797.

2-Thio-7-methylpurine (Fischer), A., i, 175.

Thioncarbamic acid, methylic, ethylic, *iso*butylic and *iso*amylic salts, and the action of alkylic iodides on them (Wheeler and Barnes), A., i, 797.

Thionyl-*p*-amido-benzylmethylaniline, -diethylaniline and **-dimethylaniline** (Francke), A., i, 46.

Thionyl-1-amidodinaphthylamine (Francke), A., i, 46.

Thionylamidodiphenylamine (Francke), A., i, 46.

Thiophanic and **Thiophaninic acids** (Hesse), A., i, 383.

Thiophen, absorption of argon by (Berthelot), A., ii, 653.

dimercuric hydroxyacetate and diacetate (Dimroth), A., i, 428.

amino-, acetyl derivative of (Rimini), A., i, 872.

Thiophten, formation of, from action of phosphorus trisulphide on aconitic acid and its sodium salt (Hanna and Smith), A., i, 577.

Thiosemicarbazides, distinction between stereoisomerides by means of carbonyl chloride (Marckwald), A., i, 503.

Thiosinamine. See Allylthiocarbamide.

Thomsonite, vapour pressure of (Tammann), A., ii, 8.

Thorium, extraction of (Wyrouboff and Verneuil), A., ii, 105.

radiation from (Becquerel), A., ii, 394.

Thorium carbide (Moissan and Étard), A., ii, 227.

*tetra*chloride and *tetra*bromide, compounds of, with amines (Matthews), A., ii, 295, 296.

nitrates (Wyrouboff and Verneuil), A., ii, 225.

Thujetin, formula and acetyl derivative of (Perkin), T., 829; P., **1899**, 161.

Thyme, oil of (Labbé), A., i, 621.

Thymegol (*o*-nitrothymol-*p*-sulphonate of mercury and potassium) (Gautrelet), A., i, 802.

Thymine from various sources (Gulewitsch), A., i, 834.

Thymol, from oil of *Monarda punctata* (Kremers and Hendricks), A., i, 770.

melting point of, influence of pressure on (Hulett), A., ii, 469.

crystalline forms of (Pope), T., 464.

depression of freezing point of *o*-nitrophenol by (Ampola and Rimatori), A., ii, 353.

depression of freezing point of solutions of ethereal salts in supercooled; by amylic propionate (Schall), A., ii, 640.

solid solutions of menthol in (Garelli and Calzolari), A., ii, 732.

condensation of, with benzoin (Japp and Meldrum), T., 1037; P., **1899**, 167.

elimination of, as thymolglycuronic acid (Katsuyama and Hata), A., A., ii, 117.

Thymolglycuronic acid, formation of, in the organism (Katsuyama and Hata), A., ii, 117.

*di*chloro- (Katsuyama and Hata), A., ii, 117.

Thymolphenolquinone (Biltris), A., i, 199.

Thymol-*p*-sulphonic acid (Stebbins), A., i, 604.

behaviour of, towards diazonaphthionic acid (Stebbins), A., i, 916.

Thymoquinone, formation of (Biltris), A., i, 199.

Thymylic carbamate, preparation of (Morel), A., i, 876.

chlorocarbonate (Barral and Morel), A., i, 747, 802.

Thyroid gland, chemistry of the (Roos), A., ii, 232.

functions of the (Blum), A., ii, 115.

physiology of the (Blum), A., ii, 779.

active substance of the (Roos), A., ii, 779.

nature of iodine compound in the (Blum), A., ii, 164.

Thyroid gland, the proteids of the (Oswald), A., ii, 439.
Thyroiodin. See Iodothyrin.
Tiglic acid. See Pentenoic acid.
Tiglonitrile (*α-methylcrotononitrile*), and dimethylamine derivative (Henry), A., i, 568.
Tin, atomic weight of (Landolt, Ostwald, and Seubert), A., ii, 87.
cathodes, pulverisation of, during electrolysis (Bredig and Haber), A., ii, 78.
hylotropic-isomeric forms of (Schaum), A., ii, 733.
partition of, in lead-zinc mixtures (Bancroft), A., ii, 470.
action of, on sulphuric acid (Adie), P., **1899**, 133.
Tin amalgams, of different concentrations, electromotive force between (Cady), A., ii, 395.
Tin alloys, with antimony, arsenic and phosphorus; antimonide, arsenide, and phosphide (Stead), A., ii, 32, 33.
with calcium (Moissan), A., ii, 154; (Tarugi), A., ii, 749.
Tin salts, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
reduction of, with calcium carbide (Tarugi), A., ii, 749.
Tin arsenide (Stead), A., ii, 33.
phosphide (Stead), A., ii, 33.
Stannic arsenite (Reichard), A., ii, 23.
bromide, as a solvent in molecular weight determinations; chloride and iodide, solutions of, in stannic bromide (Garelli), A., ii, 271.
chloride, molecular weight of, in nitrobenzene (Kahlenberg and Lincoln), A., ii, 397.
electrolysis of solutions of (Dittenberger and Dietz), A., ii, 629.
and iodide (Lenormand), A., ii, 33.
chloriodide, and a substance formed from, in ether and alcohols (Lenormand), A., ii, 33.
chloriodides and bromiodides (Lenormand) A., ii, 754.
*di*oxide, action of alkali oxalates on (Rosenheim and Platsch), A., i, 572.
Stannic acid, colloidal (Lottermoser), A., ii, 558.
Stannous ortharsenite (Reichard), A., ii, 23.
azoimide (Curtius and Rissom), A., ii, 92.
Tin:—
stannous chloride, molecular weight of, in urethane (Castoro), A., ii, 360.
reactions of, in organic solvents (Naumann), A., ii, 423.
lead iodide (Mosnier), A., ii, 222.
Tin, organic compounds:—
Stannitartaric and stannicitric acids, salts of (Henderson, Orr, and Whitehead), T., 556; P., **1899**, 108.
Tin *di*oxide *p*-toluidine (Thiele and Dimroth), A., i, 427.
Tin, detection, estimation, and separation of:—
detection of (Ducommun), A., ii, 338.
detection of, in mineral waters (Garrigou), A., ii, 616.
estimation of, in commercial antimony (Pattinson and Pattinson), A., ii, 62.
estimation of, in alloy with antimony (Fraenkel), A., ii, 524.
estimation of, in presence of copper, lead, and phosphorus (Fraenkel), A., ii, 524.
estimation of, in tin ores (Campbell and Champion), A., ii, 62.
estimation of, in tin plate (Job), A., ii, 61.
separation of antimony from (Bornemann), A., ii, 615.
separation of copper, iron, lead, and zinc from (Langmuir), A., ii, 522.
separation of mercury from (Jannasch and Devin), A., ii, 59.
Tin plate, estimation of lead in (Carles), A., ii, 183.
Tissues, animal, reducing power of (Hélier), A., ii, 374.
Titanium in peat (Baskerville), A., ii, 666.
Titanium *tri*chloride (Polidori), A., ii, 295.
nitride (Matthews), A., ii, 296.
*di*oxide "favas" from Brazil (Hussak), A., ii, 432.
compounds of, with sulphuric acid (Blondel), A., ii, 556.
"hydrated," from Brazil (Hussak), A., ii, 432.
Titanic acid, compounds of, with chromic acid (Blondel), A., ii, 369.
Titanitartaric, Titanicitric, and **Titanimucic** acids, salts of (Henderson, Orr, and Whitehead), T., 556; P., **1899**, 108.
Tobacco, estimation of non-volatile organic acids in (Kissling), A., ii, 821.

(*Toluene compounds Me*=1).

Tobacco, estimation of nicotine in (KELLER), A., ii, 194; (HEFELMANN), A., ii, 261.
See also Agricultural chemistry.

Tolane, *p-di*amino-, action of chlorine on (ZINCKE), A., i, 616.

p-**Toluacetodinitrilephenylhydrazone** (SEIDEL), A., i, 139.

p-**Tolualdehyde,** and *m*-nitro-, and its phenylhydrazone, and *o*- and *p*-nitro-, and *p*-sulphophenylhydrazone, and *o*-nitro- (HANZLIK and BIANCHI), A., i, 597.

Tolualloxazine, reduction of (KÜHLING), A., i, 722.

o-**Toluamide,** ω-chloro-5-nitro- (GABRIEL and LANDSBERGER), A., i, 133.
p-nitro- (LANDSBERGER), A., i, 210.

Toluamides, *o*-, *m*-, and *p*-, hydrolysis of (REID), A., i, 508.

p-**Toluanilide,** thio- (BAMBERGER), A., i, 694.

Toluene in lignite tar (OEHLER), A., i, 816.
molecular weight of, in carbon *tetra*chloride or alcohol (SPEYERS), A., ii, 468.
boiling point and melting point of (LADENBURG and KRÜGEL), A., ii, 545.
fractionation of mixtures of, with benzene (YOUNG), T., 682.
depression of freezing point of *o*-nitrophenol by (AMPOLA and RIMATORI), A., ii, 353.
vapour pressures of solutions of, in carbon *tetra*chloride (LEHFELDT), A., ii, 633.
vapour pressures of mixtures of, with benzene, carbon *tetra*chloride, or alcohol (LEHFELDT), A., ii, 11.
diffusion coefficient of, across vulcanised caoutchouc (FLUSIN), A., ii, 205.
distribution ratio of mercuric chloride between water and (BROWN), A., ii, 83.
absorption of argon by (BERTHELOT), A., ii, 653.
condensation of, with phenyloxanthranol, with phthalyl dichloride, and with tolyl-3-methyloxanthranol (GUYOT), A., i, 295.

Toluene, bromo-, *p*-chlorobromo-, and chloro*di*bromo-, preparation of (COHEN and DAKIN), T., 894; P., **1899**, 183.
ωω-bromo*iso*nitro-, and its sodium salt (HANTZSCH and VEIT), A., i, 402.
2-chloro-4-bromo- (MELCHIKER), A., i, 208.

(*Toluene compounds Me*=1).

Toluene, ω-*di*fluorochloro-, ω-*tri*fluoro-, and ω-*tri*fluoro-*m*-nitro- (SWARTS), A., i, 197.
ω-nitro- (*phenylnitromethane*) (KONOWALOFF), A., i, 733, 873.
o-nitro-, electrolytic reduction of (ELBS and KOPP), A., i, 270.
p-nitro-, electrolytic reduction of (LÖB), A., i, 123; (ELBS and KOPP), A., i, 270.
oxidation of, with chromic acid (OECHSNER DE CONINCK and COMBE), A., i, 347.
ω-*iso*nitro- (*phenylisonitromethane*), and ω-*iso-di*nitro- (HANTZSCH and VEIT), A., i, 402.

3′-*o*-Tolueneazoindazole (BAMBERGER and VON GOLDBERGER), A., i, 545.

2:3-Toluenedioxime and **3:4-Toluenedioxime** (ZINCKE and SCHWARZ), A., i, 751.

p-**Toluenesulphodimethylenimide** (HOWARD and MARCKWALD), A., i, 749.

p-**Toluenesulphonacetic acid** and *p*-**Toluenesulphonacetoacetic acid,** ethylic salts (KOHLER and MACDONALD), A., i, 907.

o-**Toluenesulphonic** sulphide, *tri*sulphide, and *tetra*sulphide (TROEGER and HORNUNG), A., i, 905.

p-**Toluenesulphonic** chloride and diethylamide (MARCKWALD and DROSTE-HUELSHOFF), A., i, 290.
sulphide, *di*sulphide, *tri*sulphide, and *tetra*sulphide (TROEGER and HORNUNG), A., i, 905.

p-**Toluenesulphonomalonic acid** and *p*-**Toluenesulphonosodiomalonic acid,** ethylic salts (KOHLER and MACDONALD), A., i, 907.

p-**Toluenesulphotrimethyleneimide** (MARCKWALD and DROSTE-HUELSHOFF), A., i, 290.

o-**Toluic acid,** cyano-, substance obtained from, on heating (MATHEWS), A., i, 57.
p-nitro- (LANDSBERGER), A., i, 210.

m-**Toluic acid,** amylic salt, density, specific rotation and refraction of (GUYE and BABEL), A., ii, 719.
ω-*tri*fluoro-, and its salts (SWARTZ), A., i, 197.

p-**Toluic acid,** formation of (COLLET), A., i, 434.
p-toluidide, and *p*-thio- (BAMBERGER), A., i, 694.

o- and *m*-**Toluic acids,** menthol salts of, optical activity and molecular volume of (TSCHUGÁEFF), A., ii, 3.

o- and *m*-**Toluic** chlorides (KLAGES and LICKROTH), A., i, 599.

(*Toluene compounds Me*=1).

Toluic chlorides, *o*-, *m*-, and *p*-, preparation, and melting and boiling points of (Frankland and Aston), T., 494.

o-**Toluidine**, compounds of, with metallic salts (Matthews), A., ii, 296.
  condensation of, with *αδ-di*bromopentane (Scholtz and Friemehlt), A., i, 541.
  3-nitro- (Gnehm and Blumer), A., i, 266.

m-**Toluidine**, *ω-tri*fluoro-, and its acetyl derivative (Swarts), A., i, 197.

p-**Toluidine**, formation of (Löb), A., i, 123.
  latent heat of fusion of, influence of pressure on (Hulett), A., ii, 469.
  action of ozone on (Otto), A., ii, 282.
  action of methylic *di*chloroxalate on (Anschütz and Stiepel), A., i, 573.
  velocity of diazotisation of (Hantzsch and Schümann), A., ii, 550.
  condensation of, with *αδ-di*bromopentane (Scholtz and Friemehlt), A., i, 541.
  hydrochloride, heat of formation of (Leroy), A., ii, 466.
  p-tolyl*di*thiocarbamate (Hugershoff), A., i, 886.

p-**Toluidine**, *m*-nitro-, electrolytic reduction of (Elbs and Schwarz), A., i, 270.

o- and *p*-**Toluidine**, hydrochlorides of, action of chromic acid on (Oechsner de Coninck and Combe), A., i, 244.

o-, *m*-, and *p*-**Toluidine** mercurichlorides (Swan), A., i, 38, 39.
  stannochlorides and *p*-toluidine stannichloride (Slagle), A., i, 40.
  zincochlorides, and zincobromides (Base), A., i, 40.

o-**Toluidine-3-sulphonic acid** (Cazeneuve and Moreau), A., i, 431.

o-**Toluidine-5-sulphonic acid**, 3-nitro- [$NH_2 : NO_2 : SO_3H = 2 : 3 : 5$] (Gnehm and Blumer), A., i, 266.

p-**Toluidine-*o*- and *m*-sulphonic acids** (Cazeneuve and Moreau), A., i, 431.

p-**Toluidinoacetic acid**, nitrile and amide and nitroso-derivative of the last (Miller, Plöchl, and Sieber), A., i, 128.

p-**Toluidino-oxalic acid**, amino-, methylic salt (Anschütz and Stiepel), A., i, 573.

o-**Toluonitrile**, *p*-nitro-, and *p*-amino- and its salts (Landsberger), A., i, 210.

m-**Toluonitrile**, *ω-tri*fluoro- (Swarts), A., i, 197.

o-, *m*-, and *p*-**Toluonitriles**, action of cuprous chloride on (Rabaut), A., i, 557.

(*Tolyl compounds Me*=1).

p-**Toluoylcarbinyl acetate** (Collet), A., i, 434.

Toluoylmalic acids, *o*-, *m*-, and *p*-, methylic and ethylic salts, preparation and specific rotations of (Frankland and Wharton), T., 341; P., **1899**, 26.
  methylic and ethylic salts, molecular volumes of (Frankland), T., 349.

p-**Toluoylmethylcarbinyl** acetate (Collet), A., i, 434.

Toluoyltartaric acids, *o*-, *m*-, and *p*-, ethylic salts, molecular volumes of (Frankland), T., 349.

Toluquinone, 4-bromo-, [$O_2 : Br = 2 : 5 : 4$] (Kehrmann and Rüst), A, i, 129.

Toluquinoneoxime, 4-bromo-, two forms of, and their acetyl and benzylic derivatives (Kehrmann and Rüst), A., i, 129.
  4-chloro-, two forms of, and their acetyl derivatives (Kehrmann and Tichvinsky), A., i, 129.

Toluquinone-*o*-oxime, and its silver and methyl derivatives, and the dibromide of the latter (Bridge and Morgan), A., i, 130.

Toluquinone-*m*-oxime, and its silver, methyl, acetyl and benzoyl derivatives (Bridge and Morgan), A., i, 130.

o-**Tolylacetic acid**, condensation of, with phthalic anhydride (Bethmann), A., i, 520.

p-**Tolylacetodinitrile** oxime (Seidel), A., i, 139.

p-**Tolylacetylene** (4-*methylstyrene*), 3-*ω-di*nitro- (Hanzlik and Bianchi), A., i, 891.

p-**Tolylacrylic acid** (p-*methylcinnamic acid*), *m*-nitro-, and salts (Hanzlik and Bianchi), A., i, 891.

o-**Tolylaminoacetic acid**, and *di*chloroderivative (Hentschel), A., i, 815.

p-**Tolyl anilinomethyl ketone** (Collet), A., i, 55.

p-**Tolyl-ψ-aziminoaminobenzene**, and its salts and acetyl derivative (Willgerodt and Dauner), A., i, 825.

p-**Tolyl-ψ-aziminobenzene** (Willgerodt and Klein), A., i, 882.

p-**Tolyl-ψ-aziminonitrobenzene** (Willgerodt and Dauner), A., i, 824.
  and salts (Willgerodt and Klein), A., i, 882

4-*p*-**Tolylbenzaldehyde** (Weiler), A., i, 519.

p-**Tolylbromopropylsulphone** (Troeger and Uhde), A., i, 608.

o-**Tolylcarbamic acid**, 5-nitro- and 4-nitro- (Vittenet), A., i, 757.

(*Tolyl compounds Me*=1).

p-**Tolylcarbamic acid**, *m*-nitro-, and *o*-nitro-, ethylic salts (Vittenet), A., i, 757.

o-, *m*-, and *p*-**Tolylcarbamides**, and nitroso-derivatives (Walther and Wlodkowski), A., i, 590, 591.

o-**Tolylcarbimide**, 5-nitro- and 4-nitro- (Vittenet), A., i, 757.

p-**Tolylcarbimide**, *m*-nitro-, and *o*-nitro- (Vittenet), A., i, 757.

p-**Tolyl chloromethyl ketone** (Collet), A., i, 55.

4-Tolyl-4-chlorophenylthiosemicarbazide, the imidodiazolone and thiodiazolone (Marckwald), A., i, 504.

Tolyl-4-chlorophosphine, 2-chloro- (Melchiker), A., i, 207.

p-**Tolylchlorostibine** (Hasenbäumer), A., i, 209.

2-Tolyl*iso*coumarin (Bethmann), A., i, 520.

2-Tolyldihydro*iso*coumarin, and bromo-derivative (Bethmann), A., i, 520.

p-**Tolyldithiocarbazinic acid**, methylic and ethylic, and benzylic salts (Busch and Lingenbrink), A., i, 953.

p-**Tolyl*iso*dithiodiazolone**, and its methiodide (Busch and Lingenbrink), A., i, 954.

p-**Tolyldithiodiazolone-sulphonic acid**, **-hydrosulphamine**, **-dimethylhydrosulphamine**, and **ethylhydrosulphamine** (Busch and von Baur-Breitenfeld), A., i, 951.

o-**Tolyldithiodiazolonethiol**, and its methylic ether, *di*sulphide, and *p*-aminophenylic ether (Busch and Münker), A., i, 952.

p-**Tolyldithiodiazolonethiol**, and its methylic ether, *di*sulphide, and acetyl and benzoyl derivatives, and *p*-aminophenylic, and methylaminophenylic ethers, with their nitrosamine derivatives and azo-dye (Busch and von Baur-Breitenfeld), A., i, 951.

m-**Tolylenediamine**, action of, on red blood corpuscles (Lapicque and Vast), A., ii, 504.

Tolylenedimethylcarbamide. See 2:1′:3′-Trimethylbenzimidazolone.

Tolylenedimethyldiamine [$NMe_2:NH_2=2:4$] (Gnehm and Blumer), A., i, 266.

1:2:3-Tolylenefurazan, **1.3:4-tolylenefurazan** (Zincke and Schwarz), A., i, 751.

Tolylenemethyl-blue hydrochloride (Gnehm and Blumer), A., i, 266.

Tolylenemethyldiamine [$NHMe:NH_2=2:4$], and sulphate (Gnehm and Blumer), A., i, 266.

(*Tolyl compounds Me*=1).

p-**Tolylethylideneoxy*cyclo*triazan** (Voswinckel), A., i, 959.

2-Tolylethylthiosemicarbazide (Marckwald), A., i, 505.

o- and *p*-**Tolylglucoside** (Ryan), T., 1056; P., **1899**, 196.

o- and *p*-**Tolylglycinyl-carbamides**, **-*p*-ethoxyphenylcarbamides**, **-ethylurethanes**, and **-phenylcarbamides** (Frerichs and Beckurts), A., i, 806.

p-**Tolylglyoxylic acid** (Verley), A., i, 207.

p-**Tolylhydrazine**, *m*-nitro-, hydrochloride (Zincke and Schwarz), A., i, 751.

o-**Tolylhydroxylamine**, preparation of (Haber), A., i, 270.

Tolylhydroxynaphthazinedisulphonic acid, sodium salt (Hantower and Täuber), A., i, 63.

o-**Tolylic** carbamate, preparation of (Morel), A., i, 876.
  carbonate, oxidation of (Cazeneuve), A., i, 296.

o- and *p*-**Tolylic** chlorocarbonates (Barral and Morel), A., i, 747, 802.
  mercuric chloride (Dimroth), A., i, 428.
  *tri*sulphides (Troeger and Hornung), A., i, 906.

o-, *m*-, and *p*-**Tolylic** ethylic carbonate (Morel), A., i, 875, 876.

p-**Tolylidene** diacetate, *m*-nitro- (Hanzlik and Bianchi), A., i, 891.

p-**Tolylideneacetone**, and *m*-nitro-, and phenylhydrazones and dibromides (Hanzlik and Bianchi), A., i, 890.

p-**Tolylideneacetophenone**, and *m*-nitro-, and their dibromides, oximes, and phenylhydrazones (Hanzlik and Bianchi), A., i, 890.

p-**Tolylidene-*m*- and -*p*-nitranilines**, and *m*-nitro-derivative of former (Hanzlik and Bianchi), A., i, 597.

p-**Tolylidene-*m*-nitro-*m*- and -*p*-xylidines** (Hanzlik and Bianchi), A., i, 597.

o-**Tolylimino-*o*-tolylcarbamic acid**, ethylic, propylic, *iso*butylic, and *iso*amylic salts (Dains), A., i, 592.

p-**Tolylimino-*p*-tolylcarbamic acid**, methylic, propylic and *iso*amylic salts (Dains), A., i, 592.

p-**Tolyl iodethyl** and **iodomethyl ketones** (Collet), A., i, 434.

Tolyl-3-methylanthranol (Guyot), A., i, 293.
  condensation of, with toluene (Guyot), A., i, 295.

p-**Tolylmethyl*iso*dithiodiazolone** (Busch and Lingenbrink), A., i, 954.

(*Tolyl compounds Me*=1).

p-**Tolyl methyl ketone**, preparation of; bromo-, and *di*bromo-derivatives (Verley), A., i, 207.

Tolylmethylnitramine, amino- (Pinnow and Oesterreich), A., i, 202.

o-**Tolylmethylnitrosamine**, 4-nitro- (Gnehm and Blumer), A., i, 265.

Tolyl-3-methyloxanthranol (Guyot), A., i, 294.

p-**Tolylmethyloxy*cyclo*methylenetriazan** (Voswinckel), A., i, 959.

1 : 2-*p*-Tolylmethylpyrrolidine (Scholtz and Friemehlt), A., i, 541.

p-**Tolylmethylthiodiazolinethiol**, and its *di*sulphide and methylic ether (Busch and Lingenbrink), A., i, 954.

o- and *p*-**Tolylmethylthiosemicarbazides** (Marckwald), A., i, 504, 505.

p-**Tolylnaphthindolinonequinonecarboxylic** toluidide (Liebermann), A., i, 523.

o- and *p*-**Tolyl-α-** and **-β-naphthylthiosemicarbazides** (Marckwald), A., i, 504, 505.

p-**Tolyl-*p*-nitro-*o*-tolyldisulphone** (Kohler and MacDonald), A., i, 905.

δ-*p*-Tolyloxybutylamine (Schlinck), A., i, 540.

γ-*p*-Tolyloxybutyric acid, and **nitrile** (Schlinck), A., i, 540.

p-**Tolylpentahydro-1 : 2 : 4-diazthine** (Busch and Lingenbrink), A., i, 953.

p-**Tolyl-*o*-phenylene-*p*-aminobenzenylamidine**, and nitro-derivative (Muttelet), A., i, 355.

p-**Tolyl-*o*-phenylenediamine**, methenyl derivative, mercurichloride (Jacobson and Lischke), A., i, 276.

4-Tolylphenylmethane (Weiler), A., i, 491.

Tolylphosphine *tetra*chloride, and oxychloride, 2-chloro- (Melchiker), A., i, 208.

Tolyl-4-phosphinic acid, 2-chloro-, 2-chloronitro-, and their salts (Melchiker), A., i, 208.

Tolylphosphinous acid, chloro-, its salts and phenylhydrazide (Melchiker), A., i, 208.

p-**Tolyl*iso*propylsulphone** (Troeger and Uhde), A., i, 607.

2-Tolyl*iso*quinoline, and its chloroderivative (Bethmann), A., i, 521.

p-**Tolylsemithiocarbazide** (Pellizzari and Ferro), A., i, 551.

p-**Tolylstibine** oxide (Hasenbäumer), A., i, 209

p-**Tolylsuccinic acid**, and hydrogen ammonium salt (Thiele and Meisenheimer), A., i, 603.

(*Tolyl compounds Me*=1).

p-**Tolylsulphonacetyl-amylurethane, -*iso*butylurethane, -carbamide, -ethylurethane,** and **-methylcarbamide** (Frerichs), A., i, 795.

p-**Tolylsulphone-*n*-** and ***iso*-butyric acids**, and chloride, and bromo-derivative (Troeger and Uhde), A., i, 606, 608.

p-**Tolylsulphonephenylhydroxylamine** (Bamberger, Büsdorf, and Szolayski), A., i, 342.

p-**Tolylthiocarbimide**, sulphide of (Bamberger), A., i, 695.

p-**Tolylthiodiazolinethiol**, and its *di*sulphide (Busch and Lingenbrink), A., i, 954.

1-*p*-Tolyl-3-thiotriazolone (Pellizzari and Ferro), A., i, 550.

4-Tolyl-2-tolylthiosemicarbazide (Marckwald), A., i, 504.

1-*p*-Tolyltriazole (Pellizzari and Ferro), A., i, 551.

1-*o*- and **1-*p*-Tolyltriazoline**, 3-imino- (Cuneo), A., i, 548.

p-**Tolylurazole**, action of phosphorus *penta*sulphide on (Pellizzari and Ferro), A., i, 550.

4-Tolyl-2 : 4-xylylthiosemicarbazide (Marckwald), A., i, 504.

Tomato. See Agricultural chemistry.

Tonalite-gneiss from Carinthia (Becke), A., ii, 500.

Torrensite from the Hautes Pyrénées (Lienau), A., ii, 761.

Tourmaline from De Kalb, New York (Penfield and Foote), A., ii, 304.
  from Haddam Neck, Conn. (Penfield and Foote), A., ii, 304.
  from Ross-shire (Heddle), A., ii, 497.
  formula of (Penfield and Foote), A., ii, 304; (Rheineck), A., ii, 601; (Clarke), A., ii, 767.
  groups of (Penfield and Foote), A., ii, 304.

Toxalbumin, presence of a, in eels (Bénech), A., ii, 439.

Toxalbumins, absorption spectra of (Blyth), T., 1166; P., **1899**, 175.

Toxigenone (Kiliani), A., i, 71, 932.

Toxins, estimation of, in urine (Chibret), A., ii, 459.
  of snake-venom, action of antitoxin on (Martin), A., ii, 782.
  and antitoxins, explanation of physiological antagonism of (Martin and Cherry), A., ii, 234.

Trapa natans, composition of (Neumann), A., ii, 794.

Trehalase (Bourquelot and Hérissey), A., i, 93.

Trehalose, action of yeast enzymes on (Kalanthar), A., i, 102.

Triacetamide, formation of (Mathews), A., i, 57.

Triacetamidobenzaldehydine (Pinnow and Wiskott), A., i, 501.

Triacetohydrazide (Stollé), A., i, 413.

Triacetonamine, preparation of (Pauly), A., 1, 872.
  condensation of, with ethylic mercaptan (Pauly), A., i, 228.
  imino-. See α-Tetramethylpyrroline-β-carboxylamide.

Triacetonine-ethylsulphide and **-phenylsulphide** (Pauly), A., i, 228.

Triaceto-*p*-nitrophenylhydrazide (Hyde), A., i, 689.

Triacetonylaminetrioxime and its methiodide and ethiodide (Matthaiopoulos), A., i, 10.

iso-**Triacetoxyphenylene***di*sulphide(Genvresse), A., i, 148.

Triacetyl*di*amidonaphtholsulphonic acid, sodium and barium salts (Gaess), A., i, 374.

Triacetyl*di*amidophenol (Kehrmann and Bahatrian), A., i, 31.

Triacetyl-barbaloin and **-*iso*barbaloin**, *tri*chloro-, preparation of (Léger), A., i, 157, 158.

Triacetylcampheride (Ciamician and Silber), A., i, 537.

Triacetyldibutylpyrogallol (Różycki), A., i, 880.

Triacetylgenistein (Perkin and Newbury), T., 833 ; P., **1899**, 179.

Triacetylkosin (Daccomo and Malagnini), A., i, 158.

Triacetyllariciresinol (Bamberger and Landsiedl), A., i, 929.

Triacetylmethyl*cyclo*pentene, *di*imino-, from the decomposition of dicyanodiacetylacetone (Traube), A., i, 193.

Triacetylmorphine (Causse), A., i, 394.

Triacetylmorphothebaine (Freund), A., i, 308.

Triacetylpentaphenylpentane, constitution of (Goldschmiedt and Knöpfer), A., i, 141.

Triacetylphloroglucinol, condensation product obtained on hydrolysis of (Herzig), A., i, 31.

Triacetylquercetin (Perkin), T., 448 ; P., **1899**, 66.

Triacetylurazole (Cuneo), A., i, 9.

1 : 3 : 5-Trianilinobenzene, 2-bromo-4 : 6-*di*nitro- (Jackson and Gazzolo), A., i, 744.

Triazan. See Prozan.

Triazendicarbamidine (*aminoiminomethyltriazencarboxylic acid*), and its ethylic salt, amide, amidoxime, and imino-ether (Thiele and Osborne), A., i, 412, 413.

Triazendicarbamidinonitrile. See Diazoguanidine cyanide.

Triazendicarbodiamidine(*bisaminoiminomethyltriazen*) (Thiele and Osborne), A., i, 413.

1 : 2 : 4-Triazole (2 : 4-*pyrrodiazole*), constitution of (Andreocci), A., i, 947.

Triazole, amino- and chloro- (Thiele and Manchot), A., i, 168.

Triazoleazodimethylaniline (Thiele and Manchot), A., i, 168.

Triazolecarboxylic acid, amino-, and ethylic salt (Thiele and Manchot), A., i, 168.

Triazolen ring (Bamberger), A., i, 720.

Tribenzoylacetonitrile, preparation of, and anilide (Seidel), A., i, 139.

2 : 4′ : 5-Tribenzoyl*di*amino-5-hydroxydiphenyl (Jacobson and Tigges), A., i, 275.

Tribenzoylamino-orcinol (Henrich), A., i, 171.

Tribenzoylbarbaloin, *tri*chloro-, preparation of (Léger), A., i, 157.

Tribenzoylkosin (Daccomo and Malagnini), A., i, 158.

Tribenzoylmethylphloroglucinol (Boehm), A., i, 32.

Tribenzoylnataloin (Léger), A., i, 821.

Tribenzylamine, aminolytic constant of (Goldschmidt and Salcher), A., ii, 551.
  action of propylic and *iso*propylic iodides on (Wedekind), A., i, 351.

Tribenzylidene-*l*-iditol, Tribenzylidenemannitol, and **Tribenzylidene-*d*-talitol** (de Bruyn and Alberda van Ekenstein), A., i, 662.

Triboluminescence and optical isomerism (Andreocci), A., ii, 719.

Tribrassidin, from the action of nitric acid on trierucin (Gadamer), A., i, 864.

Tribromhydrin. See Propane, *αβγ-tri*bromo-.

Tributyrin, preparation and physical constants of (Scheij), A., i, 668.

Tricaprin, Tricaproin, and **Tricaprylin,** preparation and physical constants of (Scheij), A., i, 668.

Tricarballyldiphenylhydrazide, dibenzoyl and *di*nitroso-derivatives (Manuelli and de Righi), A., i, 884.

Tricyclene and its dichloride (Ginzberg and Wagner), A., i, 618.

Tridipyridyl metallic salts (Blau), A., i, 387.

Tridymite, artificial (Morozewicz), A., ii, 765.

Trierucin, from the fatty oil of *Tropæolum majus*, and action of nitric acid on (Gadamer), A., i, 864.

Triethylamine, aminolytic constant of (Goldschmidt and Salcher), A., ii, 551.
  velocity of reaction of, with ethylic bromide (Hemptinne and Bekaert), A., ii, 359.
  action of hydrogen peroxide on (Dunstan and Goulding), T., 1006; P., **1899**, 124.
  *di*bromide (Wedekind), A., i, 352.
  cerium *hexa*chloride (Koppel), A., ii, 98.
  *per*iodide (Norris and Franklin), A., i, 663.
  oxide (Lachmann), A., i, 326.
  oxide (*triethyloxyammonia*), and its salts; also its decomposition and reduction (Dunstan and Goulding), T., 802; P., **1899**, 60.
    formation of, by action of hydrogen peroxide on triethylamine (Dunstan and Goulding), T., 1006; P., **1899**, 124.
1 : 3 : 5-Triethylbenzene, preparation of, and *di*nitro-, *tri*nitro-, *tri*bromo-, and diacetyl derivatives of (Gattermann, Fritz, and Beck), A., i, 491, 492.
2 : 4 : 6-Triethylbenzoic acid and amide (Gattermann, Fritz, and Beck), A., i, 491, 492.
Triethylbenzophenone (Klages and Lickroth), A., i, 599.
1′ : 3′ : 3′-Triethyl-2′-methylenindoline (Plancher), A., i, 451.
Triethyloxyammonia. See Triethylamine oxide.
Triethylphosphine oxide, from action of dry oxygen on triethylphosphine (Engler and Weissberg), A., i, 189.
Triglycolamic acid, mercury derivative of, constitution of (Kieseritzky), A., ii, 395.
Triguaiacylic phosphate (Boscogrande), A., i, 427.
1 : 2 : 3-Trihydroxyanthraquinone. See Anthragallol.
1 : 2 : 4-Trihydroxyanthraquinone. See Purpurin.
2 : 4 : 5- and **2 : 4 : 6-Trihydroxybenzaldehydes**, and their phenylhydrazones (Gattermann and Köbner), A., i, 363.
Trihydroxybenzophenone. See Alizarin yellow A.
2 : 3 : 4-Trihydroxybenzophenonephenylimine (Graebe and Keller), A., i, 703.
2 : 3 : 4- and **2 : 4 : 6-Trihydroxybenzylimines**, and salts (Gattermann and Köbner), A., i, 363.
Trihydroxyethylamine, and its aurichloride (Chancel), A., i, 411.
d-**Trihydroxyglutaric acid** (Lippmann), A., i, 576.
d-, *l*-, and *r*-**Trihydroxyglutaric acids**, and their affinity constants (Ruff), A., i, 324.
Trihydroxyheptane, nitro-, formation of (Henry), A., i, 729.
1 : 2 : 4-Trihydroxymethyl*apo*saffranone, and **1 : 2 : 4-Trihydroxyphenyl*apo*saffranone** and triacetate (Kehrmann and Duret), A., i, 83.
Trihydroxypicoline, and its hydrochloride (Hesse), A., i, 774.
2 : 4 : 5-Trihydroxy-1-propylphenylic trimethylic ether (Klages), A., i, 586.
1 : 2 : 8-Trihydroxyterpan (von Baeyer and Baumgärtel), A., i, 224.
1 : 3 : 5-Triketo-4 : 6-dimethyl*cyclo*hexene, 2 : 2 : 4 : 6-*tetra*chloro- (Schneider), A., i, 680.
1 : 3 : 5-Triketo-6-methyl*cyclo*hexene, 2 : 2 : 4 : 4 : 6-*penta*chloride (Schneider), A., i, 679.
Trilaurin, preparation and physical constants of (Scheij), A., i, 668.
Trimellitic acid, formation of (Collet), A., i, 56.
Trimercuracetic acid. See under Mercury.
Trimesic acid, synthesis of (Wolff and Heip), A., i, 516.
Trimetaphosphoric acid. See under Phosphorus.
2 : 3′ : 4′-Trimethoxyanthraquinone (Bistrzycki and de Schepper), A., i, 152.
1 : 2 : 4 : 5-Trimethoxybenzaldehyde (Gattermann and Eggers), A., i, 347.
2 : 4 : 6-Trimethoxybenzoylacetophenone, and bromo-derivative (von Kostanecki and Tambor), A., i, 911.
4 : 5′ : 6′-Trimethoxybenzoyl-2′-benzoic acid (Bistrzycki and de Schepper), A., i, 151.
2 : 3′ : 4′-Trimethoxydihydroanthrone (Bistrzycki and de Schepper), A., i, 151.
4 : 5′ : 6′-Trimethoxydiphenylmethane-2′-carboxylic acid (Bistrzycki and de Schepper), A., i, 151.
Trimethoxy-α-methylcinnamic acid (Gattermann and Eggers), A., i, 347.
1 : 2 : 4 : 5-Trimethoxypropenylbenzene (*asarone*) (Gattermann and Eggers), A., i, 347.
  reduction of, by sodium and alcohol (Klages) A., i, 586.
Trimethylacetic acid. See Valeric acids.

Trimethylacetonylammonium bromide, and its phenylhydrazone; also action of bromine on (Brendler and Tafel), A., i, 104.
  chloride (*coprine chloride*), and its platinochloride and aurichloride; also its oxime and its platinochloride and aurichloride, and acetyl and benzoyl derivatives (Furnée), A., i, 5.
  and its oxime and physiological action of (Schmidt), A., i, 4.
Trimethylacetophenylammonium bromide and its oxime, and physiological action of (Schmidt), A., i, 4.
Trimethylacetylsuccinic acid, ethylic salt (Bone and Sprankling), T., 848.
Trimethylacrylonitrile (Henry), A., i, 568.
Trimethylamine, action of bromacetone on (Brendler and Tafel), A., i, 104.
  action of hydrogen peroxide on (Dunstan and Goulding), T., 1005; P., **1899**, 124.
  compound of, with mercuric chloride (Hofmann and Marburg), A., i, 487.
  hydrochloride, action of potassium dichromate and sulphuric acid on (Oechsner de Coninck), A., i, 472.
  oxide (Lachmann), A., i, 588.
  oxide (*trimethyloxyammonia*) and salts; also decomposition and reduction, and the action of methylic iodide and benzylic chloride on (Dunstan and Goulding), T., 794; P., **1899**, 58.
    formation of, by action of hydrogen peroxide on trimethylamine (Dunstan and Goulding), T., 1005; P., **1899**, 124.
Trimethylammonium *per*chromate (Wiede), A., i, 244.
2 : 1′ : 2-Trimethylbenzimidazole, methochloride of (Pinnow and Sämann), A., i, 943.
3 : 1′ : 2′-Trimethylbenzimidazole, 2-amino-, 1-amino-, and salts (Pinnow and Matcovitch), A., i, 49.
3 : 1′ : 2′-Trimethylbenzimidazole-1- and **-2-azo-β-naphthylamines** (Pinnow and Matcovitch), A., i, 49, 50.
1′ : 2′ : 3′-Trimethylbenzimidazolinol and **2 : 1′ : 3′-Trimethylbenzimidazolone** (Pinnow and Sämann), A., i, 943.
Trimethylbiuret, from action of alkalis on trimethylic *iso*cyanurate (Fischer), A., i, 262.
Trimethylbornylammonium iodide, chloride, platinochloride (Forster), T., 945.
Trimethylbrazilin, and oxidation products (Gilbody and Perkin), P., **1899**, 27.
Trimethylbrazilone, and oxidation products (Gilbody and Perkin), P., **1899**, 27.
Trimethyl*iso*butylammonium platinochloride, two crystalline forms of (Wedekind), A., i, 352.
Trimethylcarbinol. See *tert*-Butylic alcohol.
s-**Trimethyldeoxybenzoin** (Klages and Lickroth), A., i, 599.
Trimethyldihydroquinoline, identity of with 1′ : 3′ : 3′-trimethyl-2′-methylenindoline (Plancher), A., i, 452.
Trimethylene. See *cyclo*-Propane.
as-**Trimethylenecarbamide** (Howard and Marckwald), A., i, 749.
Trimethylenecarbonitrile. See *cyclo*-Propanecarboxylonitrile.
Trimethylenecarboxylic acid. See *cyclo*-Propanecarboxylic acid.
bis-**Trimethylenedibenzimide** (Howard and Marckwald), A., i, 750.
Trimethylenedibenzylsulphone (Autenrieth and Wolff), A., i, 579.
Trimethylenedicarboxylic acid. See *cyclo*-Propanedicarboxylic acid.
Trimethylenediethylsulphone (Autenrieth and Wolff), A., i, 579.
Trimethylenedimethylsulphone (Autenrieth and Wolff), A., i, 579.
Trimethylenedisulphide, imino-, hydrochloride, formation of (Kohler), A., i, 737.
Trimethylene-ethylenediamine and its salts; also its *di*nitroso- and dibenzoyl-derivatives (Bleier), A., i, 664.
Trimethylene-ethylenedibenzenesulphonamide and its hydrolysis (Bleier), A., i, 664.
Trimethylene-ethylenic glycol, chlorhydrin (Mokiewsky), A., i, 726.
Trimethylenephenylthiocarbamide (Howard and Marckwald), A., i, 749.
Trimethylenetrianiline, and an isomeride of higher melting point (Bischoff), A., i, 279.
Trimethylenic bromide, action of zinc on (Berthelot), A., i, 872.
  chlorobromide, action of potassium cyanide on (Henry), A., i, 183.
  dibenzylic and dimethylic sulphides (Autenrieth and Wolff), A. i, 579.
  glycol (*αγ-propylenic glycol*), action of hydrogen bromide on (Mokiewski), A., i, 729.
    ββ-bromonitro- (Maas), A., i, 322.
  iodhydrin, action of potassium cyanide on (Henry), A., i, 183.

Trimethylenic mercaptan, and its condensation of, with aldehydes and ketones (Autenrieth and Wolff), A., i, 579, 580.

Trimethylenimine and its trimethylenethiocarbamate and nitroso-derivative (Howard and Marckwald), A., i, 749.

Trimethylethane. See Pentane.

Trimethylethylene. See Amylene.

Trimethylethylenic glycol. See *β-iso*-Amylenic glycol.

Trimethylethylmethane. See Hexane.

Trimethylgallic acid, bromo-, nitro-, and amino-, and their methylic salts (Hamburg), A., i, 364.

αββ-**Trimethylglutaric acid** (*hexanedicarboxylic acid*), synthesis of, and its anhydride and imide (Perkin and Thorpe), T., 61; P., **1898**, 250.

  α-cyano-, ethylic salt, and its hydrolysis (Perkin and Thorpe), T., 64; P., **1898**, 251.

Trimethylglutaric anhydride, bromo-, and action of alcohol on (Balbiano), A., i, 868.

αββ-**Trimethylglutaranilic acid** (Perkin and Thorpe), T., 64; P., **1898**, 251.

2′ : 3′ : 3′-Trimethylindolenine, constitution of (Plancher), A., i, 454.

  and benzoyl derivative (Plancher and Bettinelli), A., i, 543.

Trimethylmethoxyammonium iodide and decomposition and reduction; also the chloride, platinochloride, and aurichloride (Dunstan and Goulding), T., 797; P., **1899**, 59.

1′ : 3′ : 3′-Trimethyl-2′-methylenindolenine (Plancher), A., i, 454.

1 : 2 : 3′-Trimethylnaphthalene, and its ω-bromo- and ω : 3 : 4 : 4′-*tetra*bromo-derivatives (von Baeyer and Villiger), A., i, 922, 923.

Trimethyloxyammonia. See Trimethylamine oxide.

1 : 1 : 2-Trimethyl*cyclo***pentane-2 : 3-dicarboxylic acid** (Bouveault), A., i, 300.

Trimethyl-1 : 1 : 2-*cyclo***pentene-Δ^2-methyloic-3 acid.** See *iso*-Lauronolic acid.

Trimethylphenylammonium iodide, formation of (Bamberger and Tschirner), A., i, 683.

Trimethylphloroglucinol, from filicic acid, and its *tri*bromo-derivative (Boehm), A., i, 32.

α-Trimethylphosphortolubetaine and α- and **β-Trimethylphosphortolubetainecarboxylic acids** (Conen), A., i, 208, 209.

Trimethylpiperidinediethyl-mercaptole and -**sulphonal** (Pauly), A., i, 228.

Trimethylpiperidinediphenylmercaptole (Pauly), A., i, 228.

1′ : 3′ : 3′-Trimethyl-2′-*iso***propylideneindoline**, identity of, with pentamethyldihydroquinoline (Plancher), A., i, 455.

3 : 5 : 5-Trimethylpyrazoline, and hydrobromide (Curtius and Zinkeisen), A., i, 165.

2 : 4 : 6-Trimethylpyridine (*γ-collidine*), aminolytic constant of (Goldschmidt and Salcher), A., ii, 551.

Trimethylpyruvic acid, and its ethylic salt, phenylhydrazone, and cyanhydrin (Carlinfanti), A., i, 671.

Trimethylquinazolone, and its platinochloride (Bamberger and Weiler), A., i, 124.

Trimethylsuccinic acid (*pentanedicarboxylic acid*), formation of (Bone), P., **1899**, 6.

  and anhydride, anilic acid, and calcium salt (Bone and Sprankling), T., 848.

Trimethylsuccinic acid, chloro-, ethylic salt, and its hydrolysis (Komppa), A., i, 420.

  cyano-, formation and hydrolysis of (Bone), P., **1899**, 6.

    ethylic salt and hydrolysis (Bone and Sprankling), T., 855.

1 : 2 : 3-Trimethyltetrahydropyridine, and salts (Sachs), A., i, 302.

Trimethyltrimethylenic bromide. See Hexane, *di*bromo-.

1 : 7 : 9-Trimethyluric acid (Fischer and Ach), A., i, 393.

Trimyristin, preparation and physical constants of (Scheij), A., i, 668.

Trioxymethylene. See Paraformaldehyde.

iso-**Trioxyphenylene** *di*sulphide, and triacetyl derivative (Genvresse), A., i, 148.

Tripalmitin, preparation and physical constants of (Scheij), A., i, 668.

Triphenanthroline, metallic salts (Blau), A., i, 388.

Triphenodioxazine (Krause), A., i, 272.

Triphenylacetic acid, ethylic salt, velocity of formation of (Sudborough and Lloyd), T., 479; P., **1899**, 3.

Triphenylamine, cryoscopic behaviour of, in triphenylmethane solution (Garelli and Calzolari), A., ii, 732.

  nitro- (Haeussermann and Bauer), A., i, 204.

Triphenylbromomethane, *per*iodide (Gomberg), A., i, 155.

***αβγ*-Triphenylbutyramide,** γ-cyano- (HENZE), A., i, 219.
Triphenylcarbinol, formation of (BODROUX), A., i, 678.
Triphenylcarbinols, synthesis of (NENCKI), A., i, 879; (MEISSEL), A., i, 880.
1 : 3 : 5-Triphenyl-4-cyanopyrazole (SEIDEL), A., i, 139.
***αβα′*-Triphenylglutaric acid,** ethylic salt, anhydride and nitrile (HENZE), A., i, 218, 219.
Triphenylguanidine (DIXON), T., 405; (SCHALL), A., i, 280; (MONTECCHI), A., i, 429.
Triphenylmethane, formation of (MOUNEYRAT), A., i, 490.
  synthesis of (NENCKI), A., i, 879; (MEISSEL), A., i, 880.
  depression of freezing point of, by triphenylamine (GARELLI and CALZOLARI), A., ii, 732.
Triphenylmethanes, *p*-nitro*di*amino-transformation of, into rosanilines (PRUD'HOMME), A., i, 217.
Triphenylmethylphosphorketobetaine, and its salts (MICHAELIS and KÖHLER), A., i, 596.
2 : 5 : 5-Triphenyloxazolone, and its conversion into benzimidoxydiphenylacetic acid; action of hydriodic acid on (JAPP and FINDLAY), T., 1028; P., **1899**, 165.
1 : 2 : 4-Triphenyl*cyclo*pentadiene, 1 : 2 : 4-Triphenyl*cyclo*pentane, and **1 : 2 : 4-Triphenyl*cyclo*pentane-1 : 2-diol** (WISLICENUS and NEWMAN), A., i, 60, 61.
Triphenylpropane (COHN), A., i, 295.
1 : 3 : 5-Triphenyl-4-pyrazolecarboxylic acid (SEIDEL), A., i, 139.
2 : 4 : 6-Triphenylpyridine, and its oxime and dioxime (WISLICENUS and NEWMAN), A., i, 61.
Triphenylsilicol. See Silicon organic compounds.
Triphenylstibine chloride (HASENBÄUMER), A., i, 209.
Triphenyltetrahydro-γ-pyrone (GOLDSCHMIEDT and KNÖPFER), A., i, 140.
acc-**Triphenylthiobiuret** (DIXON), T., 394; P., **1899**, 63.
Triphenyl-*p*-tolylphosphorketobetaine, and its salts (MICHAELIS and KÖHLER), A., i, 596.
2 : 4 : 6-Triphenyltrimesic acid, and its anhydrides, methylic and ethylic salts (LANSER), A., i, 916.
Triphenylvinylic alcohol, and benzoyl derivative (BILTZ), A., i, 439.
Triplite, action of oxalic acid on (PATERNÒ and ALVISI), A., ii, 18.
Tripropanediolamine, formation of (L. and E. KNORR), A., i, 411.
Tripropylamine, action of hydrogen peroxide on (DUNSTAN and GOULDING), T., 1008.
  iodide and *per*iodide (NORRIS and FRANKLIN), A., i, 663.
  oxide (*tripropyloxamine*), and salts (DUNSTAN and GOULDING), T., 1008.
Tripropylarsine oxide mercurichloride (PARTHEIL, AMORT, and GRONOVER), A., i, 474.
Tristearin, preparation and physical constants of (SCHEIJ), A., i, 668.
Tritolylguanidine (DAINS), A., i, 593.
Troilite, relation of ferrous sulphide and magnetic pyrites to (LINCK), A., ii, 416.
Tropæolic acid (GADAMER), A., i, 930.
Tropæolin OO and OOO, use of, in alkalimetry (GLASER), A., ii, 573.
Tropæolum majus, fatty oil from the seeds of (GADAMER), A., i, 864.
  glucoside and essential oil of (GADAMER), A., i, 930.
  oil of (GADAMER), A., i, 535.
Tropine, action of *o*-xylylenic bromide on (SCHOLTZ), A., i, 619.
  chloride, bromide, and iodide, and their salts (VAN SON), A., i, 312.
iso-**Tropylamine,** and its thiocarbamide, hydrazide, and conversion into tropidine and *di*-*iso*tropylcarbamide (WILLSTÄTTER and MÜLLER), A., i, 178.
Truxone, bromo- (MANTHEY), A., i, 894.
Trypsin, action of heat on (HARLAY), A., i, 967.
  action of, on simple organic compounds (GULEWITSCH), A., i, 832.
Tuberone (VERLEY), A., i, 712.
Tubes, Dewar's, efficiency of (HEMPEL), A., ii, 140.
  for low temperature work (HEMPEL), A., ii, 139.
Tumours, malignant, composition of (PETRY), A., ii, 568.
Tungsten, atomic weight of (THOMAS), A., ii, 489.
  crystalline, obtained by electrolysis of lithium paratungstate (HALLOPEAU), A., ii, 158.
  preparation and specific gravity of (STAVENHAGEN), A., ii, 489.
  action of, on sulphuric acid (ADIE), P., **1899**, 133.
Tungsten *penta*bromide (DEFACQZ), A., ii, 489.
  carbide (LEBEAU), A., ii, 427.
  iron carbide (WILLIAMS), A., ii, 104; (CARNOT and GOUTAL), A., ii, 293.

Tungsten chlorobromides (Defacqz), A., ii, 754.
*tetr*iodide (Defacqz), A., ii, 159.
*di*oxide, crystalline, and tungstic anhydride (Hallopeau), A., ii, 159.
*pent*oxide (Granger), A., ii, 32.
silicide (Vigouroux), A., ii, 114; (Warren), A., ii, 158.
*di*sulphide, preparation and properties of (Defacqz), A., ii, 428.
Tungstolithic tungstate (Hallopeau), A., ii, 159.
Tungstopotassic tungstate (Hallopeau), A., ii, 555.
Tungsticitric, Tungstimalic, and **Tungstimucic acids,** salts of (Henderson, Orr, and Whitehead), T., 547; P., **1899**, 107.
Tungsten, estimation and separation of:—
estimation of (Brearley), A., ii, 337.
estimation of, in steel (Auchy), A., i, 524.
separation of mercury from (Jannasch and Alffers), A., ii, 59.
Tungsten-blue (Granger), A., ii, 32.
Tungsten-bronze (Hallopeau), A., ii, 159.
Turmeric, detection of, in rhubarb powder (Jaworowski), A., ii, 75.
use of, in alkalimetry (Glaser), A., ii, 573.
Turpentine, diffusion coefficient of, across vulcanised caoutchouc (Flusin), A., ii, 205.
active oxygen of (Engler and Weissberg), A., i, 221.
oil of, oxidation of (Lawrence), T., 530.
products of destructive distillation of (Müller), A., i, 28.
detection of mineral oils in (Schreiber and Zetzsche), A., ii, 815.
d- and *l*-**Turpentine oil,** rotatory power of (Wendell), A., ii, 199.
Tyrosinase, presence of, in beet leaves and stems, and its function (Gonnermann), A., ii, 791.
Tyrosine (p-*hydroxyphenyl-α-aminopropionic acid*), presence of, in the broad-bean (Bourquelot and Hérissey), A., ii, 324.
presence of, in cystinuric urine (Moreigne), A., ii, 317.
presence of, in fungi (Winterstein), A., ii, 240.
presence of, in yeast extract (Wróblewski), A., ii, 170.
synthesis of (Erlenmeyer and Halsey), A., i, 761.
Tyrosine (p-*hydroxyphenyl-α-aminopropionic acid*), formation of, from fibrin and detection by juice of *Russula delica* (Harlay), A., i, 656.
absorption spectrum of (Blyth), T., 1164; P., **1899**, 175.
Tysonite from Colorado (Hillebrand), A., ii, 301.

U.

Uintahite from Utah (Eldridge), A., ii, 35.
Ullmannite from Sardinia (Traverso), A., ii, 760.
Ulothrix flaccida, development of, in non-nitrogenous solutions (Bouilhac), A., ii, 238.
Umbelliferone, presence of, in Sumbul root, non-occurrence in *Rad. levistici* and *Mei* (Tschirch and Knitl), A., i, 714.
Umbilicaria pultulata, constituents of (Hesse), A., i, 382.
Umbilicaric acid, presence of, in *Gyrophora polyphylla* (Hesse), A., i, 382.
Undecane in paraffin oil (Oehler), A., i, 816.
*di*bromo- (Jeffreys), A., i, 731.
nitro- (Worstall), A., i, 399.
Undecodilactone, formation of (Fittig and Stuber), A., i, 418.
n-**Undecoic acid** (*undecylic acid*), amylic salt, density, specific rotation and molecular volume of (Frankland), T., 358.
n-**Undecylamine** and its hydrochloride, platinochloride, and benzoyl derivative; also action of nitrous acid on (Jeffreys), A., i, 731.
Undecylcarbamic acid, methylic salt, and **Undecylcarbamide** (Jeffreys), A., i, 731.
Undecylenamide (Aschan), A., i, 14.
Undecylene, and action of bromine on (Jeffreys), A., i, 731.
n-**Undecylic alcohol** and its oxidation; also phenylcarbamate (Jeffreys), A., i, 731.
Unsaturated compounds, oxidation of, with potassium permanganate (Kondakoff), A., i, 555.
and aromatic compounds, theory of (Thiele), A., i, 554.
groups of atoms, negative nature of (Heinrich), A., i, 469.
organic radicles, electro-negative nature of certain (Charon), A., i, 469.
Uranite, vapour pressure of (Tammann), A., ii, 8.
Uranium, radiation from (Becquerel), A., ii, 393.

Uranium, *tetra*chloride and *tetra*bromide, double salts with potassium, lithium, and alkaline-earth chlorides and bromides (ALOY), A., ii, 555.
  molybdiodate (CHRÉTIEN), A., ii, 363.
  oxide, action of alkali oxalates on (ROSENHEIM and LIENAU), A., i, 569.
  *di*oxide, hydrated, and oxychloride (ALOY), A., ii, 599.
  Uranic acid, sodio- and potassio-hydroxylamine salts of (KOHLSCHÜTTER and HOFMANN), A., ii, 651.
  per-**Uranic acid**, oxidation of alkalis by (MELIKOFF and PISSARJEWSKY), A., ii, 31.
  phosphate crystallised (BOURGEOIS), A., ii, 160.
  Substance, UO_5N, obtained by dehydrating hydroxylamine uranate (KOHLSCHÜTTER and HOFMANN), A., ii, 651.
  Uranous chloride and arsenate (ALOY), A., ii, 599.
  Uranyl salts, dissociation and conductivity of, and of sodium double salts (DITTRICH), A., ii, 629.
    potassium or lithium chlorides (ALOY), A., ii, 556.
Uranium mineral (*carnotite*) from Colorado (FRIEDEL and CUMENGE), A., ii, 434.
Urazole, derivatives of (CUNEO), A., i, 9.
Urceolaria scruposa and *U. cretacea*, constituents of (HESSE), A., i, 383.
Urea (*carbamide*), amount of, in various animal tissues and liquids (SCHÖNDORFF), A., ii, 373.
  origin of, from glycocine in the living body (SPIRO), A., ii, 777.
  sources of, in the organism (SCHWARZ), A., ii, 165.
  excretion of, in man (BAIN and EDGECOMBE), A., ii, 314.
  estimation of (MOREIGNE), A., ii, 72, 73; (SALASKIN and ZALESKI), A., ii, 825.
  precipitation, of by phosphotungstic acid (CHASSEVANT), A., ii, 390.
  See also Carbamide.
Ureides and acetylated alkylic carbamates (BECKURTS), A., i, 795.
Urethane (*ethylic carbamate*), molecular depression of (CASTORO), A., ii, 360.
  action of chromic acid and potassium dichromate on (OECHSNER DE CONINCK), A., i, 243.
  action of organic bases on (MANUELLI and RICCA-ROSELLINI), A., i, 887.
Urethane, nitroso-, constitution of (HANTZSCH), A., i, 400.
Urethane, nitroso-, and its methyl derivative, constitution of (BRÜHL), A., i, 871.
Urethanes, preparation of, and action of nitrous acid on (THIELE and DENT), A., i, 14.
Uric acid, origin of, in the organism (HOPKINS and HOPE), A., ii, 117.
  formation of, in the organism (WEISS), A., ii, 504.
  sources of, in the living body (SCHREIBER and WALDVOGEL), A., ii, 780.
  source of, in the bodies of mammals (MINKOWSKI), A., ii, 778.
  further proofs of origin of, in the body from nuclein or alloxuric bases (JEROME), A., ii, 678.
  formation of, by action of tissue extracts outside the body (SPITZER), A., ii, 604.
  cause of infarcts of, in the kidneys of infants (SPIEGELBERG), A., ii, 778.
  and its mono-, di-, tri-, and tetramethyl derivatives, relative stability of, towards alkalis (FISCHER), A., i, 262.
  formation of murexide from (VITALI), A., i, 117.
  mercury compound of, constitution of (KIESERITZKY), A., ii, 395.
  reduction of (SUNDVIK), A., i, 174.
  excretion of (HAIG), A., ii, 440.
  excretion of, in man (BAIN and EDGECOMBE), A., ii, 314.
  elimination of, in leucæmia (WHITE and HOPKINS), A., ii, 316.
  causes of precipitation of, in urine (JEROME), A., ii, 116.
  detection of, in sections of animal organs (SAINT-HILAIRE), A., ii, 133.
  estimation of (MALLET), A., ii, 706.
  estimation of, volumetrically (GIGLI), A., ii, 71.
  estimation of, in urine (CAMERER and SÖLDNER), A., ii, 825.
Urine, freezing point of, in health and disease (BOUCHARD), A., ii, 314.
  alloxuric bases present in (KRÜGER and SALOMON), A., ii, 233.
  excretion of bases in the, of fasting animals (KATSUYAMA), A., ii, 314.
  elimination of chlorides by, in rickets (OECHSNER DE CONINCK), A., ii, 42.
  presence of organic chlorine in (VITALI), A., ii, 41.
  separation of homogentisic acid from (GARROD), A., ii, 314.
  human, amount of indican in (BOUMA), A., ii, 568.
  supposed presence of organic iodine in (VITALI), A., ii, 116.

Urine, origin of kynurenic acid in the (MENDEL and JACKSON), A., ii, 117.
  presence of leucine and tyrosine in during cystinuria (MOREIGNE), A., ii, 317.
  of infants, relation of nitrogen to phosphates in (OECHSNER DE CONINCK), A., ii, 678.
  relation of total nitrogen to urea nitrogen in (MOREIGNE), A., ii, 73, 314.
  cause of the high value of the C/N quotient in (PREGL), A., ii, 440.
  preparation of nitroso-creatinine from (KRAMM), A., i, 85.
  recognition of pentose in (SALKOWSKI), A., ii, 679.
  nature of phosphorus compounds in (JOLLY), A., ii, 41.
  presence of proteose in pathological (ROSIN), A., ii, 42.
  determination of the reducing power of (HELLER), A., ii, 679.
  effects of administration of spermine on the (POEHL), A., ii, 502.
  the sugar present in diabetic (LE GOFF), A., i, 242; (PATEIN and DUFAU), A., ii, 375.
  elimination of various sugars in, after injection into the circulation (PAVY), A., ii, 677.
  the sulphur compounds of (HARNACK and KLEINE), A., ii, 375.
  causes of precipitation of uric acid in (JEROME), A., ii, 116.
  cause of toxicity of (HERRINGHAM), A., ii, 679.
  composition of, in fever (VON MORACZEWSKI), A., ii, 441.
Urine, analytical methods relating to:—
  analysis of (CAMERER and SÖLDNER), A., ii, 825.
  clarifying of, by lead *di*oxide (LOUBIOU), A., ii, 72.
  detection of acetone in (STUDER), A., ii, 190.
  detection of albumin in (STRZYZOWSKI), A., ii, 459; (GUÉRIN), A., ii, 716.
  detection of albumin and albumoses in (RIEGLER), A., ii, 264.
  detection of biliary acids in (VITALI), A., ii, 263.
  detection of blood in (ARNOLD), A., ii, 194.
  detection of dextrose in (FRÖHLICH), A., ii, 185.
  detection of homogentisic acid in (HUPPERT), A., ii, 706.
  detection of iodides in (VITALI), A., i, 117.
  detection of peptone in (FREUND), A., ii, 195.
Urine, analytical methods relating to:—
  detection of quinine in (CHRISTOMANOS), A., ii, 344.
  detection of taurocholic and glycocholic acid in (VITALI), A., ii, 342.
  detection of urobilin in (SAILLET), A., ii, 459.
  estimation of acidity of (DENIGÈS), A., ii, 525; (IMBERT and ASTRUC; LEPIERRE; LÉPINOIS), A., ii, 526.
  estimation of organic acids in (STEINDLER), A., ii, 704.
  estimation of albumin in (DENIGÈS), A., ii, 828.
  estimation of alkalis in (BOHLIG), A., ii, 810.
  estimation of bile pigment in (JOLLES), A., ii, 459.
  estimation of dextrose in (CARPENÉ), A., ii, 66; (SCHLOSSER), A., ii, 185; (LOHNSTEIN), A., ii, 580.
  estimation of indican in (OBERMAYER), A., ii, 263, 458; (WANG), A., ii, 458.
  estimation of indoxylsulphuric acid in (OBERMAYER), A., ii, 458.
  estimation of iron in (RÖHMANN and STEINITZ), A., ii, 814.
  estimation of oxalic acid in (SALKOWSKI), A., ii, 705.
  estimation of phenol in (NEUBERG), A., ii, 454.
  estimation of phosphoric acid in (NEUMANN), A., ii, 54.
  estimation of potassium and sodium in (HERRINGHAM), A., ii, 333.
  estimation of sugar in (POLENSKE), A., ii, 186.
  estimation of toxins, leucomaines, alkaloids, diastases, and proteids in (CHIBRET), A., ii, 459.
  estimation of urea in (MOREIGNE), A., ii, 73; (SALASKIN and ZALESKI), A., ii, 825.
  estimation of uric acid in (GIGLI), A., ii, 71; (MALLET), A., ii, 706.
Urobilin, detection of, in urine (SAILLET), A., ii, 459.
Urochloralic acid (NEUBERG), A., i, 933.
Urotropine. See Hexamethylenetetramine.
Usnic acid, presence of, in *Cladonia silvatica* and *Placodium saxicolum*; and separation from atranorin (HESSE), A., i, 382.
  from *Platysma cucullatum*, *P. diffusum*, and *Alectoria ochroleuca* (ZOPF), A., i, 716.
Utahite from Chili (ARZRUNI, THADDÉEFF, and DANNENBERG), A. ii, 563.

Uvitic acid, synthesis of (Wolff and Heip), A., i, 515, 516.

V.

Valency, nature of (Venable), A., ii, 470.

Valeraldehyde, δ-amino-, action of carbon *di*sulphide and of nitrous acid on; also oxidation of the benzoyl derivative (Maass and Wolffenstein), A., i, 110.

  nitro-, phenylhydrazone (*phenylnitroazopentane*), α- and β-modifications of, and action of soda on the latter (Bamberger), A., i, 108.

iso-**Valeraldehyde**, action of ethylenediamine on (Kolda), A., i, 328.

iso-**Valeramide**, preparation of (Aschan), A., i, 14.

  α-bromo- (Bischoff and Tschunkew), A., i, 277.

iso-**Valeramidoazobenzene**, α-bromo- (Bischoff and Sobolewski), A., i, 232.

Valeranilide, specific rotation of (Guye and Babel), A., ii, 719.

Valeric acid, surface tension of aqueous solutions of (Forch), A., ii, 641.

  preparation and bromination of (Crossley and Le Sueur), T., 166.

Valeric acid, zinc salt, preparation of (Vitali), A., i, 112.

  amylic salt, density, specific rotation and molecular volume of (Frankland), T., 358.

  ethoxyphenylic salt (Merck), A., i, 802.

  ethylic salt, viscosity of solutions of, in thymol (Schall), A., ii, 640.

Valeric acid, α-bromo-, ethylic salt, action of diethylaniline on (Crossley and Le Sueur), T., 166; P., **1898**, 219.

  α-chloro-, methylic salt (Henry), A., i, 567.

  αδ-*di*cyano-, ethylic salt, and its hydrolysis (Carpenter and Perkin), T., 928.

iso-**Valeric acid**, separation of acetic acid from (Chapman), A., ii, 704.

  separation of, from other fatty acids (Holzmann), A., ii, 68.

iso-**Valeric acid**, α-bromo-, ethylic salt, action of benzylaniline and diphenylamine on (Bischoff), A., i, 125.

    action of sodium methoxide, ethoxide, and *n*- and *iso*-propoxides on (Bischoff), A., i, 669.

iso-**Valeric acid**, α-bromo-, ethylic salt, action of sodium butoxides, *iso*amyloxide, octyloxide, and *iso*capryloxide on (Bischoff), A., i, 670.

    action of quinoline and of diethylaniline on (Crossley and Le Sueur), T., 164; P., **1898**, 219.

  β-chloro-, ethylic salt, action of potassium cyanide on, and its condensation with ethylic malonate (Montemartini), A., i, 420.

Valeric acid (*methylethylacetic acid*), *d*-, ethereal salts, density, specific rotation, and molecular volumes of (Frankland), T., 359.

  d-, *l*-, and *i*-, silver salts of, and the synthesis of the first (Marckwald), A., i, 477.

Valeric acid (*trimethylacetic acid*, *dimethylpropionic acid*), ethylic salt, velocity of formation, and hydrolysis of (Sudborough and Lloyd), T., 475; P., **1899**, 3.

  cyano-, ethylic salt, from action of heat on monethylic cyanodimethylsuccinate, and its reduction (Blaise), A., i, 480.

iso-**Valerobenzylamide**, α-bromo- (Bischoff and Tschunkew), A., i, 277.

iso-**Valerobenzylanilide**, α-bromo- (Bischoff), A., i, 126.

iso-**Valerodi-α-naphthylethylenediamine**, α-bromo- (Bischoff and Päpke), A., i, 279.

iso-**Valerodiphenylamide**, α-bromo- (Bischoff), A., i, 126.

iso-**Valerodiphenylhydrazide**, α-bromo- (Bischoff), A., i, 278.

iso-**Valeromethylanilide**, α-bromo- (Bischoff and Hirschfeld), A., i, 278.

iso-**Valero-α- and β-naphthalides**, α-bromo- (Bischoff and Päpke), A., i, 278.

iso-**Valero-*o*-nitranilide**, α-bromo- (Bischoff and Päpke), A., i, 278.

iso-**Valero-*m*-nitranilide**, α-bromo- (Bischoff and Watschjanz), A., i, 278.

iso-**Valero-*p*-nitranilide**, α-bromo- (Bischoff and Hirschfeld), A., i, 278.

Valeronitrile, α-chloro-, and its hydrolysis (Henry), A., i, 567.

iso-**Valeronitrile** (iso*propylacetonitrile*), α-chloro- (Henry), A., i, 256.

β-**Valerophenylhydrazide**, from hydrolysis of nitrovaleraldephenylhydrazone (Bamberger), A., i, 109.

iso-**Valeropiperidide** (Auerbach and Wolffenstein), A., i, 936.

  α-bromo- (Bischoff and Holm), A., i, 230.

Valero- *o*-, *m*-, and *p*-**toluidides,** specific rotations of (Guye and Babel), A., ii, 719.
iso-**Valero-**, *o*-, *m*-, and *p*-**toluidides**, α-bromo- (Bischoff and Päpke), A., i, 277.
iso-**Valerylcarbazole,** α-bromo- (Bischoff and Karukowski), A., i, 231.
iso-**Valerylcyanacetic acid,** methylic and ethylic salts, and their metallic derivatives (Klobb), A., i, 113.
iso-**Valerylcyanhydrin.** See α-Hydroxy-*iso*hexonitrile.
iso-**Valerylmalic acid,** ethereal salts, specific relations and molecular volumes of (Frankland), T., 348, 352.
Valleriite from Sweden (Petren), A., ii, 759.
Vanadium in rocks from the United States (Hillebrand), A., ii, 112; (Turner and others), A., ii, 498.
in peat (Baskerville), A., ii, 666.
electro-deposition of (Cowper-Coles), A., ii, 755.
Vanadium, *tri*chloride, *tri*bromide and *tri*iodide (Piccini and Brizzi), A., i, 297.
ver-**Vanadates,** constitution of (Melikoff and Pissarjewsky), A., ii, 299.
sulphate, for detection of alkaloids (Barth), A., ii, 47.
and ammonium and potassium sulphates (Piccini), A., ii, 297.
double thiocyanates of, with potassium, sodium, and ammonium (Cioci), A., i, 321.
Vanadium, estimation of small quantities of, in rocks (Hillebrand), A., ii, 112.
Vanadium-mica from California (Hillebrand, Turner, and Clarke), A., ii, 496.
Vanadium mineral (*carnotite*) from Colorado (Friedel and Cumenge), A., ii, 434.
Vanillic acid, β-nitro-, and β-amino-, and its platinochloride and acetyl derivative (Vogl), A., i, 698.
Vanillilosazone (Biltz and Wienands), A., i, 911.
Vanillin, presence of, in cork (Thoms), A., ii, 324.
presence of, in opoponax and Peru balsam (Tschirch and Knitl), A., i, 714; (Thoms), A., i, 715.
synthesis of (Bouveault), A., i, 437.
mono- and tri-acetates (Freyss), A., i, 875.
separation of coumarin from, in flavouring extracts (Hess and Prescott), A., ii, 531.
Vanillin, β-nitro-, and its acetate and oxime (Vogl), A., i, 697.
Vanilloylcarboxylic acid (Bouveault), A., i, 437.
Vapour density, determination of, under arbitrary pressure (Bleier and Kohn), A., ii, 643.
method for determining (Winkler), A., ii, 728.
of hexamethylene (Young and Fortey), T., 880; P., **1899,** 182.
Vapour pressure of solutions, method of determining (Wade), A., ii, 8.
measurements (Dühring), A., ii, 726.
and osmotic pressure, relation between (Noyes), A., ii, 357.
surface for aqueous solutions of two salts which form a double salt (Donnan), A., ii, 402.
of mixed liquids (Lehfeldt), A., ii, 11.
of air at temperature of boiling hydrogen (Dewar), A., ii, 741.
of amalgams (Ogg), A., ii, 14.
of solutions (Schiller), A., ii, 357.
of solutions of volatile substances (Lehfeldt), A., ii, 633.
of aqueous solutions of hydrochloric acid (Allan), A., ii, 82.
of aqueous solutions of sulphuric acid, sodium chloride, cane sugar, dextrose, glycerol, or carbamide, molecular depression of (Dieterici), A., ii, 403.
of hydrated crystals (Tammann), A., ii, 8.
of hexamethylene (Young and Fortey), T., 876; P., **1899,** 182.
of iodine (Dewar), P., **1898,** 242.
of mercurial solutions (Cady), A., ii, 395.
of naphthalene, and of camphor (Allen), P., **1899,** 122, 135.
of *iso*pentane, and of mercury (Young), A., ii, 633.
Vapours, mixed, composition of (Carveth), A., ii, 467.
Vegetables, estimation of copper in (Lehmann; Vedrödi), A., ii, 59.
"**Vegetale,**" note on (Wirthle), A., ii, 824.
Velocity of chemical change. See Affinity, chemical.
Velocity of crystallisation (Küster), A., ii, 15.
Velocity constants in conversion of ammonium thiocyanate into thiocarbamide and *vice versâ* (Waddell), A., ii, 411.
Veratraldehyde, and its hydrazone (Bouveault), A., i, 228, 437.

Veratric acid, formation of (Bouveault), A., i, 288.
Veratrine (*cevadine*), m. p., and its hydrolytic products, and physiological action (Freund and Schwarz), A., i, 464.
  detection of (Melzer), A., ii, 193; (Kondakoff), A., ii, 827.
Veratrole, depression of freezing point of *o*-nitrophenol by (Ampola and Rimatori), A., ii, 353.
  *tri*chloro-, and *tri*bromo- (Cousin), A., i, 200.
Vesiculase, a coagulating ferment of the prostatic secretion (Camus and Gley), A., ii, 779.
Vermiculite from New Jersey (Clarke and Darton), A., ii, 496.
Vetch. See Agricultural chemistry.
Vibrio septicæmiæ, action of, on biliverdin, bilirubin, and hæmoglobin (Hugounenq and Doyon), A., ii, 377.
Vicia fabia. See Agricultural chemistry.
Vicin, constitution of (Ritthausen), A., i, 715.
Victorium and its oxide, and atomic weight; phosphorescent spectrum of; separation of, from earths of cerium group (Crookes), A., ii, 751.
Viellaurite from the Hautes Pyrénées (Lienau), A., ii, 761.
Vine. See Agricultural chemistry.
Vinegar, detection of caramel in (Crampton and Simons), A., ii, 530.
  estimation of acidity and ash in (Erckmann), A., ii, 339.
Vinylacetic acid and calcium salt (Wislicenus), A., i, 736.
Vinylacetonitrile. See Butenoic acid, nitrile of.
  identity of, with ethyleneacetonitrile (Henry), A., i, 676.
Vinylamine. See Dimethyleneimine.
Vinyldiacetonamine, condensation of, with ethylic mercaptan (Pauly), A., i, 228.
Vinylglycollic acid (*a-hydroxybutenoic acid*), and action of soda on (Sleen), A., i, 864.
Vinylic alcohol, a colour reaction of (Rimini), A., i, 787.
o-**Vinylphenol** (Kunz-Krause), A., i, 201.
Violaquercitrin, potassium derivative of (Perkin), T., 440; P., **1899**, 65.
Violets, artificial oil of, composition of (Stiehl), A., i, 67.
Violuric acid. See Barbituric acid, nitroso-.
ψ-Violuric acid, methylic salt of (Guinchard), A., i, 781.
Viscosity, effect of pressure on (Bogojawlensky and Tammann), A., ii, 137.
  of gases and of gaseous mixtures, and its alteration with temperature (Breitenbach), A., ii, 403.
  of solutions of ethereal salts in supercooled thymol (Schall), A., ii, 640.
  of undercooled liquids (Tammann), A., ii, 272.
Viscosity coefficients, measurement of (Guye and Friderich), A., ii, 358.
Vitexin, relation of, to scoparin (Perkin), P., **1899**, 123.
  action of potassium acetate on (Perkin), T., 443.
Vivianite in Dutch peat (Bemmelen), A., ii, 371.
  in Mecklenburg peat (Gaertner), A., ii, 302.
Volume, molecular, of benzoyltetrahydroquinaldine, *d*-, *l*-, and *r*- (Pope and Peachey), T., 1073, 1082, 1092.
  of butyric, caproic, caprylic, capric, lauric, myristic, palmitic and stearic acids and their glycerylic salts (Scheij), A., i, 668.
  of hexamethylene (Young and Fortey), T., 878, P., **1899**, 182.
  of organic salts of menthol (Tschugáeff), A., ii, 3.
Volumes, specific, direct, and from critical constants, differences between (Leduc), A., ii, 729.
  of compounds of mercury with lithium, sodium or potassium (Maey), A., ii, 547.
  of steam (Starkweather), A., ii, 270.
Volumes of liquids, measurement of (Wagner), A., ii, 379.
Volumeometer, improved form of (McKenna), A., ii, 467.
Volumetric apparatus, methods used in graduating (Fischer), A., ii, 592.
Vulpic acid, presence of, in *Calycium chrysocephalum* (Hesse), A., i, 385.

W.

Wad, cobaltiferous, from New South Wales (Jaquet), A., ii, 162.
Walnut-cake. See Agricultural chemistry.
Water :—
  synthesis and volumetric composition of (Leduc), A., ii, 475.
  gravimetric synthesis of (Keiser), A. ii, 87.
  molecular association of (Vaubel), A. ii, 727.

Water :—
- blue colour of (Spring), A., ii, 475.
- optical transparency of (Spring), A., ii, 537.
- refractive index of (Bender), A., ii, 621 ; (Conroy), A., ii, 717.
- copper | zinc cell with hydrochloric or *tri*chloracetic acid in, E.M.F. of (Salvadori), A., ii, 721.
- heat conductivity of (Aubel), A., ii, 354.
- latent and total heat, and entropy of (Starkweather), A., ii, 270.
- effect of pressure on melting point and latent heat of fusion of, at low temperatures (Tammann), A., ii, 635.
- freezing point of mixtures of acetic acid and (de Coppet), A., ii, 546.
- critical points of mixtures of, with ethane or carbon *di*oxide (Kuenen and Robson), A., ii, 356.
- specific volume of (Leduc), A., ii, 729.
- composition of mixed vapours of acetone and (Carveth), A., ii, 467.
- solubility, mutual, of organic liquids and (Herz), A., ii, 83.
- equilibrium between alcohol, potassium nitrate and ; temperatures at which two liquid phases appear in (Dodge and Gratton), A., ii, 408.
- solutions of chlorine in, equilibrium in, partition of chlorine between carbon tetrachloride and (Jakowkin), A., ii, 736.
- equilibrium between ethylic or methylic alcohols, ammonium or sodium sulphates or potassium carbonate and (de Bruyn), A., ii, 591.
- equilibrium between phenol, aniline and (Schreinemakers), A., ii, 739.
- equilibrium between potassium chloride, acetone and ; between sodium chloride, succinonitrile and ; between potassium carbonate, alcohol and, and between naphthalene, acetone and (Snell), A., ii, 407, 408.
- partition of, between sulphuric acid and some salts (Busnikoff), A., ii, 361.
- of hydration in salts (Wald), A., ii, 276.
- action of sodium on, heat developed in (de Forcrand), A., ii, 589.

Natural Water :—
- colour of (Spring), A., ii, 228.
- agents for removing lime and magnesia from (Griffin), A., ii, 655.
  - **River water**, composition of Danish (Westermann), A., ii, 514.
    - from West Riding of Yorkshire (Halliwell), A., ii, 772.

Natural Water :—
- **River water** or lake water, decolorising of, by sunlight (Spring), A., ii, 570.
- **Lake water**, from Lake Ruszanda, Hungary (Kalecsinszky), A., ii, 161.
- **Spring and mineral water**, from Árva-Polhora, Hungary (Kalmann and Gläser), A., ii, 771.
  - from Austria (John and Eichleiter), A., ii, 493.
  - from Bagnoli, Tuscany (Nasini and Salvadori), A., ii, 771.
  - from E. Bohemia (John), A., ii, 501.
  - from Canada (Hoffmann), A., ii, 110.
  - from Carlsbad, deposition of sulphur and pyrites by (Knett), A., ii, 772.
  - from Castrocaro, Italy (Sestini and Campani), A., ii, 38.
  - from Harzburg (Otto and Troeger), A., ii, 437.
  - from an Artesian well at Ilkeston, barium salts in (White), A., ii, 420.
  - from Illyés Lake, Hungary (Lengyel), A., ii, 163.
  - from Karlsdorf, Galicia (Dunin-Wasowicz and Horowitz), A., ii, 772.
  - from Mont-Dore (Parmentier), A., ii, 675
  - from Néris-les-Bains, fluorine in (Carles), A., ii, 308.
  - from Radein, Styria (Reibenschuh), A., ii, 308.
  - from Royat, iodine in (Duboin), A., ii, 602.
  - from Sahara desert (Lahache), A., ii, 675.
  - sulphur water of Sandefjord, Norway (Bödtker), A., ii, 39.
  - from Selters, Nassau (Fresenius), A., ii, 114.
  - from wells on the sea coast at the estuary of the Somme (Guichard), A., ii, 566.
  - fluorine in (Parmentier), A., ii, 501, 675 ; (Lepierre), A., ii, 602.
  - detection of rare metals in (Garrigou), A., ii, 616.
- **Sea water**, from the Caspian (Kusnetzoff), A., ii, 303.
  - from the Mediterranean (Gautier), A., ii, 649.
  - from the Red Sea (Natterer), A., ii, 501.
  - estimation of iodine in (Gautier), A., ii, 477.

Water, potable, moorland, acidity and plumbo-solvent action of (Ackroyd), T., 196 ; P., **1899**, 1.
  containing free carbon *di*oxide, action of, on iron (Kröhnke), A., ii, 752.
  action of, on lead pipes (Antony), A., ii, 290.
  hard, action of, on metals (Howe and Morrison), A., ii, 475.
  action of, on zinc and galvanised iron (Davies), A., ii, 555.
  sterilisation of, by ozone (Marmier and Abraham), A., ii, 506.
Water, sterilised, new form of still for preparing (Gawalowski), A., ii, 515.
Water analysis:—
  analysis of (Bailey and Johnston), A., ii, 697.
  technical analysis of (Giorgis and Feliciani), A., ii, 453.
  detection of nitrates in (Cimmino), A., ii, 805.
  estimation of alkalis in (Bohlig), A., ii, 810.
  determination of alkalinity of, indicators for (Ellms), A., ii, 525.
  estimation of ammonia, nitrates and nitrites in (Winkler), A., ii, 805.
  estimation of iron in (Seyda), A., ii, 341.
  estimation of traces of lead in (Liebrich), A., ii, 58.
  estimation of organic matter in (Marboutin and Franck), A., ii, 184.
  estimation of dissolved oxygen in (Florence), A., ii, 179 ; (Mackey and Middleton), A., ii, 244 ; (Levy and Marboutin), A., ii, 381 ; (Gerland), A., ii, 697.
  estimation of, in phenols (Schryver), A., ii, 701.
  estimation of phosphoric acid in, colorimetrically (Jolles), A., ii, 579.
  estimation of, in invert sugar (Thorne and Jeffers), A., ii, 51.
  estimation of amount of softening agent required by a hard (Vignon and Meunier), A., ii, 452.
  measurement of the turbidity of (Mason), A., ii, 615.
Water. See also Agricultural chemistry.
Water-chestnut, composition of (Neumann), A., ii, 794.
Water-pump, apparatus for preventing backward flow of water from (Chatanay), A., ii, 646.
Wax :—
  beeswax, examination of (Dieterich), A., ii, 133.
  of the humble bee, composition of (Sundvik), A., i, 112.
Wax from cork, and its decomposition (Thorns), A., ii, 324.
  from opoponax (Tschirch and Knitl), A., i, 714.
Waxes, determination of melting points of (Dowzard), A., ii, 725.
Weights, equivalent, and contraction of aqueous solutions on diluting (Wade), T., 271 ; P., **1899**, 8.
Weights, molecular, deduced from dissociation pressures of gaseous hydrates (Rosset), A., ii, 548.
  determination of, by a vapour density method (Bleier and Kohn), A., ii, 643.
  of liquids (Speyers), A., ii, 145.
  of liquids, and critical constants, relation between (Berthelot), A., ii, 404.
  of some salts in nitrobenzene (Kahlenberg and Lincoln), A., ii, 397.
  of some salts dissolved in urethane (Castoro), A., ii, 360.
  of ammonium azoimide (Curtius and Rissom), A., ii, 91.
  of argon (Berthelot), A., ii, 207.
  of ozone (Ladenburg), A., ii, 89, 281 ; (Staedel ; Gröger), A., ii, 150.
  of sodium hyponitrite (Divers), T., 122.
  and melting points of the acids of the oxalic series, relations between (Massol), A., i, 738.
  of alcohols, in benzene and naphthalene solutions (Biltz), A., ii, 634.
  of benzene, toluene, and alcohol in the liquid state (Speyers), A., ii, 468.
  of benzopurpurin and "diamine-pure-blue" in solution (Krafft), A., ii, 473.
  of ethylenic chlorobromide or cyanide in ethylenic bromide ; of dimethylic fumarate in dimethylic succinate ; of elaidic in stearic, and stearic in elaidic acid (Bruni and Gorni), A., ii, 731.
  of ethylic sodiomalonate and sodioacetoacetate (Vorländer and Schilling), A., i, 672.
  of rosaniline hydrochloride, methyl-violet and methylene-blue, in water or alcohol (Krafft), A., ii, 473.
  of sodium oleate (Kahlenberg and Schreiner), A., ii, 203.
Wheat. See Agricultural chemistry.
Wheat bran or grain, estimation of cellulose in (Lebbin), A., ii, 67.
Wheat flour, detection of maize starch in (Baumann), A., ii, 703.

(o-*Xylene*, $Me : Me = 1 : 2$; m-*xylene*, $Me : Me = 1 : 3$; p-*xylene*, $Me : Me = 1 : 4$).

Wine bouquet, improvement of, addition of vine-leaf extract to must; and effect on yeasts (Jacquemin), A., ii, 377.
  mercury in (Vignon and Perraud), A., ii, 446.
  making, effect of sterilising must in (Rosenstiehl), A., ii, 508.
Wine analysis:—
  analysis of (Ripper; Barth), A., ii, 699.
  detection of fluorine in (Paris), A., ii, 804.
  detection of salicylic acid in (Abraham), A, ii, 341.
  estimation of alcohol and acidity in (Erckmann), A., ii, 339.
  estimation of extractive matter in (Fresenius), A., ii, 253.
  estimation of glycerol in (Fabris), A., ii, 131.
  estimation of mercuric chloride in (Gayon and Laborde), A., ii, 385.
  estimation of mercury and copper in (Vignon and Barrillot), A., ii, 452.
  estimation of potassium hydrogen tartrate in (Magnier de la Source), A., ii, 70; (Jay), A., ii, 133.
  estimation of tartaric acid in (Kulisch, Kohlmann, and Höppner), A., ii, 340.
  examination of "sugared" wines (Möslinger), A., ii, 700.
Wine-vinegar (Farnsteiner), A., ii, 705.
Wolframite from Caucasus (Tschernik), A., ii, 669.
  from Zinnwald, indium in (Atkinson), A., ii, 600.
Wolfsbergite, artificial (Sommerlad), A., ii, 216.
Wollastonite from Austria (John and Eichleiter), A., ii, 493.
  artificial (Morozewicz), A., ii, 764.
Wood, the so-called lignin reaction of (Czapek), A., i, 560.
  detection of (Piutti), A., ii, 340.
Wood charcoal, action of sulphuric acid on (Berthelot), A., ii, 286.
Wood oil, Japanese (Kitt), A., i, 864.
Wood tar, distillation of (Béhal), A., i, 121.
Wormwood, a new constituent of (Adrian and Trillat), A., i, 301.
Wort, influence of the mineral constituents of water on composition of (Lott), A., ii, 683.
Wort, percentages of calcium and magnesium in, and determination of acidity of (Matthews and Woolcott), A., ii, 174.
  See also Beer.

X.

Xanthine from uric acid (Sundvik A., i, 174.
  heats of combustion and formation of (Berthelot and André), A., ii, 400.
  identification of (Fischer), A., i, 176.
  theobromine and caffeine, relative stability of, towards alkalis (Fischer), A., i, 262.
  Paraxanthine, new synthesis of (Fischer and Clemm), A., i, 173.
    chloro- (Fischer and Clemm), A., i, 173.
Xanthine bases, amount of, in beer (Laszczynski), A., ii, 793.
Xanthione (Graebe and Röder), A., i, 706.
Xanthitane (?) from Dublin (O'Reilly), A., ii, 498.
Xanthone group of colouring matters, salt-formation by (Perkin), T., 442; P., **1899**, 66.
Xanthone-oxime, -phenylhydrazone and **-phenylimine** (Graebe and Röder), A., i, 705, 706.
Xanthorhamnin, formula, and potassium derivative (Perkin), T., 440; P., **1899**, 65.
Xanthorrhœa resin oil, constituents of (Schimmel and Co.), A., i, 63.
Xanthoria parietina, constituents of (Hesse), A., i, 386.
Xenon, discovery of (Ramsay), A., ii, 212.
  position of, in periodic system (Howe), A., ii, 740.
Xenotime from Ontario (Hoffmann), A., ii, 110.
o-**Xylene** hexachloride (Radziewanowski and Schramm), A., i, 197.
  p-nitro-, electrolytic reduction of (Elbs and Kopp), A., i, 270.
m-**Xylene** in lignite tar (Oehler), A., i, 816.
  diffusion coefficient of, across vulcanised caoutchouc (Flusin), A., ii, 205.
  action of sulphur chloride on, with aluminium-mercury couple (Cohen and Skirrow), T., 890; P., **1899** 183.

(*o-Xylene, Me* : *Me*=1 : 2 ; *m-xylene, Me* : *Me*=1 : 3 ; *p-xylene, Me* : *Me*=1 : 4).

1 : 4 : 6-Xylenol, 2 : 5-*di*bromo- and 2 : 3 : 5-*tri*bromo-, and its benzoate (Auwers and Ercklentz), A., i, 35.
  2 : 3 : 5-*tri*bromo-, and benzoate (Auwers), A., i, 343.
  compound formed by action of fuming nitric acid on (Auwers and Rapp), A., i, 30.
Xylenolcarbinol, *di*bromo-, and acetate (Auwers), A., i, 343.
Xylic acids (*xylylic acids*). See Dimethylbenzoic acids.
2-*m*-Xylidine, from commercial xylidine (Noyes), A., i, 284.
  velocity of diazotisation of (Hantzsch and Schümann), A., ii, 550.
  colouring matter obtained from, by action of *p*-nitrodiazobenzene (Friedländer and Brand), A., i, 351.
4-*o*-Xylidine-(? 6)-sulphonic acid (Cazeneuve and Moreau), A., i, 431.
4-*m*-Xylidine-6-sulphonic acid (Cazeneuve and Moreau), A., i, 431.
Xylitol, condensation of benzaldehyde with (de Bruyn and Alberda van Ekenstein), A., i, 662.
Xylonic acid, conversion of xylose into, by sorbose bacterium (Bertrand), A., ii, 44.
Xylonitrile. See 2 : 4-Dimethylbenzonitrile.
p-**Xyloquinone**, *di*bromo-, formation of (Auwers and Rapp), A., i, 30.
Xylose, phenylosazone of (Zanotti), A., i, 851.
  action of sorbose bacterium on, in yeast extract (Bertrand), A., ii, 44.
m- and *p*-**Xylylamines** and salts (Konowaloff), A., i, 873.
m-**Xylyl-ψ-azimino-nitro-** and **-*di*nitro-benzene** (Willgerodt and Klein), A., i, 883.
m-**Xylylaznitroso-nitro-** and **-*di*nitro-benzene** (Willgerodt and Klein), A., i, 883.
m-**Xylylcarbamide** (Walther and Wlodkowski), A., i, 590.
p-**Xylylcarboxylic acid** (Bouveault), A., i, 287.
p-**Xylylchloromethylketone** (Collet), A., i, 56.
m-**Xylylchlorophosphine** (Conen), A., i, 208.
4-*m*-Xylyldihydroquinazoline, 2-bromo- (Drawert), A., i, 643.
m-**Xylyldimethylphosphine**, and its oxide (Conen), A., i, 208.
m-**Xylylenefurazan** (Zincke and Schwarz), A., i, 751.
o-**Xylylenic** bromide, action of, on alkaloids (Scholtz), A., i, 648.
  action of, on bebeerine (Scholtz), A., i, 92.
o-, *m*-, and *p*-**Xylylenic** chlorides (Radziewanowski and Schramm), A., i, 197.
m-**Xylyl-4-glyoxylic acid**, 5-bromo-, 5-iodo- (Noyes), A., i, 285.
p-**Xylylglyoxylic acid**, and ethylic salt (Bouveault), A., i, 286.
1 : 3 : 2-Xylylhydrazine (Busch), A. i, 496.
Xylylic acids (*xylic acids*). See Dimethylbenzoic acids.
p-**Xylylic** phenylcarbamate (Auwers), A., i, 343.
m- and *p*-**Xylylic** mercaptans (Gattermann), A., i, 518.
o-, *m*-, and *p*-**Xylylic** chlorides (Radziewanowski and Schramm), A., i, 197.
2-Xylylidene-phthalide and **-phthalimidine** (Bethmann), A., i, 520.
m-**Xylyl methyl ketone**, preparation of (Verley), A., i 207.
m-**Xylylmethylnitrosamine**, nitro- $[Me_2 : N : NO_2 = 1 : 3 : 4 : 5]$, and amino-, and its picrate (Pinnow and Oesterreich), A., i, 203.

(o-*Xylene*, *Me* : *Me*=1 : 2 ; m-*xylene*, *Me* : *Me*=1 : 3; p-*xylene*, *Me* : *Me*=1 : 4).

2 : 4-Xylylmethylthiosemicarbazide (MARCKWALD), A., i, 505.

2 : 4-Xylylphenylthiosemicarbazide, and the thiodiazolone (MARCKWALD), A., i, 505.

1 : 3-Xylyl-5-phosphonium iodide (CONEN), A., i, 209.

1 : 3-Xylyl-4-phosphonium iodide, hydroxide and chloride (CONEN), A., i, 208.

2-Xylylphthalide (BETHMANN), A., i, 520.

4-Xylylquinazolone and salts, and 2-chloro-derivative (DRAWERT), A., i, 642.

4-Xylyltetrahydro-2-ketoquinazoline, and its salts (DRAWERT), A., i, 643.

Xylylthiocarbimide (BUSCH), A., i, 496.

Y.

Yeast, nutrition of, and influence of sulphur compounds on (STERN), T., 201 ; P., **1898**, 182.
- acclimatisation of, and influence of various sugars on their fermentative power (DIENERT), A., ii, 442.
- influence of mineral constituents of brewing waters on, and composition of ash (LOTT), A., ii, 683.
- action of various poisons on (WEHMER), A., ii, 785.
- absence of chitin from (TANRET), A., ii, 171.
- action of the liquid pressed out from, on dextrin (PETIT), A., i, 559.
- action of, on pure glyceraldehyde and dihydroxyacetone (EMMERLING), A., ii, 318.
- secretion of lactase and melibiase by (DIENERT), A., ii, 683.
- fermentation of sugars by, and influence of nitrogenous matter thereon (DUBOURG), A., i, 376.
- in wine making, action of vine-leaf extract on (JACQUEMIN), A., ii, 377.
- beer, absorption of oxygen by, and presence of an enzyme in (EFFRONT), A., ii, 118.
- bottom, Munich, action of, on dextrose and lævulose (BUCHNER and RAPP), A., ii, 606.
- brewer's, action of, on malic acid due to bacteria (EMMERLING), A., ii, 570.
- compressed, amount of pentosans in (MENOZZI), A., ii, 683.
- wine, formation of glycogen in (KAYSER and BOULLANGER), A., ii, 236.

Yeast-cells, influence of oxygen and mechanical shaking on (BUCHNER and RAPP), A., ii, 169.

Yeast enzymes, hydrolysis of polysaccharides by (KALANTHAR), A., i, 102.

Yeast extract (Buchner's), composition of (WRÓBLEWSKI), A., ii, 170.
- preparation ; action on starch and sugars, and influence of potassium arsenite on (BUCHNER and RAPP), A., ii, 606.
- formation of glycogen in (CREMER) A., ii, 606.
- experiments with (BUCHNER and RAPP), A., ii, 236.
- influence of a nutrient media on amount of zymase in (ALBERT), A., ii, 783.
- and xylose, action of sorbose bacterium on (BERTRAND), A., ii, 44.
- proteolytic action of, and action of various reagents (GEBER and HAHN), A., i, 94.

Yetiver oil (SCHIMMEL and Co)., A., i, 924.

Yohimbehe bark, alkaloids of (SPIEGEL), A., i, 966.

Yohimbic acid (SPIEGEL), A., i, 966.

Yohimbine, and methiodide, acetyl, and oxidation derivatives (SPIEGEL), A., i, 966.

Yohimbinine (SPIEGEL), A., i, 967.

Yolk of egg, detection of (DIETERICH), A., ii, 392.

Ytterbium in monazite sand (SCHÜTZENBERGER and BOUDOUARD), A., ii, 367.

Yttria earths, fractionation of (SCHÜTZENBERGER and BOUDOUARD), A., ii, 367.

Yttrium in monazite sands (URBAIN), A., ii, 28 ; (SCHÜTZENBERGER and BOUDOUARD), A., ii, 367.
- nitrates (WYROUBOFF and VERNEUIL), A., ii, 225.
- oxide, constitution of (WYROUBOFF and VERNEUIL), A., ii, 598.
- oxides, complex oxides and nitrates from (WYROUBOFF and VERNEUIL), A., ii, 424.
- silicate. See Thalénite.

Yttrium minerals in ore deposits (SJÖGREN), A., ii, 37.

Z.

Zeolites, action of water on (CLARKE), A., ii, 109.

Zeoric acid, probably an impure form of parellic acid (HESSE), A., i, 383.

- **Zeorin**, presence of, in *Placodium saxicolum*, and decomposition products, and isomeride (Hesse), A., i, 382.
- *iso*-**Zeorin**, and **Zeorinin** (Hesse), A., i, 382.
- **Zinc**, and zinc sponge, electrolytic formation of (Foerster and Günther), A., ii, 220.
  - presence of, in copper precipitated by its use (Shengle and Smith), A., ii, 749.
  - potential difference between, and solutions of its salts in organic solvents (Kahlenberg), A., ii, 624.
  - heat of vaporisation of (Sutherland), A., ii, 7.
  - heat of amalgamation of (Richards and Lewis), A., ii, 267.
  - mixtures of, with lead, partition of tin or silver in (Bancroft), A., ii, 470.
  - dust, action of, on *di*bromo-derivatives of paraffin hydrocarbons (Ipatieff), A., i, 469.
  - action of, on sulphuric acid (Adie), P., **1899**, 133; (Berthelot), A., ii, 283.
  - action of water on (Davies), A., ii, 555.
  - action of a hard water on (Howe and Morrison), A., ii, 476.
- **Zinc alloy** with calcium (Moissan), A., ii, 154.
- **Zinc amalgams** of different concentrations, electromotive force between (Cady), A., ii, 394.
- **Zinc salts**, absorption of Röntgen rays by (Hébert and Reynaud), A., ii, 586.
  - diffusion of light by solutions of (Spring), A., ii, 585.
  - reduction of, by calcium carbide; alloys with calcium (Tarugi), A., ii, 749.
  - influence of, on hæmoglobin formation (Wolf), A., ii, 231.
- **Zinc** antimonate (Senderens), A., ii, 557.
  - and zinc potassium thioantimonites (Pouget), A., ii, 663.
  - ortharsenite, formation of (Reichard), A., ii, 23.
  - azoimide, basic (Curtius and Rissom), A., ii, 92.
  - bromide, spark spectrum of (de Gramont), A., ii, 137.
    - electrolyis and heat of formation of (Czepinski), A., ii, 268.
    - solubility of hydrates of (Dietz), A., ii, 221.
  - chloride, molecular weight of, in urethane (Castoro), A., ii, 360.
    - spark-spectra of (de Gramont), A., ii, 137.
- **Zinc** chloride, fused, specific conductivity of (Schultze), A., ii, 623.
    - fused, electrolysis of (Schultze), A., ii, 657.
    - electrolysis and heat of formation of (Czepinski), A., ii, 268.
    - fused, dissociation coefficient of (Lorenz), A., ii, 269.
    - coagulation of colloidal solutions of gold, silver, or arsenious sulphide by (Stark), A., ii, 644.
    - hydrates of, solubility of (Dietz), A., ii, 221.
  - ammonium chloride, dissociation of, change of entropy in (Matignon), A., ii, 273.
    - chlorides (Base), A., i, 41.
  - potassium chloride, conductivity of aqueous solutions of (Jones and Ota), A., ii, 587.
  - sodium chloride, and ammonium bromides, conductivities of solutions of (Jones and Knight), A., ii, 628.
  - iodide, solubility of hydrates of (Dietz), A., ii, 221.
  - lead iodide (Mosnier), A., ii, 222.
  - molybdiodate (Chrétien), A., ii, 363.
  - nitrate, electrolysis of, with copper ferrocyanide membrane (Schreber), A., ii, 273.
    - densities of solutions of (Barnes and Scott), A., ii, 406.
    - hydrates of (Funk), A., ii, 210.
  - oxide prepared from nitrate, occluded gas in (Richards), A., ii, 101.
  - calcium silicate from New Jersey (Wolff), A., ii, 435.
  - sulphide actinometer (Henry), A., ii, 394.
    - phosphorescence of (Mourelo), A., ii, 420.
    - solubility of, in dilute hydrochloric acid, theory of (Morgan and Gotthelf), A., ii, 627.
    - action of sulphuric acid on (Berthelot), A., ii, 283.
  - sulphate, thermal change on diluting a saturated solution of (Pollok), P., **1899**, 8.
    - densities of solutions of (Barnes and Scott), A., ii, 406.
    - solution, action of magnesium on (Bryant), A., ii, 289.
  - potassium paratungstate (Hallopeau), A., ii, 160.
- **Zinc organic compounds** :—
  - Triethylenediaminezinc salts (Werner, Megerle, Pastor, and Spruck), A., i, 856.
  - Zinc, antipyrine salicylate (Schuyten), A., i, 306.

Zinc organic compounds :—
- Zinc bromide and chloride, double ammonio-compound of, with mercuric cyanide (VARET), A., i, 99.
  - cyanide, electrolysis of (BAKER), A., ii, 749.
    - or sulphide, heat developed by the action of potassium cyanide on (BERTHELOT), A., ii, 422.
    - action of ammonia on (VARET), A., i, 98.
  - potassium cyanide and its decomposition (BERTHELOT), A., i, 847.
    - action of hydrogen sulphide or sodium sulphide on (BERTHELOT), A., ii, 422.
  - dithionate phenylhydrazine (MOITESSIER), A., i, 688.
  - ethyl, preparation of (SIMONOWITSCH), A., i, 871.
    - iodide, action of *iso*butylic iodide on (SIMONOWITSCH), A., i, 471.
  - hypophosphite phenylhydrazine (MOITESSIER), A., i, 688.
  - methyl, preparation of (SIMONOWITSCH), A., i, 471; (WOROBÉEFF), A., i, 871.
  - *iso*propyl, preparation of (BOHM), A., i, 872.
  - thiosulphate phenylhydrazine (MOITESSIER), A., i, 688.

Zinc, estimation and separation of :—
- estimation of (MURMANN), A., ii, 126; (LANGMUIR), A., ii, 522.
- estimation of, electrolytically (PAWECK), A., ii, 250.
- estimation of, volumetrically (POUGET), A., ii, 695.
- estimation of, in ores containing aluminium (JENSCH), A., ii, 522.
- estimation of silver, gold, and mercury in presence of (KOLLOCK), A., ii, 811.
- separation of copper from (DEDERICHS), A., ii, 813.
- separation of copper, iron, lead, and tin from (LANGMUIR), A., ii, 522.
- separation of iron from (BREARLEY), A., ii, 815.
- separation of nickel from (DÖHLER), A., ii, 811.

Zinc-boracite containing iodide (ALLAIRE), A., ii, 156.

Zinckenite from the Harz (GUILLEMAIN), A., ii, 757.
- artificial (SOMMERLAD), A., ii, 217.

Zircon from Russia (JEREMÉEFF), A., ii, 673.

Zirconium *tetra*chloride and *tetra*bromide, compounds of, with amines (MATTHEWS), A., ii, 295, 296.
- nitrides (MATTHEWS), A., ii, 296.
- oxide "favas" from Brazil (HUSSAK), A., ii, 432.
- separation of iron from (MATTHEWS), A., ii, 335.

Zoisite from the Alps (TERMIER), A., ii, 303.
- from Scotland (HEDDLE), A., ii, 497.

Zymase in yeast extract, artificial increase of (ALBERT), A., ii, 783.

RICHARD CLAY AND SONS, LIMITED, LONDON AND BUNGAY.

LIBRARY.

The attention of Fellows is called to the times during which the Library is open for consultation.

The Library is open for consultation and for the issue of books from 10 A.M. to 6 P.M. on week days (Saturdays 10 A.M. to 4 P.M.) and on the evenings of meetings from 7 P.M. to 9 P.M.

COLLECTIVE INDEX.

Fellows can obtain from the Assistant Secretary the Collective Index for 1873–82 at the price of 10*s.*, or 11*s.* including carriage, and for 1883–92 at the price of 15*s.*, or 16*s.* including carriage. Non-members may obtain copies from Messrs. Gurney and Jackson, 1, Paternoster Row, E.C., at the respective prices of 15*s.* and £1, excluding carriage.

PROCEEDINGS OF THE CHEMICAL SOCIETY.

The attention of Subscribers to the publications of the Chemical Society is directed to the fact that a number of the papers read at the bi-monthly meetings and abstracts of the remainder, together with the discussions thereon, are now published by the Society, being usually issued to Fellows about a week after the meeting in the form of "Proceedings." The Proceedings are purchasable at a price of seven shillings and sixpence per annum, post free. Intending subscribers are requested to apply to Messrs. Gurney and Jackson, 1, Paternoster Row, London.

ISSUE OF JOURNAL TO SUBSCRIBERS.

The Journal—which comprises the Transactions of the Chemical Society and Abstracts of all chemical papers published elsewhere—is regularly despatched, post free, by the Publishers (Messrs. Gurney and Jackson, 1, Paternoster Row, E.C.) to subscribers—English and Foreign, within the Postal Union—who have paid to them in advance the annual subscription of 40s.

CASES FOR BINDING THE JOURNAL.

Cloth cases for binding the yearly volumes of the Journal can be had for 2*s.* 6*d.* the set from the Publishers, Messrs. Gurney and Jackson, 1, Paternoster Row, E.C.

JUBILEE OF THE SOCIETY, 1891.

Copies of the Jubilee volume may be obtained from Messrs. Gurney and Jackson, 1, Paternoster Row, E.C., at the price of 6*s.*

MACMILLAN & CO.'S BOOKS ON CHEMISTRY.

JUST PUBLISHED.

INTRODUCTION TO PHYSICAL CHEMISTRY. By JAMES WALKER, D.Sc., Ph.D. Professor of Chemistry in University College, Dundee, 8vo, 10*s.* net.

RECENTLY PUBLISHED.

AN INTRODUCTION TO THE STUDY OF CHEMISTRY. By Prof. W. H. PERKIN, Jr., Ph.D., F.R.S., and BEVAN LEAN, D.Sc., B.A. Globe 8vo, 2*s.* 6*d.*

CHEMISTRY FOR ORGANISED SCHOOLS OF SCIENCE. By S. PARRISH, B.Sc., A.R.C.S. (Lond.). With Introduction by Dr. FORSYTH. Globe 8vo, 2*s.* 6*d.*

THE ARITHMETIC OF CHEMISTRY. By JOHN WADDELL, B.Sc., Ph.D. Globe 8vo, 4*s.* net.

SECOND THOROUGHLY REVISED AND ENLARGED EDITION. Demy 8vo, 25*s.* net.

CHEMICAL ANALYSIS OF OILS, FATS, WAXES, and of the COMMERCIAL PRODUCTS DERIVED THEREFROM. Founded on BENEDIKT'S Second Edition of "Analyse der Fette." By J. LEWKOWITSCH, F.I.C., F.C.S., etc.

NEW EDITION OF VOLUMES I. and II. NOW READY.

A TREATISE ON CHEMISTRY. By H. E. ROSCOE, F.R.S., and C. SCHORLEMMER, F.R.S. New Edition completely revised by Sir H. E. ROSCOE, assisted by Drs. H. G. COLMAN and A. HARDEN.

VOLUME I.—THE NON-METALLIC ELEMENTS. 8vo, 21*s.*

VOLUME II.—THE METALS. 8vo, 31*s.* 6*d.*

⁂ The two volumes as they now stand form the only complete work, up to date, on Inorganic Chemistry in the English language.

VOLUME III. Organic Chemistry. Parts I., II., IV., and VI., 21*s.* each. Parts III. and V. 18*s.* each.

INORGANIC CHEMISTRY FOR BEGINNERS. By Sir H. E. ROSCOE, F.R.S. Assisted by J. LUNT, B.Sc. Globe 8vo, 2*s.* 6*d.*

INORGANIC CHEMISTRY FOR ADVANCED STUDENTS. By Sir H. E. ROSCOE, F.R.S., and Dr. A. HARDEN. Globe 8vo, 4*s.* 6*d.*

AN INTRODUCTION TO THE SCIENCE AND PRACTICE OF QUALITATIVE CHEMICAL ANALYSIS. INORGANIC. By CHAPMAN JONES, F.I.C., F.C.S. &c. Crown 8vo, 6*s.*

PRACTICAL INORGANIC CHEMISTRY FOR ADVANCED STUDENTS. By CHAPMAN JONES, F.I.C., F.C.S. (London and Berlin). Globe 8vo, 2*s.* 6*d.*

THE RISE AND DEVELOPMENT OF ORGANIC CHEMISTRY. By CARL SCHORLEMMER, LL.D., F.R.S. Revised Edition. Edited by A. SMITHELLS, B.Sc. Crown 8vo, 5*s.* net.

A TEXT-BOOK OF INORGANIC CHEMISTRY. By Prof. I. REMSEN. 8vo, 16*s.*

INORGANIC CHEMISTRY. By Prof. I. REMSEN. Crown 8vo, 6*s.* 6*d.*

ORGANIC CHEMISTRY. By Prof. I. REMSEN. Crown 8vo, 6*s.* 6*d.*

LABORATORY MANUAL EXPERIMENTS TO ILLUSTRATE THE ELEMENTARY PRINCIPLES OF CHEMISTRY. By H. W. HILLYER, Ph.D. Medium 8vo, 4*s.* net.

A LABORATORY MANUAL OF ORGANIC CHEMISTRY. By Dr. LASSAR-COHN. Translated by A. SMITH, B.Sc., Ph.D. Crown 8vo, 8*s.* 6*d.*

CHEMICAL ARITHMETIC. With 1200 Problems. By S. LUPTON, M.A. Second Edition, revised. Fcap. 8vo, 4*s.* 6*d.*

NOTES ON OBSERVATIONS. Being an Outline of the Methods used for Determining the Meaning and Value of Quantitative Observations and Experiments in Physics and Chemistry, and for reducing the results obtained. By SYDNEY LUPTON, M.A. Crown 8vo, 3*s.* 6*d.*

ESSAYS IN HISTORICAL CHEMISTRY. By T. E. THORPE, F.R.S. Crown 8vo, 8*s* 6*d.* net.

SYSTEMATIC SURVEY OF THE ORGANIC COLOURING MATTERS. By Dr. G. SCHULTZ and P. JULIUS. Translated and Edited by A. G. GREEN, F.I.C., F.C.S. Royal 8vo, 21*s.* net.

LESSONS IN ELEMENTARY CHEMISTRY, INORGANIC and ORGANIC. By Sir H. E. ROSCOE, F.R.S. Sixth Edition, thoroughly revised. Fcap. 8vo, 4*s.* 6*d.*

A HISTORY OF CHEMISTRY FROM EARLIEST TIMES TO THE PRESENT DAY. Being also an Introduction to the Study of the Science. By E. VON MEYER, Ph.D. Translated by G. M'GOWAN, Ph.D. 8vo, 15*s.* net.

OUTLINES OF GENERAL CHEMISTRY. By Prof. W. OSTWALD. Translated by J. WALKER, D.Sc., Ph.D. 8vo, 10*s.* net.

THE SCIENTIFIC FOUNDATIONS OF ANALYTICAL CHEMISTRY TREATED IN AN ELEMENTARY MANNER. By W. OSTWALD, Ph.D. Translated by G. M'GOWAN, Ph.D. Crown 8vo, 5*s.* net.

THE

DAVY FARADAY RESEARCH LABORATORY

OF

THE ROYAL INSTITUTION.

Directors:

The Right Hon. LORD RAYLEIGH, M.A., D.C.L., LL.D., F.R.S.
Professor DEWAR, M.A., LL.D., F.R.S.

Superintendent of the Laboratory:

Dr. ALEXANDER SCOTT, M.A., D.Sc., F.R.S.

This Laboratory was founded by Dr. Ludwig Mond, F.R.S., as a Memorial of Davy and Faraday, for the purpose of promoting, by original research, the development and extension of Chemical and Physical Science.

The Laboratory is open free of charge to Workers of either sex, and any nationality, prosecuting individual investigations; and the extensive collection of Physico-Chemical Apparatus presented by the Founder is available for the use, together with such materials, chemicals, electricity, &c., as the Directors may authorise.

Assistants and a trained mechanician are attached to the Laboratory to aid Workers in the prosecution of their researches.

All persons desiring to be admitted as workers must send evidence of scientific training, qualification, and previous experience in original research, along with a statement of the nature of the investigation they propose to undertake.

Michaelmas Term—Monday, October 2, to Saturday, December 16.
Lent Term—Monday, January 8, to Saturday, April 7.
Easter Term—Monday, April 30, to Saturday, July 28.

Forms of application can be had from the Assistant Secretary, Royal Institution, Albemarle Street, W.

INSTITUTE OF CHEMISTRY OF GREAT BRITAIN AND IRELAND.

Notice is Hereby Given, that an **EXAMINATION for the ASSOCIATESHIP (A.I.C.) and FELLOWSHIP (F.I.C.)** of the Institute of Chemistry will be held at **30, BLOOMSBURY-SQUARE, London, W.C.,** on **TUESDAY, January 9, 1900**, and three following days.

Forms of application can be obtained from the Secretary.—By order of the Council, **J. MILLAR THOMSON,** *Hon. Registrar.*

No. 30, BLOOMSBURY-SQUARE, LONDON, W.C., *November* 10, 1899.

ACETATE OF LIME

(Pyrolignite of lime, brown, 65—68 %)

is manufactured on a large scale and sold direct to consumers at a moderate price by

STORA KOPPARBERGS BERGSLAGS AKTIEBOLAG, Falun, Sweden.

WORKS PUBLISHED BY CHARLES GRIFFIN & CO., LTD.

IMPORTANT NEW WORK. JUST OUT. PRICE 16s.

DAIRY CHEMISTRY FOR DAIRY MANAGERS, CHEMISTS, AND ANALYSTS: A Practical Handbook for Dairy Chemists and others having control of Dairies. With numerous Tables, and 22 Illustrations. By H. DROOP RICHMOND, F.C.S., Chemist to the Aylesbury Dairy Company.

SUMMARY OF CONTENTS.—I. Introductory—The Constituents of Milk. II. The Analysis of Milk. III. Normal Milk: its Adulterations and Alterations, and their Detection. IV. The Chemical Control of the Dairy. V. Biological and Sanitary Matters. VI. Butter. VII. Other Milk Products. VIII. The Milk of Mammals other than the Cow—Appendices—Tables.

FOODS: Their Composition and Analysis. By A. WYNTER BLYTH, M.R.C.S., F.C.S., Barrister-at-Law, Public Analyst for the County of Devon, and Medical Officer of Health for St. Marylebone. With Elaborate Tables, Folding Litho-Plate, and Photographic Frontispiece. *Fourth Edition*, Revised and Enlarged. 21s.

"AN ADMIRABLE DIGEST of the most recent state of knowledge. . . . Interesting even to lay readers."—*Chemical News.*

LEAD AND SILVER (the Metallurgy of). By HENRY F. COLLINS, Assoc. R.S.M., Assoc. M. Inst. C.E. In Two Volumes. Part I.—LEAD, with sections on Smelting and Desilverisation, and on the Assay and Analysis of the Materials involved. Now Ready. Complete in itself, and sold separately. With Illustrations, handsome cloth, price 16s.

"A CLEAR, WORKMANLIKE AND COMPREHENSIVE exposition of present-day practice."—*Scotsman.*

ELECTRO-METALLURGY (A Treatise on): The Plating, Depositing, Smelting, and Refining of Various Metals, and the Reproduction of Printing Surfaces and Art Work, &c. By WALTER G. MCMILLAN, F.I.C., F.C.S. SECOND EDITION, Revised and Enlarged, with Chapters on Theories of Electrolysis, etc. 10s. 6d.

"We recommend this Manual to ALL who are interested in the PRACTICAL APPLICATION of electrolytic processes."—*Nature.*

ELECTRIC SMELTING AND REFINING. The Extraction and Treatment of Metals by Electrical Methods. Being the "Elektro Metallurgie" of Dr. W. BORCHERS. Translated by WALTER G. MCMILLAN, F.I.C., F.C.S., with numerous Illustrations and Three Folding Plates. 21s.

"FULL OF VALUABLE INFORMATION."—*Electrician.*

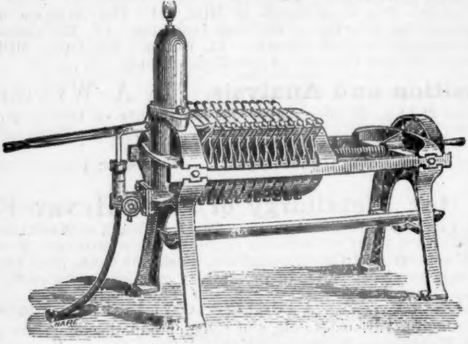
S. H. JOHNSON & CO.'S
PYRAMID FILTER PRESSES.

Many thousands have been supplied and are in use in every industry throughout the world in all sizes from 6 inches square to 60 inches in diameter, with the most improved arrangements for washing the cakes in the press.



WALL
PUMPING ENGINES.

For working Filter Presses, feeding High Pressure Boilers, or for other purposes where high pressure is required with economy of steam.

PATENT HIGH EFFICIENCY
AIR COMPRESSORS.

Constructed with our Patent Annular Valves easily accessible and replaceable, and with our Patent Spring Pistons which eliminate clearance at the end of the stroke, and thus ensures the highest efficiency: also,
VALVELESS VACUUM PUMPS (dry) for High Duty.

A. SMITHELLS, B.Sc.
JAMES WALKER, D.Sc.

ASSISTANT SECRETARY AND LIBRARIAN

ROBERT STEELE.

IMPORTANT NOTICES.

NOTICES TO AUTHORS OF PAPERS.

All communications for the Journal of the Society should be addressed to "The Secretaries, Chemical Society, Burlington House, W."

The attention of authors is directed to the following resolution of the Council.

"No communication shall be included in the list of titles of papers to be brought before a Meeting of the Society, unless the paper and an abstract of it are in the hands of the Secretaries **at least three days** before the date of the Meeting; and no announcement of titles can be made in the Proceedings until the papers have been received by the Secretaries."

In all cases, an abstract of each paper should be supplied for insertion in the Proceedings.

Authors are requested to write on their papers **the address to which they wish proofs to be sent,** also to send their corrected proofs without delay to the **Editor,** 10, Selwood Terrace, South Kensington, S.W., *and not to the Printers.* If authors require more than the **50 copies** allowed by the Society, they should inform the Editor at the time they send in their corrected proofs, when the extra copies will be supplied at cost price.

All papers communicated to the Society, with their illustrative drawings, **become the property of the Society,** unless stipulation be made to the contrary. In the case of papers which are not accepted for publication in the Transactions, the Council have decided that in order to meet any claim for priority such papers shall be deposited in the Society's Archives. Authors are therefore advised to retain copies of their papers.

It has been resolved by the Council that communications made to the Society which have already **appeared in any Foreign Journal** shall not be published in the Society's Transactions, unless this course is specially recommended by the Publication Committee, and this recommendation approved by the Council.

ILLUSTRATIONS, AND PLATES OF CURVES.

As the **Illustrations** for the Journal (including curves) are, as far as possible, executed in photographic "process" work, the drawings, &c., accompanying the papers should be carefully done on a large scale on smooth white Bristol board in Indian ink, so as to admit of the blocks being prepared directly from the drawings.

Where it is necessary to employ **Plates,** these have to be of certain dimensions. It is desirable, therefore, that Authors who wish to illustrate their experimental results by **curves,** such as cannot be reproduced by "process," should arrange them so that they may be lithographed without reduction.

Information as to **Illustrations** and the dimensions of **Plates** can be obtained on application to the Editor.

Abstractors are requested to send their MSS. and corrected proofs to the **Sub-editor,** 39, Frognal, Hampstead, N.W.; and communicate change of address to the **Printers,** as well as to the **Editors.**
